CHAPTER IV.

WHEN she arose next morning the feeling of home-sickness had completely vanished, and she felt only a sense of elation in the novel circumstances in which she found herself. She boiled herself an egg for breakfast, singing as she did so, and was proceeding to make some toast when a tap came at the door.

'I'm Miss Taylor—Miss Louisa Taylor,' explained the red-haired young lady who entered. 'I am pleased to make your acquaintance, and hope, if I can be of use to you, you'll let me.'

Francesca shook hands, and offered her visitor a seat, but the latter shook her head.

'No; I'm just off,' she said. 'But Mrs Broad told me that you were looking for a job, and I wondered if you'd like to apply to Marshall's for a vacant place that's going just now. Miss Green, in the lace department, got ill yesterday and had to leave. Know anything of business?'

'Oh no,' said Francesca. 'And—it's very kind of you; but I'm sure I wouldn't do for that. It means a lot of arithmetic, doesn't it? I never was quick at sums.'

'Ah, I thought probably you hadn't the education,' Miss Taylor answered. 'And now I see you, you look too much the lady for the work. You'd do for a model, though, and they'd be glad to get you.'

'A what?' said Francesca, who knew nothing of London shops, and her startled thoughts flew to artists and studios.

'A model for the costume department. All you'd have to do'd be to put on the dresses and walk about for the ladies to look at and see how they want their frocks made. The pay isn't bad. But then I don't know if there's a vacancy at our place.'

'You *are* kind,' Francesca said gratefully, really touched by the girl's evident interest. 'Perhaps you would find out for me, and I'll be looking about meanwhile.'

Some one whistled up the stairs, and the red-haired girl moved to the door. 'There's Mr Smith a-whistling,' she said, and Francesca saw that she blushed. 'His office lays up my way, and he generally goes so far with me. Good-morning, Miss Dunn, and I'll keep my eyes open for you, I will.'

It transpired, however, that Marshall & Snelgrove had no need for a new model at that moment, so Miss Taylor's kind thought was fruitless. Francesca went out to hunt for work on her own account. She thought small shops might be willing to take a saleswoman without experience; but wherever she applied she was refused, sometimes civilly, sometimes the reverse. Errand-girls were wanted in plenty, but she did not think she would descend to that as yet.

She bought a *Morning Post* daily, and studied the advertisement-sheets. Sometimes she would see advertisements for lady-secretaries, and once or twice applied for the posts. But those who might have been willing to engage a secretary without previous experience drew back suspiciously on hearing there was no one to whom she could even refer them for a character. At the end of a fortnight Francesca was still unemployed, her hoard of money daily diminishing, and her spirits were sinking accordingly.

'Bless your 'eart!' said Mrs Broad, to whom she had unbosomed herself one morning on her way out, 'there's many goes longer than a fortnight out of work. Keep up your spirits, my dear. Yes, miss, I should say, perhaps you'll find the very thing to-day—who knows?—seeing as 'ow it's a fine day and the sun shining.'

Mrs Broad's optimism was refreshing, and her lodger felt cheered in spite of herself as she stepped out on the search once more. In the evening, however, she returned as usual with her goal still unwon, and the career of an errand-girl looming large before her.

'With an errand-girl's wages I sha'n't be able to live in this luxurious style,' she thought as she let herself into the house with her latch-key. 'Perhaps Mrs Broad will let me sleep in the kitchen at sixpence a week.'

In the passage she was met by the landlady resplendent in her best Sunday bonnet. It was black, with bright red roses placed stiffly all round it, and crowned with what its owner proudly called a 'haygarette' of brilliant peacock-blue. She wore her 'summer mantle,' too, instead of the cloth coat in which she usually appeared in public, so Francesca concluded she was going into society.

'Any luck, my dear—miss, I should say?' she asked, sighing comfortably as she pulled on clean white cotton gloves.

'No,' Francesca answered cheerfully; 'there's nothing before me but an errand-girl, unless something turns up soon. But I'm not going to worry. I've bought a book, and I'm going to read till bedtime, and enjoy myself. Are you going to a party, Mrs Broad?'

'Not a party, dear, only to me cousin's, w'at's maid to the Honourable Mrs Domville. Mrs Domville is sister to my late lady, and I got Jane Wheeler the place twelve years ago. It's in Upper Brook Street the 'ouse is, and a fine 'ouse, too. Two men and a boy Mrs Domville keeps; there was three before 'er 'usband the Colonel was took, but now she don't entertain so much, and leads a quiet life; but there's three in the kitchen still.'

Mrs Broad rippled on till her fat hands were comfortably squeezed into the cotton gloves. Then she opened the door, and, nodding good-night to her lodger, sailed out at peace with herself and all mankind.

Francesca had invested in a cheap edition of *Pepys's Diary*, and sitting by the open window, soon became sufficiently absorbed in it to forget all her difficulties for the time being. At ten o'clock she began to feel sleepy. She had just closed the book, trying to realise that she was living in the nineteenth century and not in the reign of Charles II., when Mrs Broad burst into the room.

'I've found the very thing for you, Miss Dunn!' she cried, her fat face shining with excitement. 'You're to go and see Mrs Domville to-morrow morning as ever is. She wants a new secretairy, to come every morning and write 'er letters, and you're to be 'er. Now then!'

Inquiries from Francesca elicited the information that Mrs Domville had (according to Jane Wheeler) been much 'put about' the previous day. The girl who came for three hours each morning to act as secretary and deal with Mrs Domville's voluminous correspondence as president of many committees had been suddenly called home to a sick mother. She had then written to say that as she was required to help in the nursing she must give up her situation. Mrs Domville was thus minus a secretary.

This item of news had been poured into Mrs Broad's ears by Jane Wheeler the moment she arrived. 'And then, miss, if you'll believe it, like a 'eaving-sent message the words came into me mind, "Speak for Miss Dunn," and I did speak. I told Jane all about you, leastways not all, not the confidential part *of course*, miss,' said the good lady, sinking her voice to a whisper—she dearly loved a secret; 'but I told 'er 'ow your family 'ad treated you crool 'ard—and 'ow you'd rather beg your bread in the streets—yes, and go to the work-'ouse, than ask them for 'elp'——

'Oh, Mrs Broad!' Francesca said, half-laughing, yet a little disconcerted.

'Well, my dear miss, I mean, if you didn't say those words you meant 'em, I'm sure. But just then Mrs Domville's bell rang, and when Jane went to dress 'er she told 'er w'at I'd said, and she said would you go and see 'er to-morrow at ten o'clock? And you just see, Miss Dunn, if she doesn't engage you the moment she sets 'er eyes on you!'

Francesca rose betimes next morning, and donned a neat dark-blue cotton, the only dress she had brought with her besides the one she had travelled in and worn since her arrival. She had kept the former 'for emergencies,' as she put it, and the emergency seemed to have arrived. She cut the trimming off her hat, and did a great deal of pulling about and retrimming, before she looked in the glass, and dared to hope that she might impress Mrs Domville with honest poverty combined with lady-like taste.

'Neat, but in no way pretentious, is what a female secretary ought to look,' she decided; and with this reflection she ran downstairs.

London was beginning to get hot and stuffy. The pavements this morning seemed to give off a burning heat, and it was with a sense of relief that Francesca turned into the Park and walked briskly across it in the direction of Grosvenor Gate, having first made inquiries of a friendly policeman as to her destination. The air in the open was cooler. She looked lovingly at the blaze of June flowers in the beds, and thought with sudden longing of her beloved garden.

Presently she rang the bell of Mrs Domville's house, and a minute later was mounting the stairs in the wake of a tall footman with a peculiarly cat-like tread.

'Miss Dunn!' he announced, and retired, closing the door noiselessly behind him.

'Good-morning,' said a woman's voice with a soft drawl.

The room was somewhat dim; but Francesca, looking in front of her, saw a very slender, white-haired woman half-lying on a sofa. She had a writing-pad on her knee, and a table stood near her literally covered with papers. Her hair being snowy-white gave at first the impression of age, but on looking close one saw she was not more than five-and-forty. Her face was delicately coloured, the eyes still fine, and she would have been beautiful but that her lips were too thin.

'Have you had any experience of secretarial work?' she asked when Francesca had returned the greeting.

'No,' said the girl; 'but I think I could soon learn to be useful.'

'Typewriting?'

She shook her head.

'Well,' Mrs Domville said, 'it isn't really necessary in this case. Let me see your handwriting.' She pushed pen and paper towards her. 'Write "Dear Sir,—I have to acknowledge your letter of the 1st."'

Francesca complied, and the lady looked at her effort and nodded.

'That will do,' she said. 'Spelling good?'

'I can spell perfectly,' replied Francesca.

'Now, as to references.'

'I must tell you at once,' Francesca said, 'that I have no one to refer to. This is my first effort at getting work.'

'Well, but,' said Mrs Domville with a show of impatience, 'you must have some one who can speak for you. Your parish clergyman perhaps?'

'Mrs Domville,' said Francesca, 'there is no one I can ask to speak for me. I have separated myself from my family, and they do not know where I am. I can't apply to any friends. I would not think of pressing you to engage me; but if you do, it must be without a character.'

'Come here,' said Mrs Domville.

Francesca went a step nearer.

'Now,' said the lady, 'have you done anything wrong, anything which, if I knew of it, would prevent me from engaging you?'

'No.'

There was a pause.

'I believe you,' said Mrs Domville. 'I will engage you from to-day. Heavens, what a fool some people might call me! But who on earth could suspect a girl with a face like that?'

She named a salary, not large, but sufficient to pay Francesca's rent and feed her, with a little over.

'Well, that is settled, then.'

'I am very grateful to you,' Francesca said, beaming, 'and I will try my best to be of use to you.'

'Well, if you're no use I can't keep you. You must start with that understanding. I am far too busy,' Mrs Domville answered sharply, but her eyes twinkled. 'But I dare say you will manage all right. Now take off your hat and sit down and write to my dictation. You will have to do practically all my writing, as I get writer's cramp, and am helpless in that way.'

The next few hours passed quickly. Francesca's time was nearly up. She had risen to take a paper from Mrs Domville, and was standing by the sofa, when the softly treading footman opened the door wide and announced 'The Duchess of Wiltshire.'

There was a rustle of silk petticoats, and her Grace entered. She was a woman of presence, and sailed rather than walked into the room. Francesca saw a strong but exaggerated likeness to Mrs Domville, and rightly guessed them to be sisters.

'Well, Mary?' the Duchess said, kissing Mrs Domville rather ponderously on both cheeks. Then Francesca felt the new-comer's eyes fall on her, and looked up, to meet a gaze of approval mingled with dignified curiosity.

'Will you introduce me, Mary?'

Mrs Domville's eyes danced. 'The Duchess of Wiltshire, Miss Dunn,' she said promptly.—'Miss Dunn is my new secretary, Susan, and this is her first morning's work.'

The Duchess's look of interest changed to one of haughtiness, almost dismay. It was not her way to ask for introductions to governesses and secretaries. The appearance of this secretary had entrapped her into a momentary indiscretion. She bowed perfunctorily and extended a limp hand. Then she turned to her sister. 'I hope I am not interrupting you, Mary?'

'Not at all. Miss Dunn is just going.—By-the-bye, Miss Dunn, will you leave this note on your way home, and ask for a verbal answer, which you can bring in the morning? Good-bye.'

The new secretary, a little annoyed—but more amused—by the Duchess's manner, which she saw through perfectly, took her leave and departed, well pleased with her morning's work.

(To be continued.)

DIARISTS OF OUR DAY.

By T. H. S. Escott.

'I HEAR, Raikes, you are not going to the fancy ball to-night.' So, to one of the earliest diarists personally known to the Victorian age, remarked the man who of all others liked him least, and who was himself famous for the luxuriance of his fancy. 'No, I am not,' came the reply; presently met with the rejoinder, 'Yes, you are. And I know what you are going as—of course as Phœbus, because you rise in the east and set in the west.' 'Quite true, my dear Glengall of the long bow,' returned Raikes. 'I am going, and I shall take you with me as my lyre.' This little dialogue took place at White's Club in the summer of 1831. Having gone the round of the town, it took a generation and a half to travel to a country house in the home counties. Here, twenty-five years ago, it was first heard by the present writer.

Thomas Raikes was among the earliest of the long list of men who, born to a commercial station, have so employed the opportunities given by wealth as to achieve fashionable fame and to fulfil the social ambitions that in a little earlier and a very slightly less democratic age were attainable only by those born into the privileged classes. His city fore-

fathers had been for more than a century merchant-princes of the type present to William Pitt's mind when he spoke of an income of forty thousand pounds as qualifying its possessor for a peerage. The diarist's father was intimately acquainted with his Yorkshire neighbours, the Wilberforces. His son found an invaluable friend, on starting life, in William Wilberforce the slave emancipator. Through him he became known to the son of Chatham, and ranged himself among the second Pitt's parliamentary supporters. At Eton he had made acquaintances to whom he stuck and who helped him throughout his career. He picked up several things worth knowing and remembering at school; he also improved by practice and association a natural turn for literary expression. During an age in which conversation was as much of an artistic study as costume, Raikes made his mark among young men about town by the evidences of an observant eye conveyed in the neatly turned phrases of his table-talk or letters. Before the Victorian era the fusion of plutocracy and fashion had scarcely begun. The path of promotion, therefore, which Raikes carved out for himself was one in which he had lacked the help of any pioneer of his own quality. The publication of his diary was helped by his best-known successor in that line of composition, Charles Greville, the Clerk of the Council. Greville was generally ready to assist his friends, provided his own sense of importance was gratified at the same time. Through his friend Henry Reeve, so long the editor of the *Edinburgh Review*, he had become acquainted with the Longmans. When, therefore, Miss Raikes was bent upon printing her father's memorials, her old family friend, Charles Greville, readily promised his influence at Paternoster Row. The Clerk of the Council was Liberal or Peelite to the backbone. Thomas Raikes, a man of fashion first, politician afterwards, had ever affected the Toryism of the old school. Whenever he referred to Free Trade he wrote as a Protectionist more reactionary than Lord George Bentinck himself. In a word, he left nothing unsaid against Cobden and his followers that an industrious or imaginative partisanship could rake up from public or private sources. The diaries of his friend Thomas Raikes, when first placed in Greville's hands, were a scandalous chronicle of the period, full of personal touches telling severely against the Free Traders. Greville at once resolved on the elimination of all these passages from the manuscript. The diaries, however, had been generally read in London long before they were published. The appearance of the work in its eviscerated condition excited much disappointment. Miss Raikes herself was specially indignant. The next time Greville called at her house she showed her resentment by taking his hat and secreting it in her bedroom upstairs under lock and key. 'Let him go home bareheaded; it will do him good,' said the lady. Uncovered, therefore, the 'gruncher,' as one of his nicknames was, departed to his own roof. 'I do not know,' was the comment on this anecdote by Mr F. Leveson Gower, who originally told it, 'whether he ever forgave her.'

In appearance and manners as well as in opinions and associations, Greville and Raikes represented entirely opposite styles. Raikes at once struck every one as what he was—a sleek, well-groomed, well-bred dandy of the middle class. About Greville there was much that recalled the fourteenth Lord Derby: the same aquiline nose, with other marked features corresponding to it; the same dark, deeply set eyes flashing fire from their cavernous recesses. Both men, in fact, left upon one a like impression of patrician ruggedness. Each, too, was characterised by an easy, negligent toilet, revealing in some of its details or in points of its style the sporting aristocrat. Both were long survived by Mr George Payne, the famous veteran among polite turfites, who had interchanged bets with Lord George Bentinck as well as capped Latin verses with Robert Lowe or discussed Homeric criticism with Mr Gladstone. Making allowance for differences of complexion and of figure, those who can recall Mr Payne may think they have seen Mr Greville in the flesh. Politically, the nobleman whom this diarist facially resembled said at least one rather severe thing about him. A Whig by birth, who flaunted his Whig convictions upon every chance, Greville, on Lord Derby's succession to Palmerston as Premier in 1858, absented himself from the meetings of the Council, sending a deputy. One of the Ministers, noticing this, drew his chief's attention to it. 'Really,' replied Lord Derby, 'upon my word I had not observed the difference. The fact is, when I ring the bell for coal I am never certain whether it is John or Thomas who appears with the scuttle.'

'As for the differences between Charles Greville and Thomas Raikes, they are easily explained,' remarked Mr George Payne to the present writer. Raikes never talked politics to Greville, who did not, therefore, realise the opposite poles of opinion at which each of them stood. Greville, in a word, was a master in the gentle art of making enemies. Raikes maintained his position by never losing a friend. Greville, a past-master in all kinds of worldly wisdom, piqued himself on his intolerance of the frivolity which he pleasantly called 'poor Raikes's great failing.' The two things that in Greville's eye made life worth living were politics and sport. Both, he held, ought to be reserved for the upper classes. As for what amuses mixed society, he had a contempt and loathing for it that Raikes was shrewd enough not to share. Writing to George Payne about the insipidity of the new social circles, he records how last evening, at some place where he had been dining, Billy Something came in, sat down at the piano, and sang songs. After that, of course, everything tolerable was at an end. Even at the banquets of sporting guests and hosts of title such as he approved, Greville did not always find things to go quite smoothly. During the first quarter of the nineteenth

century, at a Newmarket dinner-party, the Lord Petre of the period seems to have been the butt of the evening. A Sussex baronet, it seems, played the fool in patronising him and showing him off. Punch Greville (the Clerk of the Council's most common nickname) disgraced himself by 'hunching' (*sic*) him. The Duke of York—so to his wife wrote Thomas Creevey—the guest of the evening, restored good humour; and, Punch's venom notwithstanding, nothing seriously disagreeable happened.

Among those who assisted at this festivity was another diarist belonging to a slightly earlier period, Captain Gronow, then in the House of Commons and busy with preparing his reminiscences. His exterior showed the fashionable soldier of the period, his moustache waxed and cut after the newest Parisian fashion, his demeanour and walk marked by the suspicion of swagger which the officers of the allied armies had picked up during the occupation of Paris. Gronow had turned the social chances of his Eton days, before going into the Guards, to nearly as profitable account as had been done by Raikes himself. But, though less bailiff-hunted than Becky Sharpe's husband, he never secured a much better position than Thackeray's Rawdon Crawley. Two distinguished soldiers of the Victorian age, the brothers William and Keith Fraser, both fresh in the present writer's memory, left diaries behind them which, if not too full of personal revelations to be printed, will be found, should they ever appear, of far more interest and value than anything written by the fashionable warrior of the Regency. Each of these military kinsmen had won such renown for tact and insight in the casuistry of polite life as to be one of society's referees in all matters of difficulty and doubt. That was the rôle to which Gronow always, but never quite successfully, aspired. At best, the office he performed was that of helping the fine world to wash its dirty linen. His noblest employment seems to have been to help aristocratic or fashionable scapegraces out of disreputable or compromising positions. Sometimes, instead of extricating them, as their relatives desired, the negotiator became the well-born scamps' agent. Thus it was in the case of the grandson of the great Earl Grey. The Reformer's daughter, Lady Hannah Grey, had married the famous 'Bear' Ellice (the Right Hon. Edward Ellice, M.P.). The son of that marriage became enamoured of Mademoiselle Duvernay the opera dancer; he gave her two thousand pounds cash at once, and contracted to allow her eight hundred a year. It soon came out that Gronow had acted as intermediary in all the business details between the young 'Bear' and the dancer's parents. Thomas Creevey, the authority for Gronow's doings, died in the early years of the last reign. He was ahead of Charles Greville only by a generation, though the Clerk of the Council, in his talk as well as with his pen, made a point of alluding with contemptuous compassion to 'old Creevey's' patriarchal age and social disadvantages. The truth is that, in point of seniority, the first of the diarists who lived into the Victorian age, Thomas Creevey, sprang from the same mercantile middle-class as Thomas Raikes, whom, in a certain sleek chubbiness of face and in features not distinctively aristocratic, he did to a certain extent resemble.

John Wilson Croker died exactly a quarter of a century after the passing of the first Reform Bill, in whose way he had thrown so many obstacles. His widow, however, lived to see household suffrage established as the law of the land by the man who had satirised her husband in the Rigby of Disraeli's best-known novel. This lady continued to occupy an apartment in Kensington Palace up to the year 1884. Then it was that I called upon her. It so happened that Mr Gladstone looked in upon the old lady at the same time. Referring to the Croker papers, then, I think, announced as in preparation, the statesman, I remember, said, 'I am sure, madam, your husband will sustain the ordeal of publication better than his enemies would desire.' 'This prediction,' he remarked several years later to Sir William Harcourt, 'fulfilled itself to the letter, for Croker really does come out with flying colours.'

Charles Greville, whose very unmistakable presence still lives in the memory of Newmarket habitués and Doncaster crowds, adopted 'gurnalising,' as Sir Walter Scott called it, for an amusement in his lonely hours as well as with the idea of showing contemporaries and posterity the character of the persons among whom he familiarly moved. When he warmed to his work he became possessed by the idea of magnifying his apostleship. In the performances of Creevey and Raikes, Greville's aristocratic nostrils scented something almost plebeian in tone, in sympathies, and associations. It should be his work to restore to this branch of polite literature the fashionable patricianism that flavours every page and almost every entry in the journals of Greville's eighteenth-century exemplar, Horace Walpole. At the same time, the nineteenth-century diarist had something in the way of a historic conscience with which his predecessor was not troubled. Where his personal partialities or political prejudices are not concerned, Greville is much less inaccurate than his critics have said. About 1830 Lady Essex's London house was converted for one or two nights into a private theatre and opera. Chief among the performers figured Henry Greville, who differed from his brother the Clerk of the Council in enjoying all drawing-room pastimes of the kind. The younger Greville's diaries have since been published and perhaps widely read. He does not, however, I think, mention this entertainment. His resemblance to his better-remembered relative lay not in taste but in temper. On the occasion now mentioned, Henry showed the family irritability by complaining first that he had no applause, then by grumbling that he had too much. The two

brothers were on tolerable terms. Henry occasionally visited Charles in his rooms on the first floor of Lord Granville's Bruton Street house, where Lady Granville complained of always meeting 'Mr Greville's horrid friends' on the staircase. Henry first became known to society as attaché at the English Embassy in Paris. He had a beautiful voice, which he managed consummately well. Fine ladies adored him for his perfect singing, and through his life were always on his side. Unlike Creevey, Raikes, and even Charles Greville, who had no regular establishments of their own, but lived about, on or with their friends, Henry Greville owned a prettily appointed London house. Here he gave the musical parties that were the first of their kind in his particular world, and set the example of familiarising a naturally exclusive society with the ornaments of the operatic stage—Grisi, Mario, &c. When, years afterwards, Christine Nilsson took the place of an earlier 'Swedish Nightingale,' Jenny Lind, as the guest of the evening at Lady Salisbury's Arlington House parties, it was but a development of Henry Greville's hospitable initiative. As autobiographical chronicler, Henry Greville bears a closer resemblance than did any of his predecessors to the later school of diarists. His chief interest is artistic, not political or even diplomatic.

In the spring of 1881 the 'Star and Garter,' Richmond, witnessed one of the most interesting dinner-parties ever given, even within those walls, which could tell such remarkable tales. It eclipsed even the send-off banquet in 1834 to the historian Macaulay, when he went to India as legal member of the Viceroy's Council. Sir Mountstuart Grant-Duff, the guest of that evening, has recorded the compliment paid to him in the letters that contain the social story of his daily life. The subject of this entertainment was also on the point of departing for Hindustan. Grant-Duff went to Madras with the reputation of being the best-informed man of his time. During his intervals of literary leisure abroad he made himself one among the pleasantest of journal-writers. His development as a diarist has been upon the same non-political lines as those of Henry Greville. Letters, science, and art, rather than statesmanship, supply the intellectual flavouring to his latest recollections of everyday life. Better than would have been possible from a philosophic analysis of polite progress one learns from the Grant-Duff diaries the extent to which other interests and associations than those of public affairs have supplied the organising principles and consolidating forces of modern clubs, drawing-rooms, and country houses. That conclusion is emphasised by contributions which several of Grant-Duff's friends and former colleagues have made to the same department of literature. A literary as well as parliamentary cadet of a great 'Revolution family' published in one of the magazines some years ago a scathing attack upon the political immorality of the old Whigs. A few days afterwards, from the ducal head of his family he received a little note to the following effect: 'MY DEAR . . . —I congratulate you on your success as a writer. You must now be making such a pretty thing of it by your pen that after this date you will scarcely look to me for your election expenses, and would not wish me to continue the allowance hitherto made you.' Among Sir M. E. Grant-Duff's contemporaries the two most representative proficients in his art are Sir Henry Drummond Wolff and Mr Frederick Leveson Gower. The former's *Some Notes of the Past* has only one fault: all too briefly it suggests rather than actually records the happy comment and illustrative anecdote which, contributed by the author in his time to dinner-tables and drawing-rooms, sensibly increased the conversational gaiety of the Victorian age. Mr Leveson Gower, brother of the late Lord Granville, the Gladstonian Foreign Secretary, by his pen and person has done at least as much as any one of his standing to put the leaders of opposite parties and their followers into a good temper such as may help them to live in social unity with one another, not only among themselves but with their opponents too. The same amiable intention and execution have animated the writer of the younger parliamentary generation who, as his first *nom de guerre*, signed himself 'One who has Kept a Diary.' It has, therefore, been reserved for the twentieth century to see the diarist who confines himself to kindly gossip, and who is a raconteur because he is a peacemaker.

The latest diarists of the day may not take their reader as boldly and deeply behind the scenes as was done by some of their predecessors. They do, however, hold up the mirror to their generation more fully than was done by most of those writers who caught their inspiration from the Hervey Memoirs. In other words, the later diarists are distinguished from the earlier in not confining themselves to one small section of the polite world, but chronicling the doings, sayings, and interests of those who represent the entire social fabric. The contemporary records of Greville are sometimes coloured by personal, even more than political, prejudice. As in the case of William IV. and of Lord Derby the fourteenth, his character-sketches often pass into caricature. These, however, are the faults of the historian not less than of the diarist. Here Greville sins not merely with others of his class but with his graver contemporaries, Froude, Lecky, Macaulay. Right or wrong, however, the elder Greville will remain, for writers on every kind of nineteenth-century theme, exactly what Walpole and Wraxall are to the preceding period.

An interval of less than seventy years separates the death of Charles Greville from the chronicler whose social and political idiosyncrasies he reflected—the creator of Strawberry Hill. Walpole's dilettanteism was the detestation of Greville, to whom the racecourse and the whist-table were less recreations than intellectual exercises and business-

like pursuits. The prime qualification for an observer laid down by Walpole, that he should be entirely the product of his period, was forthcoming in Charles Greville so perfectly as to unfit him, had he lived, for holding up the mirror to any other than his own generation. It is the novel distinction of those who have come after him to reflect and illustrate in their pages the constantly changing and multiplying interests of the educated middle-classes, whose growth to ascendency forms the social story of the last hundred and fifty years. That development Greville would have set himself to ignore and snub. His one or two indirect references to it are, as a fact, even less appreciative in tone than the allusions to the same subject of the Whig parasite Creevey or the Tory Turveydrop Thomas Raikes.

Mr F. Leveson Gower, though born into the same generation as the Clerk of the Council, with the freshness almost of youth enters into the broader interests of the new régime. Here he resembles Sir M. E. Grant-Duff and Mr G. W. E. Russell. No exclusiveness of early associations prevents each of these from being an impartially catholic, a discriminating, as well as historically a most useful commentator. So far so good. There is, however, another consideration that should not be left quite out of sight. It was the appalling fecundity, as he used to call it, of the autobiographer *à la mode* that called forth A. W. Kinglake's remark, 'In my time people did not think it worth while to say what they now hurry on each other to write.' 'Diaries, diarists, and dire results indeed!' with punning plaintiveness murmured, the other day, a connoisseur in this department of *belles-lettres*, as he took up a friend's latest contribution to it. The Latin historian of the Roman Empire has a famous chapter on the consequences to the society of the period of the delation or espionage which had grown up under it. The most intimate and witty guests at private tables are said by Tacitus no longer to indulge in the pleasant and clever or amusing talk which had given a charm to social intercourse. They were afraid lest a distorted version of their casual remarks should reach the Emperor, with result that they might be sent as companions to the poet Ovid in his place of desolate exile on the Black Sea. The fear of printers' ink may coerce into silence as effectually as the dread of an imperial despot. Conversation as an art, more or less successfully cultivated, lingered on at country houses long after it had been elbowed out at Metropolitan dinner-tables by the pressure and pace of everyday life. Now it has begun to languish even in these rural retreats. The friends whose meeting used to be the signal for the interchange of agreeable or at least irresponsible chat, now across the walnuts and the wine confront each other with a stony stare in sullen silence. Pen and ink form the agencies that have turned them all into a sort of Ishmaelites. Each has an uneasy feeling that his next-door neighbour or his *vis-à-vis* may be, like himself, a manufacturer of autobiographical 'copy.' Naturally, he is determined that his rival with the publishers shall not in his next article or volume make capital out of his own good things. Thus the literature whose chief use is to be a monument of the enlivening epigrams and the witty repartees current in cultivated circles may seem in some danger of sounding their death-knell or proving their sepulchre.

SPRINGTIME: AN AUSTRALIAN IDYL.

Oh, to hear the wattles[1] whisper in the scented evening breeze,
'Neath 'God's watchers,'[2] with the Southern Cross above,
And far off the distant Ranges, with the moonlight on the trees,
And the night-birds whispering softly songs of love!

In the gums[3] the magpies[4] warble as they call from tree to tree,
While the shey-oaks stirred by night-winds softly sigh,
And in yards the steers are lowing like the murmuring of the sea,
While from distant forest comes the mopoke's[5] cry.

'Tis a world of silver glory flooding paddocks far and near,
And the grasshoppers are singing as at noon;
But wild-grass orchids glisten with here and there an angel's tear,
As the dewdrops smile a welcome to the moon.

Near the swamp the birds are mating as the plover sail on high,
And in reed-beds black swans circle round and round,
And some fluffy little moorhens, as yet too young to fly,
Filled with nervous tremors dive at every sound.

As I pass a patch of timber where the 'possums are at work,
Comes the sleepy chirp of parrots in a nest;
And a rustle in the old trees, where mysterious noises lurk,
As a great stag-beetle booms above the rest.

In the sedges by the marshland, where the plover come to feed,
With flattened head a black snake hisses by,
And a gay young bullfrog, busy serenading on a reed,
Disappears beneath a boulder with a sigh.

'Neath the dusky starlit heavens, near the ti-tree by the creek,
One can hear the plaintive cry of curlew high above,
And a lonely little musk-rat, who has come a wife to seek,
Thinks it wiser to defer his words of love.

For the night is slowly fading, giving way to golden dawn,
And the moon behind the Ranges sinks to rest;
As in trees the sap is springing, and in pairs the birds are singing,
For Spring has come! and nature 's at her best!

PROTESTS AND SURVIVALS.

A STUDY IN POPULAR LORE.

By LAUCHLAN MACLEAN WATT, Author of *The Tryst*, &c.

SOMETIMES superstition gets hold of the names of well-known historic characters, and weaves romance around them reflecting the natural loathness on the part of popular love to admit the death of a hero. The great King Arthur is one of the most noted. Away in the land of the unknown, beyond the end of the world, he sleeps in an enchantment under the hills, with all his knights in full armour, beside their horses, waiting for the hour when he shall lead again the children of his race to victory. So, too, does Owen Glendower, whose fate in 1415, when he mysteriously dropped out of history, is veiled in inexplicable gloom. And, similarly, Earl Gerard of Mullaghmast sits at the head of his table of knights, waiting till he shall ride forth again as King of Ireland, to hold royal state for forty years. Olger the Dane, too, sits under Kronberg Castle, with his men, sleeping heavily—so heavily that his beard has grown into the stone table at which he sits. It is told how a slave, condemned to die, got promise of pardon upon condition that he descended into the unknown world below the castle, to find out the meaning of the mystic clashing of steel often heard within the rock. Trembling, he entered a subterranean cavern, and there discovered Olger the Dane and all his men deep in a sleep like death. At sound of the disturbing foot the hero started out of slumber, and as he raised himself his beard, which had grown through the table of stone whereon he leaned, broke the table in twain.

The idea is universal. The superstition is found all over Europe, with only the names of the spell-bound heroes altered. Thus the Scottish people could not bring themselves to believe that James IV. was really dead, though he had fallen, with the flower of his country's knighthood round about him, on sad Flodden's gloomy ridge. Nay, but away in some distant land, wearing the floor of some holy cell, anywhere but in death's chill shadows, the king of the chivalrous heart was waiting, and would return again. In the same way have I heard by a Highland fireside the earnest voice of an old Gael, speaking of Sir Hector Macdonald, say that he was not dead. Who that had known him best had seen him and identified that sad, self-stricken corpse in a Paris hotel as his? No; away in Manchuria it was that dauntless heart and firm hand which so well knew the swaying power of battle that were leading the irresistible Japanese to victory over their foes. And the earnest voice pleaded the conviction of the loving heart with pathetic insistence.

But perhaps one of the most remarkable examples is Thomas the Rhymer. Some say he sits with his head on his hand, waiting his hour, under Tomna-hurich at Inverness, or, as others say, under Dunbuck Hill, near Dumbarton. One who entered the hill found him there, but he lifted up his eyes and said so suddenly, 'Is it time yet?' that the fellow fled with fear. Thomas was supposed to have been carried away to fairyland, like Kirke, minister of Balquhidder, the first translator of the Gaelic Psalms in 1684. Here it was most probably the attempt of a mind steeped in superstition to explain an otherwise inexplicable disappearance. Both of them, from imperfect glimpses, were evidently given to long and lonely rambles and meditations on the moors; their attainments also, which so much exceeded those of their fellows, could only be explained by the theory of supernatural dealings with another world. Their bones most probably lie in some mossy quag in the wilderness where they were lost.

The superstitions about persons must all have arisen so. In fact, that is what seems to be the true meaning of the name—something over and above what is seen and tangible, required always to satisfy the peering inquisitiveness of simple minds.

It is humbling to moderns, and to be commended to lecturers on pastoral theology, that though Kirke the minister appeared to one of his flock, and gave the latter the secret of the charm which could restore

[*All Rights Reserved.*]

him from fairyland, the man did not use it. One feels that the hunger for a popular election was even before our day; and we are reminded of the old woman's verdict on a minister once most popular, whose popularity had waned before he died. 'Ay,' she said to me, 'he came in unanimous; but, by my faith, he gaed out unanimous!'

Naturally, about the story of Christ Himself have clustered many superstitions. The gipsies—that strange people who burst into Europe about 1417, looking into people's hands and hearts, and telling what the future held for them—explained their wandering life by the statement that they were doomed to restless roving over the world because it was a gipsy who forged the crucifixion nails; while, also, they claimed the privilege of stealing with impunity once in every seven years, because a woman of their tribes stole one of the four nails, and would have stolen all but for discovery.

Then, again, so also arose the world-wide superstition of the Wandering Jew, who, when Christ on His way to Calvary leaned against his door, thrust the Master forward, saying, 'Go on, thou Nazarene!' And the Galilean looked him deeply in the eyes, and said, 'Yea, I go on, to die and win my peace; but thou—go on for ever!' Still, after all the ages, that tired figure of the curse is traversing the world, and, as he passes, there is war or famine, black despair or crime, trailing behind him, for he carries his own curse as a blight wherever he moves.

Again, around the Christ some beautiful superstitions have clustered. You know the one about the crossbill, that strange bird the points of whose beak cross awkwardly over each other, and whose breast is splashed with red. How got it so strange a livery? Hear how the old thought of the ages gave it meaning in the Spanish ballad:

On the Cross the dying Saviour
Heavenward lifts His eyelids calm;
Feels, but scarcely feels, a trembling
In His pierced and bleeding palm.

And by all the world forsaken
Sees He how, with zealous care,
At the ruthless nail of iron
A little bird is striving there.

Stained with blood, and never tiring,
From its work it does not cease;
From the Cross 'twould free the Saviour—
Its Creator's Son release.

Then the Saviour spake in mildness,
'Blest be thou, of all the good,
Bear, in token of this moment,
Marks of blood and holy rood.'

And that bird is called the crossbill,
Covered o'er with blood so clear;
In the groves of pine it singeth
Songs like legends strange to hear.

Or, again, how is the robin beloved, while the wren is hated by all Celtic peoples? Listen to the old, rude fireside tale, and you will understand. One day Christ was fleeing from His enemies, and a man was sowing wheat in a field. And as Christ passed across the field with bleeding feet, the robin followed close, and laid its bosom on the bloodstains lest His foes should see. And in one night the wheat was grown, ready for the harvest. So, when the soldiers asked, 'Did any one pass lately?' the robin said, 'Not since that wheat was sown.' But the wren cried out, 'But it was only sown yesterday.' So the wren is a bird accursed and hated by the Gael, while the robin bears upon its breast the holy blood as a warrant for the love of all.

And, again, have you heard the aspen sighing and shivering in the day and the dark, with a grief like some deep, superhuman sorrow? It is because she remembers how the Cross of the Nazarene was hewn out of her stem, and the memory, like a wound in her heart, keeps her in an eternal shudder.

All through our own history you find the shadow of superstition looming, till you scarce can separate superstition from truth. Our wild, dark, sad national life helped in the development of this, and we could not easily escape it. Thus, when the hapless James, who led the flower of Scottish chivalry to death and disaster at Flodden, was worshipping in Linlithgow church just before he went away, a strange, commanding figure appeared before him, solemnly warning him of certain defeat and of unnumbered sorrows waiting for his race if he persisted in the enterprise; then suddenly it vanished among the astonished courtiers before they could remonstrate. It was like the spirit of that sad age pleading with him whom Fate had singled out to die amid his nobles on dark Flodden's ridge. Again, just before the king and the Scottish army left Edinburgh for that same field of sorrow, there were tales of ghostly parade and pageant having been seen moving through Parliament Square; and how an unearthly voice was heard at the Cross as if calling the roll of the noblemen and notables that were to fall, summoning them to judgment. Richard Lawson of Highriggs, formerly a Lord Provost of Edinburgh, in passing, heard his own name in the catalogue, and cried aloud, 'I appeal from that sentence to the mercy of God in Jesus Christ!' And when the fight was over, it was observed that Richard Lawson was the only one of all that dreadful list who came back to the city. The rest had obeyed the midnight cry.

Such premonitions and forewarnings were not uncommon amongst people of our race. The *bodach glas*, or gray man, was one of the commonest. You were walking up the glen, and, lo! there, not far from you, was a gray figure like your own, step for step, swing for swing, with you. Was it for yourself the warning came? Test it by shifting the plaid on your shoulder; and if the spectre did the same, go home and make ready, for the foot of death was coming round the corner.

Often, to the sick especially, a warning comes by way of remembrance; old words long forgotten,

old places and old faces, come to the bedside as if memory had drawn aside the curtain. Not long since, in a Highland village, the doctor and I sat smoking, talking of old folks mostly gone away. One, the roughest in the place, a low type of man, had just died, and the doctor said, 'I felt carried far back into shadowy times by that man's death. He said last night to me, "I am going, doctor. You can do nothing for me." But I could not see signs of his impending death. "Nonsense, John," I said to him; "you will see many a day yet." "No, doctor," he replied; "I tell you I shall die to-night, for all day I have been hearing the voices I used to hear long ago at Ardnamurchan, when I was young." And he did go home that night to them.'

Now, just to show how near we are still to the shadowy fringe of things, I may mention this. Not long since I was at a communion, and afterwards we sat a while in the manse and talked. The minister was a modern man, who knew the trends of contemporary thought, and was abreast of all business up to date; but he told me this, believing every word of it:

It happened in the night-time, in a weird glen we both knew, full of deep stillnesses, with far whisperings of falling waters behind them, a place with the name of many hauntings. The man concerned was a tailor in the clachan at the end of the glen, known far and wide as a sober, intelligent, and hard-working fellow. One night, not long before, he had, as usual, walked across to the village for something he required; but in his return journey, in the dim, gray moonlight, he saw a woman approaching, and he spoke to her, giving her 'Good-evening,' under the impression that she was the widow of a merchant in the place whom he knew quite well. Even as he spoke he saw she was a woman he had also known, but who had been lying six years in her grave! She spoke low to him, telling him not to fear, and she gave him a message for her son, who was at Muir of Ord, far down the Low Country; and then she left him. His mind was perfectly clear, but he said to himself, 'How can I ever deliver a message like that, for what chance have I of getting with it to Muir of Ord?' Well, a fortnight passed, and he was at a funeral in our churchyard, and there, among the mourners, was the woman's son beside the grave. The tailor went up to him and told him the dead woman's secret, and it was accepted and acted upon! Explain that in this late century if you can.

I have another experience of my own, but I do not speak of it in crowded places. It covers a sacred spot in my life, and I can find no clue to the mystery of its intervention.

The change of methods of life and the geographical migration of peoples have made many superstitions drop aside, while yet many of the old signs remain, fragments of lost faiths and overfaiths. For example, I have often seen a plate of salt on the breast of a corpse, and asked why it was there. After some surprise, and evidently some searching of mind, they tell me it is to keep away infection! Of course it was the old notion of the salt preventing any evil spirit from taking up residence in the body from which the rightful owner had fled. Or, again, one often sees under the head of a corpse a Bible laid reverently, and for the same reason. Book and candle are still used, though people have forgotten why. They saw their parents do the same, and they recognise it as a bit of ancient ritual, a sort of death-chamber etiquette. And, oftenest of all, the houses where I have seen these customs most observed are houses of people of Celtic descent.

There were reasons for practices such as these. Life had to become one intricate ritual of defence, every item of which had its explanation and apologetic. Even the importance of such a simple act as putting on both stockings before either of your shoes was easily accounted for. When Columba of the Churches one day put on his left shoe before his right foot was covered, was he not forced to flee for his life for miles along the shingle with only one boot on, and his right foot cut as if with knives, leaving a track of blood behind him? And was that not warning enough for all? The act and many another remain through long generations, though unexplainable in Gaelic, and difficult to explain in an alien tongue.

What was done in the glens long ago is done to-day in the crowded cities. The old shadow of the Highland ancestor stands at the side of the sorrows of his race still, with gleamings of the other world mysteriously about him.

THE HOUSE OF WHISPERS.

CHAPTER XXV.—SHOWS GABRIELLE IN EXILE.

IDWAY between historic Fotheringhay and ancient Apethorpe, the ancestral seat of the Earls of Westmorland, lay the long, straggling, and rather poverty-stricken village of Woodnewton. Like many other Northamptonshire villages, it consisted of one long street of cottages, many of them with dormer windows peeping from beneath the brown thatch, the better houses of stone, with old mullioned windows, but all of them more or less in stages of decay. With the depreciation in agriculture, Woodnewton, once quite a prosperous little place, was now terribly shabby and depressing.

As he entered the village, the first object that met the eye of the stranger was a barn with the roof half-fallen away, and next it a ruined house with its moss-grown thatch full of holes. The paving

was ill-kept, and even the several inns bore an appearance of struggles with poverty.

Half-way up the long, straight, dispiriting street stood a cottage larger and neater-looking than the rest. Its ugly exterior was half-hidden by ivy, which had been cut away from the diamond-paned windows; while, unlike its neighbours, its roof was tiled and its brown door newly painted and highly varnished.

Old Miss Heyburn lived there, and had lived there for the past half-century. The prim, gray-haired, and somewhat eccentric old lady was a well-known figure to all on that country-side. Twice each Sunday, with her large-type Prayer-book in her hand, and her steel-rimmed spectacles on her thin nose, she walked to church, while she was one of the principal supporters of the village clothing-club and such-like institutions inaugurated by the worthy rector.

Essentially an ascetic person, she was looked upon with fear by all the villagers. Her manner was brusque, her speech sharp, and her criticism of neglectful mothers caustic and much to the point. Prim, always in black bonnet and jet-trimmed cape of years gone by, both in summer and winter, she took no heed of the vagaries of fashion, even when they reached Woodnewton so tardily.

The common report was that when a girl she had been 'crossed in love,' for her single maid-servant she always trained to a sober and loveless life like her own, and as soon as a girl cast an eye upon a likely swain she was ignominiously dismissed.

That the sharp-tongued spinster possessed means was undoubted. It was known that she was sister of Sir Henry Heyburn of Caister, in Lincolnshire; and, on account of her social standing, she on rare occasions was bidden to the omnium gatherings at some of the mansions in the neighbourhood. She seldom accepted; but when she did it was only to satisfy her curiosity and to criticise.

The household of two, the old lady and her exemplary maid, was assuredly a dull one. Meals were taken with punctual regularity amid a cleanliness that was almost painful. The tiny drawing-room, with its row of window-plants, including a pot of strong-smelling musk, was hardly ever entered. Not a speck of dust was allowed anywhere, for Miss Emily's eye was sharp, and woe betide the maid if a mere suspicion of dirt were discovered! Everything was kept locked up. One maid who resigned hurriedly, refusing to be criticised, afterwards declared that her mistress kept the paraffin under lock and key.

And into this uncomfortably prim and proper household little Gabrielle had suddenly been introduced. Her heart overburdened by grief, and full of regret at being compelled to part from the father she so fondly loved, she had accepted the inevitable, fully realising the dull grayness of the life that lay before her. Surely her exile there was a cruel and crushing one! The house seemed so tiny and so suffocating after the splendid halls and huge rooms at Glencardine, while her aunt's constant sarcasm about her father—whom she had not seen for eight years—was particularly galling.

The woman treated the girl as a wayward child sent there for punishment and correction. She showed her neither kindness nor consideration; for, truth to tell, it annoyed her to think that her brother should have imposed the girl upon her. She hated to be bothered with the girl; but, existing upon Sir Henry's charity, as she really did, though none knew it, she could do no otherwise than accept his daughter as her guest.

Days, weeks, months had passed, each day dragging on as its predecessor, a wretched, hopeless, despairing existence to a girl so full of life and vitality as Gabrielle. Though she had written several times to her father, he had sent her no reply. To her mother at San Remo she had also written, and from her had received one letter, cold and unresponsive. From Walter Murie nothing—not a single word.

The well-thumbed books in the village library she had read, as well as those in the possession of her aunt. She had tried needlework, problems of patience, and the translation of a few chapters of an Italian novel into English in order to occupy her time. But those hours when she was alone in her little upstairs room with the sloping roof passed, alas! so very slowly.

Upon her, ever oppressive, were thoughts of that bitter past. At one staggering blow she had lost all that had made her young life worth living—her father's esteem and her lover's love. She was innocent, entirely innocent, of the terrible allegations against her, and yet she was so utterly defenceless!

Often she sat at her little window for hours watching the lethargy of village life in the street below, that rural life in which the rector and the schoolmaster were the principal figures. The dullness of it all was maddening. Her aunt's mid-Victorian primness, her snappishness towards the trembling maid, and the thousand and one rules of her daily life irritated her and jarred upon her nerves.

So, in order to kill time, and at the same time to study the antiquities of the neighbourhood—her father having taught her so much deep antiquarian knowledge—it had been her habit for three months past to take long walks for many miles across the country, accompanied by the black collie Rover belonging to a young farmer who lived at the end of the village. The animal had one day attached itself to her while she was taking a walk on the Apethorpe road; and now, by her feeding him daily and making a pet of him, the girl and the dog had become inseparable. By long walks and short train-journeys she had, in three months, been able to inspect most of the antiquities of Northamptonshire. Much of

the history of the county was intensely interesting: the connection of old Fotheringhay with the ill-fated Mary Queen of Scots, the beauties of Peterborough Cathedral, the splendid old Tudor house of Deene (the home of the Earls of Cardigan), the legends of King John concerning King's Cliffe, the gaunt splendour of ruined Kirby, and the old-world charm of Apethorpe. All these, and many others, had great attraction for her. She read them up in books she ordered from London, and then visited the old places with all the enthusiasm of a spectacled antiquary.

Every day, no matter what the weather, she might be seen, in her thick boots, burberry, and tam o' shanter, trudging along the roads or across the fields accompanied by the faithful collie. The winter had been a comparatively mild one, with excessive rain. But no downpour troubled her. She liked the rain to beat into her face, for the dismal, monotonous cheerlessness of the brown fields, bare trees, and muddy roads was in keeping with the tragedy of her own young life.

She knew that her aunt Emily disliked her. The covert sneers, the caustic criticisms, and the go-to-meeting attitude of the old lady irritated the girl beyond measure. She was not wanted in that painfully prim cottage, and had been made to understand it from the first day.

Hence it was that she spent all the time she possibly could out of doors. Alone she had traversed the whole county, seeking permission to glance at the interior of any old house or building that promised archæological interest, and by that means making some curious friendships.

Many people regarded the pretty young girl who made a study of old churches and old houses as somewhat eccentric. Local antiquaries, however, stared at her in wonder when they found that she was possessed of knowledge far more profound than theirs, and that she could decipher old documents and read Latin inscriptions with ease.

She made few friends, preferring solitude and reflection to visiting and gossiping. Hers was, indeed, a pathetic little figure, and the countryfolk used to stare at her in surprise and sigh as she passed through the various little hamlets and villages so regularly, the black collie bounding before her.

Quickly she had become known as 'Miss Heyburn's niece,' and the report having spread that she was 'a bit eccentric, poor thing,' people soon ceased to wonder, and began to regard that pale, sad face with sympathy. The whole country-side was wondering why such a pretty young lady had gone to live in the deadly dullness of Woodnewton, and what was the cause of that great sorrow written upon her countenance.

Her daily burden of bitter reflection was, indeed, hard to bear. Her one thought, as she walked those miles of lonely rural byways, so bare and cheerless, was of Walter—her Walter—the man who, she knew, would have willingly given his very life for hers. She had met her just punishment, and was now endeavouring to bear it bravely. She had renounced his love for ever.

One afternoon, dark and rainy, in the gloom of early March, she was sitting at the old-fashioned and rather tuneless piano in the damp, unused 'best room,' which was devoid of fire for economic reasons. Her aunt was seated in the window busily crocheting, while she, with her white fingers running across the keys, raised her sweet contralto voice in that old-world Florentine song that for centuries has been sung by the populace in the streets of the city by the Arno:

In questa notte in sogno l'ho veduto
Era vestito tutto di braccato,
Le piume sul berretto di velluto
Ed una spada d'oro aveva allato.

E poi m'ha detto con un bel sorriso:
Io no, non posso star da te diviso,
Da te diviso non ci posso stare
E torno per mai piu non ti lasciare.

Miss Heyburn sighed, and looked up from her work. 'Can't you sing something in English, Gabrielle? It would be so much better,' she remarked in a snappy tone.

The girl's mouth hardened slightly at the corners, and she closed the piano without replying.

'I don't mean you to stop,' exclaimed the ascetic old lady. 'I only think that girls, instead of learning foreign songs, should be able to sing English ones properly. Won't you sing another?'

'No,' replied the girl, rising. 'The rain has ceased, so I shall go for my walk;' and she left the room to put on her hat and mackintosh, passing along before the window a few minutes later in the direction of King's Cliffe.

It was always the same. If she indulged herself in singing one or other of those ancient love-songs of the hot-blooded Tuscan peasants her aunt always scolded. Nothing she did was right, for the simple reason that she was an unwelcome visitor.

She was alone. Rover was conducting sheep to Stamford market, as was his duty every week; therefore in the fading daylight she went along, immersed in her own sad thoughts. Her walk at that hour was entirely aimless. She had only gone forth because of the irritation she felt at her aunt's constant complaints. So entirely engrossed was she by her own despair that she had not noticed the figure of a man who, catching sight of her at the end of Woodnewton village, had held back until she had gone a considerable distance, and had then sauntered leisurely in the direction she had taken.

The man kept her in view, but did not approach her. The high, red mail-cart passed, and the driver touched his hat respectfully to her. The man who collected the evening mail from all the villages between Deene and Peterborough met her almost every evening, and had long ago inquired and learnt who she was.

For nearly two miles she walked onward, until, close by the junction of the road which comes down the hill from Nassington, the man who had been following hastened up and overtook her.

She heard herself addressed by name, and, turning quickly, found herself face to face with James Flockart.

(To be continued.)

EGG-GATHERING IN RUSSIA.

By JAMES COCHRANE, B.Sc., A.M.I.C.E.

TO the southward of Moscow, and stretching in a broad belt from the Carpathians to the Urals, lies the black-earth region of Southern Russia, where Nature would seem to foster indolence in the tiller of the soil, for she has provided that stoneless black loam known as loess, so fertile that for periods of from fifty to seventy consecutive years corn has been grown without manure.

In this region has sprung up an industry which, though little is known about it, contributes to the well-being of Western Europe, forming as it does an ever-increasingly productive source of those food-supplies of which our islands have need.

Picture a tiny colony of Dutch merchants in central South Russia. Could anything be more incongruous—Dutch thrift amid Russian thriftlessness, Dutch trimness amid Russian slovenliness? It shows grit in the founder of this colony that he has built up a business of large proportions under conditions against the grain, among a peasantry who had to be trained in the most rudimentary of principles, whom long continuance of a hand-to-mouth existence had not taught care of property, but who were rather confused as to the difference between *meum* and *tuum*.

In this fertile region settled some eleven years ago a merchant with his family. To-day this gentleman is rewarded by seeing conjured into being by his industry and forethought an establishment covering many acres, the source of supply of millions of the eggs which England consumes, thousands of the spring chickens which appear on her tables, as well as of the ducks, geese, turkeys, &c. which a Christmas season finds on the board of rich and poor alike. How was it done? How is it done? The answer to these questions may be of interest to readers.

The largest eggs in Russia come from the black-earth belt. The forest belt in the latitude of Moscow and northwards gradually passes into the ante-steppe region as the traveller turns southwards. In the ante-steppe region undulating plains, with here and there clumps of trees, are the rule; but farther south the trees creep down by the hollows which the watercourses have carved in the apparently illimitable steppe. Here the peculiar co-operative instincts of the Russian character have massed the peasantry—the farmers, let us call them—in large village communities. The landscape has assumed the aspect of a huge farm without the farmhouses dotted here and there. There are no made roads. Tracks intersect and lead as far as the eye can reach towards the next village, unseen beneath the horizon. What machinery then was there among such surroundings for the setting in motion of an industry? There was the raw material for the industry; but methods had to be devised and helpers had to be trained before London could benefit by the product of the steppe.

The working up of a staff of competent, honest peasants to act as traders and helpers was a difficult matter, one that required a close study of the peasant character, which has not much natural leaning towards business traits. That this problem has been solved, that the *moujik* has been transformed from farmer to honest trader, and in large numbers to boot, speaks for tact on the part of the trainer. To understand and justly appreciate what this transformation means, one has to picture the state of the Russian peasant before Western European ideas and methods have penetrated to his homestead. He is, indeed, a child of nature, and even the child in a dream. His simple fare—black bread and melon, with perhaps some salted fish; his methods of eating it, with nature's implements, using probably his long hair as napkin to clean his hands when the meal is over, content him. His affectionate way of walking hand-in-hand with a neighbour, his devoutness in a religion crammed with superstitions, his willingness to come long distances to church in early morning in all weathers, and stand or kneel in devotion for long periods, all point to the quality of the material of which he is made. Talents, too, he has. His abilities in using hand-tools in turning out articles in wood or leather or metal are great. He has not the business capacity to turn these talents to account, and peasant industries seem much under the control of the sweater.

By dint of careful study, the founder of the industry which we have under review began to appreciate the worth of the peasant character, and began to train a few selected from his neighbourhood to leave their farming pursuits and become his buyers. These peasants were trusted with money, and were asked to ride with their carts through certain areas, buying up eggs in the villages, and to return with them to headquarters. There proved to be black sheep among them who, when thus financed, never returned; but in the majority of cases it is pleasant to relate that the *moujik* invested with the dignity of a trader seems to become too self-

respecting to be a pilferer. Remembering his intense poverty, one wonders the more that he can so well resist temptation to misappropriate the money with which he is trusted.

It must have been, however, a very gradual, very wearying process this working into shape of a band of peasants, and making them into buying-agents. After eleven years the system has grown to such proportions that stocks of eggs to the number of sixteen millions are in store at one time. Chickens are in process of fattening in lots of one hundred and thirty thousand, besides geese, ducks, &c., all or a large part of which have been procured through the medium of the peasant-trader.

It is a curious and interesting sight to watch the return of a trader with his cartful of eggs. For a period of eight to ten days he has been on the road, sleeping on his cart, eating on it, travelling night and day without pause of long duration. In that time he has gradually accumulated eggs to the number of about seven thousand, arranging them row on row with separating layers of straw. Perhaps twenty-five will be chipped, and perhaps none actually broken, in his load, so skilful is he; and yet a glance at his springless, four-wheeled cart makes one but marvel the more. The body of the cart is long and like a dug-out canoe in cross-section. One wonders if a piece of metal has been used in its composition. The wheel-axles are of wood; the wheels are of wood, with curiously long hubs equal in length to the diameter of the wheel in some cases. The shafts are fastened to the cart-body, and are kept from rubbing on the horse's flanks by the very characteristic bow of wood which passes over the horse's head. An air of dilapidation is common to cart, horse, and driver; yet feats of the above kind are done daily in the summer season by the *moujik*, and he probably thinks nothing of it, having no experience of the world beyond his steppe-bound horizon.

The eggs are unpacked from these carts and counted in tens. So delicate becomes the touch of the counter that, no matter how many eggs he may lift in his hand at one time, if the shell of one of them be cracked the fact is noticed. Such cracked eggs are placed on one side, and afterwards their contents are tinned and sold to cake-manufacturers. The crates in which the eggs are now placed are capable of holding about fifteen hundred in their eighteen compartments, and properly aerated and dried shavings, quite non-odorous, are used in place of the straw employed by the peasant-buyer of the eggs. These crates are now placed in cold-air chambers, where the eggs are kept at a temperature slightly above their freezing-point till required for the market. Then the crates are removed from the cold-air chambers, and the eggs powdered with borax. The candling (or putting the egg up to a light for examination internally) has now to be done, and the 'blacks' and 'spots' have a sale in Russia. The eggs which show no black spots when held up to the light are now sorted into sizes, large, medium, and small, and packed in crates for their long journey of nearly one thousand miles by rail to Riga, where they are shipped for London. From twelve to seventeen days are usually reckoned upon for this journey.

Besides the egg-industry, business talent finds other lucrative channels for its exercise. This is the largest poultry-farm in the world, but hardly in the ordinarily accepted sense of the term. Chicks are bought and fattened for one glorious fortnight on millet porridge, then their tongues are cut, they are plucked and trussed, packed in crates, and frozen hard in cold store till required for market. A similar fate is meted out to the geese which may be seen coming into the yard in droves in late autumn. One is astonished to hear that this or that noisy drove has come fifty miles, and that they have progressed hither by ten-mile stages, taking five days on this their last journey. In spite of this some of the footsore, dust-covered, web-footed pedestrians have energy enough to attempt to reach the water of a lake which temptingly occupies the centre of the compound. Some, however, have long passed feeling of this kind, and are being carried by the gooseherd, dead from the fatigues of the march. The feathers of the slain birds are utilised to make down. The feathers are first sorted by ingenious machines, of German make, according to their specific gravities. Next, feathers of a certain quality (and producing down of a certain quality) are fed into the hopper of a disintegrator, a machine which has a very wide application, and can grind anything as hard as bones or as soft as breast-feathers of a duck. The result of the passage of the feathers through this machine and a subsequent sifting is very wonderful. A down has been produced and the quills have disappeared.

Electric light, telephones, all up-to-date household appliances, are to be found in this out-of-the-world spot. One is surprised to find suction gas-engines (the very modern and economical form of power-producer) installed here. Two engines, aggregating one hundred and twenty horse-power, made by the Campbell Company of Halifax, Yorkshire, supply the power needed for the production of cold, the power needed for the production of electric light, and the power to drive the flour-mill and the machine to prepare the *prosa* (millet) for the chickens' food.

But perhaps the most interesting aspect of the industry is its social one. What is being done for the peasant incidentally as he works as a unit in a thriving industry? Those employed in handling the eggs, feeding the live stock, &c. are boarded on the establishment. The allowance of bread per head per day is five pounds, procurable at the shop opened by the proprietor of the business. The shop supplies all kinds of unexpected luxuries. One can buy the most luxurious of sweetmeats. The peasant is sometimes seen buying a cake of scented toilet soap at half a rouble (one shilling and a

halfpenny). He can buy a tiny packet of tea for one kopeck (a farthing), and what is far more important, a room is provided where tea is served to the personnel and to the peasant traders already mentioned, who are thus attracted from the *vodka* shop. *Vodka* drinking is, indeed, a sad curse to them, and they of all peoples and classes who spend money on drink can surely least afford to do so.

When the day's work is done the *moujik's* recreations are of the simplest. Perhaps he dances, or plays the concertina, or sings some melancholy air. But when a wedding has to be celebrated, and the priest has duly united the couple, the peasants give themselves up to the enjoyments of the occasion. The writer well remembers peeping into the brightly lit rooms of a tiny two-roomed log-cabin where such a revel was in progress. The evening was a hot one. In one room, so small that only four couples could with difficulty wheel about, dancing was in progress. The perspiring couples had made up their minds to enjoy themselves. There was a kind of determined-to-see-it-through look on their faces, and evidently they had great staying-powers. In the same room, closely packed and lining the walls, were onlookers waiting till a couple should drop out and to take their place in the dance. The second room was laid out with refreshments. A side-table groaned with all kinds of dishes dear to the peasant palate. One knife, one table-napkin, one fork, did service for the party; but some scorned even these aids, and picked up here a sardine, there a hunch of melon, or tore at a hard sausage. One thought of the cave-dwellers, and wondered what refinements they possessed when they ate. *Vodka* was being served out by the father of the bridegroom, and it was having its effect. One tall man was pointed out as the stationmaster of a tiny wayside station near by. He was conspicuous as being better groomed and less savage in appearance than his fellows, and one heard afterwards that the seductive charms of a wedding feast made him forget on that evening his duty as signalman. A freight train waits two hours before a signal at danger, and then—for the signalman is quaffing his *vodka* and dancing at the wedding—the train proceeds. The driver reports at the next town. Result: two months afterwards the stationmaster, for neglect of duty in his capacity of signalman, is degraded to a charge at a smaller station. Surely such things happen in few other countries than Russia—Russia the land of a great future, but whose inhabitants, in the main, are only awakening out of sleep.

THE BLUNDERERS.

CHAPTER V.

THE answer which Francesca received to the note appeared from its nature to need delivery sooner than the following morning. Accordingly she made her way back to Upper Brook Street late in the afternoon, so as to make sure of finding Mrs Domville at home. It was breathlessly hot, and her head ached as, for the second time that day, she passed up the stairs to the drawing-room.

The door was wide open to admit all the air that was possible, and as she reached the landing a man's aggrieved voice broke on her ear: 'Oh, I say, Aunt Mary, you *are* hard on me!'

'Well, I don't know what sort of creature you'd be if it wasn't for me,' Mrs Domville's voice answered with asperity, and just then Francesca was announced. Her advent evidently caused some surprise.

'What! back again, Miss Dunn?'

Francesca hastily explained her reason, realising the blunder she had made in arriving just at the moment when Mrs Domville was measuring spoonfuls of tea into the teapot.

'I—I—don't know if I did right,' she said; 'but I thought it might make a difference, and that perhaps you would wish to cancel the letter I wrote on the subject this morning, as you said time was important.'

'Of course, quite right to come and tell me; and now you'd better have some tea.'

'Oh no, thank you,' Francesca said, her face growing crimson. 'I can't wait; I must go.'

'Nonsense, child; you look half-dead. Tea is very reviving. Sit down.—Charles, draw up that chair.—My nephew, the Duke of Wiltshire, Miss Dunn.'

Having effected the introduction and supplied Francesca with tea, Mrs Domville evidently forgot all about the girl, and devoted her attention to her nephew. Francesca knew nothing of the things and people they discussed, and was free to watch and listen in silence.

The Duke of Wiltshire was tall and fair, passably good-looking, and undeniably well-dressed. He was very loosely made, and he moved very slowly, as if everything he did was an effort to him. Nevertheless, he kept Francesca provided with food, and seemed as obviously conscious of her presence as his aunt was oblivious of it. While Mrs Domville indulged in a tirade against the Government the Duke employed himself in studying Francesca, always cleverly returning his gaze to his aunt in time to prevent her noticing how very little of his attention he was bestowing on her.

Francesca grew tired of his persistent stare, declined a second cup of tea offered with *empressement*

by the young man, and took her leave as soon as an opportunity occurred.

The Duke, as a matter of course, accompanied her downstairs and opened the front door.

'Good-bye,' she said, bowing.

'Good-bye,' he said, stepping out beside her. 'Er—hot evening. Far to go?'

'A long way,' she answered. 'I live near the Fulham Road.'

'Good gracious! Call you a cab?'

'No, thank you,' she said with a look of alarm, her mind reverting to money-matters. 'I am walking.'

'Much too hot for that. Better let me put you in a 'bus.'

'No, thank you,' she repeated patiently. 'I am walking. Good-bye again.'

The Duke went thoughtfully upstairs to take leave of his aunt.

'By George, Aunt Mary!' he said, 'you've got hold of a ripping-looking secretary this time. Where did you get her?'

'She fell from the skies,' answered Mrs Domville dryly.

'She looks just like that,' said the Duke, sinking into one chair and putting his feet on another. He looked dreamily out of the window.

Mrs Domville looked at him. 'Now, Charles, none of that nonsense!' she said sharply. 'And take your feet off my chair. Good-bye; I'm tired.'

But in spite of her abrupt dismissal, she looked after him tenderly, as, having meekly kissed her in farewell, he left her to herself.

Three days later Francesca was leaving Upper Brook Street after her morning's work, when she recognised in front of her the Duke of Wiltshire's back. Judging by the quick, expectant glance which he threw over his shoulder and the prompt way in which he turned to join her, she had a shrewd suspicion that he had been walking up and down waiting for her.

'Good-morning, Miss Dunn,' he said, lifting his hat in his usual slow, lazy way. 'If you are going through the Park may I walk a little way with you?'

'If you like,' Francesca answered, not very cordially.

'Thank you!' he said more fervently than to her seemed necessary. 'I've been waiting for you, you know.'

'Why did you do that?'

'Because,' he replied, sinking his voice confidentially, 'I wanted to see you. I felt very down on my luck this morning, fed up, sick of life—you know the kind of thing'——

'No, I don't,' said Francesca. 'I don't think I ever felt exactly like that.'

'Well, you're lucky!' said his Grace.

'Still, I don't see why you waited for me.'

'Don't you? Just because I thought seeing you would do me good. You might cheer me up a little, don't you think? I thought you looked as if you could cheer people up the other day when I met you at my aunt's.'

'Are you in trouble, then?' asked Francesca sympathetically, for she was always quick to feel for others.

'Oh, not more than usual. But I sat up very late last night and played bridge, and lost a hundred pounds, and that always depresses me.'

'It seems to me very silly to play in that way,' said Francesca after a pause. It was the first time in her life that gambling had been brought directly under her notice, and she was struck by what appeared to her the futility of the amusement.

By this time they had entered the Park, and were crossing it by one of the centre paths that lead in the direction of Albert Gate. Francesca, in her ignorance, felt a little doubtful as to whether it was correct for a girl to walk alone with a man in the Park. But as they walked on she thrust the scruple away from her. After all, she could meet no one who knew her, and she was beginning to enjoy the feeling of companionship of which she was conscious on finding herself with some one of her own age with whom she felt at ease.

His conversation was not particularly intellectual, but he was young, and youth naturally turns to youth. Also, she was not free from that faint thrill of interest which a girl feels when she is first conscious of being admired.

Altogether she enjoyed the walk, and was sorry when her companion bade her '*Au revoir*' at Albert Gate.

'I've promised to lunch with my mother at one-thirty, and it's nearly two now,' he said placidly, and strolled away without any increase of speed.

After that she frequently met him, and he generally had 'troubles' of a sort to pour out to her. Of her own affairs she never spoke, and he was content to think of her as having 'dropped from the skies,' and neither then nor at any other time did he ask her any questions relating to her home and family.

At the end of three weeks she had become a fairly proficient secretary. Mrs Domville had pronounced her 'exceedingly useful,' and had hired her a typewriter, which she kept at home, and at which she practised hard in the afternoons. Her evenings she generally filled in by trying to teach herself shorthand from a book. Now and then Miss Taylor would come up to sit with Francesca and pour out the history of her love for Mr Smith—to whom, by the way, she was now definitely engaged. Francesca sometimes grew half-envious of the red-haired girl's simple happiness, and wondered if she would ever feel for any man what Miss Taylor evidently felt for her blonde and amiable young Alfred.

On the whole, Francesca was satisfied with her lot for the present. London interested her, and she liked the bracing knowledge that she was earning her own bread. But one care she had deep down in her mind. Sometimes, in spite of herself,

qualms would come to her at the thought of her father alone in his far-away Rectory, and she would wonder if she had been wrong to leave him. But her answer to herself was always, 'He did not want me; he always showed me that. I was no use to him, and I *know* he would have made me give in.' Every week she sent him a post-card, of course giving no address, to say she was well and earning enough money to keep herself in comfort. Thus she salved her conscience and honestly thought she was doing the only possible thing. 'Whatever happened, I couldn't go back now,' she reflected. 'It would look as if I had changed my mind with regard to Mr Blake.'

CHAPTER VI.

ONE Sunday afternoon Francesca sat by her open window listening to the bells of several churches that rang in varying keys, at varying distances from Fowler Place. She had been to St Paul's in the morning for the second time, and had come back impressed anew by the vast immensity of the place and the glorious singing of that unrivalled choir. She sat now idly recalling the pleasure she had felt in listening to the anthem, and the wondrous solo which, thrilled out in the high, pure soprano of a boy, had moved Francesca's musical soul to its depth, and even brought tears to her eyes.

On her meditations in broke Mrs Broad. 'There's a young gentleman to see you, dear,' she said; 'you'd better come down to the parlour.'

'A young gentleman?' Francesca repeated, amazed.

'Yes, miss, yes; a message from Mrs Domville,' panted Mrs Broad, breathless from the long climb. 'I didn't ask 'is name, seeing as 'ow 'e mentioned 'er and said 'e knew you at 'er 'ouse. But run now, miss, for 'e's waiting.'

Francesca descended, and found, as she expected, the Duke of Wiltshire extended somewhat limply on Mrs Broad's best sofa. He rose at her entrance and held out his hand.

'Is it anything important?' she asked when greetings had been exchanged.

'Is what anything important? Oh, by Jove! the—the message. Well, it wasn't exactly a message. At least, you know, there wasn't anything in the nature of one. Because, as far as I know, my aunt didn't know I was coming here. But the old lady who let me in demanded with her stony glance some explanation for my being here, and that seemed the simplest. And it was quite effective.'

'You oughtn't to say things that aren't true,' Francesca said severely, feeling, however, inclined to laugh. 'And what do you want now you are here?'

'I am only paying you a Sunday afternoon call,' his Grace said rather defiantly. 'Mayn't I do that? I wanted to see you. I have been so beastly busy lately that I feel quite tired out, and thought I would give myself a treat as the reward of virtue.'

'What have you been busy at?' she asked, laughing. 'Playing bridge, playing polo, dining out, dancing? Yours is an arduous life, I know; but has it been busier than usual?'

'Well, it has,' said the Duke with an aggrieved air. 'My agent actually came up to London last week to see me. Said he couldn't get full enough answers to his letters out of me, and he thought a few hours' talk, &c. And three mortal mornings have I been sitting at a table with papers, and that man talking to me. He's gone away now, thank goodness! back to the country, and he might just as well have stayed there and done all these things on his own, without bothering me.'

'I suppose you mean matters connected with your estates that had to be settled?'

'That sort of thing.'

'It is to be hoped,' said Francesca, 'that you have honest men about you. I think you ought to be *ashamed* to talk in that way of your responsibilities.'

'Go on, rub it in!' said the Duke. 'What I really want to ask you is this, will you do a theatre to-morrow night with me?'

Francesca's eyes twinkled. 'No, I can't,' she said, 'because I am already engaged to go to the theatre with friends.' She had promised to see the Gaiety piece from the upper circle with Miss Taylor and Mr Smith. 'In any case,' she continued, 'I couldn't go with you. You are probably asking smart friends, and I have no frocks that would be suitable for the stalls.'

'I wasn't asking anybody but you.'

Francesca grew grave again. 'Then,' she said, 'I don't know that I would have gone any the more. It wouldn't be correct, would it, for me to go alone with you?'

The Duke looked away. 'Oh, all right, I think. People are very broad-minded nowadays.'

'Well,' she said, 'I couldn't if I would, anyhow, and I am not sure I would if I could. Now, I am sorry to seem rude; but I simply must have some fresh air, and I'm going out. Good-bye.'

'Where are you going?'

'I'm going to walk in Kensington Gardens, and meet some friends at tea.'

'Can't I come to tea too?'

'I don't think you'd find anything in common with the tea-party. They're my fellow-lodgers—a bank-clerk and a shop-assistant.'

'I should like to meet them.'

'Well, you may come, but I sha'n't introduce you by name. It might oppress them if they knew you were a duke.'

Kensington Gardens was gay with its usual Sunday crowd. Francesca and her escort strolled peacefully about the less frequented paths, talking in a desultory way which she found very pleasant. The Duke's society was an agreeable element in the routine of her days, and she enjoyed what she believed to be a mutual feeling of comradeship between them.

The only thing which now and then disconcerted her on this particular afternoon was the way in which he stared at her. It was such a persistent gaze that she felt it on her even when she was looking in the opposite direction.

Finally, when she could no longer bear it, she said, 'You have been staring at me for the last half-hour. If you have discovered that my hair is coming down, or that I have a hole in my veil, I wish you would tell me so.'

'You haven't a hole in your veil, and your hair isn't coming down,' he returned with a matter-of-factness that was baffling.

'Well, it's time to meet the others,' she said, turning towards the tea-place rather hastily.

Mr Smith and Miss Taylor were looking round expectantly as Francesca hurried up in advance of her companion.

'Do you mind my bringing a friend?' she asked. 'He came to call, and I had to bring him.' Then, turning to the Duke, she said, 'I want to introduce you to my friends, Miss Taylor and Mr Smith.'

They sat down at one of the tables, and Mr Smith turned affably to the Duke.

'Didn't quite catch your name, sir?'

'Wiltshire,' said the Duke, mindful of Francesca's decision.

'Ah, Wiltshire—uncommon for a surname, too. Gardens looking pretty to-day, Mr Wiltshire.'

'Very,' said the Duke with an effort. 'I admire the flowers very much. It is all charming.'

As Francesca had foreseen, the tea-party was not very successful. The Duke was polite in the extreme, and Miss Taylor, Mr Smith, and Francesca all gallantly strove to make conversation flow. But the stranger somehow damped the party, and it was not long before the engaged couple, after some eye-telegraphy between themselves, rose and said they were off to St Mary Abbot's for evening church.

'Thank goodness!' said the Duke when they were out of hearing. 'Don't they bore you?'

'No,' said Francesca stoutly; 'they are real friends. Miss Taylor is one of the nicest girls I know, and I have a great regard for Mr Smith.'

'Well, you don't want to go to church, do you? I know a quiet seat up that way. It's too early for you to go in yet.'

The seat he referred to was in the deep shade of an elm up against the thick belt of shrubs that runs parallel to the long asphalted walk. Here they sat down.

'Now, isn't this ripping?' said he. 'Pretty place it is, and it's ripping to be here with you. You looked splendid this afternoon, do you know? I wonder if you know how beautiful you are!'

Francesca did not care for the turn the conversation had taken, and tried to lead it off on to safer ground.

'Tea has done you good, then,' she said. 'Everything looks "ripping" to you now; and you've forgotten all about your agent and the papers.'

'I've forgotten everything except you,' he burst out suddenly, leaning forward; and before she could realise what had happened he had drawn her to him and kissed her.

In blind rage she struck at him again and again, freeing herself by an effort which took all her strength. Then she faced him, trembling. 'How dare you?' she gasped.

He took a step forward. 'Francesca.'

'Don't come near me! Don't *dare* to call me by my name,' she said, stammering with indignation. She took out her handkerchief and rubbed her cheek with vigour and force that seemed to sting him to impatience.

'Good gracious,' he said, 'what a girl you are! Is a kiss a thing to make all that fuss about? Have I done anything so very dreadful?'

'You may be used to kissing all the girls you meet,' said Francesca with sweeping directness, 'so you may think nothing of it. But that you should *dare* to do such a thing to me! Oh!'—and here the fire died out of her, and her voice broke into indescribable pathos—'and I thought I had found a friend!'

'Then you did like me?' said the Duke. 'Oh Francesca! I love you; and the deuce of it is I can't ask you to marry me, because I've got to marry somebody else.'

Francesca's lip curled. 'I wouldn't marry you to save my life,' she said with emphasis. 'But why have you "got to marry somebody else"?'

'Because I'm a weak ass.'

She looked at him, taking in the trouble in his eyes, the sulkiness in his handsome, weak mouth. Then sympathy and ever-ready interest welled up in her. Her voice softened. 'Surely that is a thing you must be able to decide for yourself?'

'Oh, you don't know! If you'd got a mother like mine, an aunt like mine, and uncles like mine, you'd understand. If you were a wretched man much too poor for your position, and always spending more than you'd got, you'd understand.'

'Then you're engaged to somebody rich?'

'No, not engaged. But I've got to be; they're all waiting for it, and the estate's burdened, and I've got a mountain of debts, and it's the only way out.'

'It's a *hateful* way! Does she like you?'

'Upon my word I don't know. But she'll marry me, I believe. I suppose it will be a bargain—the kind of bargain that's made every day. It *is* hateful, I agree; but it's the only way, and I didn't mind the idea till I saw you.'

Silence fell between them. The meanness and the sordidness of a sphere of life which rendered such bargains necessary struck Francesca dumb.

She had felt interested in this young man, thinking to find a friend and comrade in him, not knowing, poor girl, the impossibility of such friendships. She had in no way idealised him, but had regarded him much as she would have done a hitherto unknown brother. Now, though his weak

selfishness had shattered her honest liking, she felt her resentment at his treatment of her fade away into an intense pity and a motherly desire to save him from a fate which appeared to her to be terrible.

Till the question had arisen of Mr Blake as a possible husband, thoughts of love and marriage had presented themselves to her mind only in a vague and abstract way. But a marriage without love, or for money, had always appeared to her as a thing to be loathed, and well-nigh an impossibility. How could he be saved from this fate?

The shadows lengthened on the grass as the sun sank. The gardens grew quieter, and from their corner they could see no one, so that it seemed as if they had the whole wide stretch of grass and trees to themselves. Francesca turned to her companion and made her appeal.

'Don't do it!' she pleaded. 'It can't be right to marry for those reasons, and it can't make either of you happy. Surely it would be better to lose everything than to make such a sacrifice. Couldn't you sacrifice other things? Give up your bridge; give up spending money; save it instead and try to pay your debts. Those are the things to sacrifice, not truth and—and love, because that is what you will both do, you and she, if you marry without caring for each other. You said just now that you—loved me'—— He started forward, but she stepped back till the seat was between them. 'I don't know how to believe that in view of what you told me the moment after; and in any case it would be no good,' she added hastily, 'because you are not the sort of man I would *ever* marry. Only if I—thought I loved any one, I would rather die than marry any one else for the reasons you are going to do it. Wait, and you will find some nice girl some day whom you will love and who will love you, and how glad you will be that you waited! Do—do take my advice. There, I have done!'

'I will! I will!' he cried, fired by her earnestness. 'You're an angel, and you're perfectly right. I'll sell my ponies, I'll give up bridge—and, by George! I'll sell the place if I can't get straight. It's not entailed, and it's mine, and not my mother's or my uncles' or my aunt's. I'll act on what you've said—I swear I will!'

'Don't promise or swear, but do it,' Francesca said, smiling at him. 'Now, I am going. Will you please understand that I don't want to see you again for the present?'

'One moment,' he said, catching her hand, as she moved away. 'Did you mean it, Francesca, when you said I was not the kind of man you could ever marry? Don't you care for me at all?'

'Not *that* much, I am afraid,' she answered decidedly, measuring half an inch between her two forefingers as if determined to convince him.

'I wonder if you realise what you are condemning me to? No pleasure, nothing but pinching, and not even the hope of your friendship. If I had that to look forward to the rest would be easy.'

'Are you repenting already, then?' she asked, smiling sadly.

'No, of course not. But—now, don't fire up at me; give me one—just one kiss before you go, to remember afterwards;' and he caught her arm again.

'No!' she cried vehemently. 'Let me go, or I shall hate you!'

Rebuked, he fell back, and she held out her hand, softening again.

'Good-bye,' she said gravely, and a moment later they had parted.

She sped home, and as she mounted to her room depression descended on her. Now that she would see the Duke no more, how she would miss him! Not that she wanted to see him, but the companionship had been so pleasant, and she foresaw nothing to take its place. She felt again like a lost child, lonely and uncared-for. And again, as on her first night in London, the face of James Blake rose suddenly before her mind's eye.

This evening her spirit turned gratefully to the thought of him. There was comfort in the remembrance of his strong, sensible face, of his steady gray eyes. For the first time she definitely doubted the wisdom of her action in leaving home.

Presently she remembered the Duke again, and her advice to him. 'Will he do it? Is he strong enough?' she thought.

And the Duke at that moment, away from the inspiration of Francesca's presence, was asking himself the same question.

(To be continued.)

MARTYRS TO SCIENCE.

By T. C. Bridges.

IN September 1906 there appeared in the *British Medical Journal* a letter from Dr John Hall Edwards, President of the British Electro-Therapeutic Society, appealing for help—help in the way of suggested methods to cure himself of a cancerous growth caused by constant exposure to X-rays. The disease is known as X-ray dermatitis, and seems, by all accounts, to be one of the most cruelly painful maladies from which mankind can suffer. 'I have not,' wrote Dr Hall Edwards in this letter, 'experienced a moment's freedom from pain for more than two years, and at times the pain is so severe that I am rendered absolutely incapable of work, whether mental or otherwise. In the cold weather I am unable to dress myself, and the pain experienced cannot be expressed in words. On the

back of each hand I have from fifty to sixty warts, many of them confluent. In order to excise these it would be necessary to remove the whole of the skin from the back of the fingers and from the greater part of the hands. Drugs have so far failed to give me the slightest relief. . . . The excruciating, ever-present pain appears to be due to a permanent irritation of the cutaneous nerves which nothing relieves, and which is intensified by holding the hands in a dependent position and by cold. The pain is of a neuralgic character, it never ceases, and is intensified from time to time by sudden stabs and jumps of such severity as to make one cry out.'

Dr Hall Edwards is one of the pioneers of the X-ray treatment. It was by the aid of a radiograph taken by him that the very first operation of the kind was performed. In 1900 he went to South Africa as radiologist, and published the results of his experiences with gunshot wounds. Soon after his return, the malady which has made his life one continuous torture first appeared. He understood well enough the ghastly threat, yet never for a moment ceased his work or experiments. He took to gloves and other forms of protection, but it was too late. The mischief was done, and nothing was found to stop the spreading of the ulcers.

Since that pitiful letter of two and a half years ago, the disease had become so much worse that it was found necessary to amputate the sufferer's left arm. Yet up to the very day previous to the operation the experimenter was at work in his laboratory, and at the time of the present writing his only fear is that he may not be able to complete his book on the subject for which he has made such amazing sacrifices.

Nor is Dr Hall Edwards the only martyr to the mysterious and cruel influence of the Röntgen rays. In 1897 Mr Clarence Dally, chief assistant in Mr Edison's laboratory, did several weeks of experimental work during which his hands were constantly exposed to X-rays and to contact with highly fluorescent materials such as calcium tungstate. The first symptoms of injury were that his hands became inflamed as though scalded with boiling water, and his hair and moustache fell out. There was, however, no pain at the time, only slight soreness and numbness. Two years later cancer developed in the left wrist, and soon the other hand became affected. Everything was done that science could suggest. As many as one hundred and fifty pieces of skin were taken from his legs and grafted upon his hands, but all to no purpose. The disease went on spreading. Soon the left arm had to be amputated, next the sacrifice of the little finger of the right hand became necessary, and in June 1903 three other fingers were taken off. Eventually the whole of the remaining fore-arm was removed, and artificial arms provided. The disease still continued to spread, and after seven dreadful years kindly death cut short the torment of life.

A third X-ray experimenter was the French doctor M. Radiguet, who died in December 1903, after two years of similar sufferings. His last words were an expression of fervent thankfulness that he had been permitted to live long enough to establish reliable evidence as to the effect of the rays upon the human organism.

The list of victims to the deadly influence of the rays is by no means complete. There was Dr Louis Weigel, one of the greatest American authorities on the subject, whose end came in June 1906, after no fewer than seven different attempts by operation to save his life; Dr Blacker, of St Thomas's Hospital, who died in 1904; while many other experimenters and operators have suffered severely. Mr Edison himself, upon whose mastoidal bone an operation has recently been performed, is said to have had the focus of one eye disturbed, and to have been afflicted with curious lumps upon the chest, the nature of which has not been diagnosed, but which are suspected to be due to the effect of the rays.

One can but hope and trust that operators will in future be able to protect themselves against the malign influence. Dr Hall Edwards has shown that immunity can be obtained by the use of gauntlets lined with rubber and an apron coated with lead. But this does not alter the fact that the invaluable benefits conferred upon suffering humanity by the use of the rays has been paid for by torture unspeakable. All must do honour to the pioneers who have not hesitated to give more than life to the cause.

The pluck and self-sacrifice of the medical profession are proverbial. In the routine of his ordinary duty, more especially while engaged in research work, the doctor comes constantly into contact with all kinds of contagion and infection. Of course he takes precautions, but after all he is only human; he cannot always guard against the insidious attack of the deadly bacillus. A typical case is that of Dr H. W. Syers, physician to the Great Northern Central Hospital. One day in October 1906, while examining some organs in the post-mortem room of the hospital, he gave himself a slight prick—so slight that it did not even draw blood. Two days later the finger became painful, and was at once cut open and dressed. Too late! The poison, a virulent streptococcus bacillus, was thoroughly established in his system, and in less than a week he was dead. His is only one case among many. If the organs and tissues which have to be examined were sterilised the work would be useless. They swarm with micro-organisms, and the slightest cut or scratch may mean death.

In certain cases where it is impossible to obtain knowledge second-hand, medical investigators have had no hesitation in experimenting upon themselves and in taking risks which to the ordinary layman seem madness. Being desirous of determining the amount of carbonic acid gas which, mixed with atmospheric air, formed an atmosphere dangerous

to human life, Signor Teodoro Scribante, of Turin, offered himself as a subject. On three successive occasions he was confined in a hermetically sealed iron chamber the air of which was mixed with varying proportions of carbon dioxide. From a mixture of 1 part of the gas to 333 of air he progressed to one which contained 1·233 of the deadly choke-damp, and at the end of the third experiment was found in an unconscious condition and to all appearance dead. It was only by the use of oxygen that he was at last restored to life.

Not so dangerous perhaps, but certainly most risky and painful, was an experiment which resulted in an interesting paper read three years ago before the Royal Medical and Chirurgical Society. 'A New Aspect of the Sensory Nerves' was its title. Its author, Dr Head, F.R.S., stated that he had had the sensory nerves of his own arm divided, and watched the various sensations disappear. The nerves were reunited by stitching, and the progress of recovery carefully noted. As a result, Dr Head discovered that there are two distinct sets of nerves to the skin, carrying different kinds of sensations. The first set convey the sensations of pain, also of heat and cold; the second set are those of touch which enable us accurately to localise our sensations. The healing power of the skin, he found, depends entirely upon the first set. These discoveries were deemed by the society so valuable that the Marshall Hall prize, given once only in five years by the society, was unanimously awarded to Dr Head.

During the Spanish-American war the United States troops in Cuba suffered far more severely from yellow-fever than from the bullets of their enemies. 'Yellow jack' has been the curse of Cuba time out of mind, and a number of American army doctors at once instituted a campaign against the disease. A serum was discovered by Dr Caldas which, it was believed, would counteract the effect of the fever-germ, and volunteers were asked for who would permit themselves to be bitten by infected mosquitoes so that the effect of the serum might be thoroughly tested. A large number offered themselves, nearly all being doctors or nurses. As the inducement held out was the paltry sum of one hundred dollars, and it was stipulated that the subjects were to take all risks, it is hardly possible to suggest that those who came forward were actuated by any other motives than those of science and humanity. The experiments proved deadly. Two surgeons who permitted themselves to be bitten by mosquitoes fed on the blood of yellow-fever patients died, one of them being Dr Lazear, assistant-surgeon to the military board. Miss Clara Maas, a trained nurse from Orange, New Jersey, was another victim. Her death occurred within seven days of having been bitten by two of the infected *anopheles*. Two medical students also caught the fever and came within an ace of death.

This question of the spread of infection by insects of different kinds has engaged the attention of the medical world for some years past, and at the present time scores of patient experimenters are in the field. The well-known German, Professor Koch, recently spent eighteen months on a desolate island in the middle of Africa's great inland sea, the Victoria Nyanza, engaged in the investigation of that strange and terrible disease, the sleeping sickness. His only white companion was an army medical surgeon, and during the whole year and a half of his stay he saw but three other white men. A rough native canoe hewn out of a single log was his only means of communication with the mainland. The Professor made the curious discovery that wherever crocodiles are found the disease may be discovered. The blood of crocodiles, he says, forms the chief nourishment of the *Glossina palpalis*, the insect which conveys the germs of sleeping sickness. Naturally, the ardent scientist ran considerable risk, but happily he has returned home in the best of health and spirits.

The worst scourge of our own country is tuberculosis, and fighting the 'white death' has occupied the lives of many patient investigators. Some, like Dr Robert Scott, have laid down their lives in the campaign. Dr Scott, who lived at Grangerville, near Newcastle, made extensive experiments upon monkeys, inoculating them with tuberculosis germs, and afterwards placing the animals in hermetically sealed cells into which a breathing mixture largely composed of oxygen and ozone was pumped. Some were completely cured. Dr Scott exhibited their lungs to a jury of medical experts, and convinced them that all traces of the disease had vanished. At last he himself contracted consumption, and, a firm believer in his own treatment, had a special 'condensed pure air' chamber prepared for himself. Alas! he died a martyr, like so many before him, to his zeal for scientific research.

Of late years drug-taking has become a very serious evil, especially among the well-to-do, and of all these stimulating poisons none has more terrible results than cocaine. With the object of investigating the cocaine habit, Dr Winner, of Milford, New Jersey, an American physician of repute, began about five years ago a series of experiments upon himself. He would take large doses of the drug, and while seated before a mirror in brilliant light calmly make notes of the colour of the skin, the muscular action, and mental condition. A single quotation from these notes seems worth inserting: '*July 18th.*—Purchased one-eighth ounce cocaine hydrochloride. One grain boiled for three minutes produced only diaphoresis and local effects. Slept. Hallucinations at the end of twenty minutes, removed after one hour from the injection. Took a bath at five. No forced breathing; no convulsive movements of the muscles. Delirious in the occipital.' Then follows a note as to the administration of an antidote which seems to have

been successful. A few days later the unfortunate experimenter was discovered in a state of furious insanity, smashing the furniture in his rooms. He was taken to hospital, lapsed into unconsciousness, and died on the following afternoon.

It seems to be a fact that hardly any kind of scientific investigation is without its special perils. Little more than a year ago Dr Robert Vance Freeman died from the effects of eating adulterated food. He was one of the famous 'poison squad,' men who volunteered to test various adulterated food-products seized by agents of the American Government. In January 1904 Professor Vincent Rodella, a well-known Italian scientist, was found dead in his laboratory, having unwittingly inhaled the fumes of a prussic acid compound which he was preparing. His age was only thirty. His portrait is in the hall of his university, with this inscription below it: 'Died too young, but not without glory.' Dr Calmette, head of the Pasteur Institute at Lille, is another sufferer in the cause of science. While preparing his now famous snake-serum he was bitten in the hand by a cobra, and only the amputation of the finger saved his life.

Descriptions of death by disease and poison are of necessity gruesome. It is a relief to turn to the records of explorers. Those who penetrate wild lands in the cause of science too frequently undergo terrible sufferings, and sometimes fall victims to their ardour. Yet pain or death, when one is facing the frosts of the Arctic, the sands of the desert, the dank heat of the tropic forest, or the spear of the savage, is not unexpected, and is therefore less repulsive than that which is incurred in the crowded haunts of civilisation. How plainly the explorer foresees his possible fate was proved by a conversation between Andrée and Mr J. Stadling, who stood by when the ill-fated balloon was ready to sail away into the unknown North, and who wrote the story later in the *Century* magazine. 'Suppose the balloon should burst, what then?' 'We shall be drowned or crushed,' replied Andrée. 'When may we hope to hear from you?' 'Not before three months at least. A year, two years may elapse. And if not —if you never hear from us—others will follow in our wake till the unknown regions of the North have been surveyed.'

Arctic exploration is full of stories of intense suffering, of uncomplaining heroism, and self-sacrifice. It is very difficult for one who has never travelled beyond the Arctic circle to picture even faintly the sufferings which result merely from climatic conditions in the far North. A few lines from Lieutenant Peary's description of his crossing of Greenland give just a glimpse of them. The wind, he says, is never at rest on the 'Great Ice, and always it carries an ice-drift a foot or two in depth. In the savage blizzards of a frozen Sahara this drift becomes a roaring, hissing, blinding Niagara of snow, rising hundreds of feet into the air, a drift which almost instantly buries any quiescent object, and in which it is almost impossible for the traveller to breathe. Even when the depth of the drift is not in excess of the height of the knee, its surface is as tangible and almost as sharply defined as that of a sheet of water, and its incessant, dizzy rush and strident sibilation become, when long continued, as maddening as the drop, drop, drop of water on the victim's head in the old torture-rooms.'

In 1902 Mr Dillon Wallace and Mr Leonidas Hubbard made an unsuccessful attempt to cross the huge, barren peninsula of Labrador. Food ran short, there was no game, and their sufferings became terrible. 'Our bones,' writes Mr Wallace, 'were sticking through our skins. Hubbard and I were like walking skeletons. Hubbard grew so weak that he could not proceed farther, and we left him wrapped in a blanket, and pressed on in search of food.' When they returned he was dead!

There is probably no explorer alive who has suffered more physical hardship than Dr Sven Hedin, that plucky Swede to whom we owe nearly all our knowledge of the geography of northern Tibet. The story of his race in the desert against death by thirst is too well known to be repeated here. It is, however, doubtful whether his sufferings on that occasion exceeded those on his journey from Charlik to Ladakh, when he passed through *valleys* far higher than the summit of Mont Blanc. At these enormous altitudes the mere act of breathing became a matter of such difficulty that on this one trip four of his companions died simply because they were unable to breathe. When they came to their camping-ground one evening two were found stark dead on their camels. The others 'died gradually, from their feet upwards, retaining their senses to the end.'

'The experience,' he writes, 'was weird and awful, and certainly the worst I have ever had. I was not affected to the same degree; but I was quite unable to march, and had to remain immovable in the saddle all day. Even to unbutton one's coat meant acute pain and tension to an overwrought heart, which literally was at the point of breaking. . . . During the whole of this one journey of a thousand miles icy gales blew in our faces the whole way.'

One would like to dwell on the bravery of the heroes who have faced the waterless deserts of inner Australia, that Never-Never Land of granite, spinifex, salt-lakes, and mirage; to picture the trials of the explorers who have followed the endless monotony of the bush-paths which wind through the heart of Africa's vast forests; to touch on the enormous difficulties faced and overcome by those who first mapped out the gigantic watersheds of the Amazon and the Orinoco. But space does not permit, and one may fitly close a paper of this kind with a brief description of the dangers braved by Mr G. C. Curtis, the first man who reached the summit of Mont Pelée after its terrific eruption.

In the cause of science this man actually descended into the crater, although at the time it was still in a state of active eruption. Mist, rain, steam, and dust made an atmosphere through which it was impossible to see more than a few yards; but other senses than that of sight gave warning of the surrounding perils. The atmosphere reeked of sulphur, so that breathing was almost impossible. Constant crashes like the firing of heavy cannon proceeded from the depths in front, while at frequent intervals masses of ejected rock fell close and rolled clattering and clinking back down the precipitous slopes. One explosion was so close that the heat scorched the face of the bold observer. It was during their return that he and his companions had their narrowest escape. A great mass of blackish liquid mud was suddenly ejected and went rushing down a ravine immediately in front of the party. Crested with huge boulders, this ten-foot wall of mingled earth and water went hurtling down the mountain-side, cutting away the rocks as though they had been paper. The roar was absolutely deafening and the ground shook so continuously that Mr Curtis was barely able to keep his feet. A few yards farther on and they must have been overwhelmed. It was a stroke of good fortune that saved the explorers from a sudden and appalling end.

THE COAST OF AUSTRALIA.

By F. G. Aflalo.

THE granite rim of the Never-Never-Land is a grim fragment of the three thousand square miles of Pacific bed-rock that mesozoic upheaval flung up into the sunlight to make Australia. It does not offer to the immigrant a very encouraging sample of the legacy bequeathed by those restless folk who, having exterminated the blackfellow and his dingo, are now camped on the fringe of their heritage. The fearful interior has so far been left to the restless bunyip, which is free to roam in ghostly solitude over unending plains of sand and stones. In the heart of the continent the dead level is broken only by the gaunt growths of gums and spinifex, which might stand in the vegetable world for the emblems of despair. The pathless earth is powdered with the dust of forgotten martyrs and of their fallen camels. The dreadful cliffs, which hold back the crashing waves of two oceans from inundating this waterless region, are perhaps the fitting binding for Nature's gospel of despair. The blank visage of Cape Schank, the forbidding profile of the Otway, suggest the abandonment of hope by all that enter. A veneer of tropical vegetation, it is true, of waving palm and luxuriant fern, does something to soften the lower coast of Queensland, and to hold out a kinder welcome to incoming mail-boats; but, on the whole, the first view of the Australian coast breeds thoughts of suicide in the architect of fallen fortunes who seeks new channels for his energy.

To be just, the shell belies the kernel. No sadder, no more depressing finis could well be written to an ocean voyage of six weeks than the approach to Sydney Heads, particularly when an easterly gale is hurling the surf over the lantern of the Macquarie Lighthouse. Yet not the most sanguine immigrant could picture anything more alluring than the panorama which, with very little aid from sun and sky, unfolds to his wondering gaze the moment he has passed through those grim portals that seem to shut out the last link with the old home. In the making of the glorious harbour Nature has been bravely helped by man. Her part in the wonderful effect was a passive one. She invited decoration and suggested possibilities to the architect and landscape gardener, who have between them made something imperial out of what was merely rustic beauty of the crudest kind.

Nowhere on all Australia's rim is the coastline the just index to the hinterland. The ugliness of the barren cliffs near Newcastle gives no indication of the glories of Bulli Pass or the lovely windings of the Hawkesbury River. Sometimes, too, the edge of the continent is unduly flattering. The seductions of Whitsunday Passage and Albany Pass find a wretched sequel in the iron-roofed townships and reeking mining-camps of northern Queensland. Any one with the temperament that revels in coasting deserves pity if he dies before his steamer has crept along the twelve hundred miles of cobalt water that all but stagnates inside the Barrier Reef, so clear and still that the eye accustomed to such vertical prospect can see every brilliantly coloured fish that swims over the madrepore meadows and in and out of the coral castles buried in the jungle of lovely weeds. The narrow way within the Barrier expands no more than fifty miles, and the average depth is well within fifty fathoms. Spots there are on this perilous but fascinating passage in which the steamer, going painfully at half-speed, seems to be navigating some Norwegian fjord basking in a softer climate than the northland knows. The passage of these tranquil waters is a joy of many days to all but the anxious captain, who, in company with the special pilot, spends both days and nights upon the bridge until his precious charge is out of the toils.

Either approach to Australia, then, is full of deceit. The beauties of the northern route raise hopes soon dashed on landing. The dourness of the southern shores, than which perhaps all England cannot show ten miles of coastline more depressing, leaves room for agreeable disappointment at the journey's end.

BOY BRIGHT.

By Lloyd Osbourne.

PART I.

WHEN Miss Millie James, the Editor of the *Monthly General Intelligencer*, told Miss Effie Jupe, the office typist, to requisition seventy-five cents from Major von Buelk, the business manager, and insert an advertisement in the *New York Herald* for a new office-boy, how little she suspected the far-reaching consequences that were to follow her command! Indeed, so small was the importance she attached to it that she merely said, 'Oh, bother! look up the old one, Effie,' to Miss Jupe's request for the proper formula of boy-invitation; and thus it was that the 'old one' was resurrected, and went forth, all new and dressed up again, to jostle for a place in the dense columns of the Sunday edition:

'Wanted, Boy, bright, willing, tidy, polite, and punctual. Two dollars weekly. Apply Office *General Intelligencer*, No. 53 East Ninth Street, New York City.'

Now, whether it was the insufficiency of the two dollars weekly, or the absence of brightness, willingness, tidiness, politeness, and punctuality in the rising generation, or the altogether dingy, dismal appearance of No. 53 East Ninth Street, intensified as it was by the shabbiest stuffed bear you ever saw set out in front, and a peculiarly wild, furry, penetrating odour that seemed to attend the process of turning cat into ermine, and just-dog into mink, beaver, and astrakhan (as practised mysteriously by dark, pale aliens with hooked noses in the basement and first floor)—whether it was due to this, or merely to shortage of boy in the busy marts of trade, the fact remains that it was not until late on Wednesday that there was a single application for the vacancy.

He was a frank, smiling, attractive boy, with clustering fair hair and strange, earnest eyes; and as he stood there in his ragged clothes, twiddling his little cap, everybody smiled, for he was a contagious kind of boy, and the more you looked at him the better you liked him; and Mr Whatling, who was painting at an easel, said jovially, 'Hello!' at which everybody laughed, including the boy, the joke being in the way he said it, which was big and jolly like himself.

'Have you come in answer to the advertisement?' asked Miss James.

'Yes, miss,' the boy answered, with a duck of his head, and becoming suddenly embarrassed as they all stared at him.

'What's your name?'

'Georgie Thompson.'

'What did you do before you came here?'

'Sold papers, miss. Papa and mamma dead.'

'What made you want to come and work for us?'

'The streets are getting awful cold, and—and'—— He stopped pitifully, and looked up at her, so shrinking and small and scared, with such a tell-tale quiver of the cherubic mouth, and such a droop of the childish, ill-clad shoulders, that further personal information seemed likely to be all wet and soaky.

I suppose it was very wrong for an editor to put her arms about an office-boy and kiss him; but that was just what Miss James did, being all woman, bless her! with the tenderest, most impulsive heart in the world; and she didn't ask for references, or inquire about his punctuality or willingness, or anything; and when she let him go, all tumbled and bewildered and ashamed, yet glad too, he found himself engaged. Not to Miss James, of course. I don't mean that at all, he being ten at most, and she past twenty-eight. But engaged to a job, and officially then and there appointed office-boy to the *Monthly General Intelligencer*, with all the rights, privileges, obligations, and increments that were attached to the position. Miss James's blue eyes were too moist and there was something too choky in her throat for her to teach Georgie's duties to him at that moment; but Mr Whatling, who was always ready to talk, even when painting

[*All Rights Reserved.*]

Nocturnes, set him on a soap-box, and began in the whimsical Whatling manner to explain the universe, and more particularly that part of it on East Ninth Street that, he felt, specially needed Georgie's attention.

'Not that I like that name,' he said, running his hand reflectively through his artist-hair, which was excessively long and unkempt. 'Georgie Thompson is no name at all; it has no appeal, no colour, no—no *shock*. I think we'll call you Boy Bright—after the advertisement, you know—"Wanted, Boy Bright." It suits you; it has piquancy. Will you be Boy Bright?'

'If the lady doesn't mind, sir.'

Miss James was understood to say she didn't mind; and, as the boy caught the glance she gave him, he thought she had the prettiest, nicest, sweetest face he had ever seen, though he was not old enough to interpret the faint lines that told of bygone sorrows bravely borne, nor to appreciate the effects of poverty and discouragement which, like breath on a glass, had dimmed a beauty once as fresh as a rose.

'Now, Boy Bright,' said Mr Whatling, 'I hope you haven't come here with any anticipation of becoming President of the United States? While it is admittedly true that most of our great men have begun as office-boys, they had invariably attached themselves to something going and growing. You, my dear little midshipman, are standing (or rather sitting) on the deck of a sinking ship! Yes, Boy Bright, Failure, with outstretched arms, welcomes you to our midst.'

Mr Whatling dabbed on more sky, and retreated several paces to watch the effect, and cheerfully mixed some star-material on his palette.

Boy Bright, somewhat confused by the publicity of his position, watched and waited in silence.

He did not have to wait long, for Mr Whatling, advancing again, resumed his harangue. 'I, for instance, paint pictures that nobody buys, and if I live at all it is through the charity of Miss James, who, appreciating the difficulty of making a studio out of a hall-bedroom, allows me the run of this editorial establishment. Passing lightly from myself, let me turn your youthful attention to Miss James, who, during the long intervals of professional relaxation, writes stories for the magazines that return with the faithfulness of homing pigeons to yonder bottom left-side drawer. That imposing Austrian individual with the meerschaum pipe—Major von Buelk, Boy Bright; Boy Bright, Major von Buelk—two good fellows ought to know each other. Well, the Major, little though he looks it, is a Failure too. He was too brave, too honourable, too straightforward for any other fate. He may be a little stout for a hero, and much too devoid of hair, but he sacrificed a career and a fortune to save the family honour. Look at him respectfully, Boy Bright, not because he's our business manager, but because he's a Man.'

Boy Bright shyly gazed at the Major, whose bushy eyebrows and heavy, grizzled moustache gave him a formidable appearance. He was a very stout gentleman, and so superfluously built that he overfolded like a rhinoceros, especially at the collar.

'*Ach*, you dom fool!' he observed in a booming voice, 'the child is a goot child. Paint your dom silly picture, and let him in his duties instructed be.' No one seconding his protest, he bent over his ledger again, and blew out clouds of smoke as though to hide his bald head.

'That little lady yonder,' continued Mr Whatling, unabashed, and indicating a slender, dark girl sitting before a typewriter, 'is Miss Effie Jupe, and that work she is consulting so anxiously is not the Bible her mother gave her when she left the old farm for the temptations of the city, but a manual explaining the difference between princip*al* and princip*ull*, and such pitfalls for number one-and-a-half girl-shoes as dilapidated and vegetable. If she is the only one of us who isn't an out-and-out Failure, it must be said in her favour that she has the Failure-instinct, and chose us rather than the Grabham Gas Company, which was competing with us for her services. No; like you, Boy Bright, she searched night and day for a sinking ship, and stepped aboard with the same alacrity.'

'But, please sir, what am I to do?' asked Boy Bright, as the inventory came to an end for lack of further human material, and the Nocturne engrossed a silence that grew longer and longer.

'Oh! do?' cried Mr Whatling, quite surprised, and painting with sudden vigour. 'Why, do what we all do—do nothing. Plough the sand, dream of the Unattainable, draw cheques on the Bank of Fantasy and Hope Deferred, and consecrate every faculty in keeping clear of Art. That's enough to begin with, isn't it?'

At this Miss James looked up from her writing, and her smile was like sunshine as she told Boy Bright not to mind Joey—which seemed to be Mr Whatling when contracted. 'I'll tell you everything about everything in a minute,' she added; 'and if you work hard, and try to be cheerful, and don't talk back when I'm cross, I'll see that you become President after all.'

Boy Bright, much mystified, and yet strangely happy, sat on his box, and thought it was a very funny place, and the people very funny people, and wondered why they were all Failures when they were so nice; and wondered, too, what Mr Whatling had meant by a sinking ship. It was just his joky way of talking, of course; but it had a splendid sound, though Mr Whatling was dressed more in accordance with the sister-thought of a desert island, his clothes were so old and shiny, and his cuffs so frayed, and his hair so wild and straggling.

'Please, sir, what am I to do?' repeated Boy Bright in a lull of Nocturne, as Mr Whatling rolled and lighted a cigarette.

'The duties of an office-boy,' returned Mr Whatling oracularly, 'are a good deal what the office-boy condescends to make them. I will sketch for you

the Ideal, which, like everything ideal, is also the unattainable, and will leave you to supply the personal coefficient for yourself.'

Mr Whatling stared at him with such humorous expectancy that Boy Bright felt he had to answer something. So he answered, 'Thank you.'

'The Ideal,' continued Mr Whatling, 'arrives here at dawn, and cleans and sweeps and dusts and tidies up the whole place. He empties the stove, shines it up, and makes a fire. He puts Miss James's desk in order; he carts away the Major's tobacco-ash; he sets out Miss Jupe's pencils and note-books; he comes and looks at my things, and —listen, Boy Bright—*he leaves them alone*, after murmuring a few words of artistic delight and appreciation. Towards nine the office force begins to arrive, and he must greet them with appropriate ceremony, nicely graduated from the crawling obsequiousness due an editor to the "Hello, Joey!" that is quite good enough for me. Then he brings in the mail, and sorts it over, removing on his own responsibility fifteen bushels of advertising rubbish before laying the rest on the desks of the Major and Miss James.

'The time has now arrived for him to carry, with the caution and care of an armed bank messenger, certain priceless manuscripts and proof-sheets to the printers in Franklin Square. He does this on his two legs, at the dictates of health and economy, and remains at large for a period that is proportionate to the toughness of his conscience. He returns to lick stamps and perform other necessary functions of an allied nature, until a noticeable restlessness and a tendency to pester and drum reminds the office force that he must be lunched. This rite, to which he attaches inordinate importance, is consummated around the corner for ten cents, and its effects are visible for hours afterwards until water and soap are imperiously suggested.

'During the afternoon there is a persistent trickle of literary undesirables, who must be prevented at any cost from leaping the goat-fence in the outer office; and here come into play those qualities of firmness, conciliatoriness, and imagination with which the Ideal is so richly endowed. He must regard the intrusion of these poor wretches as a surf beating against a rock; and you, Boy Bright, are the rock. You will ask, then, who it is that supplies the material for the *Monthly General Intelligencer*. Echo answers faintly but distinctly, Miss James and Major von Buelk, eked out by the efforts of seven paupers, whose identifications and passwords will be subsequently supplied to you. There, Boy Bright, is your day; and may you be a little hustler in the vineyard!'

Miss James had been listening to all this, and when Mr Whatling stopped she called Boy Bright over to her, and asked in her low, sweet voice if he thought he would like to stay.

'Very much,' assented Boy Bright; 'though, if you'll excuse me, I think I'd better run out and find a place to sleep.' His politeness was astonishing, as were his stately, old-fashioned manners, and the sort of sure way he had, not exactly precocious—it was too boyish for that—but extraordinarily winning and self-reliant. He went off as coolly as though he were grown-up, and were going to the Waldorf Hotel; yet Mr Whatling, who had followed him surreptitiously to the landing, said he had slid down the banisters like an everyday boy.

'What a darling!' cried Miss James. 'He is the dearest, handsomest, manliest little chap I ever saw, and I'm just crazy about him.'

'Poor little mite!' said Joey. 'What a cursed world it is, where such waifs and strays have to shift for themselves! And there he is, as bold as brass, going out to look for lodgings with ten times more courage than I have, and forty times more initiative! By George, it's enough to make one feel ashamed!'

'I'm surprised that anything could make you feel that way, Mr Whatling,' observed Miss Jupe, who was always engaged in sham battles with the painter, whom secretly she admired almost as much as the stout Major.

'If you were born again,' snapped Joey, 'you'd be a nasty little seal on what you would probably call an iceberg, and you'd keep barking and annoying all the other seals till somebody in rubber boots shot and skinned you, and a rich lady would wear you at a party, and everybody would be glad.'

'I always like going to parties,' returned Miss Jupe; 'though, goodness gracious, Joey! I hope nobody would recognise my ski'——

'Effie, Effie,' interrupted Miss James with severity, 'there are gentlemen present!'

'I can't get him out of my head,' said Joey, beginning to paint with renewed ardour. 'Poor little devil, he ought to be in the Park with a nurse, skating head-foremost into grown-up bread-baskets, and making the ear-piercing noises of happy infancy. It's all darned wrong, and I'm going to become an Anarchist—a red, hairy, reviling, maniacal, bomb-throwing, seen-through-the-smoke-in-the-act-of-escaping Anarchist!'

Had he been a little lost dog who had followed one of them home, Boy Bright could not have snuggled more contentedly into the lives of these four people. His boyish, hungry heart craved affection; he had been so long out in the cold, so long nobody's little boy, that he fairly welled over with love, like a miniature gusher of the Standard Oil Company. Miss Millie James was his first favourite, of course—queenly, long-limbed, velvety-voiced Miss James, with the whimsical, tender smile, and the lovely blue eyes that were so melting-soft, though keen, too, about such matters as little boys' ears and necks, and sticky cherub mouths. There was nothing Boy Bright wouldn't have done for Miss James, even to drowning in soap and water, which, if she had stipulated for a knighthood test, she would of a certainty have made her choice.

And Joey—the jolly, irrepressible, light-hearted,

always-laughing Joey, whose pictures looked just as well wrong-side up as right-side, and were named Whistlers, perhaps from the amount of whistling that went into the composition of them? Oh, how he loved Joey, and how many miles he had walked with him, carrying a Whistler, too, under his little arm, to very-much-offended, stand-offish people in shops, who, as Joey said, couldn't see a joke! For nobody ever bought Whistlers, and in his heart of hearts Boy Bright sometimes thought it was rather a tiresome joking for little legs, and wondered why Joey didn't stick altogether to painting Miss James in a pretended motor-car, which, when he condescended to do it, could always be sold for twenty dollars each—quite small ones—and accumulate enough to buy a new suit of clothes and a hair-cut. Boy Bright used to speak to Joey seriously about it; but nobody could do anything with Joey—not even Miss James—and you had to love him just as he was, which in Boy Bright's case was an awful lot.

It took longer to get acquainted with the Major, who was so fat and gruff and grown-up, and spoke in such a spitty, hissy, foreign kind of way, that at first you were quite alarmed when you attracted his attention. The Major, like Joey, was a joker too, though a fierce, explosive joker that it took time and courage to get used to. Once he made Boy Bright cry, he was so roaring and terrible, and then it was their friendship really began, for the Major caught him up on his knee, and called himself a silly old Austrian fool, and petted him, and wiped away the tears, and said it was only in 'vun'—'*Mein Gott*, in vun, child!—in vun!'—and insisted on giving him a knife with three blades, and took him out afterwards and bought him a little overcoat with a velvet collar, and three marked-down shirts. After that there was no question about loving the Major too, who altered so much from first appearances (always deceitful, as we are told) that he could often be induced to play bear, and rampage about the floor on all-fours, and be shot with a toy pistol, his guttural accent and spitty way of talking being wonderfully effective—for bears.

And there was Miss Jupe, who was such a subdued little thing, and so quiet and demure, that it was ages before you realised she was an awful tease; though her other quality, that of an insatiable kisser, was much sooner discovered. Not that she kissed anybody but Boy Bright, except perhaps her parents in Jersey City; but she just used to eat Boy Bright up, and had such a pouncing way of doing it that she reminded him of an embarrassing little tiger, she was so quick and sudden. And she could make up the most outrageous fibs about Boy Bright, and tell them with such a serious face that it was a wonder the floor didn't open and swallow her up; not to speak of her giving him bits of board made up to look like chocolate, and lassoing him with typewriter ribbon, and dropping paper-fasteners down the back of his neck. Yes, an awful tease, in spite of her innocent, wide-open brown eyes, and the respectful, pussy-cat way she'd say, 'With pleasure, Miss James,' or, 'Shall I run off two copies, Major?'

(To be continued.)

THE DUTY OF THE NATION TO THOSE WHO HAVE SERVED IN THE ARMY.

By E. BRUCE LOW, M.A.

WITH A COMMENDATION BY LORD BALFOUR OF BURLEIGH.

I DESIRE very cordially and earnestly to commend this article to the serious consideration of my fellow-countrymen. To make service in the Army a passport to employment in civil life seems to me the corollary of short service with the colours. Unless we do this we cannot hope to get the best material for the Army by voluntary enlistment, and the calamity of compulsory service will be brought nearer than it is. I regard the movement to organise a regular system of finding employment for all soldiers who deserve it as nothing but the discharge of a national obligation.

BALFOUR OF BURLEIGH.

THE problem of the unemployed has become acute in our midst, and there are few who have not felt a throb of pity for the thousands of starving men, women, and children around us all through the dreary winter. But how many of us have given a thought to the case of the unemployed soldier—the man out-of-work who has never learned a trade, but has given the best years of his youth and manhood to the service of his country, and has taken our place in India or Africa while we have enjoyed the comforts of our home civilisation?

> For gold the merchant ploughs the main,
> The farmer ploughs the manor;
> But glory is the sodger's prize—
> The sodger's wealth is honour.
> The brave poor sodger ne'er despise,
> Nor count him as a stranger;
> Remember he 's his country's stay
> In day and hour of danger.—BURNS.

If we think of it, the case of these men is well worthy of the warmest support of every employer of labour in the country; not merely because, while civilians have been earning bread for their families and laying by a store for the days of old age or commercial depression, these men have been learning the trade which cannot be of use to them or their children in their later years; but also because they are in themselves well fitted by their training for being entrusted with positions where punctuality,

promptness, and exact fulfilment of duty are essential, which are to the soldier his 'second nature.' On higher grounds still, we feel that the soldier calls for our sympathy and confidence. To him, as to our sailors, we owe it that to-day our Empire has been preserved and extended, that our commerce is carried into every quarter of the globe, and our traders find themselves safe from insult even in the remotest regions of Central Asia and Africa under the ægis of that Power which overshadows them wherever they go. Do we recognise how much we civilians owe to the sacrifices made by these men when they appeal to us for work and for the opportunity to lead honest and respectable lives? Let a single instance suffice. There was a day in January 1900 when the great heart of the British Empire stood still, sick with apprehension, and despondent, after the black week which closed in gloom the record of the old year. On that day the fate of the whole British people, colonist and stay-at-home alike, hung on the courage of a few rough soldiers of the Manchesters, Rifles, Devons, and Gordons. Had they proved false to their trust, the fate of Ladysmith with its hunger-worn garrison, of Natal, and South Africa itself, would have been sealed, and the Boers would have carried out the boast of their leaders that they would drive the British back to the sea. Have we forgotten with what dire sinking of heart the people read, as the gathering darkness of Saturday the 6th of January was falling upon these islands, the solemn warning of impending disaster which came as his last word from Sir George White: 'Attack renewed—very hard pressed'? And then the pall of night fell, leaving us in suspense which for most of our anxious people continued till Monday morning, when the glad news of a desperate but successful resistance was carried to the uttermost parts of the earth. What were our soldiers doing for us all the while? Here is the record of two of them during the hours of close, almost eye-to-eye, fighting. Before the Boer fire the Manchester Regiment particularly suffered great loss. Some of the sangars on Cæsar's Camp were occupied by the enemy, but there was one spot in the defence which the Boers failed to carry. In the little sangar where they had been stationed, Privates Scott and Pitt—the survivors of fourteen men posted there—swore an oath that they would never give up while breath was left in their bodies, and for fifteen long hours, under a scorching sun, and later amid a torrential rainstorm, their deadly rifle-fire kept the Boers at bay. In the end, as we know, the enemy were compelled to withdraw baffled, whereupon the two plucky privates who had 'held the fort' so manfully returned to the camp, smoke-blackened, and in Scott's case wounded, to receive the due reward of their heroism. These two lads are but samples of what there is of courage, mettle, and fidelity to duty among our soldiers and sailors, and we should try to realise when one of them comes to us beseeching with their looks—for their words are few as a rule—how much our honour and credit, our commercial stability and our whole civilisation, may have depended on that man's courage in the hour of trial.

The problem of finding employment for our ex-soldiers is one which must be regarded as an obligation of the national honour. That it is one of wide extent the figures which follow will show.

Every year the number leaving the colours and joining the ranks of the unemployed considerably exceeds twenty thousand. In 1908 the number of linesmen who joined the Reserve with good characters—from the military point of view—was twenty-four thousand; but there were many more who were well worthy of employment, but who for some lapse from the strict requirements of Army routine failed to obtain more than an 'indifferent' certificate. These men, too, require our assistance before they sink, under the pressure of hard times and disappointed hopes, into the abyss of slumdom in our cities, or become tramps and outcasts, reduced to desperation, on the verge of crime. To find employment for these men, no longer attached to their regiments, is a serious undertaking and well worthy of the co-operation of every responsible citizen, whether employer or not. At least let us give them a chance.

The subject of providing employment for the best of our Reserve men has long caused anxiety at the War Office and among those who have at heart the best interests of the Army, as an essential element of our national life.

In 1877 and 1894 committees of the Houses of Parliament were appointed, and issued reports, and in 1883 and 1891 the Treasury appointed committees for the purpose of considering and reporting upon the subject. The latest committee, appointed in 1905, was an exceedingly strong one, and had Sir Edward Ward, K.C.B., the famous Director of Supplies during the siege of Ladysmith, and now Permanent Under-Secretary for War, as its chairman. Besides Sir Edward Ward and Lord Cheylesmore, the committee included representatives of the Navy, as well as the chiefs of the Army recruiting organisation, and such large employers of labour as Sir F. Harrison, then general manager of the London and North-Western Railway Company, and the late Sir George Livesey, the chairman of the South Metropolitan Gas Company. This committee signed their report in July 1908, and it well repays careful perusal. (Blue Book Cd. 2991, price 8d.)

Among its recommendations are (1) the formation of an association for the provision of employment for ex-soldiers to undertake the work now carried on by the War Office and by existing agencies; (2) that the Government should direct the various public departments to fill vacancies in certain appointments by ex-soldiers and sailors of good character; (3) that County and Burgh Councils should be urged to reserve a number of appointments for these men; (4) that the police force should be available for them under special arrangements as to age of admission and pensions; (5) that every soldier should be required to learn some technical work during his military career; (6) that

classes be opened for the education of soldiers in motor-driving and in commercial and practical subjects; (7) that lectures be delivered in military centres in order to bring the matter of their future civil career before the men; (8) that facilities be given them for emigration, after a preliminary training; (9) that thrift and the advisability of joining friendly societies be impressed on the men; and (10) that the form of character supplied to them on discharge should be improved in respect to its division, whatever their military and civil conduct.

The whole of these recommendations will no doubt in course of time be adopted, but much still remains to be done. As it was, in 1908 the whole of the various agencies existing for the purpose of finding employment were unable to do so in the case of three thousand of the best class of reservists. The subject of finding employment for reservists has naturally engaged the attention of the Spiritual and Moral Advisory Committee formed nearly three years ago by the Army Council. This committee is composed of the best authorities. Lord Roberts is a member, and clergymen and civilians, Protestants and Roman Catholics, who are well known for their interest in the well-being of the nation.

It is gratifying to learn that—largely, we believe, at the suggestion of the Rev. P. R. Mackay, D.D., a Scottish minister who has on successive occasions visited all the large military stations in India, and done military duty with our troops in Egypt and India—a scheme was originated which provided that the best opportunity be given to men of good character on their return to civil life, while means should be taken to do the best possible for those who have been less fortunate during their period of service in the Army. The scheme, which is clearly the result of long practical experience of Army conditions and knowledge of the men, has been approved by the War Office, and is now being brought into action.

The scheme was warmly supported by Sir Edward Ward, and recommended by him to the attention of the people of this country at the large and representative meeting of gentlemen connected with the Scottish regimental associations held in Edinburgh on 5th January 1909, and it was warmly approved by the Financial Secretary of the War Office during the discussion of the Army Estimates on 4th March 1909. His remarks are well worthy of quotation here. He said:

'Interesting work is going on in Scotland of associating the religious bodies with the work of looking after the soldiers. In Scotland this was perhaps particularly easy, because the ecclesiastical arm was so strong. Part of the work consisted in asking the recruit to give the name of some minister with whom he had been associated. To his great surprise, he found that 95 per cent. of recruits had been able to mention some minister. When a soldier left the colours the papers were sent to the Rev. Dr Mackay of the United Free Church. Dr Mackay got into communication with the minister of whatever religious denomination the man might belong to in the place where the soldier was going to settle down. A great deal of work has already been done in this way. This cut both ways. Not only was the soldier in touch with the minister when he left the colours, but the minister was kept in touch with the soldier when he joined the colours.

'A third way in which this was to be worked was for the soldier's home minister to look him up on furlough. He hoped the splendid work Dr Mackay was doing would be extended. The old reproach that the soldier was a blackguard when he was in the force and a wastrel when he was out of it had almost altogether disappeared. They trusted the soldier more, they looked after him better, and as a result they got a better and cheaper Army which was more in touch with the life and sympathies of the mass of the people.'

In carrying out his great scheme Dr Mackay has been nobly sustained by the personal encouragement of Sir Edward Ward, and by a powerful section of the leaders of public opinion; and it is especially noteworthy that on every hand the clergy, Catholic and Protestant, of every denomination have responded to Dr Mackay's appeals for co-operation. How the men themselves have appreciated the efforts being made on their behalf is evident from numerous letters which we have seen. The following extract from one of these, from a soldier whose certificate was only 'indifferent,' speaks for itself:

'I take the present opportunity of writing to thank you for your kind reception of me when, in company with A., I called on you last Saturday. Your kind words on that occasion did a lot towards dispelling a somewhat despondent feeling which had been creeping over me. I intended saying a good deal more when I saw you, but did not wish to intrude further on your valuable time. . . . I should like to be in a position to form a home of my own, where I could keep my father in his declining years. He is the only relative I have got, having lost my mother when I was but twelve months old.

'Now, sir, I have tried for several good situations, but have always failed, not from lack of ability, but unfortunately from lack of references. This constant failure naturally made me somewhat despondent, until I heard of your success in securing a situation for A.

'I then plucked up courage and decided to ask you to assist me in like manner. If I only get one chance I shall do my best, and am positive I shall succeed in any respectable situation.

'I am in possession of a first-class Army School Certificate. I have also got a fairly good reference (of which I enclose a copy) from a previous employer. I think I could manage to get another one also. . . . In the meantime, accept of the sincere gratitude of —Your humble servant.'

Another Scots soldier for whom a situation has been found described his case as follows:

'I am an ex-soldier, discharged with an "indifferent" character, according to the records. That I merited this designation I will not attempt to deny. I joined the Army at sixteen years of age, and when it is remembered the temptations to which a young person is subjected in the Army, and the regardlessness of the future inherent in some people, and of which I was especially guilty, it can easily be seen how an account can be run up in a defaulter-book. I may say that my crimes (so called) chiefly consisted of overstaying passes, four cases of drunkenness, one of these on duty (picket), but it was proved that I was under the influence of drink ere I was aware that I was required for duty. My regimental entries consist of two only. Now, the effect this "indifferent" character may have on my future is obvious, as I cannot turn my hand to any Government employment.

'I thought I would make this appeal to you to assist me in obtaining an appointment as postman or policeman, for which I am physically adapted, though I hardly dare hope for the latter.

'I can only say, in conclusion, that should you see your way to assist me in obtaining any of these appointments I shall endeavour to the best of my ability to show I have merited your assistance.'

Though these men left with their character marked 'indifferent,' it is clear from their letters that they are men who have not forfeited their claim to be helped by their fellow-countrymen.

Although the scheme has involved a considerable amount of extra work upon the officers commanding the various regiments who are asked to obtain from the men in the ranks (who may have recently joined, or who may be about to leave the colours) such facts regarding their religious and civil connections as are likely to enable Dr Mackay to set at work the machinery which he has provided for the benefit of the soldiers when they leave the colours, it has worked well, and, as the War Office has declared, it is worthy of general support.

It remains for all employers of labour and for all those who are interested in the welfare of our soldiers and sailors to follow Dr Mackay's example, and to bestir themselves in order to remove that nightmare which haunts every soldier in the last year of his service with the colours as to what is to become of him when the State casts him adrift.

Dr Mackay has wisely resolved that his care shall not be limited to those who may carry with them what are described by the military reports as 'good' characters, which, however, exclude four classes whose characters may, in a military sense, be only 'fair' or 'indifferent,' 'bad' or 'very bad.' Personal knowledge of military conditions satisfied the last committee that great hardship has resulted from the present form of character granted on discharge to our soldiers, and they have strongly urged that no time should be lost in improving the present defective system. As an example of the present method it may be mentioned that no soldier (however perfect his conduct, from a military or civil point of view, may have been) can obtain the highest form of 'good character'—namely, 'exemplary'—unless he has served for at least six years.

It is not to be forgotten that every soldier has his conduct under observation for twenty-four hours daily, whereas men in civil employment enjoy practical freedom from supervision during more than half of the day. In this way it cannot be denied that for a soldier to produce a good character his conduct must be of a much more consistent and steady nature than is represented by the certificate of an employer in a civil calling.

With the greatly improved conditions of service which now exist, the class of men attracted to the Army has also improved. It is to be hoped that, with the clergymen of every denomination at work on his behalf, and able to certify as to the applicant's antecedents, employers of labour, public offices, and all sections of society who require steady, reliable, punctual men, accustomed to give prompt attention to orders, and men methodical in their habits, will feel themselves bound in honour to put themselves into touch with the various agencies, regimental associations, and recruiting offices, where lists of candidates are always kept, before proceeding to fill any vacancies in their staff.

We have no doubt whatever that the Rev. Dr Mackay (33 Chalmers Street, Edinburgh) will be very pleased to assist and advise those who are on the outlook for reliable men. Lists of unemployed soldiers are also carefully kept by Major Masterton, V.C., and Lieutenant Robertson, V.C., the chief recruiting officers in Glasgow and Edinburgh respectively.

THE HOUSE OF WHISPERS.

CHAPTER XXVI.—THE VELVET PAW.

THE new-comer stood before Gabrielle, hat in hand, smiling pleasantly and uttering a greeting of surprise.

Her response was cold, for was not all her present unhappiness due to him?

'I've come here to speak to you, Gabrielle—to speak to you in confidence.'

'Whatever you have to say may surely be said in the hearing of a third person?' was her dignified answer. His sudden appearance had startled her, but only for a moment. She was cool again next instant, and on her guard against her enemy.

'I hardly think,' he said with a meaning smile, 'that you would really like me to speak before a third party.'

'I really care nothing,' was her answer. 'And I cannot see why you seek me here. When one is hopeless, as I am, one becomes callous of what the future may bring.'

'Hopeless! Yes,' he said in a changed voice, 'I know that; living in this dismal hole, Gabrielle, you must be hopeless. I know that your exile here, away from all your friends and those you love, must be soul-killing. Don't think that I have not reflected upon it a hundred times.'

'Ah, then you have at last experienced remorse!' she cried bitterly, looking straight into the man's face. 'You have estranged me from my father, and tried to ruin him! You lied to him—lied in order to save yourself!'

The man laughed. 'My dear child,' he exclaimed, 'you really misjudge me entirely. I am here for two reasons: to ask your forgiveness for making that allegation which was imperative; and, secondly, to assure you that, if you will allow me, I will yet be your friend.'

'Friend!' she echoed in a hollow voice. 'You—my friend!'

'Yes. I know that you mistrust me,' he replied; 'but I want to prove that my intentions towards you are those of real friendship.'

'And you, who ever since my girlhood days have been my worst enemy, ask me now to trust you!' she exclaimed with indignation. 'No; go back to Lady Heyburn and tell her that I refuse to accept the olive-branch which she and you hold out to me.'

'My dear girl, you don't follow me,' he exclaimed impatiently. 'This has nothing whatever to do with Lady Heyburn. I have come to you from purely personal motives. My sole desire is to effect your return to Glencardine.'

'For your own ends, Mr Flockart, without a doubt!' she said bitterly.

'Ah! there you are quite mistaken. Though you assert that I am your father's enemy, I am, I tell you, his friend. He is ever thinking of you with regret. You were his right hand. Would it not be far better if he invited you to return?'

She sighed at thought of the blind man whom she regarded with such entire devotion, but answered, 'No, I shall never return to Glencardine.'

'Why?' he asked. 'Was it anything more than natural that, believing you had been prying into his affairs, your father, in a moment of anger, condemned you to this life of appalling monotony?'

'No, not more natural than that you, the culprit, should have made me the scapegoat for the second time,' was her defiant reply.

'Have I not already told you that the reason I'm here is to crave your forgiveness? I admit that my actions have been the reverse of honourable; but—well, there were circumstances which compelled me to act as I did.'

'You got an impression of my father's safe-key, had a duplicate made in Glasgow, as I have found out, and one night opened the safe and copied certain private documents having regard to a proposed loan to the Greek Government. The night I discovered you was the second occasion when you went to the library and opened the safe. Do you deny that?'

'What you allege, Gabrielle, is perfectly correct,' he replied. 'I know that I was a blackguard to shield myself behind you—to tell the lie I did that night. But how could I avoid it?'

'Suppose I had, in retaliation, spoken the truth?' she asked, looking the man straight in the face.

'Ah! I knew that you would not do that.'

'You believe that I dare not—dare not for my own sake, eh?'

He nodded in the affirmative.

'Then you are much mistaken, Mr Flockart,' she said in a hard voice. 'You don't understand that a woman may become desperate.'

'I can understand how desperate you have become, living in this Sleepy Hollow. A week of it would, I admit, drive me to distraction.'

'Then if you understand my present position you will know that I am fearless of you, or of anybody else. My life has ended. I have neither happiness, comfort, peace of mind, nor love. All is of the past. To you—you, James Flockart—I am indebted for all this! You have held me powerless. I was a happy girl once, but you and your dastardly friends crossed my path like an evil shadow, and I have existed in an inferno of remorse ever since. I'—

'Remorse! How absurdly you talk!'

'It will not be absurd when I speak the truth and tell the world what I know. It will be rather a serious matter for you, Mr Flockart.'

'You threaten me, then?' he asked, his eyes flashing for a second.

'I think it is as well for us to understand one another at once,' she said frankly.

They had halted upon a small bridge close to the entrance to Apethorpe village.

'Then I'm to understand that you refuse my proffered assistance?' he asked.

'I require no assistance from my enemies,' was her defiant and dignified reply. 'I suppose Lady Heyburn is at the villa at San Remo as usual, and that it was she who sent you to me, because she recognises that you've both gone a little too far. You have. When the opportunity arises, then I shall speak, regardless of the consequences. Therefore, Mr Flockart, I wish you good-evening;' and she turned away.

'No, Gabrielle,' he cried, resolutely barring her path. 'You must hear me. You don't grasp the point of my argument.'

'With me none of your arguments are of any avail,' was her response in a bitter tone. 'I, alas! have reason to know you too well. For you—by your clever intrigue—I committed a crime; but God knows I am innocent of what was intended. Now that you have estranged me from my father and my lover, I shall confess—confess all—before I make an end of my life.'

He saw from her pale, drawn face that she was desperate. He grew afraid.

'But, my dear girl, think—think what you are saying! You don't mean it; you can't mean it. Your father has relented, and will welcome you back, if only you will consent to return.'

'I have no wish to be regarded as the prodigal daughter,' was her proud response.

'Not for Walter Murie's sake?' asked the crafty man. 'I have seen him. I was at the club with him last night, and we had a chat about you. He loves you very dearly. Ah! you do not know how he is suffering.'

She was silent, and he recognised in an instant that his words had touched the sympathetic chord in her heart.

'He is not suffering any greater grief than I am,' she said in a low, mechanical voice, her brow heavily clouded.

'Of course I can quite understand that,' he remarked sympathetically. 'Walter is a good fellow, and—well, it is indeed sad that matters should be as they are. He is entirely devoted to you, Gabrielle.'

'Not more so than I am to him,' declared the girl quite frankly.

'Then why did you write breaking off your engagement?'

'He told you that?' she exclaimed in surprise.

The truth was that Murie had told Flockart nothing. He had not even seen him. It was only a wild guess on Flockart's part.

'Tell me,' she urged anxiously, 'what did he say concerning myself?'

Flockart hesitated. His mind was instantly active in the concoction of a story.

'Oh, well—he expressed the most profound regret for all that had occurred at Glencardine, and is, of course, utterly puzzled. It appears that just before Christmas he went home to Connachan and visited your father several times. From him, I suppose, he heard how you had been discovered.'

'You told him nothing?'

'I told him nothing,' declared Flockart—which was a fact.

'Did he express a wish to see me?' she inquired.

'Of course he did. Is he not over head and ears in love with you? He believes you have treated him cruelly.'

'I—I know I have, Mr Flockart,' she admitted. 'But I acted as any girl of honour would have done. I was compelled to take upon myself a great disgrace, and on doing so I released him from his promise to me.'

'Most honourable!' the man declared with a pretence of admiration, yet underlying it all was a craftiness that surely was unsurpassed. That visit of his to Northamptonshire was made with some ulterior motive, yet what it was the girl was unable to discover. She would surely have been cleverer than most people had she been able to discern the hidden, sinister motives of James Flockart. The truth was that he had not seen Murie, and the story of his anxiety he had only concocted on the spur of the moment.

'Walter asked me to give you a message,' he went on. 'He asked me to urge you to return to Glencardine, and to withdraw that letter you wrote him before your departure.'

'To return to Glencardine!' she repeated, staring into his face. 'Walter wishes me to do that! Why?'

'Because he loves you. Because he will intercede with your father on your behalf.'

'My father will hear nothing in my favour until'—— and she paused.

'Until what?'

'Until I tell him the whole truth.'

'That you will never do,' remarked Flockart quickly.

'Ah! there you're mistaken,' she responded. 'In all probability I shall.'

'Then, before you do so, pray weigh carefully the dire results,' he urged in a changed tone.

'Oh, I've already done that long ago,' she said. 'I know that I am in your hands, utterly and irretrievably, Mr Flockart, and the only way I can regain my freedom is by boldly telling the truth.'

'You must never do that! By Heaven, you shall not!' he cried, looking fiercely into her clear eyes.

'I know! I'm quite well aware of your attitude towards me. The claws cannot be entirely concealed in the cat's paw, you know;' and she laughed bitterly into his face.

The corners of the man's mouth hardened. He was about to speak and show himself in his true colours; but by dint of great self-control he managed to smile and exclaim, 'Then you will take no heed of these wishes of the man who loves you so dearly, of the man who is still your best and most devoted friend? You prefer to remain here, and wear out your young life with vain regrets and shattered affections? Come, Gabrielle, do be sensible.'

The girl did not speak for several moments. 'Does Walter really wish me to return?' she asked, looking straight at him, as though trying to discern whether he was really speaking the truth.

'Yes. He expressed to me a strong wish that you should either return to Glencardine or go and live at Park Street.'

'He wishes to see me?'

'Of course. It would perhaps be better if you met him first, either down here or in London. Why should you two not be happy?' he went on. 'I know it is my fault you are consigned to this dismal life, and that you and Walter are parted; but, believe me, Gabrielle, I am at this moment endeavouring to bring you together again, and to reinstate you in Sir Henry's good graces. He is longing for you to return. When I saw him last at Glencardine he told me that Monsieur Goslin was not so clever at typing or in grasping his meaning as you are, and he is only awaiting your return.'

'That may be so,' answered the girl in a slow, distinct voice; 'but perhaps you'll tell me, Mr Flockart, the reason you evinced such an unwonted curiosity in my father's affairs?'

'My dear girl,' laughed the man, 'surely that isn't a fair question. I had certain reasons of my own.'

'Yes; assisted by Lady Heyburn, you thought that you could make money by obtaining knowledge of my father's secrets. Oh yes, I know—I know more than you have ever imagined,' declared the girl boldly. 'You hope to get rid of Monsieur Goslin from Glencardine and reinstate me—for your own ends. I see it all.'

The man bit his lip. With chagrin he recognised that he had blundered, and that she, shrewd and clever, had taken advantage of his error. He was, however, too clever to exhibit his annoyance.

'You are quite wrong in your surmise, Gabrielle,' he said quickly. 'Walter Murie loves you, and loves you well. Therefore, with regret at my compulsory denunciation of yourself, I am now endeavouring to assist you.'

'Thank you,' she responded coldly, again turning away abruptly. 'I require no assistance from a man such as yourself—a man who entrapped me, and who denounced me in order to save himself.'

'You will regret these words,' he declared, as she walked away in the direction of Woodnewton.

She turned upon him in fierce anger, retorting, 'And perhaps you, on your part, will regret your endeavour to entrap me a second time. I have promised to speak the truth, and I shall keep my promise. I am not afraid to sacrifice my own life to save my father's honour!'

The man stood staring after her. These words of hers held him motionless. What if she flung her good name to the winds and actually carried out her threat? What if she really spoke the truth? Ay, what then?

(To be continued.)

IMPRESSIONS OF ALGERIA.

By Captain P. L. OLIPHANT.

PART III.—THE PEOPLE.

WHEN the French took possession of Algeria in the first half of the nineteenth century, they assumed responsibility for the government of a mixed population of Moors, Arabs, Kabyles, Jews, negroes, and foreigners, amongst whom racial feeling was more or less acute, but all of whom—with the exception of the Jews and foreigners—were bound by the common tie of Islam. At the time the French were not very sure of their ideal of government. Sometimes they upheld the Empire; then they relapsed into Republicanism, only to restore the Empire once more; until they finally decided that the Republic was the thing for them, and raised the cry of 'Liberty, Equality, Fraternity.' Now, liberty is all very well in so far as it is consistent with our ideas of civilisation, and fraternity is an excellent ideal; but equality, either between individuals or races, never has existed, and never can exist. But the catchword was adopted with enthusiasm, and, with the inflexible logic which is characteristic of the nation, it was applied impartially to all nations and races which fell under the dominion of the French Republic. Arabs and Kabyles and Jews were all made brothers, and assured of their equality to each other and to their conquerors, the French. But the brown men and the black, knowing less of civilisation but more of human nature than the white, are quite unable to grasp the republican view of equality. The Moors and Arabs were furious when, in 1871, the French Government declared the Jews, whom they had persistently persecuted, to be entitled to all the rights and privileges accorded to themselves. The general hand-shaking and fraternal embraces were performed according to order, but with great wonderment and consternation on the part of the brown men of the Tell and of the desert. Even the Kabyles, who amongst themselves are communistic, could not understand the attitude of the French, who had scarcely finished the task of bringing them into subjection, and now proclaimed a universal state of equality. If the French had been content to give a full measure of liberty, and to have advocated fraternity as a desirable ideal, and had left out all foolish talk of an impracticable equality, they would have done better for themselves and for their subjects, the people of Algeria.

The results of this mistaken policy are only too obvious in the mixed communities of the larger towns. The native inhabitants, anxious to avail themselves of the privileges of equality, have eagerly adopted all the vices of their conquerors and none of their virtues; nor have they dispensed with any of their own peculiar failings to make room for the imports of foreign depravity. On the other hand, the French and European settlers, from overfamiliarity with the natives, have acquired much of their indolence and crooked dealing without that dignity and reserve which are the Arabs' most impressive characteristics.

A denial of racial equality does not necessarily imply that the superiority is all on one side. A visit to the annual ball given by the Governor-General at his winter palace in Algiers will convince one on this point. This ball is the great official function of the season, and to it are bidden all the Arab chiefs from every quarter of Algeria. The invitation partakes of the nature of a command, and all are expected to attend, though the journey from the uttermost parts of the desert to the

capital takes weeks to accomplish. The French and foreign inhabitants are there also in large numbers, and the officers of the army. As this is a republican country, there can be no discrimination in the issue of invitations, and so far as the French residents are concerned the gathering is decidedly mixed. In this assembly of jigging French nonentities, pushing and struggling through the densely packed *salons*, the resplendent robes of the Arab chiefs and the calm dignity of their bearing form a most striking contrast. Needless to say, they take no part in the dancing. One trembles to imagine what they are thinking of the unveiled, half-clothed women who are being dragged through the mazes of the dance in the arms of the men! But they pay little attention to this part of the entertainment. For the most part they are seated majestically round the illuminated courtyard, engaged in grave conversation with their neighbours, or gazing silently before them through dark, inscrutable eyes. There is an Arab proverb which says, 'Keep your eyes open, and keep your ears open, and talk of date-stones;' and the Arab guests of the Governor-General no doubt have it in mind as they sit in the court of the winter palace.

Whatever may be our opinion of the ethics of the Mohammedan religion, there can be no doubt that it is an intensely living faith, and that it exercises a far more potent influence on the lives of its followers than does Christianity. For this reason it must receive first place in any attempt at a description of the people of Algeria. It is manifested at every turn: in the prostrate form of the Arab who has left his camels and is praying by the wayside, in the little shrines in the streets presided over by *marabouts* reading in sing-song tones from the Koran, in the mosques daily at the hour of prayer, in the fierce fanaticism of the wilder desert tribes, and, most of all, in the eyes of every man whom one encounters. 'The trivial round, the common task,' of the Arab's existence is bound up indissolubly with his religion and the Koran, and he is an adept at finding plausible explanations for his lapses from the law. There was a certain *marabout* who had a great liking for champagne, a beverage forbidden by his religion. He used to assemble his disciples to witness a miracle. The cup which he held in his hand and raised to his lips undoubtedly contained the forbidden wine; but as soon as it passed his lips it was turned to milk. His disciples were perfectly satisfied with this explanation, and watched with awe and reverence the performance of their teacher's miracle.

Like other Eastern religions, Mohammedanism owes much of its power to superstition. The tombs and relics of holy men possess remedial and beneficent qualities. An elderly woman suffering from lumbago will sit for hours with her bare back resting against the cold stone pillar of a *marabout's* sepulchre, now and then eating a handful of earth from a hole scooped out on the top of the grave. There are special shrines recommended to childless women in hope of offspring. A pretty idea is that which lies beneath the little vessel of water to be seen on every grave. It is placed there that the birds may drink of it, and drop by drop carry the soul of the departed to heaven. Representations of the hand of the Prophet and of his wife are to be seen on every side, that those who pass by may touch and be fortunate. Trinkets also are made in this form, to be worn round the neck.

The fanaticism of the Mohammedan is a quality which loses force when brought in contact with European civilisation. In the interior of Morocco it is still unsafe for an unbeliever to go about openly. The European in the city of Morocco who sets any value on his earthly existence goes about in native costume; for there is an awkward conviction in the minds of the people that to kill an unbeliever is a sure passport to heaven. The same idea exists on the north-west frontier of India, and in other places where Islam is not in close touch with foreign ideas. But there is nothing of this to be anticipated in the settled provinces of Algeria. The tourist may wear his loudest suit of checks without fear of reprisals from the natives. If he is anxious to see something of Arab fanaticism in perfect safety, he can, on payment, persuade a few Dervish priests to perform for his benefit. He will witness a weird and revolting performance: the passing of skewers through cheeks and limbs, the burning of the body with flaming torches and red-hot irons, the devouring of live scorpions, and finally the collapse of the performer in a real or simulated fit. How much of it all is trickery and how much due to hypnotic trance is a matter which must be left to the spectator to decide for himself. There are also sacrifices of a fanatical description; but the French Government does not encourage performances of this nature, and they are generally celebrated in secret and at unearthly hours of the morning.

The Arab is by nature indolent; to him time does not mean money, and if it did, it would not be worth while hurrying. But there are a good many things he can do well enough when he chooses. A distinction must be drawn between the Arabs of the interior and the Moors who inhabit the towns on the seaboard. The Arab of the desert does nothing beyond cultivating a few date-palms or a little patch of irrigated cornland, or rearing a few camels and goats. The Moors, who are the offspring of the mixed races which have from time to time occupied the towns and villages along the coast, or are the descendants of the Moors who were driven out of Spain, are far more advanced in civilisation than the Kabyles or desert tribes. Nearly all the industries of the country, putting aside those that have been introduced by the French, are carried on by the Moors. Their architecture is famous all over the world; their brass and leather work and embroideries are also well known. Their children attend the schools, whilst the parents are engaged at their shops and offices doing all in their power to adapt their outward habits to the new civilisation

which has sprung up on the north coast of Africa. Inwardly they are still of the East—unchanging; but the effort to assimilate Western notions has robbed them of the dignity and reserve which the Arabs of the desert have never lost through undue familiarity with the stranger.

The Arab takes his pleasures quietly. He is quite contented lounging all day in a café, with an occasional game of draughts or dominoes. He will spend happy hours asleep in the mosque, or at the door of his house with his back to the wall. In the evening he will again resort to the café to look on silently at the performances of the dancing-girls. The café has been cleared, and the benches arranged round the walls. On a platform at one end of the room sit the musicians. One plays a violin, resting the instrument on his knee; another bangs dexterously on an earthenware drum; and the third performs upon a small wooden instrument resembling a clarionet of singularly ear-piercing quality. The girls dance, one at a time, on the cleared space below. It is the *dance du ventre* common all over the East. In the majority of the dancers there is little or no grace, the merit of the performance depending on the abnormal development of the muscles and adipose tissue of the stomach, the legs and arms playing an entirely secondary part. But now and again one chances on a dancer whose inherent grace carries her through the tortuous performance with credit, even to Western eyes. The ranks of the dancers are recruited from all the native races, and they lay no claims to respectability; but the tribe of the Ouled Naïls supplies the greater number of them. They are handsome, swarthy women from the desert, with an abandon which is not without its charm. The Arabs who have assembled to witness the dancing look on in silence, and never applaud. Sometimes they will mark their appreciation by a gift of money, pressed against the forehead of the dancer. But, in spite of the apparent apathy of the onlookers, much jealousy exists both among the girls and their silent admirers. The simple son of the desert knows of only one cure for jealousy—it is a knife in the ribs of his rival. On this account dancing is forbidden in the native cafés in Algiers; but it can be witnessed in Constantine or Biskra without let or hindrance.

The position of Arab women in Algeria is very much the same as that of their sisters in all Mohammedan countries; they are either the drudges or the playthings of the men. The status of woman has ever since time began been a vexed question. We of the West are shocked at the restrictions imposed by the East on womankind; and they of the East are infinitely more scandalised by the license which is allowed to ours. On this point East and West will never be in agreement. Nevertheless, the feminine influence is felt with equal force in both hemispheres. The Mohammedan has discovered that to aver that woman has no soul does not prevent her from rising on occasion to heights of heroism and devotion; whilst the Westerner, who protests that she is all soul, expects her to perform the menial duties of his household with a good grace. Consistency, if such a thing be possible in our dealings with women, seems to lie rather on the side of the Oriental, who has assigned woman a definite destiny, and will admit of no further possibilities for her, than with us, who have never yet been able to define her position in the universe.

Certainly, to our ideas, the Arab woman lives a dreary life. Until the age of twelve she is allowed the freedom accorded to children in every quarter of the world, with the reservation that her sex is a standing reproach to her. Then she is required to veil her face, and thenceforward she passes into the ranks of womanhood, and she may never show her face again except to her husband or in the seclusion of her own house. The custom of veiling the face sprang from the very human weakness of no less a person than Mohammed himself. The Prophet was desperately jealous of his child-wife Fatima, and to ensure that none but himself looked upon her, he ordered her to veil her face. The idea caught on with his disciples, with the result that for the best part of fifteen hundred years the daughters of Islam have been compelled to cover their faces.

The emancipation of the women of Algeria from the thraldom of Oriental custom is one of the chief objects of Christian missionary endeavour in the country. In Algiers and in Cherchell there are industrial schools where young Arab girls are taught the art of embroidery and carpet-making, and the little pupils become very proficient at the craft. But it is difficult to understand what advantages are gained for them by their proficiency. If they listen to the teachings of the estimable people who have enticed them into the schools, and become Christians, they incur social ostracism amongst their own people, and fall into a condition far worse than the 'slavery' from which it was intended to free them. If they do not listen, then they return to their normal existence, and a certain number of pious Mohammedans obtain wives who, in addition to other desirable qualifications, are expert carpet-makers.

Jews form a very considerable proportion of the inhabitants of the towns in Algeria. In Algiers alone there are some ten thousand of them, and throughout the country between fifty and sixty thousand. They are, for the most part, descendants of the Jews who were driven out of Italy, Spain, and Portugal in the fourteenth century. Until the French occupation they were despised and persecuted by the Moors and Arabs; now they are on an equal footing. They have played an important part in the commerce of the country since the time of the Deys, making themselves indispensable when a bargain has to be driven. In the bad old days, when the European states, roused by popular outcry against the marauders from the African coast, sought to appease discontent by the ransom of some of their countrymen

who were held in slavery by the Algerines, it was through the Jews in Algiers that the negotiations were carried out. In appearance there is little to distinguish the Jews from the Arabs except their dress; but even in this particular the Jewish women are given to aping the Arabs, and sometimes veil their faces in the streets that they may be taken for Arab women. An abnormal excess of adipose tissue is essential in a Jewish beauty. It is said that young girls are fattened up for two years previously to their arriving at a marriageable age that they may find favour in the eyes of the men of their race.

There are also many negroes in Algeria. They come from the Soudan. Many of them are the descendants of slaves. Their black skin does not seem to prejudice them in the eyes either of the Government or of the Arab population; for they enjoy equal rights with the rest of the community, and they intermarry freely with the Arabs. On the borders of the desert it is often difficult to distinguish between the two races; for Soudanese features and colour seem to merge into the more classic lines and shades of the Arab. The negroes in Algeria profess Mohammedanism as readily as the negroes in America take to Christianity. Religion with them seems to be purely a question of environment, and whichever faith they adopt, they graft upon it the grotesque emotionalism of their nature.

But Jews and negroes leave but little impression on the mind of the traveller in Algeria. It is the Arabs and the Kabyles of the native population who interest him most. When he looks back upon his travels it is not the crowded streets of Algiers and Constantine, with their medley of French, Moors, Jews, and Arabs, that arrest his thoughts, but rather the ruined villages of old Biskra on the edge of the illimitable desert, with the date-palms clustering at the foot of the sandy mound, and the Aurés Mountains glowing crimson and golden in the rays of the setting sun. He will remember how he stood alone, looking out across the waste of sand, unconscious of the presence of any human being, until the stirring breeze wafted to him the odour of incense from a hidden shrine.

THE BLUNDERERS.

CHAPTER VII.

THE answer to the question came two days later. Francesca and Mrs Domville were at their morning's work, sitting for coolness in the back drawing-room, which faced north, when some one was shown into the front room. It was the Duchess, and Mrs Domville laid down her papers and moved through the folding-doors to greet her sister.

She did not trouble to shut the door behind her, and Francesca heard the Duchess's eager tone of mingled excitement and exultation, 'Oh Mary, my dear, he has done it, and it's all right!'

'You mean Charles is engaged?' Mrs Domville's cool voice replied. 'Well, it's about time. I am glad it is settled.'

'My dear, I am thankful! She will do very well. She is certainly very pretty, and if I can get a hand in her clothes—— I could wish,' the Duchess went on pensively, 'that Mother M'Cann was a little different, but one can't have everything.'

'Where did it come off?'

'At Bessie Canterbury's ball last night. I must tell you that he had been too odd about it—but *too* odd! He came to me on Sunday night, told me that he could not go on with it, that he couldn't stand it, didn't care about her; and said he would rather begin to economise and get things straight himself. Fancy, Charles economise! I was desperate—begged him to reconsider; but he went to bed as sulky as a bear. I wrote a note to his uncles, told them everything he had said, and asked them to look in in the morning. Francis took him a ride in the Park. Then John spoke to him after luncheon, and between us all I fancy we made him see what his plain duty was. In the evening Blanche M'Cann was at the ball, and so it all came off.'

The Duchess sighed comfortably, and Francesca heard her settle herself heavily on the sofa.

'And does he look happy this morning?' Mrs Domville asked a little sharply.

'Of course he's a little thoughtful,' admitted the Duchess, 'and a little cross,' she added. 'But it's only natural. It's a very important step to take.'

'Very,' agreed Mrs Domville dryly. 'And, after all, he can't afford to be particular.'

But Francesca, as she heard, found the tears stealing down her cheeks. 'Oh, poor Charles!' she thought. 'Poor, weak Charles!'

She bent resolutely to her work, and it was perhaps ten minutes later when the two ladies, having exhausted the great topic for the time being, drifted to other subjects. Francesca was absorbed in a calculation, but a familiar name fell on her ear, and she found herself once more interested.

'I saw Nina Scovell this morning,' the Duchess was saying. 'They came home a fortnight ago. She is looking well.'

'She was at tea here yesterday,' said Mrs Domville, 'and is much taken up with a change which she imagines she sees in Jim Blake. I thought him looking depressed myself when I saw him one day. Nina says he dined with her and Algy, and was so distrait and dull that they could get nothing out of him. Finally, Nina asked him in

chaff if he was in love, and he looked so guilty that Algy kicked her under the table and changed the subject. She is sure she hit the right nail on the head, or he would have chaffed her back.'

'Well,' said the Duchess, 'he ought to marry, of course, now that he has bought Scovell and settled down. How would Pamela Stanley suit him, if he hasn't found some one already?'

'I won't be a party to your match-making,' Mary Domville said, laughing. 'I'll leave all that to you. But I think you would find Jim Blake a difficult man to match-make for; and I know no woman who is good enough for him,' she ended with more warmth in her voice than Francesca had ever heard.

'I believe I agree with you,' said the Duchess half-grudgingly. She was not given to praise. She left soon afterwards, and Mrs Domville rejoined her secretary.

'When my sister arrived, Miss Dunn,' she said, 'I was just going to begin to talk about plans. I go away generally a fortnight later than this; but letters I got this morning have made me change my plans. I want to go away to-morrow, so when you have finished up these papers you can begin on your holiday too. There will be no meetings of any of these societies in August, so there will be nothing fresh to deal with. And in September, too, things will be very slack. I shall be back on the 1st of October, when I shall expect you to resume work. I may tell you that I am *very* pleased with you; you have got wonderfully quickly into my ways. Well, we shall part now for two months, and I believe I shall be quite glad when we meet again. What shall you do with yourself? Shall you go to the country?'

'I really don't know,' Francesca answered. 'I had hardly thought of holidays. I shall probably stay in London.'

Mrs Domville looked at her curiously. 'What is your story, I wonder?' she said. 'No, don't be afraid. I am not going to ask for it. But you ought to be at home, I am sure, not alone in London. Not that I am afraid for you; you look very well able to take care of yourself. And I am sure good old Mrs Broad looks after you well. But you must be lonely all the same. Do you know, if I wasn't going to other people's houses I should like to take you away with me.' And she added to herself, 'I could make that girl look so attractive that she would turn the heads of a roomful of men. With proper clothes, and her hair done well, she would be a beauty.'

'You *have* been kind to me,' Francesca said, blushing with gratitude and pleasure.

As she left the house that morning she felt she had plenty of food for reflection. First she began to wonder how she should fill up her two months of entire liberty. It was pleasant to feel the rustle of notes in her pocket, the first instalment of her salary; but, somehow, though she had keenly looked forward to the moment when she should handle the first money she had ever earned, the reality did not come up to the anticipation. For some reason she felt out of spirits.

Her mind went back to the Duchess's conversation with her sister. So Charles had succumbed to his fate! He had made a struggle; she was glad at least of that. But his weak defences had soon been battered down by his family, and she could hardly be surprised, knowing his character and having heard his mother's description of the formidable attack. She wished him well with all her heart, and hoped he might find happiness in spite of the unpromising outlook. There was good in him, and latent ability, she felt sure, for 'Blanche M'Cann' to discover and encourage—if she could or would.

The remarks about James Blake had forcibly recalled his image to her mind, and with it came thoughts against which she struggled in vain. What was this something about him which could make Mrs Domville enthusiastic and the Duchess generous? What was there about the memory of him that held her and braced her, and yet gave her something like pain at her heart? She had turned in contempt from his clumsy wooing. This pain at her heart was surely remorse for her rudeness; it was not, could not be, regret for having lost him?

She was in the Park now, and as she walked along comforted herself with her old theory.

'He made no pretence of caring,' she thought. 'It was as the Duchess said—it was the proper thing to marry and settle down now he had a place. He might have made me care if he had cared himself, and there was no word of that. But, oh dear, I want something badly to-day! I want home; I want father! I wish I knew that he wanted me!'

'Miss Duncombe,' said a voice.

A man who had been walking quickly past had stopped suddenly, and now barred her way.

It was James Blake.

Her heart seemed to stop beating; the colour rushed over her face.

'I have been looking for you,' he said quietly. 'You are wanted at home.'

'I can't go home,' she said, finding words with an effort, and feeling a curious trembling about the knees.

'I think you will when you know my reason. Your father isn't well, Miss Duncombe; he needs you.'

'Do you mean he is very ill?' Francesca asked.

'His heart has been weak for a year, and he has been pretty bad since you left home.'

'I did not know,' she whispered.

'How could we tell you? I have searched for you and watched for you everywhere, but never found a trace of you.'

Francesca hardly heard him; her thoughts were with her father.

'When can I go? When is the first train?'

'At four o'clock.'

She had another question ready, and after a moment or two it came. 'Does—does he want

me?' She held her head high and looked at him; but Blake saw her lip quiver as she waited for the answer.

'You are all he wants,' he said.

'Thank you,' she answered quietly. 'I will go home now and pack.'

He turned and walked beside her.

'Where are you staying?' he asked, and she told him.

'I don't want to bother you with questions,' he went on; 'but are you all right? Have you been well, and got on all right?'

Briefly she told him of her life since she had left Stellbridge, dwelling on the comfort of her lodgings and the motherliness of Mrs Broad.

She heard him draw a long breath as of relief.

'When did father get ill?' she asked.

'The night you left,' Mr Blake answered after a pause. 'For a week he was very bad. They got him two nurses, and Dr Drew was with him for three nights. He got better slowly, but I am afraid you will find him changed.'

'He will get well, won't he?' said Francesca in sudden fear. Then, as her companion was silent, she cried, 'Oh, Mr Blake, will he die? You think he will, and that it is my fault?' and she clutched his arm, not knowing what she did.

'Listen!' he said firmly, for her voice had risen in her grief. 'You are not to think that kind of thing. Your father told me the night before you left home that his health was bad, that any day might see the end of his life; his heart might fail at any moment. I did not dream, until I heard you had gone, that you had not been told the situation as I had been. Your departure was a shock to him, and it *may* have made him ill; but a sudden start, any haste or over-exertion, would have brought about the same result. On the morning you left he was late for a meeting in the village, and walked up the hill too quickly; it is more than possible that the strain caused the breakdown independently of your leaving him.'

'How could I leave him?' Francesca said miserably. 'What must he—must you—anybody, think of me?'

'Don't look back,' said Blake energetically; 'look forward. Your coming will be everything to him. You made a mistake—we all do that at times. Don't waste time regretting it. You didn't understand, that was all.' He spoke the last sentence softly, half to himself.

By this time they had reached the Albert Gate.

'It's too hot for you to walk any farther,' he said in an authoritative tone which made Francesca feel half-grateful, half-resentful. As he raised his stick to a passing hansom a voice cried, 'Jim! Jim!' and a lady in a carriage which had just turned out of the Park beckoned to him while she called to her coachman to stop. Blake looked a little embarrassed, but went forward as the carriage drew up to the curbstone.

It was Lady Scovell, looking fresh and dainty in a cool muslin dress.

'Why have you *never* come to luncheon with us, as you promised, Jim, you wretch?' she said, looking at him kindly with friendly brown eyes. 'Algy and I want you to do a play with us to-night. He is furious with you.'

'It can't be to-night, I'm afraid,' he said with a smile. 'I'm engaged to-night; and I've been very busy, or you know I should have looked you up. Give my love to Algy, and tell him not to give me up yet as a bad job.'

Lady Scovell's eyes wandered past him to where Francesca stood shyly on the pavement.

'I mustn't keep you. I didn't see you had anybody with you. Why, it's Francesca Duncombe!' she added, and, leaning forward, she held out her hand cordially.—'I didn't know you ever came to London! Do come and see me. I have always felt we ought to know each other better.'

'I'm going home to-day,' said Francesca, 'or I should have liked very much to come.'

'Well, give my love to dear old Stellbridge, and let me know if you ever come up again.—Good-bye, Jim, and I'll never forgive you for refusing all my advances.'

With a nod, and a smile that lit up her charming face, she was gone.

'Now, *is* it that girl that is the reason of Jim's preoccupied airs?' she asked herself as her horses turned towards Mayfair.

The others drove westward in silence; but as the hansom neared Fowler Place, Blake spoke, looking straight before him. 'I just want to say this to you, because I think it will put your mind at rest. You remember what we talked about last time we met? Don't be afraid that I shall ever bother you in that way. I won't force myself on you in any way. But will you try to think of me as a friend, and count upon me for help if you need it?'

She thanked him mutely. Then something impelled her to ask a question. 'Will you tell me something?'

'What is it?'

'Why did you ask me—to marry you, I mean?'

'Don't you know?' he asked gruffly, still looking ahead.

'Please tell me why.'

Then he turned and looked at her. 'Because I loved you.'

'Oh!' The direct answer took her aback. She flushed hotly. How could she have been such a fool as to ask that question and bring that embarrassing answer on herself? The next minute the hansom stopped. He helped her out and stood gravely beside her on the steps as she opened the door with her latchkey.

'Good-bye,' she said.

'Good-bye,' he answered, almost coldly, as he turned away.

Poor Francesca! She ate a hasty luncheon, and

then began her packing. This, then, was the end of her great venture! She had felt courageous, independent, strong-minded, when she had quitted Stellbridge for London two months before. Now, as she looked back, her hasty action appeared to her to be selfish and foolish, and—worse than all—melodramatic. Her conscience tortured her when she thought of her father, whom she had always imagined indifferent to her and utterly outside her life, lying ill and wanting her, while she had remained heedless of him in her self-imposed exile.

How Blake must despise her! He had loved her, he said, using the past tense. It was over, then. Her cruel thoughtlessness had killed his love, and no wonder!

But she would look forward as he had told her, and do all that love and care could do for her father while he remained to her. Afterwards, she hardly cared what would happen. She would come back to Mrs Broad and try London again.

Her farewell to Mrs Broad fairly upset that good lady. 'Leaving me, miss! Well, to think of it! A week's rent instead of notice—no, that I will not take from you. And what I'm to do, miss, without you—you that's so bright and cheery and singing in the 'ouse like a sunbeam!' In agitation Mrs Broad was apt to mix her metaphors. 'Well, we'll all be dull indeed.' Some large tears fell as she spoke, and she wiped them with her apron. 'But then, miss, my dear, I'm glad as 'ow you're making it up with your poor pa. I am sure 'im on a sick-bed—I just 'ope for your sake it's not a deathbed, for I know what *that* is—all the differences as you may 'ave 'ad with 'im 'll vanish away, and I 'ope as 'ow you'll live 'appy at 'ome now; though it's true your gain's our loss, so it is.'

'I'll come back and see you, Mrs Broad,' Francesca said, holding the fat hand in her cool, friendly grasp. 'And, oh, I can't thank you enough for all you've done for me and been to me! And you'll say good-bye for me to Miss Taylor and Mr Smith, and tell them I'll send them a wedding-present when the wedding's fixed.'

She arrived at Waterloo a quarter of an hour before the train was due to start, and established herself in a third-class carriage. She was so lost in thought that she hardly knew when the train started. On the journey she sat still in her corner, now her father's face, now James Blake's, rising before her. She dedicated herself to her father, making many resolves to begin her life anew, to make him feel the new sympathy which she would have with him, to *make* him need her if he never had before. And she prayed silently and fervently that it might not be too late.

Worn-out with anxiety, she had fallen asleep when the train drew up at Stellbridge, and she woke with a jerk. She stepped out dreamily on to the platform, and saw the village asleep in the still peace of an August evening.

'I will drive you up, Miss Duncombe,' Blake's voice said beside her; and she turned, too tired to be surprised. He had come by the same train, then.

A quarter of an hour later Blake entered the sick-room quietly after a whispered consultation with the nurse. He came in with the air of being well accustomed to be there, and the calm greeting of the invalid from the bed told of a quiet understanding between the two.

After a few desultory remarks the visitor led the conversation round to the subject uppermost in his mind.

'Well, I had more success in my search, to-day,' he said lightly.

The sick man changed colour and turned eagerly. 'Well?' he said.

'It would be odd if I hadn't met with some, after all this time, wouldn't it?' Blake went on. 'However, it was no credit to me. The success was pure luck, because I ran against your daughter in the Park. She looks splendidly well.' He spoke in a matter-of-fact tone, and as he went on the invalid, who had begun to show signs of agitation, became calm again under the influence of the pleasant voice. 'She has had good luck in getting a secretaryship to a friend of mine, Mrs Henry Domville. She has worked for that lady for six weeks, and I might have seen her any day if I had ever gone to the house. It is a small world after all!'

'And is she coming home?' Mr Duncombe asked.

'Of course,' Jim Blake answered. 'In fact, she has come already.'

There, it was out, and the invalid bore the news better than they had expected. The nurse came forward with a smile, and something in a cup. 'You will see your daughter presently, Mr Duncombe, if you rest now.'

Late in the evening Francesca came softly. She knelt beside the bed and slipped her hand into his, half-expecting it would be coolly put aside.

'I am glad you have come home at last, Francesca,' he said, and actually kept her hand in his.

'I ought never to have gone away, father. And I want you to forgive me.'

'Forgive you?' Then, after a pause, 'Francesca, some things have been revealed to me lately that were hidden before. I dare say I have been a little cold to you, my dear. But I always was too reserved. Your mother sometimes told me so. I have cancelled the—the decision which caused you to leave me. After all, I am conscious that all the trouble came from my want of faith. I will leave your future in the hands of God, who does all things well. We will let the past go, and begin again for the little time we have left. That is what you would like, I think?'

Francesca stooped and kissed him, the tears in her eyes.

'Good-night, Francesca,' he said. And they were nearer to each other then than in all the twenty-two years they had spent together.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

THE study of London, its evolution and its progress, is unceasingly interesting, and diligent searchers among the records of the past are constantly discovering facts which, if not absolutely new, have a considerable appearance of freshness and are very wonderful. We think that at some time or other it must occur to every man who is of a contemplative mind, when walking through London, to ask himself the question as to how it all began. Here are these thousands of miles of streets, hundreds of thousands of houses, shops, and warehouses, millions of people all so closely packed together that it is with difficulty one moves about in this seething, busy mass which represents the farthest advance of civilisation for the time being. Here we have the utmost complication of life, and yet there must have been a time when all this place was green fields and sloping wooded hillsides, past which little rivers and rills sought their way towards the big Thames. Wild animals prowled about, and the predominant sounds when the winds were still were not those of wheels or whistles or motor-horns, but of the birds who piped their songs between the earth of this primeval London and the clear sky above it. In good time men came along, the first Londoners, and at once they set about the grand evolution which has gone on unceasingly ever since. We have seen the state of the central part of London, as it was in these early times, described as consisting of a tidal river almost a thousand feet in width, with marshes on either bank, while there was a wild moorland on the north side which was useless for agricultural purposes, and there were dense forests on both the north and south sides; while over to the west, somewhere between where Oxford Street and the Strand now are, there was a little patch of pasture-land. The early Londoners (or Lyndyners) had, by the natural conditions of the place, protection against an enemy by river, marsh, and forest, but they were dependent for supplies from outside, save for fish, birds, and game. They had a very good natural port at Dowgate, near the Walbrook, which accommodated small ships sailing up the river. Mr J. George Head has been making some deep examination into the details of the rise and growth of London, and has come by a mass of most interesting detail. He concludes that the beginning of London was somewhere near the present site of St Paul's Cathedral, and that in the earliest times it was merely a collection of mud huts, the village being only of the extent of about an acre. That was some two thousand years ago, and in the interval London has increased from the solitary acre to a matter of one hundred and seventeen square miles. In place of the mud huts we have over six hundred thousand houses, for the tortuous paths among the huts we have over two thousand miles of streets, and for the few hundreds at most of the early Londoners we have five millions of the most civilised people, for whose convenience in moving about from one place to another there are no fewer than three hundred and twenty-nine railway stations. There is a piece of land in St Clement Danes, near to the present Law Courts, for which six horseshoes were paid as rent in the reign of Edward the First, and to satisfy tradition and the old statutes the Corporation of London still pays that same rent for it, but the freehold of that land is now worth three or four pounds for every square foot of surface. In 1339 the rateable value of the City of London was twelve thousand pounds a year; but now it is more than five million pounds. Three hundred years back there were some wise people who thought they were far-seeing, and who came to the conclusion that London was then getting very much too big, and that unless some check was placed upon it there would be great trouble in store for posterity. They advised Queen Elizabeth of their views, and suggested that some steps should be taken to impede the growth of the town. But London is fifty times as big to-day as it was in the reign of Queen Elizabeth, and folks have long since ceased to talk of stopping its

[*All Rights Reserved.*]

growth or to suggest that any good was to be gained from doing so.

* * *

Brighton is to have another day. A few of its old glories may yet be revived. Very likely it is quite impossible in these days of nervousness and fear, and of quick and easy movement, for gay and notable society ever to be concentrated in one place and to perform such feats in social life as was the case in the Georgian times at Bath and Brighton. In these latter days Brighton has not had a very good time; it has found some difficulty in making ends meet to any satisfactory extent, and all the sparkle has seemed to have disappeared from the life of the place. The motor-car, and the South African war, and the income-tax, and the bad times generally have had a lot to do with the bringing about of this state of affairs. People came first to consider that they had better not go to Brighton, and then afterwards they were moved to ask themselves what was the good of going to Brighton anyhow. So they stayed away. But there is a beautiful dignity about the place, a charm of architecture and arrangement, a majesty of frontage, and a great halo of rich tradition hanging constantly above it which cause it to be really a very easy matter for Brighton to be assisted to a great revival at almost any time. There is a great charm even in the name, so that people who have not been to the place and know nothing of it still nearly always feel that this cannot be like other resorts at the seaside, that it must be something brighter and finer and grander. And just lately Brighton has come by a revival. The patronage that has been extended to it during recent months by the King has done it immense good, just as it did His Majesty good also. Here he enjoyed a greater freedom and more respected privacy than he has done at most Continental places, and it was a charming sight to see the First Gentleman taking his walks and his rests in the semi-private gardens on the front which are reserved for the residents with certain household rights. Somehow this did seem to be a real link with the past, such as few other revivals of custom have been. And so it is not surprising that in these days there is a great new interest being taken in the things of Brighton, and particularly in all the wonderful facts of its history and its traditions. It was a book published by Dr Russell in 1750, in which he advocated the use of sea-water in the treatment of the diseases of the glands, that first brought about the prosperity of Brighton, for it at once became the fashionable watering-place of the day, displacing Bath, Tunbridge Wells, Harrogate, and other inland resorts of the same kind; and when some thirty years later the Prince of Wales went to live there, it rose to the height of its success and glory. Many and excellent are the stories that have been told about the Prince and his doings at Brighton, and some of the best of them are repeated by Mr Lewis Melville in his interesting new book on the place. One of them concerns what the Prince said to a lady of Brighton at the time when he kept harriers there. 'I was out one day, ma'am,' he said, 'with my harriers; we found a hare, but the scent was catching and uncertain, so that we could go no continuous pace at all. There was a butcher out, ——, ma'am! a great big fellow, fifteen stone, six feet two inches without his shoes, and the bully of all Brighton. He overrode my hounds several times, and I had spoken to him to hold hard in vain. At last, ——, ma'am! he rode slap over my favourite bitch Ruby. I could stand it no longer, but, jumping off my horse, said, "Get down, you —— rascal! pull off your coat; none shall interfere with us, but you or I shall go back to Brighton more dead than alive!" ——, ma'am! I threw off my coat, and the big ruffian, nothing loath, did the same by his. By ——, ma'am! we fought for an hour and twenty minutes, my hunting-field forming a ring round us, no one interfering, and at the end of it the big bully butcher of Brighton was carried away senseless, while I had hardly a scratch.' The Prince then turned to a foreigner high in his favour for corroboration. '——! you remember it?' he asked, only to receive the reply, 'By ——! your Royal Highness, I do forget.'

* * *

Lloyd's is a very wonderful institution. It is known that although it is ships that are chiefly insured there, you may insure anything else. And the institution is not less wonderful by reason of some facts concerning it which have just been made known. So many and vast are the ramifications of its dealings, and to such a large extent is the general safety of trade dependent upon it, that it is perhaps not surprising that at various times one hears questions as to whether it is absolutely secure, while hints to the contrary sometimes emanate from American, German, and other competitors. But its stability has been amply and finely vindicated. In answer to the criticisms that had been made, the members some time since decided to submit their methods and accounts to chartered accountants, and the results, which have just been made known, show that 98 per cent. of the membership is certified as good for the liabilities undertaken, while of the 2 per cent. whose names did not appear on the certified list the majority were expected to qualify for certificates almost immediately afterwards. As Sir John Luscombe, the chairman of the committee, remarks, the stability of Lloyd's is a matter that concerns the whole world, and the results of the recent investigation are highly satisfactory from all points of view. Wonderful thing, this Lloyd's! And why Lloyd's? Who was Lloyd? He has been dead a very long time now, and he never knew in his lifetime or had the slightest suspicion that his name would be perpetuated most likely through all time, or anyhow so long as London remained a business centre or ships sailed the seas; that in one sense his fame would be more enduring than that of statesmen or other people who have

serious influence upon the affairs of the world. And old Edward Lloyd was a Welshman who merely kept a coffee-house in Tower Street somewhere about the end of the seventeenth century. Owners, captains, and others connected with shipping got into the way of looking in here and meeting each other, and Lloyd came to do so well from this special custom that he moved off to a bigger place at the corner of Lombard Street and Abchurch Lane, and took his valuable customers with him. The underwriters and shippers came to regard the coffee-house as their recognised meeting-place, and sales of ships, cargoes, and shipping material were held there from time to time. So the idea of the institution gradually grew and became more exact, and in 1774 Lloyd's—now a separate and very definite thing—moved off to the first floor of the Royal Exchange, where it has remained ever since. It was not until 1871 that it was incorporated by Act of Parliament; but to correct a misapprehension which is general among people who are not concerned in any way with seafaring matters, and have little knowledge concerning them, we may state that it does not as a corporation undertake insurance business; only its members individually or in firms do so. Of these individuals there are some six or seven hundred attached to the corporation.

* * *

A little while since we had some most interesting conversation with a member concerning some of the curious customs which belong to this old institution as to most others that have grown up in the same way in the City of London; and one of the things he told us was that every now and then, when important news comes to hand concerning some ship about whose fate there has been doubt, a bell is rung which was under the sea for many years, and belonged to a sunken frigate which is still there. It is the bell of the *Lutine*, and, big and sombre-looking, it hangs from a hammered-iron bracket at Lloyd's, with a length of an ancient ship's cable-chain suspended close by. The *Lutine* was a frigate carrying thirty-two guns, and one October evening in 1799 she was lying comfortably in Yarmouth Roads laden with a large quantity of specie which for the most part belonged to English merchants and bankers. She was to go out to sea very soon, and this night a ball was given on board as a sort of farewell to the local people and the friends of those belonging to the ship. It was a happy affair; but before it was entirely over and all the guests had left the ship, orders were received for the *Lutine* to sail forthwith for Cuxhaven. She went out in the moonlight to sea, and all was well until three days later, when a heavy gale got up, and just after midnight, running under a heavy press of sail, she struck on the outer bank of the island of Vlieland and sank at once. All on board were lost except two men, who were picked up by a Dutch cutter. Both died shortly afterwards. Many attempts at salvage have been made since those days. Treasure to the value of fifty-five thousand pounds was fished up very soon after the wreck had taken place, and even so recently as twenty years ago some three thousand coins, two cannons, three watches, and various other articles were got up from the wreck. And somehow Lloyd's has always felt itself to be peculiarly associated with the lost *Lutine*, and when the members came to establish a Masonic Lodge of their own, they were moved to call it the Lutine Lodge. When a member of Lloyd's, by reason of the risks he has undertaken, is anxious about the fate of any particular vessel, he expresses in writing to the committee his desire to be informed of the first news in regard to her, and the name of the ship is then added to the list of the overdue vessels, the happenings to which are formally announced in the big room. When a ship that is so overdue is reported in any way—as arrived, spoken, or abandoned—the crier is handed a slip of paper, and then he tolls the bell of the old *Lutine* twice, a solemn hush falls upon the busy scene, and the crier shouts out his news. It may mean a difference of thousands of pounds, or hundreds of thousands, to some people in that throng; but in a moment the usual activity is resumed, and the scene is just the same as it was before. The continuity will not be broken until the bell of the old *Lutine* is rung again, and it is told how another ship is still safe or that she has gone beneath the sea.

* * *

When the sunshine comes again after the winter gloom, the enterprising inventor becomes very busy, and you have no idea how very busy the inventor can become when he likes. The mind does not seem to invent things so well in the times of short days and long cold nights, or at all events things that can be patented. But the spring and the summer bring with them large crops of ideas, the most wonderful ideas, as any one who will pay a visit of investigation to the Patent Office may discover. Naturally, and indeed necessarily, the inventor is very topical in his ideas. When there is war in the air he goes along to Chancery Lane with specifications for all the most wonderful engines of death, while his brother-inventors bring forward means for the preservation of life. And as there is nearly always war in the air, a constant supply of new war-patents is made. Lately there have been many registrations in connection with aeronautics—not indeed many for complete flying-machines themselves, but for various little adjuncts to mechanical flying such as every thorough aeronaut will feel he must have. Soon enough we shall have something invented to prevent our flying-machines from skidding in the air, or doing that which is equivalent to the great trouble of the motorist. And this reminds us that, either because interest in motoring is to some extent waning, or because it is felt that a state very closely bordering on perfection has been reached, there have not been so many motor-inventions during recent months as there were previously for fifteen years or more. At the same time, the inventors are almost des-

perate in their pursuit for a perfect non-skidding wheel, and are improving on the existing ones almost daily; in fact, it was ascertained that during the first three months of the present year no fewer than one hundred and twenty patents for improved wheels were registered, which is at the rate of more than one a day. Skating on rollers being one of the crazes of the moment, it follows that the inventor has been giving his mind up very earnestly to solving the question as to how it may be better done than at the present time. He wants to render it more delightful, easier, and so forth, and so he is making all kinds of patent roller-skates. Specifications for large numbers have been put in this year, whereas not one new invention of this class had been registered for a long time previously. If all these inventors had their way what a world of complicated convenience this would be! They have something for you from the first moment after rising until you seek your rest again at night, or rather they consider you before you do even rise, for we see here at the Patent Office, recently put in, the specification for an apparatus for 'automatically igniting, particularly domestic, fires at predetermined times.' What happens is that when the alarm goes off in the morning a strip of oil-soaked paper leading to the already laid fire is brought into contact with a night-light, and by the time the person roused has properly opened his eyes and come to realise that the time for sleeping is at an end, and the work of the world must go on, he or she is in a measure comforted by the knowledge that the first and most irksome task is already performed—automatically.

THE HOUSE OF WHISPERS.

CHAPTER XXVII.—BETRAYS THE BOND.

THE girl hurried on, her heart filled with wonder, her eyes brimming with tears of indignation. The one thought occupying her whole mind was whether Walter really wished to see her again. Had Flockart spoken the truth? The serious face of the man she loved so well rose before her blurred vision. She had been his—his very own—until she had sent off that fateful letter.

In five minutes Flockart had again overtaken her. His attitude was appealing. He urged her to at least see her lover again even if she refused to write or return to her father.

'Why do you come here to taunt me like this?' she cried, turning upon him angrily. 'Once, because you were my mother's friend, I believed in you. But you deceived me, and in consequence you hold me in your power. Were it not for that I could have spoken to my father—have told him the truth and cleared myself. He now believes that I have betrayed his business secrets, while at the same time he considers you to be his friend!'

'I am his friend, Gabrielle,' the man declared.

'Why tell me such a lie?' she asked reproachfully. 'Do you think I too am blind?'

'Certainly not. I give you credit for being quite as clever and as intelligent as you are dainty and charming. I'——

'Thank you!' she cried in indignation. 'I require no compliments from you.'

'Lady Heyburn has expressed a wish to see you,' he said. 'She is still in San Remo, and asked me to invite you to go down there for a few weeks. Your aunt has written her, I think, complaining that you are not very comfortable at Woodnewton.'

'I have not complained. Why should Aunt Emily complain of me? You seem to be the bearer of messages from the whole of my family, Mr Flockart.'

'I am here entirely in your own interests, my dear child,' he declared with that patronising air which so irritated her.

'Not entirely, I think,' she said, smiling bitterly. 'I tell you, I much regret all that has happened, and'——

'You regret!' she cried fiercely. 'Do you regret the end of that woman—you know whom I mean?'

Beneath her straight glance he quivered. She had referred to a subject which he fain would have buried for ever. This dainty, neat-waisted girl knew a terrible secret. Was it not only too true, as Lady Heyburn had vaguely suggested a dozen times, that her mouth ought to be effectually sealed?

He had sealed it once, as he thought. Her fear to explain to her father the incident of the opening of the safe had given him confidence that no word of the truth regarding the past would ever pass her lips. Yet he saw that his own machinations were now likely to prove his undoing. The web which, with her ladyship's assistance, he had woven about her was now stretched to breaking-point. If it did yield, then the result must be ruin—and worse. Therefore, he was straining every effort to again reinstate her in her father's good graces and restore in her mind something akin to confidence. But all his arguments, as he walked on at her side in the gathering gloom, proved useless. She was in no mood to listen to the man who had been her evil genius ever since her school-days. As he was speaking she was wondering if she dared go to Walter Murie and tell him everything. What would her lover think of her? What indeed? He would only cast her aside as worthless. No. Far better that he should remain in ignorance and retain only sad memories of their brief happiness.

'I am going to Glencardine to-night,' Flockart went on. 'I shall join the mail at Peterborough. What shall I tell your father?'

'Tell him the truth,' was her reply. 'That, I know, you will not do. So why need we waste further words?'

'Do you actually refuse, then, to leave this dismal hole?' he demanded impatiently.

'Yes, until I speak, and tell my father the plain and ghastly story.'

'Rubbish!' he ejaculated. 'You'll never do that—unless you wish to stand beside me in a criminal dock.'

'Well, rather that than be your cat's-paw longer, Mr Flockart!' she cried, her face flushing with indignation.

'Oh, oh!' he laughed, still quite imperturbed. 'Come, come! This is scarcely a wise reply, my dear little girl!'

'I wish you to leave me. You have insulted my intelligence enough this evening, surely—you, who only a moment ago declared yourself my friend!'

Slowly he selected a cigarette from his gold case, and, halting, lit it. 'Well, if you meet my well-meant efforts on your behalf with open antagonism like this I can't make any further suggestion.'

'No, please don't. Go up to Glencardine and do your worst for me. I am now fully able to take care of myself,' she exclaimed in defiance. 'You can also write to Lady Heyburn, and tell her that I am still, and that I always will remain, my blind father's friend.'

'But why don't you listen to reason, Gabrielle?' he implored her. 'I don't now seek to lessen or deny the wrongs I have done you in the past, nor do I attempt to conceal from you my own position. My only object is to bring you and Walter together again. Her ladyship knows the whole circumstances, and deeply regrets them.'

'Her regret will be the more poignant some day, I assure you.'

'Then you really intend to act vindictively?'

'I shall act just as I think proper,' she exclaimed, halting a moment and facing him. 'Please understand that though I have been forced in the past to act as you have indicated, because I feared you—because I had my reputation and my father's honour at stake—I hold you in terror no longer, Mr Flockart.'

'Well, I'm glad you've told me that,' he said, laughing as though he treated her declaration with humour. 'It's just as well, perhaps, that we should now thoroughly understand each other. Yet if I were you I wouldn't do anything rash. By telling the truth you'd be the only sufferer, you know.'

'The only sufferer! Why?'

'Well, you don't imagine I should be such a fool as to admit that what you said was true, do you?'

She looked at him in surprise. It had never occurred to her that he, with his innate unscrupulousness and cunning, might deny her allegations, and might even be able to prove them false.

'The truth could not be denied,' she said simply. 'Recollect the cutting from the Edinburgh paper.'

'Truth is denied every day in courts of law,' he retorted. 'No. Before you act foolishly, remember that, put to the test, your word would stand alone against mine and those of other people. 'Why, the very story you would tell would be so utterly amazing and startling that the world would declare you had invented it. Reflect upon it for a moment, and you'll find, my dear girl, that silence is golden in this, as in any other circumstance in life.'

She raised her eyes to his, and met his gaze firmly. 'So you defy me to speak?' she cried. 'You think that I will still remain in this accursed bondage of yours?'

'I utter no threats, my dear child,' replied Flockart. 'I have never in my life threatened you. I merely venture to point out certain difficulties which you might have in substantiating any allegation which you might make against me. For that reason, if for none other, is it not better for us to be friends?'

'I am not the friend of my father's enemy!' she declared.

'You are quite heroic,' he declared with a covert sneer. 'If you really are bent upon providing the halfpenny newspapers with a fresh sensation, pray let me know in plenty of time, won't you?'

'I've had sufficient of your taunts,' cried the girl, bursting into a flood of hot tears. 'Leave me. I—I'll say no further word to you.'

'Except to forgive me,' he added.

'Why should I?' she asked through her tears.

'Because, for your own sake—for the sake of your future—it will surely be best,' he pointed out. 'You no doubt, in ignorance of legal procedure, believed that what you alleged would be accepted in a court of justice. But reflect fully before you again threaten me. Dry your eyes, or your aunt may suspect something wrong.'

She did not reply. What he said impressed her, and he did not fail to recognise that fact. He smiled within himself when he saw that he had triumphed. Yet he had not gained his point.

She had dashed away her tears with the little wisp of lace, annoyed with herself at betraying her indignation in that womanly way. She knew him, alas! too well. She mistrusted him, for she was well aware of how cleverly he had once conspired with Lady Heyburn, and with what ingenuity she herself had been drawn into the disgraceful and amazing affair.

True it was that her story, if told in a criminal court, would prove so extraordinary that it would not be believed; true also that he would, of course, deny it, and that his denial would be borne out by the woman who, though her father's wife, was his worst enemy.

The man placed his hand on her shoulder, saying, 'May we not be friends, Gabrielle?'

She shook him off roughly, responding in the negative.

'But we are not enemies—I mean we will not be enemies as we have been, shall we?' he urged.

To this she made no reply. She only quickened her pace, for the twilight was fast deepening, and she wished to be back again at her aunt's house.

Why had that man followed her? Why, indeed, had he troubled to come there? She could not discern his motive.

They walked together in silence. He was watching her face, reading it like a book.

Then, when they neared the first thatched cottage at the entrance to the village, he halted, asking, 'May we not still remain friends, Gabrielle? Will you not listen, and take my advice? Or will you still remain buried here?'

'I have nothing further to say, Mr Flockart, than what I have already said,' was her defiant response. 'I shall act as I think best.'

'And you will dare to speak, and place yourself in a ridiculous position, you mean?'

'I shall use my own judgment in defending my father from his enemies,' was her cold response as, with a slight shrug of her shoulders, she turned and left him, hurrying forward in the darkening twilight along the village street to her aunt's home.

He, on his part, turned upon his heel with a muttered remark and set out again to walk towards Nassington Station, whence, after nearly an hour's wait in the village inn, he took train to Peterborough.

The girl had once again defied him.

(To be continued.)

THE PILGRIM FATHERS.

A TABLET AND A REVERIE.

By Herbert Russell.

As I wandered down along the old water-side Barbican of Plymouth, my eye was arrested by a stone let into the cobbles. It bore the simple inscription, '*Mayflower*, 1620.'

An aged, dim-eyed waterman approached me, croaking out a query as to whether I wanted a boat. 'No,' said I. 'Can you tell me the meaning of this stone?' 'Why, sure 'nuf, it's there in memory of them they call the Pilgrim Fathers, who embarked from them very steps there to go aboard their vessel, the *Mayflower*, and sailed away to America.—D'ye want a boat, master?' and he waddled in chase of another possible fare.

Mayflower! Pilgrim Fathers! To be sure, it was from old Plymouth that this sturdy little band sailed away to begin life afresh, with a sweet conscience, in the settlement of New England. From old Plymouth, I say—which one of the greatest of America's writers has christened 'the mother of a hundred Plymouths up and down the world.'

Here was I standing on the very spot, viewing the symbolic foundation-stone of the mightiest commonwealth history has ever known. And it was old Plymouth still.

I strolled to the extremity of the little, weedy jetty, around which the tide sluggishly swirled into Sutton Pool, and sat down on the parapet to muse. Before me lay grouped the most ancient quarter of Plymouth; behind me stretched the sparkling lagoon of the Cattewater.

The finger of Time has writ many wrinkles upon this quaint picture, and the hand of the modern master-builder has done little towards smoothing these out. Barring a few touches of incongruity, I was gazing upon much the same scene that grew dim before the eyes of those heart-stout disciples of William Penn as they loosed their sails and flew away for Cape Cod to found New Plymouth. A picture of mullioned windows, hoary gables, pillared façades, low-pitched arches dawning upon mysterious courts—all time-mellowed as an old Dutch painting in the warm glow of the afternoon sun.

Fancy scarcely needed any better stimulus than such a bygone setting in order to fit the figures of the Pilgrims themselves into those surroundings. Ghosts of grave-looking, venerable men, in sombre doublets and sugar-loaf hats, seemed to rise up from that tablet in the ground, and flit in vanishing array to the moss-green landing-steps, chanting plaintive hymns as they set their faces to God and the Great Unknown.

Here was the tract of water which had cradled their caravel—a lofty-pooped, cumbersome-bowed structure, yet proud in her posture of uprearing masts and raking boltsprit, as though sentient with the spirit of liberty.

Mayflower! What prettier name, or more fancy-touching with a vision of sturdy hopes, dark superstitions, vague misgivings, and an ever-over-riding quality of deep faith?

A dim, silvery, early-autumn mist hovered over the Cattewater, nearly obscuring the tall background of the Batten shores. An old-fashioned coaster rode solitary to her anchor, looming somewhat vaguely through the calm haze. She was the one detail which gave material shape to my musing. The magic, illusory touch of that atmospheric dimness wrought the stirless ship into a very semblance of the ancient fabric which I had in my mind's eye.

How little did those solemn men wot of the prodigious part they were destined to play in the world's story as they slowly descended into their waiting pinnace and pulled out towards the little caravel, with her festooned sails, and her ancient drooping to the kiss of the water!

The dripping of the oar-blades would stand for the tears which their 'right good courage' alone subdued. For there were women amongst them—the mothers of that sturdy American race which a century and a half later was to enter upon a struggle for independence against the land that had exiled their forebears.

It was home they were leaving—home, in days when all beyond the violet rim of the horizon was steeped in mystery; home, which wears her fairest and most tender guise in this nethermost corner of green Devonshire.

I rose from my seat and strolled in a leisurely fashion under the shadow of the Citadel, whose gray battlements had blinked down upon the picture of my musing. And this wise I gained Plymouth Hoe.

Out of the hazy serenity of the seascape beyond the breakwater there came a mighty steamship. Her proportions were magnified by the murkiness, and she towered like an island as she swept round into the curve of Cawsand Bay. A fisherman leaned against the parapet watching her. I asked him what steamer she was. 'The American mail-boat from New York,' he answered.

My vision of the poor little *Mayflower* vanished abruptly before the prosaic marvel of this contrast. Yet that four-funnelled monster appealed to me as but the fruits of the seed which that three-century-gone band of Pilgrim Fathers had sown.

THE BLUNDERERS.

CHAPTER VIII.

THE first week or two after Francesca returned to take up her life at Stellbridge were not altogether easy ones. It was awkward to have to face people who, of course, knew of her escapade, and guessed at various reasons for it. The Rectory servants, it was true, who had always loved and pitied Francesca, and had secretly admired her for taking her fate in her own hands, were overjoyed to see her back.

It was Mrs Drew and her like that were especially hard to face. The doctor's wife bowed coldly to Francesca when they met. She told her husband that until she knew every detail of the story, and everything Francesca had done during those two months the girl had been away, she could not dream of allowing Lily to hold any communication whatever with her. To desert her father, to leave him almost to die without ever coming near him! 'There is no use in speaking, doctor,' she ended, 'for my mind is made up.'

Mrs Carter, of Laurel Villa, *had* heard it whispered that Francesca had certainly eloped and was secretly married. Another story was current, that Mr Duncombe had informed his daughter that *he* intended to make a second venture in matrimony, and that she had thereupon left in anger, and refused to come back even though she heard he was at death's door. Francesca, of course, heard none of the gossip, but was conscious of a chilly atmosphere amongst all her acquaintance, with the exception of her old cousins and Dr Drew, who continued her friend in spite of his wife's opposition.

Mr Duncombe improved very slowly. An assistant had been found to take his duty for the present, and he clung to the hope that the winter would see him at work once more. But the doctor shook his head.

It was one afternoon about three weeks after her return that on her way up from the village she met Mr Blake coming from the Rectory. She had just crossed the stile from the road, and was ascending the field-path leading to the garden, when he advanced upon her.

'I am glad to have met you,' he said in his cool, pleasant tones. 'I have just been up to say good-bye to your father. I am going away to-morrow.'

Francesca's heart literally jumped, and then seemed to fall down like a leaden weight. She heard her own voice say calmly, 'Are you going away for long?'

'For some months probably. I am going to join my friends the Scovells, who are yachting, for the present, and then later on I shall get them to drop me somewhere abroad to wander for a bit. I am glad to leave your father better. I want you to promise me that if he—or you—should ever want me or my help you will send for me. If you write to Scovell, a letter will always find me. I have seen so much of your father these last few months that we have grown to be friends, and I should like to come if he ever wants me.'

'I will remember. You are very kind,' she said. 'You have been very kind to us all this time.'

'Please don't call me kind!' he said roughly. Then, checking himself, he went on in a more gentle tone, 'It is not a question of kindness. As I said, your father and I are friends. Well, I must not keep you;' and he held out his hand. 'Good-bye.'

'Good-bye.'

She turned and went up the field-path, abjectly miserable, and furious with herself for being so. What a dull, dark day! She wished the sun would come out. It felt chilly and autumnal, and the leaves were actually turning. The summer was over. The long, long winter would be upon them all too quickly.

There was a step behind her. 'Francesca!' It was Blake's voice. It vibrated with feeling so that she hardly recognised it. She looked at him. His face was alight, radiant with hope.

'Francesca, I saw your face as you turned away. Do you care—whether I go or stay? I will stay if only you tell me to.'

For a moment she struggled for self-possession; then the tears rained down her face as she hid it in her hands. Then she felt his arms round her, and he whispered again, 'Francesca, tell me!'

'Oh, stay, stay; I couldn't bear you to go!' she cried at last. 'You mustn't go away ever.'

'Then you love me?' he asked as the sobs ceased and she grew calm.

'Of course I do; but I thought you didn't love me any more. Are you sure of it?' she asked anxiously. 'How can you? And why don't you hate me after all I've done?'

There was no answer to be made just then in words.

The rapturous happiness of the moment when two souls, destined for each other, find each other was theirs then. They seemed to stand apart from all the world, heeding nothing, knowing nothing but that the best of life was theirs after all, and that till death, and after, they belonged to each other.

Then, when speech returned to them, how much there was to recall, how much to explain, and how little, after all, the explanations mattered! Nothing could matter now in view of the one glorious, wonderful fact.

'But, oh, Francesca,' Blake said, 'your letter—that pitiful, pathetic letter! I hadn't cried since I was a boy, but I cried over that letter you wrote to your father. He gave it to me, and I took it away, and simply made a fool of myself. How could you—how could you? Did you really think I could be such a brute as to put real pressure on you? But I saw how frightened you were, and I *raged* to think I had been the cause of driving you away. And I saw so clearly that you thought it was a conspiracy between your father and me. He and I had it out long ago; but I couldn't forgive him that night for what he did, nor for long after—not till we got very near each other in the weeks he was so ill. But that time wiped it out.'

'Poor father!' Francesca said. 'But I was wrong, utterly and entirely wrong. I see that now.'

'We were all blunderers, but you were the least wrong of the three of us. Imagine my being such a dolt as to ask you to marry me, and never to convey to you the ghost of an idea that I had fallen in love with you the first time I ever saw you, and had worshipped you from that time on!'

'Did you?'

'The wonder to me is that you didn't see it. But I always have been a fool at expressing myself. My only excuse is that when I spoke to you I felt there was so little reason why you should love me that I had very little hope. And I suppose I thought it so obvious that I should love you that I left out the telling of it. Well, I paid for my stupidity.'

'You won't go abroad, will you?' Francesca asked shyly.

'I rather think I won't,' Blake answered.

They were standing on the path a few yards from the little gate into the garden. Unheard by them, Mrs Drew, who had been up to inquire for the Rector, approached the gate. She saw Francesca first, and summoned the cold look which she had of late been wont to bestow on that young lady. Then, as she came in view of Blake, though the two were standing apart soberly enough, she surprised a certain expression on his face which caused a rapid readjustment of her mind.

The doctor's wife had a remarkably quick perception, also a vivid imagination. She saw herself, as in a prophetic vision, calling upon Francesca, and being received in the large drawing-room at Scovell. Her mind was made up in a moment, and with a pleasant smile she advanced on the couple.

'I am *so* glad, Francesca, to hear your dear father is still improving.—Such an old friend the Rector is!' she continued, turning with outstretched hand to Blake. 'I have felt so for Francesca, and now she must be so glad to have her anxiety lessened!'

Francesca could not feel any very great cordiality towards Mrs Drew, remembering the latter's late treatment of her; but she answered more responsively than did Blake, on whom the attitude of the village towards the Rector's daughter had not been lost.

Mrs Drew, however, appeared oblivious of any coldness in their reception of her, and chatted pleasantly for some minutes before she descended towards the village, full of eagerness to impart her impressions, and conscious also of a sharp regret that she had not cultivated Mr Blake's acquaintance for Lily.

And Blake and Francesca passed through the gate into the scented garden, hand in hand, with their hearts full of happiness and the love-light shining in their eyes.

THE END.

THE MONTH: SCIENCE AND ARTS.

A NOVELTY IN BABY-CARRIAGES.

IT was American ingenuity that devised the light, collapsible chair-carriage for children which has now come into such extensive vogue. Unfortunately, however, it has been sadly misused. It was contrived to offer the parent a light, convenient means for assisting the little one by giving baby welcome rests during walking excursions, which at the same time, owing to its collapsible design, could be packed up and easily carried on a public vehicle such as a tram, omnibus, or train when occasion arose. To-day it is extensively used for babies of extremely tender age, for whom it is the most uncomfortable vehicle that could be pressed into service, since it offers no support whatever to the body of the little one such as is essential to its welfare. As a result the carriage has been the butt of emphatic medical obloquy, and there is no doubt but that it is responsible for many physical infirmities among

children. Again, however, American inventive genius has come to the rescue in the evolution of a new type of carriage fulfilling the requirements of lightness, convenience, and portability. It is strongly made of wicker, and in general design resembles a basket of sentry-box design. It is scientifically constructed, the object being complete comfort and assistance in the correct formation of the frame and body of the tiny rider, by providing adequate support at the small of the back. When seated therein baby is snug and warm, rests in a comfortable position, and cannot possibly fall out. Possibly, however, its most commendable feature is its universal character, as it can be used as a carriage, high-chair, floor-chair, or if desired can be carried in the hand. For outdoor service the carriage is mounted upon a pair of small rubber-tired wheels of the usual type, and can be pushed or pulled with equal facility, with the child inclined at an easy angle. For table-use all that is necessary is to lift the carriage off the wheels and place it upon an ordinary chair at the table; while, when placed on the floor, it forms an enticing little wickerwork chair, which owing to its broad base cannot readily be upset. It can also be carried in the hand from place to place, with baby safely seated inside, by means of two round handles which form the top frame of the vehicle. It will thus be seen that the conveyance can be used for a multiplicity of purposes, and owing to its compact design and light weight can be taken anywhere without menacing the health or safety of the child, and without being an encumbrance to the nurse or parent.

ELECTRICAL ENERGY FROM THE WIND.

A short time ago we drew attention to the extensive use that was being made on the Continent of windmills for driving electrical machines for the supply of energy for lighting or other purposes. In this country the possibilities of this cheap source of power have not been realised, though in Germany, Denmark, and other countries there are several firms who have built up flourishing businesses in the supply of the special inexpensive plant required for this field of activity, and numerous installations have been laid down at country residences where the whole requirements of the house and estate, both in regard to lighting and the driving of all descriptions of implements, from the knife-machine to the chaff-cutter, are derived from the wind. This apathy may be attributable to the apparent whimsical nature of our winds; but as a matter of fact official records show that in these islands the mean hourly velocity of the wind is from seven and a half to seven and three-quarter miles, and during the past year the longest period when the wind velocity ruled below five miles per hour was only seven days. Considering that a seven-mile wind is sufficient to yield some eight horse-power, it is apparent that the intervals when insufficient atmospheric movement prevails to generate energy are very short and few and far between. Of course, in order to take the fullest advantage of the wind it is essential that the windwheel or windmill should be of such design as to offer the minimum of resistance in revolution, and in this direction an English firm has effected a decisive advance upon Continental practice. The wheel is of special construction, and, unlike the ordinary type, is supported on either side of its axle, the wheel itself revolving on roller bearings, so that friction is reduced to the minimum and the power proportionately increased by the elimination of resistance losses. The wheel is fitted with a special type of tail which automatically regulates the speed by varying the angle of inclination of the wheel to the wind. The wheel itself can be made up to a diameter of one hundred and fifty feet, whereas hitherto the diameter limit has been thirty-five feet. The whole is carried on a steel tower, the extremities of which form apexes, and is stayed in position by hard steel guy-ropes. Another benefit accruing from this design is that no elaborate foundations are required, a log of wood being ample upon which to support the mill. Again, in the Continental systems a petrol or other engine must be kept in reserve to drive the dynamos during those periods of calm when the wind-turbine is inoperative, and this not only entails a capital outlay of some three hundred pounds, but invariably necessitates the services of a skilled engineer. In the new system the stand-by engine is dispensed with, and instead a battery of accumulators is used of sufficient capacity to fulfil all requirements for a week of calm, though they can be made to meet any such possibilities. It will be seen that the English system is not only cheaper to install than the usual type of wind-turbine, but costs much less to maintain, and can be operated by any one possessed of average intelligence. The advantage of the wind-turbine over the engine system of generation is that it is a silent servant the whole time a breeze is blowing, and owing to the perfection of automatic control requires no attention when in use.

RELATIONSHIP BETWEEN BLINDNESS AND SENSE.

Are the senses of the blind more acute than those of normal people? It is generally supposed that a sightless person, more especially if his infirmity is congenital, has the remaining faculties abnormally developed in order to compensate somewhat for the deprivation of the one sense. Upon this point some interesting experiments have been carried out by German scientists, the sum of which would appear to upset popular contention in a pretty convincing manner. They found that the blind was no more able to detect the direction of sound than the sighted person, that the sense of smell was somewhat more deficient in the former than the latter, and that the normal person possessed a keener sensitiveness of touch than the afflicted. It is, however, somewhat difficult to reconcile this contention with absolute facts. One may use the most delicate instruments it is possible for human ingenuity to contrive for the determination of the

above question, but after all they merely constitute a tangible basis for comparisons. One has only to recall the remarkable accomplishments of Miss Helen Keller, who is no doubt the most extraordinary blind person of the day. To pit such an example against scientific investigation would, however, only be construed as the exception proving the rule, were it not for the fact that there are innumerable other instances which could be cited of a similar character. In the German experiments the question of standard of intelligence does not appear to have been taken into consideration, and yet this, after all, is an important factor. The blind person must be trained in the use of his remaining senses as much as the sighted person is taught to distinguish colours, objects, and so forth, while it must also be borne in mind that the possession of all the senses rather tends to assist the individual work of any one. This can be proved in various ways. For instance, click two objects in the hand in close proximity to a blindfolded sighted person and a sightless individual. The former will be quite at sea in detecting the locality of the sound, but the average blind person will readily determine its direction and source. Again, face the two unconsciously to the wall and tell them to step forward. The former will unhesitatingly collide with the obstacle, but the latter will pull up and say that he can 'feel' its existence. Such experiments could be repeated *ad lib.* with similar results. Under these circumstances it is obvious that far more conclusive testimony is necessary to disprove the popular impression concerning the peculiar sensitiveness of the blind's remaining faculties than the German experiments afford.

LURKING DANGER IN DRINKING-WATER.

Although extreme care is observed to secure the purity of our water-supply, questions of health demand that elements of risk should be reduced to the minimum. This can only be completely done by sterilising or filtering all water, even when drawn from the tap, before drinking, since during its passage from the reservoirs through the mains and supply-cistern to the tap it is liable to become contaminated with either organic or inorganic substances, or possibly both, which are highly prejudicial to health. Boiling is a tedious and inconvenient precaution. What is required is some system of obtaining what may be termed 'ever-ready' filtered water. This is now possible by inserting a filtering medium between the supply-pipe and the tap, through which substance the water for human consumption must pass, and thereby become separated from all foreign substances in suspension. The filter comprises an inverted cast-iron cylinder attached to the service-pipe. Within this outer casing is a hollow tube of compressed kieselguhr, which is the most efficient water-filtering medium known. When the tap is turned on the water passes into the outer cylinder, and under the imposed pressure is forced through the wall of kieselguhr into the hollow space within and out of the top through the delivery-pipe. There is no delay whatever, as under the pressure the water is forced through the filter in a steady, continuous stream. Water so treated is absolutely sterile, as a bacteriological test has conclusively proved. Periodically the kieselguhr is removed and cleaned merely by wiping its outer surface with a soft rag, and if required it can be sterilised by being boiled. Were household taps equipped with such a simple device as this, complete protection would be afforded against any possible outbreak of a malignant water-borne disease, which occasionally results, even in these scientific days, from the water becoming inadvertently contaminated.

FRUSTRATING THE CLOAK-ROOM THIEF.

A simple and ingenious little device which should commend itself to restaurants, hotels, clubs, and public cloak-rooms in general where garments have to be temporarily placed, has recently been perfected. Its object is to frustrate completely the nefarious practices of the cloak-room thief, while at the same time it guards against the possibility of mistakes arising. It comprises a metal attachment to the rack. There is the bracket upon which the coat and hat are placed. Above is a short descending arm which is pressed down until the coat and hat are tightly gripped between the extremities of the two bracket-sections. Once the lock clicks the garments cannot possibly be removed surreptitiously from their position without tearing, and yet at the same time the pressure of the two sections does not exercise the slightest damaging effect upon even the most delicate fabrics. To release the garments one has to insert a key in the lock and move the sliding piece back. The same principle is adapted to umbrella-stands, the upper member of which carries a line of small slots. The umbrella is simply pressed in the slot until a click indicates that the umbrella is automatically secured. To obtain its removal the key is inserted in the lock and pressed down, and the umbrella is withdrawn, leaving the slot again ready for use. In this invention possible loss of keys when the apparatus is not in use is overcome by rendering them irremovable from the lock while it is open. The fact that there are no two keys alike prevents a coat, hat, stick, &c. from being taken in error. The utilisation of this device, the necessity of which has long been experienced, to supersede the prevailing happy-go-lucky methods should successfully remove one of the greatest worries afflicting the manager of any public building or the cloak-room attendant, especially as it is inexpensive and can be attached to existing fittings.

GAS MADE AT HOME.

One of the greatest drawbacks to life in the country is the absence of public gas-supply facilities. So far as lighting is concerned, this deficiency can

be tolerated, but it vitally affects the good housewife who is compelled to resort to coal-fires, with all their numerous drawbacks, for cooking purposes. Under these circumstances the application of what is generically termed 'air-gas' to domestic uses is one of far-reaching possibilities. This invention, which has been perfected by Mr F. J. Cox, M.I.Mech.E., comprises the preparation of a gaseous vapour from a light hydrocarbon derived from petrol, and its combination with air in such a manner that the proportion of gas is so small as to render it safe from explosion. As a matter of fact, the mixture is only 1·4 per cent. of gas to 98·6 of air. At first sight it would appear impossible for such a weak gaseous mixture to be capable of combustion; but with the special type of burner that has been designed an intensely hot bunsen flame free from all impurities is obtainable eminently adapted to cooking purposes. Moreover, owing to the extreme purity of this gas and the absence of all fumes arising from combustion, edibles cooked thereby are immune from that peculiar flavour so easily perceptible in foods prepared by ordinary coal-gas. The air-gas is made as required by a little device occupying only two or three feet of space, and so simple to operate that the servant can attend to it. All danger of explosion or ignition of the spirit is removed by sealing the volatile liquid in a special reservoir, so that no pure gas is emitted. The system has recently been subjected to a series of severe tests in France, and its safety and economical working, combined with efficiency, were demonstrated. It has the further advantage of being automatic in its action, so that no more gas is generated than is actually required. For an outlay of some twenty-five pounds a complete miniature gas-making plant capable of supplying all demands for gas both for lighting and cooking in a small house can be obtained, and the cost of the gas is only a fraction of what that of coal would be to achieve the same end. It places the lover of rural life upon exactly the same footing as dwellers in our towns and cities, where the householder has the gas laid to his front door. It is not surprising under these circumstances that several country residences have been equipped with this system, and there is no doubt that were the installation marketed upon the popular rental system, its use would be widely extended to those small houses where at present the initial outlay is the only deterrent against its adoption.

INGENIOUS MEANS FOR SECURING SMOKE ABATEMENT.

Strenuous efforts are to-day being made to bring about a welcome abatement of the smoke nuisance, and numerous devices have been perfected to minimise smoke emission, coupled with drastic legislation and the infliction of heavy penalties upon offenders. Far more in this direction could be achieved, however, were the simple expedient offered by Sir Alexander Kennedy more extensively practised. All that is required is a small mirror so fitted in the boiler-house as to enable the stoker to see at a glance, by reflection and without moving far from his furnace-door, whether his chimney is smoking or not. Improper stoking is one of the chief causes of the smoke nuisance, and when the stoker is reprimanded he invariably pleads as his excuse his ignorance of the fact that smoke was issuing from his chimney, as he was not in a position to see it. One firm in the north country has given the idea a trial, and has found it very efficacious, it having enabled them to keep beyond the strong arm of the law more successfully than formerly.

A HANDY AUXILIARY MOTOR-ATTACHMENT FOR YACHTS.

Though the true yachtsman, who is so firmly wedded to his sport and delights in harnessing the wind to speed him along, regards mechanical propulsion with disdain, yet there are times when a small, compact auxiliary motor-outfit would be very acceptable. This is most apparent when he wants to reach port in a calm or to save a tide. To meet these emergencies a handy little attachment has recently been evolved, which is auxiliary in the fullest sense of the word, since it does not form a permanent fixture of the craft, but can be easily attached and detached at will, and does not entail any structural alterations. There is a short spar carrying a length of shafting which is slung over the side of the vessel so that the screw at its lower end lies under the counter in clear water. At the forward end of the spar bearing against a thrust-chock is a small pulley over which passes a belt connected with the motor bolted to the deck usually just abaft the mast. The action of the propeller keeps the spar bearing so hard against a distant piece slung over the yacht's side as to render it almost impossible to push it away. Steering under way is perfect, far less helm being required than is needed when the vessel is running before the wind. When stowed on board, the spar occupies but little space, and can be lowered or hauled aboard in three minutes. By means of the power thus obtained, the yachtsman can be rendered independent of calms when the necessity arises without impairing the sailing qualities of his craft. When not required, the whole outfit can be stowed on board or left ashore.

HANDBOOK OF SOUTH AUSTRALIA.

That South Australia is awakening to the value of her magnificent assets as the central state of the Commonwealth is evident by the issue of a Government *Handbook of South Australia*, by David J. Gordon (C. E. Bristowe, Adelaide), in which her remarkable resources are set forth, which are at present being developed by only about four hundred thousand people. Very interesting features are the irrigation colonies of Mildura and Renmark, this

last on an elbow of the great Murray River. Other colonies are proposed. The Surveyor-General says that without great expense the low-lying lands along the Murray River valley might be made worth three and a half millions sterling. In one case five thousand acres of mature vines yielded produce in one season equal to forty pounds an acre. The Government has gone to great expense in forming wells. There are over one hundred and thirty Government bores, and more than twenty-five artesian wells. The theory as to artesian wells is that the supply from which they draw is the result of excessive rainfall on the Queensland Great Dividing Range, which has soaked down into an immense layer of porous strata between two impervious rock-beds, forming a sort of water-sandwich. The prospects of settlers in regard to sheep-farming, poultry-farming, fruit-farming, and viticulture are all discussed. When the rush to Canada becomes more normal the claims of Australia may receive greater attention, with its more attractive climate.

A NEW METHOD OF MANUFACTURING OILSKIN.

Oilskin overwear, so long indispensable to seafaring men, now finds favour with landsmen in both town and country, and its use by both sexes is fast becoming widespread. As with many other articles, despite the host of British firms who manufacture oilskin clothing, much of the supply comes from America, where large and wealthy concerns are engaged in the industry. The making of oilskin by any of the methods hitherto known is a very slow process, and the best results of the old method have serious defects. The cloth used for the purpose is first painted or soaked with a ground-coating of the waterproofing solution, and hung up for a few weeks in a heated room to dry. Then a second coating is applied, and the material is again hung up for some weeks. At the end of that time the cloth, if dry enough for tailoring, is made into garments. These garments next receive a coating, and the drying process is repeated. When the drying is as complete as possible, the garments must be allowed to mature. This usually takes about three months, dependent on the weather; so that, from start to finish, the time spent in making an oilskin garment may amount to nearly five months. Even with the utmost care, the oilskin thus manufactured has certain objectionable features: its appearance is seldom pleasing; it has an offensive smell; the cloth is always more or less greasy, damp, and sticky; and the waterproofing is not durable, for it is apt to crack and peel off, especially when it begins, as it usually does, to harden with age. From the trade point of view, the goods so made are difficult to handle in stock because of the impossibility of storing them in bulk, owing to their stickiness. When packed together they are apt to cake into a solid mass, and can be separated only by being torn asunder, to the utter destruction of the waterproofing. These defects are due chiefly to the action of the metallic oxides used in the waterproofing solution to hasten the very imperfect process of drying. Besides having such bad effects, and a tendency to rot the actual fabric, the oxides generate heat and render the garments highly inflammable—so much so that spontaneous combustion often occurs. A new method of manufacture has been recently invented, and is now in operation at a Glasgow factory. By this new method a great saving of time is effected. Within so short a space as twelve hours from the moment when work is begun upon the raw material a finished oilskin garment can be produced ready for immediate wear, in contrast with the five months taken by the old method. All the faults of the old method have been remedied, and the difficulties and dangers overcome, by the new process. The new material neither smells nor sticks; and though absolutely dry from the outset, it remains pliable and does not harden with age. Its appearance is good, and its finish and quality far superior to the old material. The inventor claims for the new oilskin that it will not crack or peel, nor stain or discolour, as does the old oilskin; that it will stand any climate and withstand frost, snow, or any weather; and that the waterproofing will last as long as the fabric. Goods made of the new oilskin may be packed together in any fashion and in any quantity without risk of caking or spontaneous combustion. Moreover, brine, oils, petrol, ordinary acids, or chemicals cannot injure or destroy the waterproofing. The uses the material may be put to are almost countless. For instance, it insulates electricity and can be adapted for medical purposes. Indeed, for any object where a thoroughly waterproof, airtight cloth is wanted this new material may be employed. It can be made in all textures from the most delicate silk required by the surgeon to the coarsest wagon-cover needed for railway traffic. Another novelty of the process is that the new oilskin can be made in colours. And not the least satisfactory element of the discovery is that it marks one more success for British inventive skill in open field against the foreigner.

SUMMER COLONIES FOR CITY PEOPLE.

In one of the latest reports of the American Commissioner of Education there is a section on this subject, describing the method adopted in Berlin whereby thousands of children are enabled to lead a healthy open-air life on the land, go to school, and gain a knowledge of small culture at the same time. On what is waste land outside the city, the parents rent at about four shillings for the summer season a patch of land on which is erected an arbour or temporary house, with corrugated iron roof, for housing themselves and their children. On these patches the children, under the guidance of teachers and parents, sow seeds and plant shrubs and vines and kitchen-produce. These arbour-gardens are tended by the amateur gardeners, who do not all remain overnight; thousands return to their homes in the city, and others only spend Sundays and holidays there. The German Empress, after

a visit to the arbour-gardens, was so impressed with the healthy appearance of the gardeners and the habits of thrift engendered that she sent a selection of strawberry-plants and flowers to the little colonists. The example of Berlin has been followed by Düsseldorf on the Rhine. The 'school in the forest' has been adopted at Charlottenburg, Dresden, and Elberfeld, and at Borstal Wood, near London.

FASTING AND FRUITARIANISM IN THE CURE OF DISEASE.

A remarkable hospital report on these lines by Dr O. L. Abramowski, Mildura, South Australia, is given in the April issue of the *Herald of the Golden Age*. It corresponds in many points with the methods adopted by Dr Oldfield in the fruitarian Lady Margaret Hospital, Bromley, Kent, and with some of the hints contained in Dr Keith's *Plea for a Simpler Life* and *Fads of an Old Physician*. No meat, alcohol, or drugs are used, and tea, coffee, and cocoa are weak and sparingly given. In acute cases of typhoid-fever the abstinence from food coincides with the feverish stage. In chronic cases no food, or only a limited supply of fresh fruit or fruit-juice, is given until after the disappearance of the 'habit hunger.' As soon as the tongue is clean, the temperature normal, and genuine hunger begins, feeding is resumed, but not before. Under these conditions nursing has been easier and shorter, and a much smaller proportion of deaths has occurred under hospital treatment.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

BOY BRIGHT.

PART II.

BOY BRIGHT was soon as much at home as though he had known them all his life; and, oh dear, how he loved every one of them, and how they loved him, and how jolly it was in the dingy old rooms, and how often they rang with laughter and fun! He came in to them like a streak of sunshine, with his adorable face and pretty, winning ways, and his gay, bubbling laugh; and if he wasn't utterly spoiled I suppose it was because he was an old-fashioned child, with a singular earnestness and perception that kept him nice under extraordinary provocation to degenerate into brat.

In time, being inquiring as well as old-fashioned, he learned to know why Joey had referred so despondently to the *Monthly General Intelligencer*—usually called the *General*, as though it were a Grant or a Sherman—as a sinking ship. Originally founded in 1858 by Erasmus Trotter, the American Slavery Abolitionist, it had once been a real monthly, with a real circulation, and, standing in the van of civilisation, had appealed to Man and Heaven to strike the shackles from the slave. Its musty, ill-printed files were full of a passionate denunciation. Trotter himself went out at the first call to arms; his letters from the front (all appearing in the *General*) were couched in the strain of a lofty and fervid patriotism not unworthy of an ancient Roman. He died of his wounds at the battle of the Tennessee, and the *General* had to go on without him—which it did, dismally enough, in a black border.

From that day to this it had steadily dwindled. Its only subscribers, apparently, were those who had taken it in its prime, and who, from sentiment or affection, continued to do so long after its decadence. It had been bought, rebought, and bought again; but no editor had been able to increase the number of that faithful handful who year after year paid their tribute to Trotter's memory. All sorts of people put money into it, and hope, and ideas—and all lost them. The *General*, whether as an exponent of fiction, of philanthropy, mission furniture, or civic reform, slowly ate up everybody connected with it. It never was a hearty eater, but merely chewed up three or four hundred dollars a month more than its income. It would have perished off the earth had it not, in some mysterious, long-forgotten manner, got finally entangled with the Titheradge Estate.

Why the Titheradge Estate was willing to lose three or four hundred dollars a month is more than I can explain. Perhaps it was because it was an excessively rich estate, dragging with it such a myriad of expenses that the *General's* monthly bite passed unnoticed; or perhaps, having been in litigation for half a century, it had grown so old and bewildered and decrepit that it didn't see well, and thought the deficit wasn't a deficit at all, but a profit. Anyhow, the *General* belonged to the Titheradge Estate, whose attorneys, Messrs Lyon & Klaw, used to write to it very snappishly every quarter-day, enclosing a cheque, and announcing that it—the *General*—was shortly to be wound up.

They had been winding up the *General* in this way ever since the Major had come into the office sixteen years before, and so far nothing had ever happened except to make every one feel insecure and uncomfortable. It was surprising the *General* dared to come out at all, with Lyon & Klaw so ready to chop his poor old head off; but he was a war-time *General*, very conscious that he had three thousand friends that loved him, not for what he was, but for what he had been. What he was, it must be confessed, wasn't anything much. Some trashy short stories, a serial from one of the literary unemployed, four or five scolding articles on the dreadful decay

of decency and honour in our midst, and a statistical-shotted page headed, 'Progress of our Coloured Brother'—and there you had the *General* in his old, whity-green regimentals, appealing more to your charity than to any idea you might have of really getting twenty-five cents' worth for your money.

All this about the *General* is necessary to explain the Tragedy of December 20, 1907. It was an ideal day for a tragedy—gloomy, wild, and driving with snow; and the frosted windows, misty and dripping, distorted the figures on the street till they were mere blobs against the all-pervading white.

Boy Bright was on the floor, whittling thirteen-inch guns for a battleship in process of construction; Joey, temporarily stopping whistling to try something that would sell, was painting Effie Jupe, who, with her shirt-waist off, and her hair down and clustered on her bare, girlish shoulders, was standing very close to the stove, and listening to the paper bag she held to her ear—it was supposed to be a sea-shell; and the picture was to be called 'A Message from the Sea.' Joey had painted a lot of such messages, and they were, as he expressed it, 'sure pop.' He was certainly in awful need of 'sure pop,' being reduced to two dollars and eighty-five cents, and his room-rent overdue. Miss James was writing at her desk, and the Major was snorting through some callisthenic exercises which he was accustomed to perform at intervals throughout the day, and was making such a grampus of himself that nobody but Boy Bright heard a knock on the outer door.

He ran out, thinking naturally that it was one of the seven paupers with a manuscript; but what was his surprise to find himself confronted by two splendidly dressed gentlemen in fur coats, who looked so important and commanding and stern that his little heart quailed within him.

'Is the editor in?' one of them inquired in a grand, overwhelming way.

'I will take in your name, sir, and see,' answered Boy Bright, with the customary formula. 'Please be seated, and I will find out.'

But the two, instead of sitting down properly, boldly pushed their way through the goat-fence gate and trod in right behind him. Effie uttered a shriek and grabbed for her shirt-waist; Miss James gasped and looked up; Joey, palette in hand, turned threateningly with the light of battle in his flashing eyes; the Major, who in his day could fight his weight in wild cats, started forward as though willing to do it again.

'I beg your pardon,' said the first grand, overwhelming gentleman, indicating the second grand, overwhelming gentleman, 'this is Mr Victor Titheradge, who by the recent decision of the Supreme Court of the United States has established his ownership of the vast Titheradge Estate, and incidentally of this—er—ludicrous and deplorable magazine enterprise. I am Mr Peabody, his legal adviser. Which of you, may I ask, is Miss James, the editor of the—er—*Monthly General* what-do-you-call-'em?'

'I am,' said Millie, flushing such a lovely pink that Mr Peabody's somewhat strident tone modulated perceptibly.

'Well, ah—er—Miss James—I am sorry to say—for your sake, but not for Mr Titheradge's, whose interests in this matter have been scandalously abused—to say, yes, that your services, and those of your staff, will be dispensed with on January the 1st. In a day or two—oh, ah, er—after Christmas, I had better say—I will send a reliable person to take charge of everything here, and pay you off.'

'Yes, yes,' said Mr Titheradge, who had been turned to for confirmation, and was trying to steal a view of 'The Message from the Sea'—'yes, yes, of course, Peabody. Wind it up! Wind it up!'

'I think we ought to look over the Eighth Avenue block next,' said Mr Peabody, quite unconcerned at having killed the *General* for ever and ever. 'It's on our way, you know, and the Fister Brothers have raised their offer to three hundred and seventy thousand for it. Expert advice is all right, but why not see the thing for ourselves?'

'If it's on our way,' assented Mr Titheradge, as though it would have taken a million to make him go out of it.

'Then, good-afternoon,' said Mr Peabody to the still-speechless Miss James. 'The person that I will send you will find most courteous and kind, I am sure, and I know you will afford him every assistance in your power.'

Then the two grand, overwhelming gentlemen, with a grand, overwhelming urbanity as icy as the blast outside, passed out in single file like a pair of Indians who had massacred a family of settlers and were departing with their scalps.

The stricken household gathered about the stove, mourning for the *General;* mourning for the happy, cosy, care-free days now over; mourning for themselves, thus grimly cast back into the sea of life—mourning and laughing, and crying and smiling, and all telling Boy Bright at once that he wasn't to be scared, for whatever happened there was always to be room for him too; and Miss James hugged him, and Effie hugged him, and the Major said he couldn't 'lofe him any better if he were an Austrian child, and all his own;' and Joey said he was a brick, and that they'd all chip in by-and-by and send him to school, so he shouldn't grow up a Failure, but be just such another as the splendid, silk-hat Gazabus who had fired them.

Then, what do you think, as Boy Bright was vehemently protesting that he didn't want to grow up a silk-hat Gazabus—why, it somehow came out that Joey was engaged to Millie James, and that the Major and Effie had been devotedly attached for two years, and that everybody loved everybody, so to speak, and were going to get married. Joey said it was not only the wisest thing they could do, but was an economy that was positively forced upon them since they all could live together for half-nothing in a squeegee flat, and Boy Bright could sleep on a convertible sofa.

The next few days were spent, not in getting married—which was easy and could wait—but in trying to get jobs—which was terribly hard and couldn't. The Major landed one on Ellis Island, at seventy-five dollars a month, to interpret for the Hungarian immigrants; Joey went off to make sure there was no slackening in the demand for girls in motors, and grew so discouraged that he fell a victim to a decorator, who hired him to fresco angels on ceilings for two dollars a day; poor, pretty Miss James just couldn't find anything except insults from horrid men; and Effie got the promise of an engagement with a statistical bureau with the longest hours, and the smallest salary, and the darkest, dismalest hole to work in that man in his might ever offered to girlhood in her extremity.

But the *General's* family did not falter—no, indeed not. Lovable, irrepressible Joey saw to that, and it was his idea that of giving a good-bye Christmas party in the old rooms, with a tree and a supper, and all the lights lit, and punch with sliced pineapple floating in it, and pully-crackers, and a train of cars for Boy Bright, and a wind-up torpedo-boat, and——

Oh! it was a wonderful party, and so gay and sad, and tearful and jolly, that probably in the whole of New York there wasn't one like it that night. It was only Boy Bright who seemed unable to join in properly, and his wistful, woebegone little face wore a strange expression, more as though he were grown-up and the others were the children; and he kept looking at them as though his heart were full of other and deeper things than trains or torpedo-boats, and was almost bursting.

After supper they sat on a Navajo blanket before the stove, very squeezy and close, with silly tissue-paper caps on their heads, and told stories; and Joey told one about a starving painter in Paris; and Millie told a perfect curdler about a spectre who was the means of restoring a cancelled mortgage; and Effie told a story about a blind man's faithful dog, which would have been terribly pathetic if they hadn't always laughed at the wrong places; and the Major told one about a lady who found herself at midnight stark alone in a railway compartment with a sleeping gentleman in a corner, and how he wasn't a sleeping gentleman at all, but a dead gentleman, with his throat cut from ear to ear. And then, when they were all done, what if Boy Bright didn't pipe up and say, 'Please, mayn't I tell a story too?'

Now, none of them dreamed that Boy Bright wanted to tell a story, and they were all astonished, though, of course, anything might be expected from such an old-fashioned child; and after he had been encouraged, and told, yes, they'd just love to hear it, he took a deep breath and began: 'Once upon a time there was a little boy who lived in a great big splendid castle, and he hadn't any father or mother—that little boy hadn't—but belonged to an estate, just as the *General* did, though he was called little Crœsus, because he was so rich, or rather was going to be when he grew up. And though he had ponies and automobiles, and stacks and stacks of toys, and two little boys who were hired to come and play with him, do you know, little Crœsus wasn't happy. No; he used to look out of the window, and wish he had a mother instead of Miss Marchmont, who was hired just like the boys, and a father instead of Mr Pendergast the lawyer; and, oh! he'd get so blue—oh! so awful blue, Joey—that I believe he'd have traded any time with some of the fellows skating down Fifth Avenue, even the commonest and poorest of them. And Miss Marchmont was good to little Crœsus, and so was Mr Pendergast too; but still—— You see, if anybody seemed to like little Crœsus they sent him right off; and first it was Jimmy the stable-boy, and then it was Robert the second footman, and then it was Katie, one of the under-housemaids. And when Katie was sent away it just broke little Crœsus all up, and he said to himself, "I am going to run away like Tommy in the book."'

Boy Bright stopped for a moment with such a far-away look in his eyes that he didn't notice the effect his story was having. The others were all holding their breath with the motionlessness of people struck dumb with amazement, while shivers of excitement danced along the Navajo blanket like shocks of electricity.

'Well, one night little Crœsus crept out as dirty and ragged as he could make himself, and tried to be as much like Tommy in the book as he could; though the book was all wrong about its being hard. Why, everybody was good to little Crœsus, puffickly, wonderfully good; and a Swedish lady took him in for nothing, and nobody beat him or ill-treated him at all, and the only bother was a Salvationist who tried to catch him for a home. And then he got a job as office-boy with the dearest, kindest, bestest people in the world—— No, no, Joey, the story ain't finished. Yes, he loved every one of them, little Crœsus did; and finally, when the *General* busted, and they all had to look for jobs, and weren't specially good at finding them, little Crœsus thought and thought and thought how to help, and then he said to himself, "Why shouldn't they get the reward and divide it, and I'll just make them a Christmas present of myself, even if I have to go back? And, oh, Joey, it's TEN THOUSAND DOLLARS!'

He didn't get any further than that, for Effie had run at him, and was shaking him, and kissing him, and slapping him all at once, and screaming, 'You're Philip van Nuys! You're Philip van Nuys! You're Philip van Nuys!' And the others all cried out 'Philip van Nuys' too, as though it was a miracle, for the papers had been full of nothing else for weeks, and there were articles broadcast about the Black Hand and the terrible increase of crime; for the universal idea was that Philip van Nuys had been kidnapped, and was being held for ransom by fiends in human shape.

Joey didn't want to go to the telephone at all, and at first didn't want to claim the reward either;

and Boy Bright had to talk and talk and talk, and order and order, they were all so backward and undecided, and kept hugging him instead of doing anything. But, finally, Joey was made to ring up the Van Nuys' mansion on Fifth Avenue, and say he had found Philip, and would they kindly come and fetch him? And come and fetch him they did, in two automobiles crammed with policemen, who burst into the office with revolvers; and while the situation was being explained to Miss Marchmont and the officers, my stars! if more reserves didn't come pounding up, and more after that, till East Ninth Street was all jammed with a crowd that sprang up from nowhere, and surged about the entrance of No. 53, yelling and gesticulating as though they were a riot.

Then, as they said he must go now, Boy Bright turned to Joey, who was crying just as bad as he was, and kissed him; and kissed Miss James, who was crying too; and kissed the Major, who was just dripping; and kissed Effie, who even at that watery moment was still such a little tease that she bit his ear till it hurt, and said it was a love-bite, so she'd know him again if they ever met; and Boy Bright said she was too stupid for anything, because they were going to meet ever-ever-every day, and he was going to ask Miss Marchmont to let him come to the squeegee flat and sleep at night on the convertible sofa! And Miss Marchmont, who was dreadfully agitated and trembly, said he could do anything in the world if only he'd promise never to run away again and drive them distracted. And then all the officers opened a kind of lane for Boy Bright and Miss Marchmont to pass through; but at the door Boy Bright stopped, and insisted on looking back, tugging at Miss Marchmont's hand until she had to. And if ever he appeared a cherub from heaven it was then, his eyes were so shining, and his face so strangely noble in its childish beauty; and all he said was 'Merry Christmas!' just like that, to the four people he loved better than anything on earth. 'Merry Christmas!' and then he turned, like the great little gentleman he was, to allow Miss Marchmont to precede him, to return to his great, splendid, lonely house on Fifth Avenue.

THE END.

THE OLD HOME.

'Neath the shade of the towering pine-woods,
Where the fairy footsteps tread,
In a garden gay where the children play,
The old home rears its head.
It is gray with the storms of winter,
As it stands in its flower-strewn dell,
Where my sires did fight for their King and Right—
That's where I love to dwell.

They look from their panelled pictures,
Warrior and Cavalier,
With their lovely dames, in their gilded frames,
And their eyes speak loud and clear:
'We did our best for the old home,
We reared this roof-tree well,
And we trust that you will be strong and true
To the home where we loved to dwell.'

And across this old stone threshold,
With a joyous heart, I led
The fairest bride in the country-side
On that day when we were wed.
And in all life's woes her sunlight
Has never ceased to shine,
And sorrow dies when her welling eyes
Look lovingly into mine.

When the spring has tinged our woodlands,
In the joy of the budding year,
With the bright primrose, and the violet grows
In the groves of the fallow deer;
When the birds are singing sweetly
In the woods and vale and hill,
Where'er I roam, in the dear old home
Is where I would be still.

When the harvest brings its treasures,
Its sheaves of golden grain,
And with dance and song a joyous throng
Goes merrily down the lane;
Then every lass has her sweetheart,
And they're blithe on the village green,
There's no joy on earth like the homely mirth,
The old pipe and tambourine.

Hark! the sound of the huntsman's horn
Through the merry woodland rings:
And we must ride to the covert-side,
To join in the 'sport of kings.'
And then when the chase is over,
And the darkling shadows fall,
Old tales are told by the friends of old
In the firelit, haunted hall.

And there's joy when the bells of Christmas
Ring out over dale and hill;
And the King of Kings His message brings
Of peace, and to men Goodwill;
And the children's happy voices
Re-echo unceasingly,
Where the fire shines bright on a Christmas night—
That is where I love to be.

So here's to the Homes of England,
The hall and the cottage too;
The sturdy men of the moor and fen
Who are honest, brave, and true.
We love our homes by the hillside,
Our garths by the guarding sea,
And will aye defend, till life shall end,
Our homes where we love to be.

P. H. Ditchfield.

*** TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
2nd. For its return in case of ineligibility postage-stamps should accompany every manuscript.
3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.
4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

JOHN MAINWARING, FINANCIER.

By MOLLY ELLIOTT SEAWELL, Author of *Little Jarvis, Sprightly Romance of Marsac*, &c.

IN FOUR CHAPTERS.—CHAPTER I.

THE wide, bright terrace of the great watering-place of Heimbad was a riot of colour on an August afternoon. The gay gowns of the women rivalled the gorgeous flower-beds, while toward the farther end of the terrace a mass of snorting and puffing automobiles lent a note of savage colour to the scene.

At a table on the terrace sat Richard Courtenay, lawyer and gentleman, watching the scene in the meditative manner with which a thinking man of forty observes such things. He was forty, and his whole life up to that time had been spent in that grim conflict known as providing for a family. Only within six months had his sisters married, his mother come into an inheritance, and his younger brothers become self-supporting.

Courtenay thought his prosperity had arrived too late. It should have come two years before, when he found himself in a little Swiss village, where at the same hotel was Lucia Mainwaring, the woman he would have wished to make his wife. Courtenay surmised that she was the paid companion of the elderly lady with whom she was travelling. His passion for Lucia Mainwaring was one of those sudden and overwhelming cataclysms which are liable to overtake a man from twenty to eighty. He had never felt himself in a position to ask any woman to marry him; therefore he did the only thing possible — bade Lucia a cheerful good-bye and took the next steamship for New York.

Courtenay's sombre reflections concerning life, love, and Lucia Mainwaring were interrupted by a tall, handsome, oldish man seating himself at the same table. Never, thought Courtenay, had he seen such vivid eyes. They reminded him vaguely of Lucia Mainwaring's blue pools of light. Everything about the stranger shouted out his nationality —he was an American.

The new-comer inspected Courtenay, and remarked, after a few minutes, 'This is a very interesting place.'

'Very,' answered Courtenay.

'Of course, I did not mean Heimbad alone, but the whole of this toy Grand Duchy of Osterberg. It furnishes nine hundred men to the Imperial army, and a bodyguard of three hundred more, with brass helmets and nickel cuirasses, to protect the Grand Duke from ghosts, I suppose. Have you ever seen the Grand Duke?'

'Yes,' answered Courtenay; 'I knew him twenty years ago, when both of us were students at Giessen University. By a series of deaths and a streak of insanity in the family he became Duke of Osterberg, and I'll warrant there never was such a surprised Grand Duke in the world when he was notified of his succession.'

'Streak of insanity, did you say?' The stranger, his voice resonant with keen interest, turned full on Courtenay.

'Well, that's the polite name for it. I think it is simply degeneracy and drink.'

It was evident that the family history of the Grand Duke Hugo XVIII. was of the deepest interest to Courtenay's new-found acquaintance. Just then something happened which made Courtenay forget everything else in an instant of time. It was the sight of Lucia Mainwaring walking along the promenade, the sun glittering gloriously upon her, graceful, tall, and radiantly handsome. With her was an elderly lady, evidently her mother, and a slip of a girl, as plainly a younger sister. Lucia, who was essentially a clothes-wearing woman, seemed to add a splendour of her own to her superb white gown, to the ropes of pearls around her throat, and the waving white plumes in her picturesque hat. On catching sight of the older man, Lucia nodded to him, a brilliant smile illuminating her eyes, while the younger girl threw him a kiss. The identity of his new acquaintance suddenly flashed upon Courtenay. He was John

[*All Rights Reserved.*]

Mainwaring, a man of whom Courtenay knew much and had heard more, a master of finance whose millions were untainted; and Lucia was his daughter.

Then Lucia's eyes met Courtenay's. She gave no sign of agitation, and after an exchange of glances and a courteous bow, she passed on in silence.

'So you know Miss Mainwaring?' said Miss Mainwaring's father.

Courtenay, without betraying his conviction that he was talking to the father of Lucia Mainwaring, replied, 'Yes. I had the honour of making Miss Mainwaring's acquaintance in Switzerland two years ago.'

'That was the time when she was travelling with a chaperon who was taken very ill at Alpensberg. Miss Mainwaring likes once in a while to lead the simple life, but not for very long.'

Courtenay blushed at the remembrance that he had even considered whether he might not ask Lucia if she were in temporary need of money, and thanked God that he had not dared so much.

'Her mother has a pedigree,' said Mainwaring. 'I am a great believer in atavism. Those two girls, Lucia and Milly, show they have a grandfather, at least on their mother's side.'

'They certainly have a father,' remarked Courtenay, looking full at Mainwaring. 'I have been at work on some of those land-grant cases in which Mainwaring is mixed up, and I know his course pretty thoroughly.'

'I hope you like it,' said Mainwaring with a grin.

'I am lost in admiration of the man,' responded Courtenay boldly.

Just then there was a great commotion on the terrace, everybody standing up, while the band played the national hymn of Osterberg. It was the Grand Duke Hugo XVIII. and his suite—the same big, blonde, innocent-eyed Hugo of twenty years before, who used to wear Courtenay's shirts and complained that the collars were too small.

The next thing Courtenay saw, the Grand Duke was standing with Lucia Mainwaring, the centre of a dazzling group. The younger sister Milly, a marvel of prettiness, had slipped off and was sitting at a table with Tommy Goddard, a little naval ensign who had crossed the ocean with Courtenay, and had thrown out mysterious hints of being upon a love-errand.

Then a stiff and glittering object in brilliant uniform approached and spoke to Courtenay. It was Baron von Tempsky, aide-de-camp of the Grand Duke. 'This is Mr Courtenay, I believe? His Serene Highness asks your attendance.'

Courtenay at once joined the group, in which stood Lucia Mainwaring. The Grand Duke embraced and kissed him student-fashion.

'Wait for me,' said the Grand Duke after the first greetings were over, 'on yonder bench. I wish to have a long talk with you, and you must join my party at dinner to-night on the terrace.'

Courtenay with cordial thanks accepted, and then turned to Lucia Mainwaring and exchanged a few words. There was a glint of laughter in her eyes, as if saying to him, 'What do you think of me now?'

The afternoon was full of pleasure and pain for Courtenay. It was on toward sunset when he found himself sitting on a bench alone with the Grand Duke and listening to his confidences.

'Ah, what a joy it is to meet one like you, my friend,' he cried, 'to whom one can speak from the heart! I have a dream that sounds like one of the tales of Scherezed, but it is as practical as anything ever devised by an American financier. You observed the beautiful Miss Mainwaring on the terrace?'

'Yes,' replied Courtenay. 'I have the honour of a slight acquaintance with Miss Mainwaring.'

'Now, hear my story,' continued the Grand Duke. 'I adore Miss Mainwaring.'

'That is very unfortunate,' replied Courtenay dryly.

'But listen, my friend. I contemplate offering her marriage—morganatic of course. Her father, you know, is stupendously rich, and it is not to be supposed he would not be willing to bestow a splendid dowry upon his daughter for the honour I wish to do her. I make no secret of the fact that my finances and those of the Grand Duchy are in a very confused state. The Kaiser, I may say, is somewhat angry with me on account of the financial situation in Osterberg. I hope to obtain from him the rank of countess at least for Miss Mainwaring. That will put the marriage upon a dignified basis, morganatic though it will be; and Mainwaring, I am sure, will give his daughter a magnificent dowry.'

The angry blood rushed into Courtenay's face at the mention of a morganatic marriage for Lucia Mainwaring; but he realised that his viewpoint and the Grand Duke's were as far as the poles asunder.

'Have you reflected,' asked Courtenay after a moment, 'whether Miss Mainwaring would accept such a proposal, and what her father will say to it?'

'What! to become a countess, the wife, even morganatically, of a Grand Duke of the Empire; to be recognised as such; to rank next to royalty and before ambassadors?'

Courtenay remained silent. The Grand Duke prattled on until there was just time left to hurry to the hotel and dress for dinner on the terrace.

The party was large, and Courtenay was placed next Lucia. Above them was the blue-black sky of night, satined with palpitating stars, and a great golden moon hung trembling over the tree-tops of the park. In Lucia's eyes, as she turned them full on Courtenay, was something which was either coquetry or passion, he could not tell which. Courtenay was charmed, pained, mystified. For Lucia was, like all women, subtle and simple, frank

and sly, bold and timid, strong and weak, rash and calculating, and able to deceive herself and all the world beside.

CHAPTER II.

WHETHER Lucia Mainwaring were in love with Courtenay or not, there could be no doubt in the days that followed that her father at once fell deeply infatuated with him, and would scarcely let Courtenay out of his sight.

One thing amazed Courtenay, and that was Mainwaring's evident ignorance that the Grand Duke's marked attentions to Lucia could only mean a morganatic marriage. Mainwaring discussed the Grand Duke and Lucia quite frankly with Courtenay.

'You see,' he said as they walked together one morning in the park, 'it all depends on Lucia herself. If she loves the fellow there is nothing more to be said. And I must admit that, with all my daughter's fine qualities, she has that strange feminine hankering after what women call social position. When we came from the West Lucia expected New York society to fall at her feet. It didn't, and this chagrined her. She appears to me to be torn between love and ambition, and I can't tell which will win.'

Courtenay did not ask the name of the man who represented love in the game. His own lack of fortune and Lucia's supposed poverty had stood between them two years before. Now there was the vast lump of Mainwaring's money like a lion in the path.

Just then Lucia's graceful figure appeared coming toward them. Mainwaring quickly slipped off into a bypath, leaving Lucia and Courtenay alone under the trees.

'Papa has been talking to you about the Grand Duke?' said Lucia, with a directness inherited from her father.

'Yes,' replied Courtenay; 'and the notion of the kind of marriage the Grand Duke means has not yet dawned upon your father.'

Lucia blushed a little under Courtenay's eye, but she replied, half-laughing, 'I believe the Grand Duke thinks my father is a little cracked.'

'All Europeans think that American fathers are a little cracked,' answered Courtenay with a short laugh. 'But I shouldn't like to be in Hugo's shoes when he mentions the word morganatic to your father, and he certainly will.'

There was a pause, and then Lucia said with downcast eyes, 'But I have had my dream of love, and it went wrong. Now I may have my dream of ambition, and take its chances.'

Courtenay set his jaw hard. If she were capable of this morganatic marriage—well, then, she could never have been the woman for him. Then they separated.

Courtenay walked back in the direction of the terrace; but when he had gone fifty yards the Grand Duke's voice hailed him from a motor-car, and almost before he knew it he was whirling toward the summer palace of Sternberg, six miles away.

The Grand Duke was in a state of suppressed ecstasy, and as soon as they reached the palace and were alone he clasped Courtenay in his arms and cried out joyfully, 'My friend, it is all arranged! A week ago to-day I sent Von Tempsky to see the Kaiser. Von Tempsky returned this morning, bringing with him the Kaiser's stipulations in writing concerning my marriage. I immediately sent Von Tempsky to Heimbad with a request to Mr Mainwaring that he come to Sternberg at two o'clock to-day. There may be some difficulties in the way of our coming to a mutual understanding. Mainwaring is to me a daring and perfectly incomprehensible person, and I foresee that your services will be valuable. He may object to giving his daughter the sum of money—ten million marks—which the Kaiser positively requires before conferring upon her the rank of Countess of Heimbad.'

'Mainwaring won't make the least objection to giving his daughter ten or twenty million marks,' replied Courtenay. 'But whether he would allow you to control one penny of the money, or even consider your proposal to marry his daughter morganatically, is more than I can say.'

'Then Mainwaring is a lunatic!' responded the Grand Duke.

The two had luncheon together, and then returned to the small, high-ceiled room in which the Grand Duke held his most private interviews. They had lighted their cigars when Mainwaring's arrival was announced.

'I shall continue to smoke,' remarked the Grand Duke, 'as it will indicate a certain indifference to the result, which, I assure you, my friend, I am very far from feeling.'

Courtenay could have laughed aloud at the idea of this six-foot infantile Serene Highness being able to throw dust into the eyes of John Mainwaring. In another moment Mainwaring was ushered in, and the Grand Duke received him with marked courtesy. After a pause the Grand Duke began, with an air of expansive candour, and taking his cigar from his mouth, 'Mr Mainwaring, you see before you a lover. I adore Miss Mainwaring.'

'So do I,' responded Mainwaring.

Courtenay could have added that he too adored Lucia.

'But,' continued the Grand Duke, becoming serious, 'a reigning sovereign cannot always follow the promptings of his heart.'

'Quite true,' replied Mainwaring, with equal seriousness. 'Napoleon had to divorce Josephine. Your Serene Highness can appreciate better than I this painful parallel.'

The Grand Duke saw a laughing devil in Main-

waring's eye as he said this, and was afraid he was joking. The Grand Duke continued, however: 'At first it seemed a titanic task to make it possible that I should be able to secure my happiness with Miss Mainwaring. However, love can surmount great obstacles. I sent my favourite aide-de-camp and my personal friend, Lieutenant-Colonel Baron von Tempsky, on a special mission to the Kaiser, laying before him all the circumstances in the case. These'—taking up some papers from the table—'are the Kaiser's terms. I can give them to you in brief.'

Mainwaring moved his chair up to the table, and the Grand Duke read in a sonorous voice: 'The Kaiser requires first that ten million marks shall be settled upon the Grand Ducal Crown of Osterberg without conditions. There are certain obligations of the Grand Duchy toward the Imperial Government which the Kaiser stipulates shall be liquidated out of this ten million marks; but this is a subject of negotiation between the Imperial Government and the Grand Duke personally. The Grand Duchy of Osterberg has no constitution.'

'And probably never will have,' said Mainwaring suavely.

'Such is my hope,' responded the Grand Duke tartly. 'The Grand Duchy of Osterberg has been happy without a constitution for eight hundred years.'

'Then, to bestow a constitution upon Osterberg would be like giving a telescope to a blind man,' replied Mainwaring.

The Grand Duke liked less and less Mainwaring's easy, not to say debonair, manner; but he was prepared for this, and kept on resolutely: 'Miss Mainwaring's position as Countess of Heimbad will be entirely fixed and regular. The marriage itself will be perfectly regular, morganatic though it will be.'

At the word morganatic the light leaped into Mainwaring's eye. It was the first time he had suspected the species of marriage which was being offered to his daughter.

Something seemed to illuminate the Grand Duke's mind also, for he turned to Courtenay and said quickly, 'Please explain to Mr Mainwaring the true status of the perfectly honourable marriage which I offer Miss Mainwaring.'

'That is unnecessary,' replied Mainwaring, rising to his feet.

Instinctively both the Grand Duke and Courtenay stood up. Mainwaring remained silent, grinding his teeth, while his face turned a dull red. The next moment his arm shot out, and but for Courtenay would have landed full upon the Grand Ducal nose. Courtenay had rowed stroke in the university boat-race, but he was as helpless as a child to hold Mainwaring, who dashed around the table with the obvious intention of throwing the Grand Duke out of the window. The Grand Duke was a soldier and courageous enough, but he thought he was dealing with a madman, and before Mainwaring could get at him he slipped out of the door. Mainwaring, now pale and panting, recovered himself with a strong effort. He walked back to his chair and sat down quietly enough; but Courtenay could see the veins pulsating in Mainwaring's neck and powerful jaw.

Both men were perfectly silent for ten minutes. When Mainwaring spoke his comprehensive mind had already produced the germ of a course of conduct. It even brought a smile to his strong, expressive mouth. 'Why didn't you let me whack that scoundrel?' he asked pleasantly of Courtenay. 'I would have liked to have got in a blow on his solar plexus. However, I can still make him sweat for his devilish, colossal, and infernal impudence in daring to propose that my daughter should become his morganatic wife.' Mainwaring's eyes grew sultry as he spoke these words; but in a moment he continued, Courtenay meanwhile scarcely able to believe his own ears: 'Now, do you go and find the Grand Duke, and make my compliments and apologise to him. Tell him that I am a man with a violent temper, which my daughter does not inherit. That's a lie, by the way; my daughter has a temper just like mine. Then you tell his Serene Highness that I am prepared to resume the negotiations, and that I am fully able to give my daughter forty million marks if I choose, and I will if she marries to please me. So just go and speak to the Grand Duke, and I'll stay here as quiet as a lamb until you come back.'

Courtenay's short absence was utilised by Mainwaring writing a memorandum, to which he signed his name.

In two minutes Courtenay returned grinning. 'The Grand Duke says he will accept your apologies, and will see you in the next room.'

Mainwaring, with an answering grin, went with Courtenay into the next room, and going up to the Grand Duke, said, 'I beg your Serene Highness's pardon for my exhibition of temper just now. I admit that I resented the idea of a morganatic marriage for my daughter. However, I have changed my mind. Here is a little memorandum which I have written and signed. I offer to give my daughter forty million marks upon her marriage to your Serene Highness if the Kaiser can be induced to bestow sufficient rank upon her to permit of her becoming Grand Duchess of Osterberg instead of merely Countess of Heimbad. I have also given a list of references to New York banks and trust companies which will prove my ability to keep my part of the bargain. I have put in one stipulation, which any father would, I think. It is that my daughter shall fully and freely consent to the marriage.'

The Grand Duke opened his arms wide, and Courtenay was afraid that a kiss and embrace of Mainwaring were impending; but Mainwaring by a skilful manœuvre got out of the way, and accepted only a cordial handshake.

'I agree to your stipulation, and nothing shall be wanting on my part,' cried the Grand Duke enthusiastically, 'to bring about making Miss Mainwaring Grand Duchess of Osterberg.'

Courtenay did not for a moment believe Mainwaring's sudden change of front meant what it seemed to mean. He saw in it some elaborate scheme of revenge, such as Mainwaring was capable of working out in every detail.

(To be continued.)

HOW TO IMPROVE THE HOUSEHOLD ARTS.

By Walter Shaw Sparrow,
Author of *Old England, The English House, Hints on House Furnishing,* &c.

A GOOD story is told of Tennyson and a jerry-builder. The poet, having a great detestation for a free-trade in ugliness, protested against a common act of vandalism—the felling of useful trees on a new site. 'Why do you cut them down?' he asked. 'Put the foundations of your house a few yards back, and you could save them; trees are beautiful things.' The home-spoiler laughed with amusement. 'Trees are luxuries,' he replied. 'What *we* need is utility.' And the slipshod commercialism of our time has never had a more laconic spokesman.

Most of us have one thing in common with the jerry-builders: we are fond of cheapness, and believe that it pardons a great many frauds. The word cheap fascinates the modern mind. Who does not wish to buy something at a bargain? Even thriftlessness, mere waste of money, is bought in that way, not without pleasure to the purchasers. 'My dear,' says Mrs A. to Mrs B., 'this furniture may be too fragile and too varnished, but consider the price! Cheap, my dear—very! You'd be astonished if I showed you the bill—receipted. Not hire-purchased, you see; I'm not to be gulled by silly advertisements. No. I found my own shop and made my own choice.' Then Mrs B. looks enviously at her friend's sofa and chairs, reflecting that her own better furniture 'cost quite a lot,' and marvelling why she did not get a cheap suite without value, so as to save money for her dress-account.

A friend of mine some years ago was very proud of his belief that bad workmanship became good if he bought it 'cheap.' His hobby was reading. 'I am buying,' said he, 'in the cheapest editions to be found, all the classics published in French, German, and English. Print and paper don't count for much, you see; the important thing is to have a writer's thought and style, and these may be got to-day at rare bargains. It's modern enterprise,' he concluded with pride, as though he formed part of each printing-machine and of each publishing speculation. The last time I saw this devotee of cheapness he was reading by a heavily shaded light, with his eyes protected by blue glasses, and a green shade around his forehead. 'Very troublesome, my eyes,' he said to me. 'Reading—well, it's a splendid hobby; but it plays the deuce with my eyes, somehow.' For he had then in hand one of those translations from the Greek classics which are sold in Paris for twopence or threepence.

If medical men were to write down all the bodily troubles that have their rise in bad work at 'bargain prices' we should understand why chemists look so prosperous. It is because the ills produced by cheapness need expensive medicines. In the long-run cheapness means annoying discomforts and bad nerves.

Then, of course, there are questions of social economy. Crafts and trades are not properly nourished by tiny prices and defective work. That sort of diet resembles Falstaff's plentiful sack accompanied by little good solid food, producing weak legs and a swelled body. Lord Morley, who has never feared to be serious, would put the truth in a different way, and ask us to remember that all civilisations are tested and proved by their household arts—that is, by their home-life considered in relation to domestic achitecture and to the general equipment of cottages and houses.

Here, if anywhere, thoroughness of work will be prized and safeguarded, if only because of its daily effect on that for which men labour—namely, the happiness and health of their womenfolk and children. Yet, somehow, during the last fifty years good house architecture has been a rare thing, a joy for the well-to-do. The middle-classes and the poor have been dependent on jerry-builders, whose speculations have been a national disaster, as bad almost as a foreign raid or invasion. Have they not ravaged great districts of beautiful country? Where farms used to be we find labyrinths of mean streets, so badly built that even the decencies of life are not considered with the least care. Walls and floors, which ought to be as sound-proof as science can make them, particularly when bedrooms adjoin one another, are as indiscreet as phonographs. Every movement in one bedroom is heard in another, so that children cannot help listening to their parents' words and actions.

Again, take the transmission of sound through wood. It ought to be common knowledge that timber is an excellent conductor of noise. Yet the joists of floors often touch one another from house to house, with the result that many houses become one in disturbing sounds. Privacy is quite impossible under such conditions. Why is it, then, that householders do not complain as a body? Could they not form a Society of Home Defence, with a central

office in London, and with power enough to press their needs and grievances on all political candidates? One fears, though, that the jerry-builder has represented the popular taste; and what that taste is, and has been for five decades, may be seen clearly in the following picture, drawn by a distinguished architect, the late J. J. Stevenson:

'The principle of construction seems to be that it [that is, a home] shall always be out of repair, so as to provide work for the building trades; and that at the end of the lease a house may be worthless to a ground landlord. The walls are thin, and let in the cold and the sound even of conversation in the next house. But for the floor-timbers that tie the walls together, a gust of wind would overturn them. The floors shake with the slightest movement; the plaster is half sand, and is kept on the walls mainly by the paper pasted on it; doors and windows do not fit; the plumber-work is bad, and the water-pipes freeze; the "compo" outside requires constant painting, and occasionally scales off in masses. Workmen are never out of the house, and the tenant finds that to keep it habitable adds a third to the rent. The architecture, again, however small the house may be, is a union of vulgar pretentiousness and mean shams.'

Such is an English home when cheapness becomes the standard of value. It is then the negation both of common-sense and of decency. Common-sense ought to know that in an age of general competition things cannot be made or sold for less than their market value, and hence it is absurd to talk about cheapness. But there is something more important than that to be understood, something that touches the welfare of a whole nation—namely, that a habit of doing bad work is degrading, like a habit of telling lies. Thoroughness of work is honesty of character, without which no nation can progress.

For that reason, and no other, the present bad condition of household art denotes a very dangerous time in our national history. If the past has left us any tradition more remarkable than our delight in sport and our love of adventure, it is the tradition of good and thorough craftsmanship, which may be followed from the early Victorian era backward to the settling of Christianity among the Saxons of the seventh and eighth centuries. During that long span of time Great Britain was loyal to honest workmanship. Here and there, as in the tower of Earl's Barton Church, Northants, you may see to-day how firmly and well the ancient Saxons built. On *their* thoroughness Time cannot play with lingering hands that ravage and undo. And you may see, also, in all typical examples of old British work a reticence of style that keeps away from showy and meretricious ornament. To-day, on the other hand, side by side with the craze for cheapness, there's a parade of sham decoration. The public hates simplicity and insists upon having a fussy make-believe. Wall-papers are covered with realistic patterns, the 'cheapest' furniture is often inlaid, basswood (a bad thing that soon wears out) is stained to look like rosewood or mahogany, and ordinary oak is turned into brown oak by being treated with a solution of chromate of potash. Sycamore is a fine wood, but the taste of the hour prefers it when it is 'converted' into ebony, for which purpose two or three applications of logwood chips are used, followed by a treatment with vinegar and steel filings.

Wherever we look, in any branch of the popular household arts, we find pretension and glaring sham. It is difficult to believe that we have had great public teachers like Pugin, Ruskin, Carlyle, and William Morris. Where has their influence gone? Why are their writings looked upon as 'stodgy'? Critics, amazed by the worthless household things displayed in the shop-windows, ask themselves these questions every day. At one time they believed that early Victorian furniture was the ugliest in the world, but now they admit that it was well made, while the bulk of our own furniture is bad in every way. This fact must be clear to any one who compares the simplest cottage furniture of the eighteenth century with the wares sold to-day in large and important shops. Finally, owing to this degradation of our contemporary household crafts, fabulous sums are paid for old examples of British furniture. Collectors have given a thousand guineas for a single arm-chair which Chippendale would have been glad to make for thirty. Thus we pass from the extravagance of cheapness encouraged by popular shops to the extravagance of collecting at public sales by auction. The one represents a time of shoddy and the other a protest against that time.

But it is not enough to state a case. The origin of bad things should be explained, and it is necessary also to suggest practical remedies. The decline of British workmanship in the domestic arts and crafts, though clear enough to all students of social history, has not yet been explained in a definite fashion. To understand its origin we must remember that the usual growth of a nation is like that of yew-trees: an imperceptible addition of new substance and life extending over hundreds of years. Such was the social growth of England from Saxon times to the invention of steam machinery. Now and again the growth was interrupted by grave national disturbances, just as yew-trees are harmed by occasional tempests; but when strong things grow under conditions of resistance, of struggle against opposition, they gain tenacity and stamina. Further, when a nation's progress goes on slowly age after age through the centuries, traditions are formed in all crafts and trades, and they change gradually, imperceptibly, like the home-life to which they appeal. Artisans learn in youth all that traditions have to teach, learn it thoroughly, and understand it to their finger-tips. Thus village masons centuries ago were true architects, for they did unaided such beautiful work as our modern architects are happy to imitate; and among other craftsmen also admirable things were done as a

matter of course, without any fanciful chatter about 'art.' A child's sampler was a good thing of its kind; a carpenter's deal table had beauty and distinction; and the same fine spirit of thoroughness may still be found in fishing-smacks, canal-barges, costers' barrows, saddles, country carts, and other examples of old craft-methods. Indeed, wherever the great traditions manage to survive, there you will find humble and common objects that artists love because of their beauty.

It follows, then, that bad work means the disappearance of good traditions. This may arise either from mere carelessness or from a sudden and complete change in a nation's life and normal progress. Such a change began with the invention of steam machinery, which has produced in less than a hundred years more grave questions of social economies than did all the other centuries lying between us and the Roman domination.

The Roman roads, elaborately built and paved, mark the beginning of one type of society in which growth was slowly accumulative; railways and the factory system put the world on new lines of progression, giving us mechanical invention and speed for traditional handicrafts and slowness. It is hard to realise how complete was the social revolution. In a few years women and men had to adapt themselves to a new ordering of their daily lives. Houses were no longer built, but thrown together in a few weeks; great factories seemed to spring out of the fields by enchantment; and soon a fever of restlessness spread from town to town, fostered by a newspaper press that screamed for the people's pennies from early morning till late at night.

All this, no doubt, was not friendly to any old tradition that the nation wished to keep; and soon it became evident that the general standard of workmanship was regulated, not by economic principles favourable to all household wares, but by two things: (1) by the element of danger in the products of certain industries, and (2) by the people's alert criticism in all that belonged to their sports and pastimes. In other words, the peaceful home arts declined rapidly, while good workmanship was maintained in all sporting tackle and in all things which brought people face to face with dangers, such as ships, railway engines, surgical implements, revolvers, guns, rifles, and so forth. This fact is very remarkable. I do not think you will find without difficulty any examples of slipshod craft-methods in those two classes of industrial enterprise. It is only in the home arts that sham and pretension hold sway. As an example of this, compare any surgical implements with ordinary penknives or with table-knives, and you will find that while the first are admirably simple and thorough, and therefore fit for their purpose, the others look much better than they are in reality. The steel of ordinary penknives leaves much to be desired, and many table-knives are soon blunted even by tender meat. Silver fruit-knives, again, show much wasted and showy labour, for their blades are usually scrawled over with unnecessary designs, manufacturers having no confidence in the natural beauty of silver.

If surgeons were careless like householders, if they did not insist upon having excellent tools, we may be sure that competitive manufacturers would cheapen the quality of work in surgical implements. Under modern conditions, no tradesman will give more than his customers will accept. For instance, cricket-bats are well made because all cricketers are good judges of their own needs, and dangerous things are usually well made because manufacturers know that slipshod work would mean a loss of life and a very serious public scandal, as in the case of the bayonets which 'corkscrewed' in the Soudan. Shipowners were inclined to be careless before the Plimsoll mark was introduced to keep them and the public in mind of the dangers attending dishonest trade-methods. It is because the household arts have neither the protection of private knowledge nor the discipline of public fear and criticism that they decline under the competition of to-day's industrialism.

Only a householder here and there knows anything helpful about design and decoration, and those who supply him with furniture are subject to no public criticism. The newspaper press never criticises the shop-windows, never reviews a trade catalogue, and has seldom a word to say on any question of house architecture and furnishing. Are homes, then, of no account? Is a nation's family life of less importance than books, plays, and pictures, which are kept under searching public discipline?

The jerry-builder could never have won for himself such a bad reputation if the newspaper press had 'slated' his first achievements; and the displays of cheap goods in shop-windows would soon be improved by expert criticism in the leading journals. Tradesmen would then be afraid to show off any defective wares, realising that their shop-windows are public exhibitions subject to censure as well as praise. The general principle is this: that all goods shown publicly for sale ought to be criticised publicly by experts, so that their workmanship may not become deceptive and therefore bad for the people to buy.

It may take some time for this principle to be recognised by the newspaper press. Meanwhile householders may defend their own interests by following three simple rules of common-sense: (1) Never buy from illustrated catalogues unless the articles are introduced by some well-known expert, like Mr Walter Crane, Mr Heywood Sumner, or Mr Lewis F. Day. Who desires to know what a tradesman thinks of his own market goods? What householders need, and should insist upon having, is the recommendation of some independent judge, who will not discredit himself by praising bad design and careless workmanship. (2) Make sure that the tradesman who sells furniture is also

the manufacturer. When he is not the public suffers, and for the following reason: A retailer buys goods at a large discount, the minimum being 25 per cent., and no manufacturer in the home arts can give that discount and yet keep his craft-methods at a proper level of excellence. Many large stores are mere distributers, and some of them persuade the smaller manufacturers to give even higher discounts than 25 per cent., with results disastrous to fine old industries. This point deserves notice from the Board of Trade and the County Councils. Every town needs a communal showroom for the best products in the household arts; then good craftsmen would be able to exhibit their work in a public manner and make themselves known. At present they cannot afford to advertise, nor can they compete against the trading methods of the great retail shops. (3) Never buy any furniture which is profusely advertised. Too much importance cannot be attached to this rule. Advertisements are not only very expensive, they form part of the cost of production; and any efficient craftsman will tell you that well-made furniture cannot bear costly advertising and yet be sold at a reasonable price. No good work was ever done in a hurry; and there are technical reasons why good furniture cannot be made rapidly, and therefore in sufficient quantities to justify extensive advertising as a business speculation. One technical reason is the intractableness of wood. All woods, no matter how long they are kept, nor how dry they may be superficially, begin to shrink as soon as you cut into them and expose new surfaces to the air. Oak three hundred years old will do that. Yet advertisements ask us to believe that sound furniture can be made easily, quickly, and in huge quantities at the same time. Experts hold different opinions. One admirable craftsman, Mr Stephen Webb, gives the following advice, the best which can be given: 'The longer the interval between the cutting up of the wood and its fitting together the better for the work. In the old times the parts of a cabinet lay about in the workman's benchway for weeks, and even months, and were continually turned over and handled by him while he was engaged on the mouldings and other details. The wood thus became really dry, and no further shrinkage could take place after it was put together.' To-day, on the other hand, in most trade furniture, machinery is used even for mouldings, and stability of craftsmanship is often neglected in order that money may be saved for advertising. With thick varnish you may keep the air from acting on ill-seasoned woods, and you can say to your critics, 'After all, I sell my wares. And those who live to please must please to live.'

When will the public understand that contempt for its intelligence and taste is the ruling factor in those types of business that pretend to be 'popular'?

THE HOUSE OF WHISPERS.*

By William Le Queux.

CHAPTER XXVIII.—THE WHISPERS AGAIN.

WAS it really true what Flockart had told her? Did Walter actually wish to see her again? At one moment Gabrielle believed in her lover's strong, passionate devotion to her, for had she not seen it displayed in a hundred different ways? But the next she recollected how Flockart had taken advantage of her youth and inexperience in the past, how he had often lied so circumstantially that she had believed his words to be the truth. Once, indeed, he had openly declared to her that one of his maxims was never to tell the truth unless obliged. After dinner, a simple meal served in the poky little dining-room, she made an excuse to go to her room, and there sat for a long time, deeply reflecting. Should she write to Walter? Would it be judicious to explain Flockart's visit, and how he had urged their reconciliation? If she wrote, would it lower her dignity in her lover's eyes? That was the great problem which now troubled her. She sat staring before her undecided. She recalled all that Flockart had told her. He was the emissary of Lady Heyburn, without a doubt. The girl had told him openly of her decision to speak the truth and expose him, but he had only laughed at her. Alas! she knew his true character, unscrupulous and pitiless. But she placed him aside.

Recollection of Walter—the man who had held her so often in his arms and pressed his lips to hers, the man who was her father's firm friend and whose uprightness and honesty of purpose she had ever admired—crowded upon her. Should she write to him? Rigid and staring, she sat in her chair, her little white hands clenched, as she tried to summon courage. It had been she who had written declaring that their engagement must be broken, she who had condemned herself. Therefore, had she not a right to satisfy that longing she had had through months, the longing to write to him once again? The thought decided her; and, going to the table whereon the lamp was burning, she sat down, and after some reflection, penned a letter as follows:

'My Darling,—I am wondering how and where

* Copyright in the United States of America by the Authors' and Newspapers' Association, New York, 1908.

you are! True, I wrote you a cruel letter; but it was imperative, and under the force of circumstance. I am full of regrets.

'I have had you before my eyes to-night, and I feel quite sure that at this very moment you are thinking of me. You must know that I love you dearly. You gave me your heart, and it shall not belong to any other. I have tried to be brave and courageous; but, alas! I have failed. I love you still, and I must see you soon —very soon.

'Mr Flockart came to see me to-day, and says that you expressed to him a desire to meet me again. Gratify that desire when you will, and you will find your Gabrielle just the same—longing ever to see you, living with only the memory of your dear face.

'Can you doubt of my great, great love for you? You never replied to my letter, though I have waited for months. I know my decision was a cruel one, and to you quite unwarranted; but I had a reason, and the reason was because I felt that I ought not to deceive you any longer.

'You see, darling, I am frank and open. Yes, I have deceived you. I am terribly ashamed and down-hearted. I have tried to conceal my grief, even from you; but it is impossible.

'Grim circumstance forced me to write as I did. Forgive me, I beg of you. If it is true what Mr Flockart says, then send me a telegram, and come here to see me. If it be false, then I shall know by your silence.

'I love you, my own, my well-beloved! *Au revoir*, my dearest heart. I look at your photograph which to-night smiles at me. Yes, you love me!

'With many fond kisses like those I gave you in the well-remembered days of our happiness,—
Your own,
GABRIELLE.'

She read the letter carefully through, placed it in an envelope, and, marking it private, addressed it to Walter's chambers in the Temple, whence she knew it must be forwarded if he were away. Then she went out to the village grocer's, where she posted it herself, so that it left by the early morning mail. When would his welcome telegram arrive? She calculated that he would get the letter by midday, and by one o'clock she could receive his reply—his reassurance of love.

So she went to her bed, with its white dimity hangings, more calm and composed than for months before. For a long time she lay awake, thinking of him, listening hour by hour to the chiming bells of the old Norman church. They marked the passing of the night. Then she dropped off to sleep, to be awaked by the sun streaming into the room.

That same morning, away up in the Highlands at Glencardine, Sir Henry had groped his way across the library to his accustomed chair, and Hill had placed before him one of the shallow drawers of the cabinet of seal-impressions.

There were fully half-a-dozen which had been sent to him by the curator of the museum at Norwich, sulphur-casts of seals recently acquired by that institution.

The blind man had put aside that morning to examine them, and settled himself to his task with the keen and pleasurable anticipation of the expert.

They were very fine specimens. The blind man, sitting alone, selected one, and, fingering it very carefully for a long time, at last made out its design and the inscription upon it.

'The seal of Abbot Simon de Luton, of the early thirteenth century,' he said slowly to himself. 'The wolf guards the head of St Edmund as it does in the seal of the Benedictine Abbey of Bury St Edmunds, while the Virgin with the Child is over the canopy. And the verse is indeed curious for its quaintness:

✠ VIRGO. DEUM. FERT. DUX. CAPUD. AUFERT.
QUOD. LUPUS. HIC. FERT.' ✠

Then he again retraced the letters with his sensitive fingers to reassure himself that he had made no mistake.

The next he drew towards him proved to be the seal of the Vice-Warden of the Grey Friars of Cambridge, a pointed one used about the year 1244, which to himself he declared, in heraldic language, to bear the device of 'a cross raguly debruised by a spear, and a crown of thorns in bend dexter, and a sponge on a staff in bend sinister, between two threefold *flagella* in base'—surely a formidable array of the instruments used in the Passion.

Deeply interested, and speaking to himself aloud, as was his habit when alone, he examined them one after the other. Among the collection were the seals of Berengar de Brolis, Plebanus of Pacina (in Syracuse), and those of the Commune of Beauvais (1228); Mathilde (or Mahaut), daughter of Henri, Duke of Brabant (1265); the town of Oudenbourg in West Flanders, and of the Vicar-Provincial of the Carmelite Order at Palermo (1350); Jacobus de Gnapet, Bishop of Rennes (1480); and of Bondi, Marquis of Sasolini of Bologna (1323).

He had almost concluded when Goslin, the gray-bearded Frenchman, having breakfasted alone in the dining-room, entered. 'Ah, *mon cher* Sir Henry,' he exclaimed, 'at work so early! The study of seals must be very fascinating to you, though I confess that, for myself, I could never see in them very much to interest.'

'No. To the ordinary person, my dear Goslin, it appears, no doubt, a most dryasdust study; but to a man afflicted like myself it is the only study that he can pursue, for with his finger-tips he can learn the devices and decipher the inscriptions,' the blind Baronet declared. 'Take, for instance, only this little collection of impressions which

they have so kindly sent to me from Norwich. Each one of them tells me something. Its device, its general character, its heraldry, its inscription, are all highly instructive. For the collector there are opportunities for the study of the historical allusions, the emblematology and imagery, the hagiology, the biographical and topographical episodes, and the other peculiarities and idiosyncrasies in all the seals he possesses.'

Goslin, like most other people, had been many times bored by the old man's technical discourses upon his hobby. But he never showed it. He, just the same as other people, made pretence of being interested. 'Yes,' he remarked, 'they must be most instructive to the student. I recollect seeing a great quantity in the Bargello at Florence.'

'Ah, a very fine collection—part of the Medici collection, and contains some of the finest Italian and Spanish specimens,' remarked the blind connoisseur. 'Birch of the British Museum is quite right in declaring that the seal, portable and abounding in detail, not difficult of acquisition nor hard to read if we set about deciphering the story it has to tell, takes us back as we look upon it to the very time of its making, and sets us, as it were, face to face with the actual owners of the relic.'

The Frenchman sighed. He saw he was in for a long dissertation, and, moving uneasily towards the window, changed the topic of conversation by saying, 'I had a long letter from Paris this morning. Krail is back again, it appears.'

'Ah, that man!' cried the other impatiently. 'When will his extraordinary energies be suppressed? They are watching him carefully, I suppose.'

'Of course,' replied the Frenchman. 'He left Paris about a month ago, but unfortunately the men watching him did not follow. He took train for Berlin, and has been absent until now.'

'We ought to know where he's been, Goslin,' declared the elder man. 'What fool was it who, keeping him under surveillance, allowed him to slip from Paris?'

'The Russian Tchernine.'

'I thought him a clever fellow, but it seems that he's a bungler after all.'

'But while we keep Krail at arm's-length, as we are doing, what have we to fear?' asked Goslin.

'Yes; but how long can we keep him at arm's-length?' queried Sir Henry. 'You know the kind of man—one of the most extraordinarily inventive in Europe. No secret is safe from him. Do you know, Goslin,' he added in a changed voice, 'I live nowadays somehow in constant apprehension.'

'You've never possessed the same self-confidence since you found Mademoiselle Gabrielle with the safe open,' he remarked.

'No. Murie, or some other man she knows, must have induced her to do that, and take copies of those documents. Fortunately, I suspected an attempt, and baited the trap accordingly.'

'What caused you to suspect?'

'Because more than once both Murie and the girl seemed to be seized by an unusual desire to pry into my business.'

'You don't think that our friend Flockart had anything to do with the affair?' the Frenchman suggested.

'No, no. Not in the least. I know Flockart too well,' declared the old man. 'Once I looked upon him as my enemy, but I have now come to the conclusion that he is a friend—a very good friend.'

The Frenchman pulled a rather wry face and remained silent.

'I know,' Sir Henry went on—'I know quite well that his constant association with my wife has caused a good deal of gossip; but I have dismissed it all with the contempt that such attempted scandal deserves. It has been put about by a pack of women who are jealous of my wife's good looks and her *chic* in dress.'

'Are not Flockart and mademoiselle also good friends?' inquired Goslin.

'No. I happen to know that they are not, and that very fact in itself shows me that Gabrielle, in trying to get at the secret of my business, was not aided by Flockart, for it was he who exposed her.'

'Yes,' remarked the Frenchman, 'so you've told me before. Have you heard from mademoiselle lately?'

'Only twice since she left here,' was the old man's bitter reply, 'and that was twice too frequently. I've done with her, Goslin—done with her entirely. Never in all my life did I receive such a crushing blow as when I found that she, in whom I reposed the utmost confidence, had played her own father false, and might have ruined him!'

'Yes,' remarked the other sympathetically, 'it was a great blow to you, I know. But will you not forgive mademoiselle?'

'Forgive her!' the old man cried fiercely—'forgive her! Never!'

The gray-bearded Frenchman, who had always been a great favourite with Gabrielle, sighed slightly and gave his shoulders a shrug of regret.

'Why do you ask that?' inquired Sir Henry, 'when she herself admitted that she had been at the safe?'

'Because'—— and the other hesitated. 'Well, for several reasons. Yesterday Stewart told me that the Whispers had been again heard in the Castle. The people believe them precursory of evil to fall upon this household, you know. The story of your quarrel with mademoiselle has leaked out.'

'The Whispers!' laughed the old man in defiance. 'Let the people believe what they will. My daughter shall never return to Glencardine—never!'

As he had been speaking the door had opened, and James Flockart stood upon the threshold. He had overheard the blind man's words, and as he came forward he smiled, more in satisfaction than in greeting.

(To be continued.)

LONG-DISTANCE TELEGRAPHY.

IFTY years ago, or more, it was the writer's privilege to assist at Edinburgh in the *direct transmission* of a Royal message between Balmoral and Potsdam. The event took place on a fine summer Sunday morning, when the lines were quiet and the atmosphere was calm and highly conducive to the passage of the electric current. The Morse embosser had not long before taken the place of the Cooke and Wheatstone double needle; and the *click* of the armature enabled us to hear whether the signals were going through all right. The embosser was, indeed, a very good 'sounder,' although it was not until many years after that that form of instrument was adopted for general use. The wire was in relay at Edinburgh, the primitive windmill or 'mouse-mill' form of relay being in use—a very simple contrivance compared with the elaborate 'translator' of to-day. The experiment was carried out under the direction of Mr Cromwell Fleetwood Varley, electrician of the Electric and International Telegraph Company, one of the most prominent scientists of his day, whose ingenuity in the matter of telegraphic invention was amazing. One of Mr Varley's staff was at Balmoral, and my old countryman and *confrère* David Lumsden was at Amsterdam, where the Electric Company had an office at that time, which was designated 'English Amsterdam' to distinguish it from the Dutch office.

The experiment was successful, the message going through without a hitch; and we all plumed ourselves on being associated, however remotely, with such a marvellous feat of telegraphy. And it *was* a feat for that day, although it pales into insignificance with what has recently been accomplished by the Indo-European Telegraph Company, or even with what takes place every day between the Foreign Gallery at St Martin's-le-Grand and the more distant capitals of Europe. Here, however, the progress is not so great as it seems, for the late Sir Henry Fischer used to tell how, on Sundays, he would amuse himself when on duty at 'old F. G.', in Founder's Court, Lothbury, by getting through to St Petersburg or Constantinople, and having a chat with 'Sir Bruin' or the 'Unspeakable Turk,' as the case might be. And yet, not long before, messages between Edinburgh and London might have to be retransmitted half-a-dozen times in bad weather, when the insulation went to pieces.

The cable companies have been reproached for want of enterprise in the adoption of improved methods of transmission, and for constituting themselves a 'ring' in order to maintain the present high rates for telegrams passing over their lines. Be this as it may, the reproach does not lie very heavily at the door of the Indo-European Company, which has taken the lead in the matter of long-distance telegraphy, and is likely to maintain, if not to improve, its position in that respect. A year or two ago, by the adoption of the Wheatstone automatic system, it set up direct working between Manchester and London and Teheran, a distance of nearly four thousand miles, which was a world's record at that time. Now it has beaten its own record, and pushed through to Calcutta, between which and London, a distance of seven thousand miles, messages were exchanged on a Saturday towards the end of January last. This is a most notable achievement, to put it in the mildest possible form—an achievement which even a Kelvin or a Varley or a Wheatstone would have deemed impossible a quarter of a century ago, and which the present writer, familiar with all the improvements of the past half-century, looks upon as almost uncanny. Of course it has only been rendered possible by the free use of relays, of which there are no fewer than thirteen in circuit between London and Kurrachee, and one between Kurrachee and Calcutta, at Agra. The clerks at these lonely outposts, scattered amongst the barren steppes of Russia and through the great Persian lone land, must lead an eerie life, as they sit in their huts listening to the hum of the world as it passes from the Far East to the distant West, and *vice versâ*. The idea of the relay is, no doubt, taken from the old coaching days; but there is this essential difference, that the coaches pulled up for change and refreshment, whereas the electric current speeds along and takes up its 'refreshment' as it goes, more closely resembling the locomotive which scoops up its water from between the rails as it careers along at fifty or sixty miles an hour.

Cables do not enter very largely into the operations of the Indo-European Company, being confined to a length of some two hundred miles between Lowestoft and Emden, beyond which, by way of Berlin, Warsaw, Odessa, and Tiflis, a land-line is carried to Teheran. This is probably as wild a stretch of country as exists anywhere, and the climatic conditions are of the worst possible character, so that the delicate operation of telegraphing by means of relays through seven thousand miles of line becomes the more remarkable. Beyond Teheran the difficulties are not less serious, although of a different character perhaps. Here the line passes through unsettled country, swarming with hostile tribes who look upon it with suspicion rather than with awe; and the utmost vigilance on the part of engineers and patrols is necessary to maintain it in working order. Compared with a cable lying comfortably at the bottom of the sea, the maintenance of a land-line carried through a foreign country some thousands of miles distant from the base of operations is an anxious as well as a costly undertaking. Nor is the costliness of telegraphing to the Far East likely to be greatly mitigated by this system of direct communication,

because, while transmitting stations have been eliminated, relay stations have had to be set up. The gain to commerce will be in increased speed and accuracy of transmission, two most essential points in telegraphy; and the rest may be safely left to Mr Stratford Andrews, managing director of the Indo-European Company, to whose well-directed skill and enterprise these marvellous achievements are due.

Those who, in their innocence, think that wireless telegraphy, so called, is destined to supersede cables should ponder the history of long-distance telegraphy, which has ever been associated with the continuous wire, whether enclosed in a cable or carried overland. The current passes as readily out of the cable into the open wire, and *vice versâ*, as though they were one, and this it is which has made long-distance telegraphy possible on a scale never dreamt of by the pioneers of the cable system. The great problem with the early inventors of the telegraph was 'how to tie the current to a wire;' but the problem with the wireless people is how to let it loose, so that it may career over the face of the globe for any one to catch hold of! Even at sea, where the system has undoubted advantages, any ship within radius may help itself to the messages knocking about; and although this was a mercy in the case of the wreck of the *Republic*, it might be far otherwise in the case of ships of war at close quarters with the enemy. There is great trouble at Aldershot, where there is a powerful wireless station, through messages coming to hand from all quarters not intended for them, and some curious stories are told of the vagaries of the system. Wireless waves from Berlin have been received, and it is known that the Aldershot waves have been taken up by the German wireless stations, so that there is a constant tapping of messages not intended for the Aldershot station. During the troubles at Casa Blanca the wireless messages sent by the French warships to the station on the Eiffel Tower in Paris were received by the British warships at Dover and passed on to Aldershot! American millionaires, fired by the exploits of Binns of *Republic* fame, have set up costly installations along the coast, near New York, as playthings for their sons, and to such an extent has the nuisance grown that legislation has been demanded to put a stop to it. This only proves what has been foreseen by practical telegraphists from the first, that the more the system is extended the less efficient it becomes; and if to this we add that it lacks the great essentials of speed, security, and secrecy, we shall see that it can never become of any real value for commercial purposes, although it may continue to excite interest as a scientific curiosity. Secrecy is of the very essence of all telegraphy; but there can be no secrecy where messages are thrust violently into the air, to be picked up by the first eavesdropper who comes along.

AN EX-ARTILLERYMAN'S YARN.

By M. A. Richardson Jones.

'TALK about the fidelity of animals! Ugh!' Such was the euphemistic remark which greeted our ears. It was uttered by the man in the corner. A most discreet silence had made us hitherto oblivious of his very presence.

The scene was the general dining-room of a very third-rate coffee-shop situate somewhere down Farringdon Road way.

We comprised a very curious assortment of individuals. The person who had been doing most talking was, as would be expected, the person whose experience was the most limited—to wit, a London sewerman. Another of the party was an old man with gray hair and white, close-cropped whiskers. He was endeavouring to impress upon our senses the fact that we were not mountains. I am afraid I must confess ignorance as to the purport of his remarks. A third person was obviously a Yankee. There were two other persons, by appearance foreigners; also, the manager of the establishment, an amiable, stout, good-natured sort of chap, who was leaning his arm upon the back of one of the seats and casting a benevolent and indulgent smile upon everything and everybody—even upon myself—a broken-down clerk of no fixed abode, with no particular aim or ambition in life except to be certain of a sufficiency of meals (or their equivalent in the shape of coin of the realm) for the morrow.

'Fidelity of animals!' again repeated the hitherto reticent stranger. 'You mean the fidelity of an animal to itself in the carrying out of any fell plan, and never deviating from its purpose until it has accomplished its desire!' Such a remark fell like a thunderclap upon his audience. We had been telling one another of the faithfulness and fidelity of animals to men, each and every one speaking with a certain amount of personal experience on that particular subject. We expected something sensational whereby the speaker would be able to give foundation for his remarks. We got it.

'Several years ago I belonged to the Artillery. We were stationed at a picturesque little town somewhere in the district of Monghyr, province of Bengal. In addition to horses, we had several elephants attached to our battery. These elephants were greatly prized and petted by our fellows, one huge beast in particular, by name Tom, being always singled out as the recipient of a few delicacies.

'Before I proceed further I may as well state that if any of you present have an intimate knowledge

of, or have had dealings at all with, elephants, the first remark you will make when I have finished will be, "Oh, but that is not compatible with the mannerisms and doings of elephants; consequently we must take your story with a grain of salt."

'If it *was* compatible with the mannerisms and doings of elephants I should not say a word about it; but the general public nowadays have got themselves tired of listening to the schoolboy yarns of the elephant who refused to cross the unsound bridge, and the elephant who swamped the tailor (who pricked his trunk) with dirty water. People tire of those things and want something unusual—in fact, something hard for them to credit or believe, something that whets their appetite and makes them wonder what on earth *couldn't* happen. To continue with my story.

'It was the custom of our men to take these elephants for a morning bath in a picturesque little lake hard by the town, and a very pretty sight it was to see them gambolling and disporting themselves in the water, and playing with our men, who also took advantage of the opportunity which availed itself of having a morning dip.

'It happened on three or four occasions when the garrison went for their morning bathe that a garrison-man's body was found in the water, having been washed ashore. This was most unaccountable, as in each instance the unfortunate person was a most accomplished swimmer, and there were never any marks of violence noticed upon the deceased's body. Apart from that, the person was never missed after general bathing; it seemed to be only on occasions when he went by himself in the afternoon or evening. In fact, the whole affair seemed so mysterious and black that we began to doubt the faithfulness of the natives living in the town, and yet no suspicion could possibly be laid on any one.

'One day, as it was approaching twilight, I found myself at leisure, with absolutely nothing to do; neither could I find any means of amusement. It had been an extra sultry day, and was apparently working up for a storm. A happy thought struck me: I would have a bathe! I went round and searched up Tom, mounted, took a seat upon his head in the approved Oriental fashion, and drove him off to the lake. Thinking he would appreciate a splash about first of all, I kept my seat and headed him straight into the water.

'He very gradually waded out until the water was lapping about his ears. There was no hurry, and I allowed him to cool and rock himself in the water for some considerable time.

'After tolerating his leisure for quite long enough and beginning to get impatient, I endeavoured to drive him back on to the bank, when without the slightest warning he seized me around the waist with his trunk and lifted me off his head. I then noticed—which of course I hadn't seen before—a most unusual gleam in his eyes. He held me in his trunk and waded farther and farther into the lake, proceeding carefully the while, as though he were searching for some particular spot.

'Presently he stopped and dipped me, dressed as I was, into the water. Immediately a most horrible presentiment flashed across my mind. *The elephant intended to drown me!* Before he submerged me I had fortunately taken a very deep inhalation, and as I was a most experienced swimmer I fully intended to make a desperate effort to save my life.

'I knew that under ordinary circumstances I was able to keep under water for considerably over a minute. I also recollected at the moment that I had a native knife stuck in my belt, and this I instinctively felt for. Unfortunately the elephant's trunk was covering it at the moment. I endeavoured to force my hand down to secure the handle, and to accomplish this task I struggled with all the strength of a frenzied man. I might just as well have hoped to fly at the moment as to secure the knife.

'However, in struggling as I did I accomplished one thing, and that particular thing saved my life. For a brief space I found my head above water, and during that second an idea came to me how I could cheat the elephant of his prey.

'I had just sufficient time to breathe deeply and formulate my plan of escape when I found myself submerged once again, this time lower in the water. It now resolved into a duel of brute force and cunning *versus* man's strategy and endurance.

'I knew the elephant had to breathe some time, as well as I had to breathe, so for about ten seconds I struggled fiercely to free myself, and then I quietly gave up the struggle. I did not give up hope, however, for to cease struggling was part of my programme.

'I could see the beast's eyes watching me in the water, and after a few more seconds I allowed my left arm to drop motionless. Not so my right hand, however; I kept that still over the spot where my knife lay. Just about ten more seconds, and then I allowed my head to sink backwards as though I were lifeless. It was my idea to sham death in order that the beast might loose me from his hold, and the sooner I was apparently dead the more probable my chance of ultimate escape.

'Conflicting thoughts passed through my mind. Would he let go his hold or would he not? If the worst came to the worst, and I was just about spent and still a prisoner, I would make one more desperate effort to secure the handle of my knife; and once that trusty weapon was in my hand it would be a matter of a few seconds or so ere I had severed the elephant's trunk, and then the tables would be turned with a vengeance. If I failed! The idea was too horrible to entertain. No, I couldn't—I wouldn't fail! I could play the waiting game as long as the elephant! Besides, I wasn't spent yet. I could hold out for nearly a minute longer in a case like this.

'But what did he intend to do with me when I was drowned? And why on earth had he seized on me as his prey? Ah, what was that? Surely, surely

my plan was successful! I felt the trunk gradually, very gradually relaxing its hold. Yes! Hurrah, I had succeeded! I was saved! I had outwitted the beast, but I had to be cautious. When I was entirely free my apparently lifeless body gently floated to the surface of the water, and I found myself able once again to breathe God's pure air.

'For the first time for many years I breathed an earnest prayer of thanks for deliverance. My knife was now in the grasp of my right hand, and I felt a far greater sense of security. I saw the trunk of the beast emerge above water and heard his deep breathing. I dared not move! I noted with joy that the ripples on the surface of the water gently bore me away from the beast. All seemed deathly still and silent.

'After a short space the animal waded into shallower water. Still I did not move; and lucky for me I did not do so, for I observed, out of the corners of my eyes, the elephant turn round and deliberately watch to see if I made any movement. After a most critical survey he walked farther ashore. Presently he again turned, as if to make assurance doubly sure, and concentrated his gaze upon me. Evidently satisfied, the beast finally turned and walked back in the direction of the barracks.

'How glorious the sunshine seemed! How lovely the birds and insects flying over the face of the water! How lovely it was to be able to swim and move about! Nature seemed to have an entirely new seduction. Whilst I, as one back from the dead, was admiring Nature's works, it suddenly dawned upon me that no one had observed my exit from the barracks. No, not a single person! That was most peculiar.

'This set me thinking seriously. Could it be—— Good heavens, never! What was the elephant's object in attempting to drown me? Why was such method shown, for method it surely was? I endeavoured to thrust my knife back into my belt so as to swim ashore; but in so doing I blundered, and the knife slipped from my hand to the bottom of the lake. I immediately dived for it, and after a brief search discovered it on a patch of sand, and was just about to pick it up when I noticed also a revolver, an army revolver, lying scarcely a foot away. I seized both, and rose to the surface to examine my discovery. Imagine my feelings when I found that the number on the revolver corresponded with the number of the soldier whose dead body had been washed ashore only a few days ago! My suspicions were pretty nigh confirmed.

'How I got back to barracks I don't know. Suffice it to say that when I did get back I scared all by my appearance and alarmed them somewhat considerably by my story and the exhibition of our dead comrade's revolver.

'When my story had been reported to the officer in charge, he at once ordered our late comrade's body to be exhumed; and sure enough, after examination, a discoloured ring was noticed around the middle of his body in the selfsame spot where the elephant had seized me. This ring had escaped notice before, as the poor fellow was washed ashore in his regimentals, just as I should have been but for that lucky inspiration which enabled me to save my life.

'The elephant, whom we were all most kind to in the barracks, had a systematic way of dealing death to his benefactors, and he would never have been found out except by accident, and that accident was the sparing of my life that afternoon.

'A most exhaustive inquiry elicited the fact that some one in uniform had once teased the animal considerably; and, not being able to identify his persecutor, the beast had concluded to avenge himself in his own particular way, and if the lust of the animal had not been satiated, terrible as it is to contemplate, man by man might have suffered until either the survivors were removed to fresh quarters, or probably the whole original company were wiped out.

'Early the following morning two dozen eager men gladly and willingly ensured future protection from the beast by volleying into his skull the contents of their rifles.'

THE PERILS OF ORCHID-HUNTING.

ORCHIDS abound in the greatest profusion in the hot, damp parts of the West and East Indies, in Madagascar and other islands in the same region, in the moist forests of Brazil, the warm parts of Central America, and in Western Mexico. Not dependent on the soil for their nutriment, they are mostly found clinging to the trunks and branches of trees, to stones and crags, where they vegetate among ferns and other shade-loving plants, or occupy by themselves exclusively the places which they affect.

Warmth and moisture are essential to orchids, and warmth and moisture in tropical countries are synonymous with miasma and fever. Wild animals also, and poisonous serpents, abound in the umbrageous depths wherein the rarer varieties lie hidden. Not infrequently, too, the collector has to seek his specimens among savage or semi-civilised peoples, who strongly resent his intrusion into their midst. Many an orchid-hunter has sacrificed his life to his daring. Falkenberg perished thus at Panamá, Klabock in Mexico, Brown in Madagascar, Endres at Rio Hacha, Wallis in Ecuador, Digance in Brazil, Schrœder in Sierra Leone, Arnold on the Orinoco, and so on through a long list of victims of the passion for orchid-finding.

One firm of orchid-importers reported a year or

two ago that they had five collectors killed in as many months by the wild tribesmen of the Western Himalayan slopes; while three others, even more unfortunate, were made prisoners, and carried off to undergo the nameless horrors which have from time immemorial been characteristic of Central Asian slavery. If the pay is big, the risks an orchid-hunter runs are correspondingly great. Cutting his way through tangled forests, wading often up to the waist through stagnant swamps, always on his guard against savage beasts and still more savage men, the orchid-hunter earns every penny of his money. Even orchid-fanciers seldom realise the terrible dangers and hardships that have to be faced by the men who go into the wildest depths of the tropic forests in search of new or rare examples. The rarer orchids are generally found in the most inaccessible spots and in the densest and most marshy jungles. Even the natives avoid the districts into which the intrepid orchid-hunter penetrates in pursuit of his floral quarry.

One has only to talk with any of these men to hear remarkable stories of hairbreadth escapes and of appalling sufferings; but, unhappily, in too many cases the daring orchid-hunter never returns to tell the story. Large numbers are sent out by Messrs F. Sanders & Company of St Albans, the great specialists in orchids.

A few years ago eight orchid-hunters met at Tamatave, and then separated in search of specimens. Within a year only one of them survived, and he had spent months in the most pestilential swamps, from which he emerged with his health impaired. One of the others had been captured by the native priests, who drenched him with oil and burned him to death on their altar.

Fostermann the German, who holds the record of having discovered nearly forty orchids which were previously unknown to science, tells the story of how one of his finds cost a human life. He was far up in the wilds of the Siamese forest when, just before sunset, he noticed with his field-glasses an orchid which he did not know growing high on a tree overhead. The question was whether to stop and climb for it. It was late, and the ground was unsuitable for camping. His guide volunteered to go on ahead and search for a camping-place while the others procured the orchid. This was agreed to, and the party were busy securing the plant, when a terrible scream was heard in the brush in front. Fostermann ran as hard as he could in the direction of the sound, and was just in time to see a huge tiger carrying off his friend. He followed, but darkness fell, and it was not until next morning that they managed to track and kill the man-eater and bury the remains of its victim. The orchid was named after the man of whose death it had been indirectly the cause.

M. Hamelin, one of the most successful of all collectors, and the discoverer of many new orchids in the little-known inland forests of Madagascar, tells how, in these regions, 'not only was our party exposed to the risk of being strangled by hostile and ferocious tribesmen—a fate which befell many a poor fellow belonging to our expedition—but we had to struggle almost night and day against the wild animals that haunt these primeval forests.' He himself, in the same country, had to go through the ceremony of being made 'brother-in-blood' to King Moyambassa in order to penetrate the interior of the island, an honour which nearly cost him his life. In a letter home he says: 'It was nearly a year before I discovered the gorgeous orchid now known as *Eulophiella Elisabethæ*. This plant only grows in a very limited region, and on trees of slow growth which only begin to attain any height after ten years. To secure the orchids, which flourish on the tops of the tallest trees, I was obliged to have the trees cut down, and then I most carefully gathered all the plants myself. Enormous difficulties and manifold dangers have to be surmounted before the country where they grow can be reached.' Speaking of wild animals, he says: 'The most terrible of all is the *fossa* (a carnivorous beast related to the cat tribe), against which we had constantly to be on guard. One of these animals caused the death of the brother-in-law of the king, a fine, handsome, well-built man. It pounced upon his shoulder, rending the flesh from his back and mangling him in a frightful manner. Being "brother-in-blood" to the king, and thus a relative of the deceased man, I had to take part in the funeral ceremony; and, worse than that, I had to obey their laws, which command that if any one has the moral responsibility of an accident, and death is the result of it—especially of a relative—he has the choice of being greased and burned alive or of taking the whole family of the deceased and of marrying his wife. I chose the latter alternative!'

When a hunter finds an orchid there are three ways of getting it: he may cut down the tree to which it clings, he may lasso the branch or limb on which it hangs and draw it to him, or he may cut a sapling, lean it against the tree, and climb up and bring down the plant. As a precaution against snakes and scorpions, which are as often found in trees as anywhere else, cutting down the tree is with most orchid-hunters the favourite method of securing the coveted plant.

If a man climbs a tree for an orchid and is suddenly confronted by the head of an angry snake in the dense foliage, his chances of escape are very small indeed. Many of the little snakes of the tropics are as poisonous as the dreaded rattler. In one expedition two men were bitten on the feet. Both died. One lingered for four hours in greatest agony. Such fear have the natives of the bite of one variety of snake found in Colombia, South America, that they amputate whenever possible as the only means of saving life. On one occasion, when an Indian was bitten on the hand by a snake, his companion immediately drew his *machete* and chopped it off at the wrist. A famous collector once got a terrible scare with one of these venomous

little reptiles. Two Indians came into camp with their finds. From one of them the collector got what appeared to be a splendid orchid. It was about a foot across and well preserved. He held it in his hand, admiring it, when his eyes were attracted to a bright spot in the centre of the plant. For what seemed a long time he stood there gazing on that bright spot before it resolved itself into the head of a poisonous snake. He dropped the plant and ran.

It was in South America that Roezl, the most celebrated orchid-hunter of his day, met with an adventure which he often told. Roezl always carried a folding trestle, with a light board to fix upon it, which made a sort of desk, with a camp-stool to match. His hut was the last one in the row of huts composing the village at which he was then encamped, and one evening he set himself as usual to write labels and memoranda for his herbarium. Darkness set in, and so absorbed was the enthusiast that he gave no attention to a loud purr, though conscious of the sound for some moments. At length he raised his eyes. By the open doorway stood a creature whose dusky fur glistened like silk in the lamplight, its great yellow eyes staring into his. It was a black jaguar, rarest and most savage of all felines. So they remained staring. Roezl felt his hour had come. He could not have moved a limb; his hair rose and the sweat poured down. The jaguar also kept still, purring louder and louder, its velvet lips slightly raised, and showing a gleam of the huge fangs. Presently it drew nearer, still purring, came up to the trestle, arched its back like a cat, and pressed against it. Crash fell desk, lamp, specimen-box, camp-stool, and enthusiast—a clattering overthrow! The servants rushed in. No jaguar was there. Roezl used to attribute his escape to the fact that he never carried arms. When the brute was approaching he must have fired had a weapon been handy—no man could resist the impulse; and then, whatever the issue of the shot, he would certainly have died.

In addition to the dangers and difficulties inseparable from the actual finding of the orchid, there are innumerable troubles ahead of the indefatigable collector before his work is done. The task of getting it out of the country and seeing it safely on board a home-going steamer is no easy business. In many cases, indeed, the difficulties are almost insuperable, and nothing but the most indomitable perseverance on the part of the hunter could overcome them. Occasionally an unforeseen circumstance robs a collector of the spoils for which he has so strenuously striven. The cruel luck of one unfortunate hunter would be hard to beat. After months of ceaseless toil, exposed to the usual risks and hardships of his profession—occasionally wading up to the waist in mud, and at other times venturing into almost inaccessible places—he at last succeeded in collecting between three and four thousand orchids of an exquisitely beautiful and rare species. His delight knew no bounds; and with all possible haste he commenced his tortuous journey back to the seaboard, where his precious and dearly won floral treasures would be shipped to England. At the first opportunity he telegraphed to Messrs Sanders. Joy reigned in St Albans that day at the success of the home-coming orchid-hunter; but it was short-lived. A fire broke out in the hold of the vessel that very night, and not a single plant was saved! The unfortunate collector was nearly distracted when he realised what had happened. With a heavy heart he wired to his employers: 'Collection destroyed by fire. What shall I do?' Back came the mandate from the disappointed orchid-importers: 'Go back at once!' It was impossible; the rainy season was at hand, and native servants were difficult to procure. To that effect he wired to St Albans. 'Go back!' was the reply. And back to Antioquia, perhaps the wettest country under the sun, the luckless collector had to go.

Even when a consignment is safely despatched—a consignment of, say, forty thousand plants—if three thousand are landed more or less alive the collector has reason to congratulate himself. A few years ago Roezl sent home from Colombia no less than twenty-seven thousand specimens of a valuable kind. Only two were alive when they reached Britain. They were sold for forty guineas each—not a high price when one considers what they had cost. On another occasion one thousand orchids were sent from the Philippines. Not one of them lived. The consignment represented the year's work of an experienced collector, assisted by more than one hundred natives; the expenses of the expedition were considerable, and the dangers encountered and the difficulties overcome in getting the plants to the seacoast for shipment to this country sufficient to appal any man. 'In this connection,' remarked a celebrated orchid-hunter when recounting some of the hardships and dangers of his remarkable career, 'I often think, now that my work as a collector is over, that had I known at the start of an expedition just what my experiences would be, I should have abandoned the attempt in despair of coming through alive.'

A LINE OF GOLD.

Across the sea it stretched out far away,
As evening shadows closed the summer day;
For miles the sunset lit the waters cold
With brilliant glory in a line of gold.

Its pathway shone serene that summer even,
Like to a golden roadway up to heaven;
And visions brought me of a land afar,
Beyond the lustre of the evening star.

And often as I sit and dream, or lie
Thinking of better things beyond the sky,
The line of gold with all its brightness broad
Turneth my thoughts with reverence to God.

THE TURK AT HOME.

By ROBERT L. JEFFERSON, F.R.G.S.

IT is not too much to say that the world was a little surprised, and perhaps not a little disappointed, at the apathetic manner in which Turkey witnessed the spoliation of her territory a little time ago. One expected something more than the feeble bleat of protest which was made. Poor little Servia, with her scanty population of less than three million souls, presented a much more manly front to the spoilers than did the original ruler of the Balkans. The prevailing idea that the Turk is a truculent and bloodthirsty individual received a shock. He accepted the situation with a mildness which was rather bewildering. To those who remember Bulgarian, Armenian, and Macedonian 'atrocities,' in which the Osmanli figured as a blood-drenched butcher of human beings, this meekness on his part was contrary to the general idea of his character.

I have visited Turkey a good many times, and, if one can be allowed to form a general idea from such visits, my impression of the Turk is that he is far from being the swashbuckling fire-eater one would expect him to be from casual report, or even from the occasional uprisings, religious or political, which periodically shock Europe. Indeed, I have invariably found him a rather dull, stupid, and languorous Oriental. His patience and obedience are rare. As a soldier he is blindly compliant to the commands of his superior officer, and, supported by his belief in the existence of a paradise for the true Osmanli who dies in battle, rarely questions the cause, but fights with a sullen courage, although without enthusiasm.

The Turk is a good worker, but he does not like work; the life of the lotus-eater is much more in his line. Everything, including fighting, means effort, and effort means fatigue. His greatest wish is to be left alone. He hates railways, good streets, sanitation, and other emblems of up-to-date civilisation. Of no man can the saying be more truthfully given that what was good enough for his forefathers is good enough for him. The consequence is that the more avaricious and ambitious Christian or Hebrew ousts him at every turn. Turkey swarms with Greeks, Armenians, and Jews, and these people are *the* business people of the Near East. In Constantinople, Salonika, Smyrna—in fact, in all the ports of the Turkish littoral—nine-tenths of the trade is in the hands of Greeks, Armenians, or Jews. The Turk cannot compete—he collapses on the merest show of business rivalry; he raises an apathetic hand in plaintive protest, murmurs '*Kismet*,' and retires.

Of the peasant Turk it may be said that he has no mind except on the subject of his religious belief. In that he is fanatical. Apathetic and indolent on nearly all other matters as he is, prick him on the raw of his religion, and he is at once a fiend.

I was in Constantinople at the time of the last massacres, and witnessed sights which will never be eradicated from my memory. The subtle cunning which characterised the preliminaries leading up to the massacre fills the Europeans of Constantinople to this day with a sort of admiration for Johnny Turk. The sleepy-eyed, narghile-smoking, coffee-drinking sloth in one day was transformed into a raging demon; for forty-eight hours he battered, stabbed, and shot. Glutted with his work of carnage, glorying in what he had done on behalf of his religious principles, he then subsided into the quiet, mild, and suave personality from which he had so unsuspectingly and so suddenly emerged.

His ignorance is not to be wondered at when one considers the almost entire want of educational facilities; but his dense ignorance, combined with his natural apathy, invests him with a character which is always a puzzle to the European. His superstitions are absolutely child-like, and no amount of reasoning will get him to see things as they really are. He is suspicious of everything new. He does not want anything new. He is firmly, indissolubly wedded to the old. During the reign of Sultan Abd-ul-Hamid electricity was taboo in Constantinople, because electricity had something to do with dynamos, and dynamos sug-

[*All Rights Reserved.*]

gested dynamite—of which the Sultan had a great terror. A year or two ago a big hotel in Constantinople installed an electric light plant in defiance of the Imperial decree. The owners of the hotel were asked to stop their enterprise, but they flatly refused. Force was out of the question, for the hotel belonged to a powerful European syndicate; so the difficulty was got over by a heavy fine being imposed, which the hotel people most cheerfully paid.

One of the most amusing phases of Turkish life is the manner in which the Government has allowed itself to be hustled in connection with its internal affairs. Thus, in Constantinople and Smyrna, when the Englishman wants his letters he does not apply to the Turkish post-office for them; on the contrary, he goes to his own English post-office; while, if he writes home, he buys English stamps and affixes them to his letters. And the same applies to the German, the Austrian, and the Frenchman. When the late massacres were on the point of breaking out, a certain English merchant applied to the Sublime Porte for passports in order to pass his Armenian and Greek servants to the safety of British vessels in the harbour. They were refused. 'Very well,' said the Englishman, 'I shall write the passports myself, and if you refuse to honour them the matter must be thrashed out between Great Britain and Turkey.' The passports *were* honoured, and to this day some are in existence, and are known by officials as 'G.'s passports.'

When I rode my bicycle to Constantinople the advent of the humble wheel in the city of the Caliphs created something of a sensation. The roads in Constantinople are vile, but this did not prevent enthusiastic would-be cyclists from getting cycles out. The Sultan was very alarmed at the introduction of the newfangled thing, and issued an Imperial *irade* forbidding the faithful to cycle, on the ground that it was 'immoral and dangerous to the State.'

There is one wretched little music-hall in Constantinople, mainly the resort of sailors. Some years ago an Austrian sharpshooter gave an exhibition of his prowess in the way of shooting the pips out of playing-cards, and feats of a similar character. The next day the Grand Vizier interviewed him. Under no circumstances must the artiste repeat his performance. It was the Imperial wish that the sharpshooter should change his occupation at once. He was offered a post in the Turkish administration representing a far bigger income than he could ever hope to derive from music-hall work, and he accepted. The inference was that, as he was such a crack shot, there was the danger of his being employed by the hostile 'Young Turk' party to shoot the Sultan at Selamlik.

In my own personal relations with the Turks I have, I must say, found them most kind and most hospitable. While tremendously suspicious of every movement on the part of the intruding Giaour, they are politeness itself once the way is smoothed with official explanatory papers. In a country where indolence is the besetting vice, corruption is naturally rampant. The bribe is in no country so powerful as in Turkey. The skilfully planted *mejedeh* is the 'open sesame' to almost everything. Passports and *teskeris* are mere bits of paper; the bribe is an oracle which is never known to fail. Altogether the Turk is a most interesting creature, and the recent events in Constantinople supply abundant evidence of his curious character. It is amazing that in a single fortnight a regime, which had been in existence for thirty-three years, could have been wiped out and a new one installed with so little national disturbance. It is singular, also, that all this has been done, not at the call of the nation, but by the action of revolutionaries heterogeneously made up of Turks, Christians, and Jews, with an organisation and strength unknown to all but themselves. Impassively the Turk accepts his new Sultan, and regards with indifference the fate of the Caliph who for thirty-three years he has all but deified. What is the mind of this man who outwardly is so amusingly dull, so child-like in most things, and yet who bears the reputation of being a fire-eater of the first order?

THE HOUSE OF WHISPERS.

CHAPTER XXIX.—CONTAINS A FURTHER MYSTERY.

'MY dear Edgar, when I met you in the Devonshire Club last night I could scarcely believe my own eyes. Fancy you turning up again!'

'Yes, strange, isn't it? how two men may drift apart for years, and then suddenly meet in a club, as we have done, Murie.'

'Being with those fellows who were anxious to go along and see the show at the Empire last night, I had no opportunity of having a chat with you, my dear old chap. That's why I asked you to look in.

The two men were seated in Walter's dingy chambers on the second floor in Fig-Tree Court, Temple. The room was an old and rather frowsy one, with shabby leather furniture from which the stuffing protruded, panelled walls, a carpet almost threadbare, and a formidable array of calf-bound volumes in the cases lining one wall. The place was heavy with tobacco-smoke as the pair, reclining in easy-chairs, were in the full enjoyment of very excellent cigars.

Walter's visitor was a tall, dark man, some six or seven years his senior, a rather spare, lantern-jawed young fellow, whose dark-gray clothes were of un-

mistakable foreign cut, and whose moustache was carefully trained to an upward trend. No second glance was required to decide that Edgar Hamilton was a person who, having lived a long time on the Continent, had acquired the cosmopolitan manner both in gesture and in dress.

'Well,' exclaimed Murie at last, blowing a cloud of smoke from his lips, 'since we parted at Oxford I've been called to the Bar, as you see. As for practice—well, I haven't any. The gov'nor wants me to go in for politics, so I'm trying to please him by getting my hand in. I make an odd speech or two sometimes in out-of-the-world villages, and I hope one day to find myself the adopted candidate for some borough or other. Last year I was sent round the world by my fond parents in order to obtain a broader view of life. Is it not Tacitus who says, "*Sua cuique vita obscura est*"?'

'Yes, my dear fellow,' replied Hamilton, stretching himself lazily in his chair. 'And surely we can say with Martial, "*Non est vivere, sed valere vita*"—I am well, therefore I am alive! Mine has been a rather curious career up to the present. I only once heard of you after leaving Oxford—through Arthur Price, who was, you'll remember, at Balliol. He wrote that he'd spoken one night to you when at supper at the Savoy. You had a bevy of beauties with you, he said.'

Both men laughed. In the old days Edgar Hamilton had been essentially a ladies' man; but since they had parted one evening on the station-platform at Oxford, Hamilton had gone up to town and completely out of the life of Walter Murie. They had not met until the previous evening, when Walter, having dined at the Devonshire—that comfortable old-world club in St James's Street which was the famous Crockford's gaming-house in the days of the dandies—had met his old friend in the strangers' smoking-room, the guest of a City stockbroker who was entertaining a party. A hurried greeting of surprise, and an invitation to call at the Temple, resulted in that meeting on this gray afternoon.

Six years had gone since they had parted; and, judging from Edgar's exterior, he had been pretty prosperous.

Walter was laughing and commenting upon it, when his friend, removing his cigar from his lips, said, 'My dear fellow, my success has been entirely due to one incident which is quite romantic. In fact, if anybody wrote it in a book people would declare it to be fiction.'

'That's interesting! Tell me all about it. My own life has been humdrum enough in all conscience. As a budding politician, I have to browse upon blue-books and chew statistics.'

'And mine has been one of travel, adventure, and considerable excitement,' declared Hamilton. 'Six months after I left Oxford I found myself out in Transcaucasia as a newspaper correspondent. As you know, I often wrote articles for some of the more high-class papers when at college. Well, one of them sent me out to travel through the disturbed Kurdish districts. I had a tough time from the start. I was out with a Cossack party in the Aras valley, east of Erivan, for six months, and wrote lots of articles which created a good deal of sensation over here. You may have seen them, but they were anonymous. The life of excitement, sometimes fighting and at others in ambush in the mountains, suited me admirably, for I'm a born adventurer, I believe. One day, however, a strange thing happened. I was riding alone through one of the mountain passes towards the Caspian, when I discovered three fierce-looking Kurds maltreating a girl, believing her to be a Russian. I called upon them to release her, for she was little more than a child; and, as they did not, I shot and killed two of them. The third shot and plugged me rather badly in the leg; but the shooting had been heard by my Cossack companions, who, coming quickly on the spot, killed the last of the girl's assailants, and released her.'

'By Jove!' laughed Murie. 'Was she pretty?'

'Not extraordinarily—a dark-haired girl of about fifteen, dressed in European clothes. I fainted from loss of blood, and don't remember anything else until I found myself in a tent, with two Cossacks patching up my wound. When I came to, she rushed forward and thanked me profusely for saving her. To my surprise, she spoke in French, and on inquiry I found that she was the daughter of a certain Baron Conrad de Hetzendorf, an Austrian, who possessed a house in Budapest and a château at Semlin, in South Hungary. She told us a curious story. Her father had some business in Transcaucasia, and she had induced him to take her with him on his journey. Only certain districts of the country are disturbed; and apparently, with their guide and escort, they had unwittingly entered the Aras region—one of the most lawless of them all—in ignorance of what was in progress. She and her father, accompanied by a guide and four Cossacks, had been riding along when they met a party of Kurds, who had attacked them. Both father and daughter had been seized, whereupon she had lost consciousness from fright, and when she came to again, found that the four Cossacks had been killed, her father had been carried off, and she was alone in the brutal hands of those three wild-looking tribesmen. As soon as she had told us this, the officer of the Cossacks to whom I had attached myself called the men together, and in a quarter of an hour the whole body went forth to chase the Kurds and rescue the Baron. One big Cossack, in his long coat and astrakhan cap, was left to look after me, while Nicosia—that was the girl's name—was also left to assist him. After three days they returned, bringing with them the Baron, whose delight at finding his daughter safe and unharmed was unbounded. They had fought the Kurds and defeated them, killing nearly twenty. Ah, my dear Murie, you haven't any notion of the lawless state of that country just then! And I fear it is pretty much the same now.'

'Well, go on,' urged his friend. 'What about the girl? I suppose you fell in love with her, and all that, eh?'

'No, you're mistaken there, old chap,' was his reply. 'When she explained to her father what had happened, the Baron thanked me very warmly, and invited me to visit him in Budapest when my leg grew strong again. He was a man of about fifty, who, I found, spoke English very well. Nicosia also spoke English, for she had explained to me that her mother, now dead, had been a Londoner. The Baron's business in Transcaucasia was, he told me vaguely, in connection with the survey of a new railway which the Russian Government was projecting eastward from Erivan. For two days he remained with us; but during those days my wound was extremely painful owing to lack of surgical appliances, so we spoke of very little else besides the horrible atrocities committed by the Kurds. He pressed me to visit him; and then, with an escort of our Cossacks, he and his daughter left for Tiflis, whence he took train back to Hungary.

'For six months I remained, still leading that roving, adventurous life. My leg was well again, but my journalistic commission was at an end, and one day I found myself in Odessa, very short of funds. I recollected the Baron's invitation to Budapest; therefore I took train there, and found his residence to be one of those great white houses on the Franz Josef Quay. He received me with marked enthusiasm, and compelled me to be his guest. During the first week I was there I told him, in confidence, my position, whereupon he offered me a very lucrative post as his secretary, a post which I have retained until this moment.'

'And the girl?' Walter asked, much interested.

'Oh, she finished her education in Dresden and in Paris, and now lives mostly with her aunt in Vienna,' was Hamilton's response. 'Quite recently she became engaged to young Count de Solwegen, son of one of the wealthiest men in Austria.'

'I thought you'd probably become the happy lover.'

'Lover!' cried his friend. 'How could a poor devil like myself ever aspire to the hand of the daughter of the Baron de Hetzendorf? The name doesn't convey much to you, I suppose?'

'No; I don't take much interest in unknown foreigners, I confess,' replied Walter with a smile.

'Ah, you're not a cosmopolitan nor a financier, or you would know the thousand and one strings which are pulled by Conrad de Hetzendorf, and the curious stories afloat concerning him.'

'Curious stories!' echoed Murie. 'Tell me some. I'm always interested in anything mysterious.'

Hamilton was silent for a few moments.

'Well, old chap, to tell you the truth, even though I've got such a comfortable and lucrative post, I'm still, after several years, considerably mystified.'

'How?'

'By the real nature of the Baron's business.'

'Oh, he's a mysterious person, is he?'

'Very. Though I'm his confidential secretary, and deal with his affairs in his absence, yet in some matters he is remarkably close, as though he fears me.'

'You live always in Budapest, I suppose?'

'No. In summer we are at the country house, a big place overlooking the Danube outside Semlin, and commanding a wide view of the great Hungarian plain.'

'The Baron transacts his business there, eh?'

'From there or from Budapest. His business is solely with an office in the Boulevard des Capucines in Paris, and a registered telegraphic address also in Paris.'

'Well, there's nothing very mysterious in that, surely. Some business matters must, of necessity, be conducted with secrecy.'

'I know all that, my dear fellow, but'—— and he hesitated, as though fearing to take his friend into his confidence.

'But what?'

'Well—but there, no! You'd laugh at me if I told you the real reason of my uneasiness.'

'I certainly won't, my dear Hamilton,' Murie assured him. 'We are friends to-day, dear old chap, just as we were at college. Surely it is not the place of a man to poke fun at his friend?'

The argument was apparently convincing. The Baron's secretary smoked on in thoughtful silence, his eyes fixed upon the wall in front of him.

'Well,' he said at last, 'if you promise to view the matter in all seriousness I'll tell you. Briefly, it's this. Of course you've never been to Semlin—or Zimony, as they call it in the Magyar tongue. So that you may understand aright, I must describe the place. In the extreme south of Hungary, where the river Save joins the Danube, the town of Semlin guards the frontier. Upon a steep hill, five kilometres from the town, stands the Baron's residence, a long, rather inartistic white building, which, however, is very luxuriously furnished. Comparatively modern, it stands near the ruins of the great old castle of Hetzendorf, which commands a wide sweep of the Danube. Now, amid those ruins strange noises are sometimes heard, and it is said that upon all who hear them falls some terrible calamity. I'm not superstitious, but I've heard them—on three occasions! And somehow—well, somehow, I cannot get rid of an uncanny feeling that some catastrophe is to befall me. I can't go back to Semlin. I'm unnerved, and dare not return there.'

'Noises!' cried Walter Murie. 'What are they like?' he asked quickly, starting from his chair and staring at his friend.

'They seem to emanate from nowhere, and are like deep but distant whispers. So plain they were that I could have sworn that some one was speaking, and in English, too!'

'Does the Baron know?'

'Yes; I told him, and he appeared greatly alarmed. Indeed, he gave me leave of absence to come home to England.'

'Well,' exclaimed Murie, 'what you tell me, old chap, is most extraordinary! Why, there is almost an exactly similar legend connected with Glencardine!'

'Glencardine!' cried his friend. 'Glencardine Castle, in Scotland! I've heard of it. Do you know the place?'

'The estate marches with my father's; therefore I know it well. How extraordinary that there should be almost exactly the same legend concerning a Hungarian castle!'

'Who is the owner of Glencardine?'

'Sir Henry Heyburn, a friend of mine.'

'Heyburn!' echoed Hamilton. 'Heyburn the blind man?' he gasped, grasping the arm of his chair and staring back at his companion. 'And he is your friend? You know his daughter, then?'

'Yes, I know Gabrielle,' was Walter's reply, as there flashed across him the recollection of that passionate letter to which he had not replied. 'Why?'

'Is she also your friend?'

'She certainly is.'

Hamilton was silent. He saw that he was treading dangerous ground. The legend of Glencardine was the same as that of the old Magyar stronghold of Hetzendorf. Gabrielle Heyburn was Murie's friend. Therefore he resolved to say no more.

Gabrielle Heyburn!

(To be continued.)

THE GRAND MUJIK.

CAN any good thing come out of Russia? we are inclined to ask, that land of vast distances, of anarchy, misgovernment, revolution; that unspeakable country, which is not one but many countries. Count Leo Tolstoy, during a long lifetime, in more than fifty volumes has made Russia articulate to the whole civilised world. Even more by his courage, character, and nobility of purpose has he captured the imagination of many people. The critics complain of a lack of clearness and movement in some of his books. The Church disowns his rendering of Scripture doctrine, and has excommunicated him. Withal, he is the one person in the Russian Empire whom the Tsar has never dared to touch; the Government has prohibited some of his books, mutilated others, and banished some of those who assisted him. Although the Moscow Government vetoed the decision of the municipality to hang portraits of Tolstoy in the schools, we have two picture post-cards before us bought from among half-a-dozen others in that town and posted to us.

The way in which his eightieth birthday was celebrated formed a striking tribute to the esteem in which he is held. Over a thousand letters, telegrams, and addresses poured in to his house at Yásnaya Polyána, near Moscow. Reuter flashed the event, with comments upon it, to the newspapers. The booksellers in Russia made a feature of his books and books about him. The Single-Taxers of Australia sent an address; and one which Tolstoy valued much came from the waiters of a music-hall in Moscow: 'We are far from following the ideals set forth by you, but we rejoice in the thought that we are beginning to learn a little of your teaching, and out of "men" [name given to a waiter] we are becoming human beings, who have a consciousness of God and a striving for eternal truth.' A German admirer wired: 'Hail to the pride of Russia!'

Few can go all the way with Tolstoy as a thinker and reformer, and it is a pity that he should have misunderstood, and misrepresented as well, that good man Dr Baedeker, and rather caricatured him in his *Resurrection;* this gentleman did a notable work in visiting Russian prisons, and in elevating the spiritual life of many of the Russian nobility. Tolstoy seemed entirely incapable of understanding Baedeker's point of view.

One of the greatest things Tolstoy has done has been to illuminate the life of the Russian peasant, and to stretch out a helping hand for his elevation. Such books as Dr Kennard's *Russian Peasant* give a deplorable account of his condition. The *izba* of the peasant is on a much lower level even than the hut of a West Highland crofter or an Irish cabin. Though emancipated, the peasant is still treated like a dog, and is in many cases as much of a serf as ever. Dr Kennard says he is as yet an unworked mine, waiting to be exploited by broad and liberal educational measures. But first he must himself get awake. For many are wallowing in filth in their homes, ignorant, superstitious; there is an entire absence of ventilation in their huts, an atmosphere impregnated with unutterable odours, superheated, dense, owing to the absence of a chimney. There is no abuse of language in saying that such an atmosphere, to one used to pure air, is fit to 'knock you down.'

By initiative and enterprise much may be done. Where British capital and enterprise have had a chance it has been like exploiting a gold-mine. One does not like to hear of certain industrial conditions, however, where the working hours are from 6 A.M. to 7.30 P.M., Saturday included, for our equivalent of one shilling and a halfpenny a day. An offer of tea-money amounting to twopence halfpenny has a wonderfully stimulating effect in the amount of work done. It is difficult to know what thoughts are simmering beneath those brows with the long straight hair as thick as a mat, clipped below the ears and the back of the neck to the bowl's edge, which is placed on the head to guide

the rustic barber. Below the rim everything is shaved. The faces below the thatch are past description for uncouthness; there are also not a few *vodka* noses in every village. The saints' days and the village *yarmak* or fair are a sure apology for holidays. Fish, cucumbers, water-melons, and dry black bread are the fare of many. The trains in Russia go slower than those in Britain, and, like the houses of the better classes, are heated to sixty-five degrees in winter.

To all who wish to understand Tolstoy and the work he has done Mr Aylmer Maude, in his *Life of Tolstoy: First Fifty Years* (A. Constable & Co.), supplies abundance of information. There are full materials here for forming a judgment on the great Russian, while the same author is writing up the period that follows. Mr Maude has written his book because he found so many people were interested in Tolstoy, and so few understood him; and his twenty-three years of residence in Russia, and experience of the novelist's country home near Moscow, have given him abundance of opportunity and material to do so. Along with his wife, Mr Maude has translated some of the more important of Tolstoy's works, he has taken part in a Tolstoy colony, and he went to Canada at his request to make arrangements for Doukhobor migration. This has made him a sound and capable exponent of Tolstoy's views, and one who has the approval of the Master.

Count Leo Tolstoy is an aristocrat by ancestry, who has solved the problem of 'back to the land' and back to the people. A certain Peter Tolstoy, born in 1645, distinguished himself in the service of the State. Count Elias Tolstoy, who figures in *War and Peace*, married a wealthy Princess Gortchakoff, and ran through her money as well as his own. Tolstoy's own father, Count Nicholas, married Princess Marie Volkhonsky, descended from a prince of Montenegro. She spoke six languages, was musical, and had a gift for improvising tales which her son inherited. Leo, born 28th August 1828 at his mother's estate at Yásnaya Polyána (Bright Glade), was the youngest of five children, and was deprived of his mother's care in early childhood. He was still young when his father died. Aunt Tatiana supplied the place of both parents, and had a strong influence in the moulding of his character. She it was who revealed to him the high and spiritual delights of love and of an unhurried, quiet life. Up till he was fourteen, Tolstoy's youth was happy, innocent, and, as he says, 'joyful, poetic.' Leo was an odd little fellow, never doing things like other boys; and once, in trying to fly, threw himself out of a window with nearly fatal results.

Mr Maude, speaking of the freedom and natural conditions prevailing in Tolstoy's first school, is led to compare what he endured at Christ's Hospital School between 1868–74, which he called years of mental stultification. The pages of *Chambers's Journal* came as mental relief and recreation. He says: 'I feel sure the stultifying effects of such cruel and senseless treatment would have been even more serious had not the school authorities, by some strange oversight, allowed *one* really readable and interesting periodical to find a place among the Sunday magazines and other sterilised literature obtainable in the school library. This one publication, which I read ardently during my school years, was *Chambers's Journal*. It contained novels by James Payn, and other matter suited to my powers of mental digestion. From smuggled copies of Captain Marryat's novels I also got a good deal of culture—far more, I am sure, than from any of the lessons we endured.'

The books which influenced Tolstoy most up till he was fourteen were the story of Joseph from the Bible, the *Arabian Nights*, Poushkin's *Tales*, and the Russian folk-legends. Later came discursive reading, the Gospel of St Matthew, Rousseau, Dickens, and Voltaire. At the school in Moscow he imbibed the prevailing opinion that the Christian religion was an old-fashioned superstition. Later he was to return to its main teaching. He went next to the University of Kazan, where he alternated between the asceticism of his brother Demetrius and the self-indulgence of his brother Sergius. We are told he enjoyed hunting and indulged in gambling and the society of gipsy girl-singers. Those years he afterwards regarded as the wildest and the most wasted of his life. Afterwards we find him settled on his estate at Yásnaya Polyána, and endeavouring to improve the condition of his serfs. After three years he went to the Caucasus to economise, in order to pay off his debts.

He entered the army, in which his elder brother was serving, and which was then engaged in subduing the native tribes. He was impressed by the beauty of the mountains, which he described in his *Cossacks*, but did not take kindly to the officers with whom he was thrown in contact. Here he began to write for the *Contemporary*, a Russian periodical, and made an impression at once.

Tolstoy volunteered for active service when the Crimean war began in 1854, and received an appointment on the staff of his uncle, Prince Gortchakoff, the Commander-in-Chief. Tolstoy was engaged in the defence of Sevastopol during the siege, and was frequently under fire. Here he saw war in all its naked horrors, and made others see it later in his *War and Peace* and different sketches he wrote. His description of Sevastopol in December, when published, caused the Dowager Empress to shed tears and gave Tolstoy his first European fame. It also caused the Emperor Alexander II. to give orders that the life of that young man be cared for. Accordingly he was moved some distance away from the seat of war. In writing he aimed at directness and simplicity. While at the Crimea Tolstoy had the reputation amongst his brother-officers of being the soul of the battery; a good story-teller, who improvised rhymes and was full

of witty anecdotes; an excellent hunter, rider, and athlete.

He settled in St Petersburg when the war was over, with the growing reputation of a brilliant writer, having entry to the best society of the place, but being profoundly dissatisfied with himself. He asked himself if the present life was worth living. He could not afterwards think of those years without loathing. He was sceptical of his work as a writer, convinced that he could not teach others if he did not himself know what he had to teach. Tolstoy next settled in the country near where he was born, and did what he could to ameliorate the condition of the serfs previous to the decree of emancipation in 1861. During two visits abroad, he travelled in England, Germany, and France; made special inquiry regarding the various educational systems; and conducted experiments, too, in teaching the peasant children around him in Russia on original lines.

Tolstoy's marriage in 1862 to Sophia Behrs gave him the completest happiness in family life, and to them were born thirteen children during twenty-six years. His wife admired the work of her husband, and assisted him in many of his literary labours. Some parts of *War and Peace* she copied many times. He worked best in winter, and walking and work out of doors formed his recreation. When run down a change of scene to the steppes, and draughts of *koumiss*, helped to restore him. He interested himself in horse-breeding, and from time to time increased his possessions in land. When Tschaikowsky and Rubinstein arranged a musical evening in his honour, the great writer said, 'Never have I received so precious a reward for my literary labours as on that wonderful evening.' Tschaikowsky says: 'He who in his writings was the deepest of heart-seers proved in personal contact to be a man of simple, whole, and frank nature, showing very little of the omniscience I feared.' Tolstoy has always liked the country better than Moscow, because there the people he did not want turned up, and prevented him from seeing those he did want. Mr Maude tells us Tolstoy's stories are as straightforward as daily life, showing his large capacity to feel intensely, note accurately, and think deeply. He always displays a scientific accuracy of observation. Life to him is all-important, and art is a handmaid of life. Beauty, simplicity, and sincerity was his criterion of art. Tolstoy besides wrote some simple stories for the people such as appear in English in *Twenty-three Tales from Tolstoy*, complex tales for society, three plays, one really great novel, and many interesting essays. He launched opinions, rightly or wrongly, on dogmatic theology, Christianity, economic and social problems, war, conscription, art, science, food-reform, and the use of stimulants and narcotics. Some think that *Anna Karenina*, which aroused immense interest when being issued serially, stands higher than even the highest point reached by Meredith. Howells calls Tolstoy one of the greatest imaginative writers that have ever lived, and says that supreme art in literature had its highest effect in making him set art for ever below humanity. He learned from Tolstoy to try character and motive by the highest ideal. A Frenchman writes: 'His collective works might be entitled "Views of the Nude Human Soul." In *Anna Karenina* we see the soul in the coils of passion; in *War and Peace* we see the soul in battle and intrigue; in *A Night's Lodging* we see the soul where *vodka* and worse gnaw it. *The Dominion of Darkness* takes us into the catacombs of the hideous. *Ivan Ilyitch* is the greatest study of death ever made.' Tolstoy wrote the long novels *War and Peace* and *Anna Karenina* during the fourteen years that followed his marriage. Of his school reading-books, including an ABC book, nearly two million copies have been sold, while millions of copies, in a cheap form, have been sold of his *Tales and Parables*, and of such stories as *Where Love is, there God is also*, *Ivan the Fool*, *Texts for Woodcuts*, illustrating, as has been said, the single and simple aspects of the Tolstoyan morality with the familiar directness of *Æsop* and the *Arabian Nights*. The history of his mind and thought, with frequent changes of attitude towards the problems of life, is reflected in the works published during the last twenty years, of which these are the more important: *My Confession*, a *Criticism of Dogmatic Theology* (not yet translated), *The Four Gospels Harmonised*, *What I Believe* (or 'My Religion'), *The Gospel in Brief*, *What then must We Do? Life*, *The Kreutzer Sonata*, *The Kingdom of God is Within You*, *The Christian Teaching*, *What is Art? Resurrection*, and *What is Religion?*

Tolstoy has deposited his memoirs and diaries with the curator of the Moscow Museum, and they are not to be published until ten years after his death.

In December 1858 Tolstoy was nearly killed by a bear. While he was out shooting with a party, the bear rushed at him and knocked him over on his back in the deep snow. The next thing he knew was that he was being weighed down by something heavy and warm, and he felt his face being drawn into the beast's mouth. He could only offer a passive resistance by pulling his head down and presenting his cap for the bear to chew. Assistance came, frightening the beast away, but a permanent mark was left on his face.

Beyond the experiences in the Caucasus and at the Crimea, duly noted in his works, his life has been uneventful. The death of his brother Nicholas at Hyères in 1860 bit deep into his soul. A journey in Italy left no permanent impression in his writings. A long-standing feud with Turgenief, whom he challenged in 1861, was settled in 1878. Other events have been the handing over of his property to his wife and family in keeping with his own peculiar views, the distribution of relief to the starving Russian peasants during 1891–92, and his sympathy with the Doukhobors. To this extraordinary body he gave the profits of the first edition of his *Resurrection*. But Tolstoy seems to have

repented in his old age of getting and holding property, money, and goods. He is, says Mr Maude, no faultless and infallible prophet whose works should be swallowed; but he is a man of extraordinary capacity, sincerity, and self-sacrifice, who has for more than twenty years striven to make absolutely plain to all the solution of some of the most vital problems of existence.

JOHN MAINWARING, FINANCIER.

CHAPTER III.

IN a few minutes Courtenay and Mainwaring were in Mainwaring's automobile rushing back to Heimbad.

When the hotel was reached Mainwaring said to Courtenay, 'Come to my rooms and let's have a drink. I tell you I felt to-day for the first time that I am sixty years old.'

As they entered the drawing-room Lucia appeared from the balcony.

'Lucia,' said Mainwaring to his daughter, 'I wish to say something to you, and I want a witness. Courtenay will do extremely well.'

Lucia turned a lovely, startled face upon her father.

'It is this,' continued Mainwaring in a cool voice. 'I went out to the Castle of Sternberg to-day by appointment with the Grand Duke. He made a direct proposal for his marriage with you—morganatically, of course.'

Courtenay saw the blood stealing into Lucia's face at the word morganatic, but she remained silent.

'The terms are these: the Kaiser will agree to make you Countess of Heimbad, and demanded ten million marks as a settlement on the Grand Duke. There is one thing about it which the Grand Duke did not mention, but which I happen to know. Those left-handed marriages may be dissolved. If the Grand Duke throws you over when he gets the money you will be still my child, and you shall never want for anything as long as I have a dollar. However, he may never wish to throw you over, but'—here Mainwaring's voice showed a note of concentrated rage and contempt—'mark my words well. If you marry the Grand Duke on these terms—these shameful terms—do you never as long as you live let me see your face again. You may do as you like about your Grand Duke, and I shall do as I like about my daughter!'

Mainwaring's deep and controlled emotion communicated itself to Courtenay. Every nerve in his body was tense as he watched Lucia's face. Her head drooped as if in shame that she had even considered for a moment a morganatic marriage. When Mainwaring stopped she stood like a bird poised for a rush of wings, and in another moment she had thrown herself, sobbing, in her father's arms, and Courtenay fled to the street.

Courtenay was not surprised when, next morning, the whole Mainwaring party left Heimbad. At the station Mainwaring said, smiling, to him, 'Don't be surprised at any time if you hear from me, and I understand you will be willing to come to me at my request?'

Courtenay remained the winter and spring in Europe, but did not go near the Mainwarings.

One day in June he received a peremptory telegram from Mainwaring, who desired Courtenay's presence immediately near Frankfort. The next day found him at the handsome suburban villa which Mainwaring had given as his address. Mainwaring met him, and carried him off at once to a private room.

'I have been having a strenuous time with both my daughters,' he said, laughing a little. 'Milly has bullied me into letting her engage herself to the little Goddard chap. Both of them are much too young; but, of course, Milly got the upper hand of her mother and me. My daughter Lucia appears to be in a reflective mood, thinking about her Grand Duke, no doubt.'

Courtenay felt his face grow warm at the mention of Lucia's name, but he said coolly, 'How do matters stand at present with the Grand Duke?'

'Beautifully! Beautifully!' cried Mainwaring. 'My object is to have the Grand Duke offer to make my daughter his Grand Duchess, and to pay him off for his infernal, scoundrelly proposal to make her his'——

Mainwaring stopped speaking, and his ruddy face darkened. Then he spoke again with an incipient grin: 'Of course, it all depends upon my daughter's wishes. I made that express proviso, but I suppose that the idea that she shouldn't want to be a Grand Duchess would seem like a pipe-dream to the Grand Duke. However, I think I have got the Grand Duke pretty well shanghaied. First, I had to get hold of the salt-mines, the largest source of revenue to the Grand Duchy; but they were working the mines at a loss, because they had made no improvement in methods since the days of Frederick Barbarossa. Just to humour the Osterbergers, I offered seven hundred thousand dollars in real money—American money, I mean—for the salt-mines, which was more than they were worth. I countered on this, though, by buying for a song the Osterberg copper-mines, the finest I ever saw in my life, with the bornite lying around in chunks. Then I managed to acquire—on the sly, of course—a controlling interest in two of the leading industries of the Grand Duchy, and I bought outright the new hotel at Heimbad. Next I closed the whole business up for the season just to show the Oster-

bergers what I was prepared to do if the Grand Duke wasn't obliging. Then came the best stroke of all. I found that my prospective son-in-law had notes floating around in every capital in Europe. I bought up every scrap of paper with the Grand Duke's name on it. I can now put the screw on him to the tune of about four hundred thousand dollars. The whole investment foots up something like two million dollars, but I estimate that with the copper-mines and a modern system of mining salt I can close out in the end at a profit. I have got not only the Grand Duchy but the Grand Duke in pawn, and neither he nor they can turn a wheel until I get solid cash.

'After all,' Mainwaring kept on, 'it's a small affair, this toy Grand Duchy and miniature Grand Duke. In America we play a bigger game than this every day in the year except Sundays and holidays. But there is a kind of charm in the very smallness. It is like playing bagatelle after a game of horse-billiards. It's the very thing to amuse a tired financier. But there is one point on which I want to consult you.'

Mainwaring was interrupted by a knock at the door, and the footman ushered in Von Tempsky. He bowed stiffly to Courtenay and Mainwaring, and handed Mainwaring a letter sealed with the Grand Ducal arms.

CHAPTER IV.

THE letter was from the Grand Duke, formally notifying Mainwaring that the Kaiser would agree to confer the rank of Duchess upon Miss Mainwaring, thus making her eligible to become Grand Duchess of Osterberg, on condition that the sum paid down should be forty million marks, instead of ten million, and on the same terms.

'Then I take it,' said Mainwaring to Von Tempsky, 'that it only remains now to get my daughter's formal consent. And I should like to have your opinion with regard to publicity. I have managed by bluffing and lying to keep the matter out of the American newspapers until a fortnight ago. I think the best thing now is to admit the truth, and simply say what the Grand Duke has offered, and that the matter is in negotiation.'

Von Tempsky reflected a moment, then replied, 'Your plan appears to be judicious. It would perhaps be just as well that the news should come back to Europe from America, thereby familiarising Europe with the idea of the marriage before it is officially confirmed.'

After a few commonplaces Von Tempsky rose, and Mainwaring escorted him out. Then Mainwaring returned to Courtenay.

'I think it's all settled,' he said. 'That newspaper business is the thing I wish to consult you about. I shall cable to the inquisitive New York newspapers that the Grand Duke has made his offer, the Kaiser has consented, and it rests with my daughter to say whether she will be Grand Duchess of Osterberg or not.'

Courtenay remained silent; he had scarcely spoken a word during the whole interview. In his heart was stirring the fierce pain of disappointed love and baffled passion.

Mainwaring, without noticing Courtenay's strange silence and sombre looks, continued: 'I can't make out how my daughter stands on this Grand Duchess business. Of course there was no question of a morganatic marriage; but ever since the game has been in her own hands, so to speak, she has been depressed, uncertain, tormented. But she must settle the matter for herself. There are some things the simple creature man cannot decide for the complex creature woman.'

Courtenay rose as pale as death, and mumbling something about being remembered to the ladies, took his leave. Once outside the villa, he turned from the avenue into an alley of dwarf fir-trees, which offered a short-cut to the high-road, where his carriage awaited him. As he reached the middle of this dim solitude he saw advancing toward him a white figure which he knew to be Lucia Mainwaring.

In a minute or two they met face to face. Courtenay was shocked at Lucia's appearance. She was ashen in colour, and as near ugly as a beautiful woman could be.

They exchanged everyday greetings, scarcely knowing what they were saying, and then came a pause.

Courtenay, his heart wrung with the evidence of Lucia's suffering, burst out, 'You are looking terribly pale and thin. Have you been ill?'

'Not outwardly,' replied Lucia, moved by the passionate anxiety in Courtenay's voice, 'but very ill here.' She placed her hand on her heart and raised her beautiful, miserable eyes to Courtenay. 'I don't understand what my father means about this—this marriage. No one but myself knows what I suffer.'

Some impulse, sudden and uncontrollable as a bolt from the blue, made Courtenay seize her hand and cry, 'Is it that you love another man?'

'Yes,' answered Lucia in a thrilling voice, 'I do love another man.' She trembled as she spoke, and would have fallen but for Courtenay's sustaining arm.

'Lucia!' he cried—'Lucia!' and laid his lips upon hers.

. . . . . .

They remained long in the shaded alley—they knew not how long. In paradise there is no note of time. But after a while, hand in hand, the man and the woman passed through the shadows and came into the shimmering sunlight.

All at once Courtenay roused himself from his heavenly dream, and said to Lucia, 'It seems to me there is but one thing to do, and it is for us to be married as soon as possible, and that without con-

sulting your father. If we do, it will place him in a position of playing fast and loose with the Grand Duke. Of course he has done it outrageously'—Courtenay laughed like a man who has won a game—'but we must not let on we know it.'

'How quick you are to think!' murmured Lucia.

Courtenay was indeed quick to think, his trained mind taking in the situation at a glance. 'I shall return at once to Frankfort,' he said, 'see the American Consul, and get a clergyman. It can all be arranged by four o'clock. Then, if you will meet me at the station in Frankfort, we can be married and take the night train for—Alpensberg.'

Both of them laughed merrily at this.

'My mother would come with us,' said Lucia.

'Better not,' replied Courtenay after a moment. 'You ought not to implicate any member of your family.'

'Good-bye!' cried Lucia, turning away with a radiant smile. 'I will be at the Frankfort station at four o'clock, if you will have it so.'

At four o'clock that afternoon Courtenay, with the Consul and his wife, met Lucia in the Frankfort station. Courtenay and Lucia were married in a little, dingy church close by, and the next morning found them in Alpensberg and in paradise.

On the third evening after their marriage, as they sat on their balcony watching the moon rise over the white peaks, a firm step resounded in the room behind them, and Mainwaring appeared. He caught Lucia in his arms and kissed her, and grasped Courtenay's hand.

'It was the neatest thing possible,' he said, 'and you have saved me a whole lot of trouble and my reputation as an honest man besides. I never meant this Grand Ducal marriage to take place.'

'Then,' cried Lucia, all smiles and tears, 'why did you worry me so about it?'

'Because,' replied Mainwaring, rumpling up his hair like a delighted schoolboy, 'it gave me a chance of getting even with the Grand Duke Hugo XVIII. for that impudent morganatic proposal. And it tickled me to get a blanket mortgage, so to speak, upon him; and I am not so sure that didn't have a good grip upon the Kaiser himself. It took me ten months' work and cost me two million dollars, but it was worth all it cost.' The light of a gladiator shone in Mainwaring's eyes as he said this.

'I suppose the Grand Duke has heard the news by this time, and thinks me a double-dyed villain,' said Courtenay, laughing.

'I should think so,' chuckled Mainwaring. 'I telegraphed the news to Reuter's, and it was all over Europe and America the night before last. The Grand Duke, *incog.*, with only Von Tempsky as an escort, turned up at the villa at seven o'clock yesterday morning. He was as near crazy as any man I ever saw. I told him that I had not the remotest idea there had been anything between you and Lucia until we got your telegram saying you were married. Of course I saw all the time you two were dying for each other. The Grand Duke executed a regular ghost-dance while imprecating me, and you, his false friend, and women in general, while even Von Tempsky limbered up and made a few unstudied remarks. But the Grand Duke, I tell you, has a latent capacity for business. I believe he wouldn't mind sitting at meat with the Money-Devil himself. As soon as the first paroxysm was over he proposed to marry my daughter Milly on the same terms. I sent at once for my wife and Milly, and in the presence of the Grand Duke laid the proposal before them. The girl gave a scream that made even Von Tempsky jump. Then she dashed herself into her mother's arms, and the two wept and wailed as if I had suggested Milly's immediate electrocution. The Grand Duke looked from one to the other of us, completely dazed. I said, "Your Serene Highness sees how it is. My daughter is engaged to be married to an ensign in the American navy, with his pay and one-fourth interest in a farm in Kentucky—so he tells me on his word of honour—and she won't give him up. There is no use trying to make the deal."

'"But," bawled the Grand Duke, foaming at the mouth, "she is your daughter, and you can prevent her from throwing away a Grand Ducal crown." My wife then spoke up. She said to me, "John, this child shall not be made merchandise of with my consent." And I answered, "Good Lord, Sarah, did you ever know me to do anything without your consent since the day you promised to love, honour, and obey me?" She turned, with an air as if she were a Grand Duchess herself, and walked out of the room, carrying Milly with her. Well, the Grand Duke raved and stormed until Von Tempsky dragged him off as limp as an old shoe-string. Then I sent for the newspaper men, and gave out an interview a yard long. I told every detail of the affair up to the point that my daughter, without telling me or even her devoted mother, walked off with Mr Richard Courtenay, the well-known New York lawyer, and married him, I presume against his will, as he had never given the least indication of wishing to marry my daughter. I am proud of that interview. As a piece of casuistry it has not been equalled since Mark Antony made his funeral oration over the bones of Julius Cæsar, and I want to express my eternal thanks to both of you. You have placed me under lasting obligations to you, and have afforded me superhuman beer and skittles, so to speak.'

Mainwaring, Lucia, and Courtenay had supper in the garden of the villa. Mainwaring managed to obtain a bottle of thin champagne, and drank the health of the bride and groom. Courtenay responded with the health of Mr and Mrs Mainwaring, and Lucia suggested that of Milly and Tommy. Then Mainwaring declared that he must not leave out the Grand Duke, whose health he drank standing and with all honours.

'I have not made up my mind,' he said with his rich laugh, 'what I shall do with the Grand Duke, whom I have in chancery, and the Grand Duchy,

which I have in pawn. But I got my whole family into Switzerland to-day, and will take passage from Cherbourg on Saturday. Cherbourg is not in the Kaiser's dominions. My experience of the last ten months will always be the most cherished recollections of my life.'

When it was near ten o'clock Mainwaring, Lucia, and Courtenay strolled along the little, dimly lighted town to the railway station, where Mainwaring's special carriage was waiting for the through-train. At the tender parting between father and daughter Courtenay turned away. It was too sacred even for the eyes of a husband. Courtenay and Lucia walked back through the dusky night, hand in hand, in silence and in perfect joy.

THE END.

TYROLESE MARKSMANSHIP.

By REGINALD WYON.

N these days of rifle-clubs and strenuous effort to awake in England a love of target-shooting, a little information regarding the greatest race of European marksmen may be of interest.

The German Tyrolese—and by this is meant the German-speaking Tyrolese of the north—undoubtedly deserve this designation. The Swiss, the Bavarian Highlanders, and the natives of many Austrian provinces are likewise splendid shots; but at all their great meetings Tyrolese marksmen invariably take all the best prizes. Marksmanship is, indeed, the Tyrolese heritage. A century ago Tyrolese peasants armed with the most primitive weapons again and again utterly routed the disciplined and conquering French and Bavarian armies. They were well led, it is true; but it was solely due to their marvellous shooting that these peasants were able to hold more than their own against the invaders. It is said that these marksmen when aiming waited where possible for every shot to kill three or four of the enemy. Regarded from their present capabilities, this can be easily credited.

As a result of their loyalty to the House of Hapsburg and their shooting-skill, the Tyrolese to-day enjoy certain unique privileges: firstly, the right to perform their military service in the crack Tyrolese Imperial Rifle Regiment (Tiroler Kaiser Jäger Regiment), the smartest light infantry corps of the Austro-Hungarian army; and, secondly, the right of possessing and carrying firearms without a permit (*Waffen pass*), a privilege granted to no other province in the Austro-Hungarian Empire. In consequence nearly every peasant has one or more rifles and shot-guns in his home—for they are passionate lovers of the chase as well—and can walk abroad armed to the teeth if it so please him, and with none to say him nay. This privilege ceases south of Bozen, where Italian is the language of the peasants.

Each able-bodied Swiss possesses a military rifle, but it is solely for military purposes, and is the property of the State; as is the case also with the Montenegrin, though with the latter warlike race the rifle invariably accompanies its owner wherever he may wander.

Of course, from a serious shooting point of view, no nation can compare with Montenegro and Albania. In these countries, and in particular on the border, men carry rifles never knowing when they may be called to use them in real earnest. Consequently their target-practice is confined to practical shooting; that is, a mere tiny 'bull' is a luxury—it is a man's body they practise to hit; and, as long as they can kill, the exact spot is immaterial. Likewise, judging distance accurately is an essential gift, and on their Sunday practice-shoots the target (usually a white or conspicuous block of stone the size of a man's body) may be placed at any distance from two hundred to five hundred yards.

Not so with the Tyrolese marksman. It is too crude, and he has reduced target-shooting to a fine art. He disdains the military rifle as clumsy and inaccurate, and his own rifle is a weird and cumbersome object, with an enormously heavy butt, a leaf-sight, a tiny fore-sight the size of a pin's head, and a most delicate hair-trigger. The 'bull' at two hundred yards measures twelve inches only in diameter, is divided into five rings, and no shot counts on the white. Plumb in the centre counts six, the outer ring of the 'bull' one. Though these rifles are twice as heavy as the modern magazine-rifle, all shots are fired standing, with no rest at all.

Some idea of the accuracy of a crack shot may be gathered from the fact that unless he can, standing, put five successive bullets into a space that can be covered by a half-crown piece at two hundred yards, he considers himself in very poor form. Even then his score may be only twenty out of a possible thirty. A poor shot, though a man who can get on the twelve-inch bull every time, may find himself credited with a paltry five or six. It is disheartening work for a novice, even if he has not done so badly at Bisley in former days, and proudly sported the marksman's crossed rifles on his volunteer tunic.

That this fancy shooting—there is no better name for it—does not spoil the Tyrolese peasant for military rifle-shooting is amply demonstrated when we witness an imperial rifle regiment on parade. It would seem as if every man wore the green velvet balls dangling on his breast, the Austrian army badge of marksmanship. But excellent weapon as is the Austrian Mannlicher rifle, it is of little use at the tiny targets of the national shooting-ranges.

The writer has had ample opportunity of studying the Tyrolese peasant marksman at home. Every village or cluster of villages has its own rifle-range run by the village council and controlled by the State. Membership is not obligatory, but there is no subscription attached to it, and, once a member, the peasant may use any rifle-range throughout the country. A further privilege is granted him after the completion of his three years' military service—namely, that one of the annual three weeks' trainings with the colours as reservist is remitted to the *Standeschutz*, or member of the National Rifle Club. This is also an exclusive Tyrolese privilege.

When a youth reaches the age of eighteen he must attend the nearest rifle-range whether he be a member or not, and fire a certain number of shots; and later, if he is passed for military service, he must again fire a certain number of rounds as conscript ere he joins his regiment. The regimental authorities thus know the shooting possibilities of each recruit, and these preliminary tests are carried out with the service rifle, of which every range must possess a few.

Weather permitting, every range is open for practice on Sunday throughout the year from 11 A.M. till sundown. Ammunition is supplied at cost price; but most marksmen prefer to supply their own cartridges, which they fill themselves. The clerk of the range enters every score on an official sheet, and a nominal charge of four hellers (less than a halfpenny) is made for every shot entered therein. This pays for the upkeep of the range, the markers, &c.

An additional zest is given by a weekly *Gnadengabe* (gift of grace) from the Government, whereby the top scorers of the day receive two or three shillings each as a prize. The older men and crack shots, however, seldom compete for these small prizes, and give their younger and poorer comrades a chance to pay their day's shooting expenses.

Every opportunity is also seized to hold a *Preis* or *Freischiessen* (prize or free-shooting match). In the former case, substantial prizes are provided by subscriptions, entrance-fees, and a higher charge for every round fired, and the local cracks travel continually all over the country attending such meetings. It speaks much for their love of shooting pure and simple that in most cases they are more than content if they merely cover their expenses; and they by no means try to make a business of it. The writer has often seen a particularly successful marksman spend the bulk of his winnings treating his comrades to a great wine-carouse. The *Freischiessen* is more of a local affair, open, however, to all comers, and is more of a jollification. It is given on any excuse, as, for instance, the marriage of a member. He supplies free drinks and the expense of the range out of his own pocket, all of which may cost him anything from five pounds to fifty pounds, according to his means. The feature of this is a specially prepared and highly ornate *Ehrenscheibe* (or target of honour) inscribed with the giver's name and date, at which every one may fire one shot. Every hit is carefully pegged and numbered, so that on the score-sheet being referred to each marksman's hit may be recognised. At the conclusion the target is hung up permanently in the shooting-gallery.

More complex is the great annual prize-shooting at the huge central rifle-ranges, such as was held recently at Bozen in honour of the Emperor's Diamond Jubilee. The shooting lasted for a fortnight, and nearly five thousand riflemen competed. To English ideas the method of deciding the best shots is fluky in the extreme. It is literally the best shot that wins. To explain. The rifleman may fire as many shots as he likes, but once he hits the bull he must retire. That shot of his may be plumb in the centre or on the outside edge—it remains as his shot in that particular competition. As may be imagined, at a large meeting the distances from the plumb centre differ often only by a hair-breadth, and to measure the hit an instrument is used which registers the thousandth part of a centimetre. It happened at Bozen that a very indifferent rifleman, not out of his teens, who had come merely to look on, suddenly made up his mind to have a shot. He borrowed a rifle from a friend, paid his ten crowns entrance-fee, and with his first and only shot hit plumb in the centre. For this he got eighty pounds, a banner worth half that amount, and several medals. It happened to be the best hit of the whole fortnight's meeting. At the same time, there are prizes for the best series of shots, as is the case in England; but the great prizes are all won in the above manner, and it is not often given to the novice to fluke so successfully. The old hand seldom fails, and always knows when his hand is absolutely steady. He will test himself by holding the ends of his thumb and forefinger about a quarter of an inch apart and note if there is the slightest tremor. Maybe he will consider a pint of wine essential first, or step up at once and fire his rounds, or wait till another day.

It must be admitted that the Tyrolese crack shot abhors teetotalism, and smokes strong tobacco from morning till night, and he will make in some instances as good a score drunk as sober. At any rate, an all-night carouse will not prevent him from making a magnificent display next morning.

Though most of the shooting is done at two hundred yards, every *Bezirk* or district containing several villages possesses a four hundred yards range, where an oblong target is used. It is eighteen inches in width, and has a blue-black bull of only six inches diameter. As is the case in all Tyrolese target-shooting, standing is the only position allowed; and, in addition, the leaf-sight may not be used at this range, but the ordinary back-sight only. This range must be used a certain number of times each year, and every four years a compulsory competition takes place at it in each *Bezirk*. The Emperor here again shows his love for his

mountaineers by giving ten ducats for prizes at each of these matches; and it is worthy of notice that only in Tyrol and solely connected with rifle-shooting is this old designation of a coin used (ducat, about nine shillings and sixpence).

Many villages have, in addition to the outdoor rifle-ranges, an indoor air-gun club, where they shoot one evening a week during the winter. The air-gun, which costs about five pounds, is no toy, and is modelled on the lines of the heavy target-rifle. The darts, too, are carefully tested, and the conditions are precisely the same as in firing out of doors at two hundred yards. Many a young shot begins here, and emerges on to the range a first-class marksman. Prizes are shot for each evening; but a suspicion of levity is introduced every week by the following rule: Each member in turn is called upon to provide a *Juxscheibe* (a joke-target), usually some advertising poster. One member selects an object on the poster—it may be a bottle, or a person's ear or nose—as the 'bull,' the name of which he writes down, and encloses it in a sealed envelope, which the clerk of the range holds. Every member may fire one shot at whatever point he imagines may be the 'bull,' and at the conclusion the man who has hit nearest the secret point wins the prize given by the evening 'joker.' Otherwise, target-shooting in Tyrol is not treated lightly.

THE WARREN AT FOLKESTONE.

By F. G. Aflalo.

IN the blue gault mausoleum of Folkestone's broken undercliff lie the disintegrated remains of a hundred generations of animals which dwelt in shells. The coast of Kent is hereabouts broken by a stretch of strange and beautiful verdure fed by the water which, draining through the porous surface-soil of the cliff, finds its farther progress to the beach barred by this funereal gault. There, on the Warren, lies the imprisoned water in a basin, and vegetation has benefited and rankled with such bewildering results as to have produced a natural garden of tangled beauty nowhere equalled on the coast of Britain.

The garden is ever changing. To the geologist—to whom the soft clay is a happy hunting-ground, enabling him at a blow to drive his pick through fifty centuries of evolution—the changes that mark the face of the Warren during a human lifetime would be imperceptible, for he reckons only in æons, and his eye is focussed on a far horizon that ignores the middle distances of time. Yet every period of flood and drought marks the Warren for its own. Slimy newts and clinging pond-snails change homes with the thrifty ant and nervous lizard within a year. Gleaming pools, over which golden-armoured dragon-flies chase their tiny prey, may at the passing of a heavy train be filled up with a miniature landslip that smothers a hundred homes. The little, wild creatures of the Warren live ever on the brink of destruction, like peasants on the slopes of Pelée or Vesuvius. After the drought of summer, autumn rains turn the tables; and, after the fashion of Indian tank-life, the children of the waters swim at ease over the sodden remains of land-animals.

There, amid the mazes of the Warren, may be seen collectors gloating over all manner of spoils. One with probing hammer would lay bare the family vault of ancient beings, who inherited the earth ere the coming of man. Another, sweeping the droning harvest of the air with his green net, transfers to a cyanide Nirvana the gay fritillary or elusive burnet. A third is intent only on such old-fashioned wild flowers as luxuriate in this sun-bathed spot, gathering—let us hope with sparing hand—the gentian and centaury and queer little terrestrial orchids. A fourth kneels watchful on the margin of a stagnant pool, and waits for some treasure of insect life to float within his grasp. Frogs and newts keep company with whirligigs and other lesser lights in these still pools. Vipers, willing to wound and yet afraid to strike, rustle suggestively in the dry bracken, and the innocent slow-worm often suffers for the guilty. It is lazier to evade the quick heel of some fool who, having crushed the beautiful burnished body, congratulates himself on having killed a dangerous reptile.

Here, in fact, is a microcosm of life's little tragedies, of silent endings and humble beginnings. Here each spring is a renascence in which tadpoles wriggle once more in every pool and little throats call for food in every bush. Here in winter-time is a sleeping city in which only those find evidence of life who take the trouble to turn up the hard earth or frozen mud that hides the sleepers from the light of day.

Only at rare intervals round the sea-washed barrier of this kingdom is there such wealth of flowers within reach of the collector. The wild wallflower and horn-poppy, with other fair or fragrant treasures of the cliffs, bloom in mid-air, and are often hidden from every eye save those of mewing gulls and screaming daws. Down on the red walls of Devon sweet-scented patches may be seen at intervals by those who coast in yachts and search with telescopes, but their fragrance is only for the scurrying rabbits. Here and there in Hampshire far-seeing municipalities have preserved green chines from the builder, but gorse and other evergreens alone deck their slopes, and no wild-flowers make the pattern of their carpet.

The general rule is that the spindrift stings wild

land-flowers to death, and it is for this reason that the Warren is unique in offering wild flowers and wild seas in one focus, preserving the beauty of an inland garden in the grip of the spray, a seismic confusion of flowers and ferns very pleasing to the eye that loves to dwell on simple vegetation. It is perhaps after the more artificial beauty of the Lees that you find this wilderness irresistible. Nature and the railway have combined to beautify it, and only a botanist and engineer in conclave could distinguish the share of art. Little ponds gleam through screens of hawthorn and curtains of sweet-briar, and invite closer acquaintance by the aid of winding paths not so abrupt as to tire you. Trefoil, stonecrop, and other simple plants no longer encouraged by salaried gardeners linger hereabouts in tender memory of an unsophisticated generation that loved their modest worth.

GRETA HALL.

By R. H. Brewer.

VEN the 'unliterary' man often takes an interest in a house which has been the dwelling-place of a distinguished writer. I am acquainted with two men who, though they had not read a line of Wordsworth, put themselves to some inconvenience in order to have a look at Dove Cottage. It is a little curious that many men, knowing little or nothing of the works of an author who has made the house in which he lived famous, will nevertheless expend both time and money for the mere satisfaction of being able to say they have seen it. The explanation in some instances may be that they have an idea that the qualification to speak with authority about the birthplace of a genius entitles them to share the glory that clings to the name of that genius. When this is so let us look upon the weakness with charity, for their interest in a 'literary' house may lead them eventually to read the immortal works which were written within its walls.

Happily, those interested in literary shrines have in Great Britain plenty of easily accessible places affording the means of gratifying their appetites, for the quondam homes of great literary men are dotted all over the country; and nowhere are they more plentiful than in the English Lake District. I wish here to introduce the reader to one of these Lake District shrines—Greta Hall, Keswick, where Coleridge and Southey dwelt together, whose walls sheltered Southey for forty strenuous years, and whose hospitable threshold was often crossed by Wordsworth, Lamb, De Quincey, and other literary celebrities.

Greta Hall revived my interest in its associations when it was offered for sale by public auction, and, with the grounds adjoining, was bought for six thousand two hundred pounds by Mr Robert Slack, Derwent Hill, Keswick. What the Hall cost to build I do not know exactly, but imagine it must have been well within three thousand pounds, for the man who built it was by no means rich.

The builder of Greta Hall, William Jackson, is an interesting personality. He was a carrier from Whitehaven on the West Cumberland coast to Kendal and Windermere. Wordsworth has immortalised him in his poem *The Wagoner*. Jackson carried passengers and goods in pre-railway days, and his business was fairly lucrative; at all events he made enough by it to build Greta Hall and to be in a position to retire on an assured income of two hundred pounds a year—not a large fortune as fortunes are reckoned in these days; but then Jackson's ambition was to acquire intellectual rather than monetary riches. Therefore he built Greta Hall, and settled there with the intention of devoting his bounteous leisure to the enjoyment of his books, having already got together a fairly good library. Among his volumes he prized most highly the works of Milton and Shakespeare; but he admired all the poets, and his sympathies were not confined to poets who had passed beyond human aid, as afterwards appeared from his kindly treatment of Coleridge. The latter was invited to use Jackson's library as freely as if it were his own, and in a letter to his friend Poole in 1800, Coleridge referred to the carrier's books in the following terms: 'Our landlord, who resides next door in this twofold house, is already much attached to us. He is a quiet, sensible man, with as large a library as yours, and perhaps larger, well stored with encyclopædias, dictionaries, and histories, &c., all modern.' In that out-of-the-way corner of the world in the year 1800 such a library must have been to Coleridge a priceless treasure.

The story of how Coleridge came to live in the Lake District is interesting. After the 'Pantisocracy' craze—in which Southey was associated, and which fortunately for English literature fizzled out—Coleridge married at Bristol Miss Fricker, and took her to a five-pound cottage at Clevedon. Here his fertile brain bred many literary schemes, but those put to the test of public opinion were disastrous financially. Then ensued restless wanderings about the country, succeeded by a visit to Germany. At length, in June 1800, with his wife and 'Little Hartley,' he went to stay with the Wordsworths at Dove Cottage, in the Lake District. Presently Dove Cottage was exchanged for another house on Windy Brow, Keswick.

At the time Coleridge went to Windy Brow, Jackson was settled in Greta Hall, and was on the lookout for some one to share the 'twofold house' with him. By chance he heard from Mr Calvert,

a cultured man, steward to the Duke of Norfolk, that a young poet had lately come to the neighbourhood, intending to settle and work in the quiet valley of Keswick. Jackson interviewed the young poet, who was Samuel Taylor Coleridge, and as a result the latter, with his wife and child, removed to Greta Hall.

When Coleridge's first rent-day came round a quaint incident occurred. Jackson knew well enough that writing poetry was not, as a rule, a 'paying occupation.' He knew, too, that in the case of the young poet who shared Greta Hall with him it did not pay. Add to this the fact that the worthy man had a rare and tender sympathy for the whole race of poets, and for Coleridge in particular, and one has no difficulty in believing that on the first settling-day he refused to take a penny of rent. 'Nay, nay, Mr Coleridge,' he exclaimed, waving back the proffered rent, 'I like you and your family and your company. The rooms are not plastered yet. I won't take any rent this time.' The reader will have noted with what good taste and delicate sensibility the 'wagoner' put the matter. Coleridge's company was more than value for rent; which in a sense no doubt it was. Besides, if that were not reason enough, there was the further unanswerable argument—the rooms were not yet plastered. How could anybody, least of all a poet who was such splendid company, be expected to pay for rooms that were not plastered? How happy the modern race of poets would be if the world were full of landlords like Jackson and of houses like Greta Hall, with unplastered walls!

In addition to the advantage given to it by the library possessed by its owner, Greta Hall had an even stronger recommendation in being situated amid scenery of surpassing beauty. The prospect from Greta Hall was one that could not fail to ravish the eye of a poet. Coleridge, soon after beginning his residence there, described the situation in the following words: 'Our house stands on a low hill, the whole front of which is one field and an enormous garden—nine-tenths of which is a nursery-garden. Behind the house is an orchard and a small wood on a steep slope, at the foot of which flows the river Greta, which winds round and catches the evening lights in the front of the house. In front we have a giant's camp—an encamped army of tent-like mountains—which by an inverted arch gives another view of the vale. On our right the lovely vale and the wedge-shaped Lake of Bassenthwaite, and on our left Derwentwater and Lodore in full view, and the fantastic mountains of Borrowdale. Behind us the massy Skiddaw, smooth, green, high, with two chasms and a tent-like ridge in the larger. A fairer scene you have not seen in all your wanderings.'

This description was given in a letter pressing Southey to come and live at Greta Hall. While accurate as far as it goes, it falls short of conveying adequately the impressive grandeur of the scene. But the most happily chosen words must fail to do full justice to it. One looks with awe upon a panorama of towering mountains, the slopes of some thickly wooded, the jagged rocks and pinnacles of others standing out sharply, peak jostling peak, and giving the impression of a huge encampment of mammoth tents, the tops of those in the distance wrapped in cloud. At first the eye is held by the striking panorama of mountains and clouds; but by-and-by one turns to more lowly objects, and a beauty of another kind reveals itself. Immediately before you stretch out pleasant green fields, broken by clumps of trees and tree-encircled residences; while, farther away, wooded slopes form a charming background to lovely Derwentwater. Now let the eye turn to the right, and Bassenthwaite Water is seen washing the feet of Skiddaw, round its margin thick woods, behind which rise mountain peaks—a bit of Switzerland dumped down in this delectable corner of England. To repeat Coleridge, 'a fairer scene you have not seen in all your wanderings.'

When he came later to look upon this enchanting scene, Southey was hardly less enthusiastic. Writing at the end of a month's residence in the district, he said: 'What a country is this land of the lakes for a man who loves mountains as though he were a true-born Swiss! I would try to give you the situation of this house if I could find words enough for the combination of the beautiful in the panorama which it commands.'

Then there is the beauty of the river Greta itself. Among the happiest memories of boyhood are hours spent looking over the bridge near Greta Hall, watching grayling sport in the clear stream. In times of drought I have seen the Greta with scarcely any water in it, a trickling stream meandering among huge boulders; I have seen it again after a heavy rainfall—an impetuous, foaming river, tumbling over rocks and boulders with a deafening roar, bringing down trees and broken fences, and even sheep—irresistible in its sweep, a sight which must have stirred the imaginations of Coleridge and Southey, who, sitting in Greta Hall close by, listened to its ceaseless roar. Southey has described the Greta as a lovely stream, a word which fits it well enough in the summer season; but in the rainy period it is grand rather than lovely, for then it is turbulent and imperious. While speaking of the river, I recall that near the Hall there were stepping-stones across the Greta, and that on one occasion Sarah Coleridge, the little daughter of the poet, nearly lost her life from falling into the water there.

Amid surroundings such as have been described the literary worker ought, one imagines, to produce much of the best quality with the minimum of effort. All the aids to inspiration are at hand. The distractions of city life are not here to interrupt work; there are no society busybodies to intrude and stop the free flow of the pen; everything calculated to assist literary production is present. Southey found the conditions helpful, and wrote

with a regularity, and at a speed, and with a result that must astonish the writers even of this day of rapid and continuous production. Southey's literary output at Greta Hall was, in fact, prodigious. Coleridge, on the other hand, did not write nearly so much amid these inspiring surroundings as one wishes he had done. While at Keswick he dawdled away his time, indulging in day-dreams or reading in desultory fashion, and sometimes wandering (note-book in hand) over the mountains or up the charming valleys. Occasionally, however, the impulse to write came upon him, and in these inspired moments he composed the second part of *Christabel*. In extenuation of his comparative idleness it can be urged that his health was broken during his stay at Greta Hall. He began his residence there prostrated by a cold, and became so weak and bad that writing was hateful to him. Later he was tormented by a complication of rheumatic and gouty ailments, and it was in the hope of finding relief for his physical sufferings that he first turned to opium, the drug which was the cause of the tragic elements in his later life. The climate of the Lake District has been blamed for Coleridge's rheumatic troubles, but the charge does not rest upon a solid foundation. It is quite as likely his ailments were largely the result of his own carelessness and indiscretions. Thinking by that means to rid himself of his physical afflictions, he made a long journey in the Highlands of Scotland, but his condition at the end of the time was even worse than at the beginning.

Southey's life at Greta Hall stands out in striking contrast to that of his friend Coleridge. While the latter idled and dreamed, Southey worked with the regularity of a City clerk, carefully portioning each day out, allotting to each task a certain amount of time, and adhering punctiliously and heroically to the prearranged programme. The method, or rather the absence of method, of Coleridge is more in keeping with the traditions of poets and their productions; but the regularity of Southey is more admirable. That Southey's method resembles that of a business man is not to its discredit, and to stick to it as Southey did called for great self-control and heroism. It enabled Southey to maintain Coleridge's family as well as his own at Greta Hall for a considerable time.

Owing to Coleridge's continued absence, Southey in 1807 had to make up his mind to renew the lease or remove to another house. He chose the former alternative, enclosed the garden, planted currant-trees, procured the luxury of a carpet for his great study upstairs, put up white curtains, and installed his four thousand books, which grew to fourteen thousand before his death. He became master of the whole of Greta Hall upon Jackson's death in 1809, and continued there during the years of life that remained to him. But his existence in this quiet, beautiful retreat was not unruffled. In his commonplace-book he mentions such worries as the bursting of the oven, a night-attack on the windows, the blowing open of the door in the night, putting up the roof, invasion of the pig, invasion of the cow, invasion of the asses, misfortunes among the maids, mice in the cupboard, and other happenings of a more or less disturbing character. Southey, however, lived long, and continued to work hard, notwithstanding these trifling misfortunes; and, finally, on 21st March 1843, he passed away in the house in which his great life-work had been accomplished, being buried not far from the scene of his strenuous labours, in Crosthwaite churchyard, an ideal resting-place for the bones of a poet, situated near the centre of 'a great camp of single mountains each in shape resembling a giant's tent;' 'wedge-shaped Bassenthwaite Water' on the one hand, and on the other Derwentwater, 'with its islands and white sails, and glory-lights of evening.'

As I think of Greta Hall and its associations, the reflection comes that our literature would rise to a higher standard than it reaches to-day if it were possible for more writers to follow the example of Coleridge and Southey, and slip away from the excitements and distractions of modern city and society life, and settle down in some quiet, picturesquely situated old house such as Greta Hall, where they might work regularly and with vital effect. Many could do this were they able honestly to re-echo the noble words of Coleridge: 'I expect neither profit nor general fame by my writings, and I consider myself as having been amply repaid without either. Poetry has been to me its own exceeding great reward. It has soothed my afflictions, it has multiplied and refined my enjoyments, it has endeared solitude, and it has given me the habit of wishing to discover the good and beautiful in all that meets and surrounds me.'

'PEACE WEARS A GREEN GOWN.'*

I know that Peace her green gown keeps,
And she has trimmed it white and red;
I've seen the pillow where she sleeps,
With mossy hangings to her bed.

The golden gorse before her door
Hums with the sun-drench'd song of bees;
She walks upon a silent floor
Under the wise and ancient trees.

White hawthorns hide her woodland way,
The giant beeches guard her place;
Yet she has welcome, night and day,
And love for those who seek her face.

I know; for once you led me where
Peace in the green gown takes her rest:
And when I crept to gaze at her
She caught me to her lovely breast.

THE HUMPBACK.

By J. J. BELL.

PART I.

ABOUT ten o'clock on the evening of the 11th of August 1899, the little black whaler *Haakon* left the hval-station in Sigluefjord, one of the small inlets at the mouth of Eyja-fjord, that long, narrow loch leading to Akureyri, the chief 'town' on the northern coast of Iceland.

It was near the hour of sunset, and the crisp, sweet air was still. The bare, rugged mountain ranges were bathed in strong, warm purple light; here and there a snow-patch flushed pink. The sky was clear, save to the westward, where a violet mist overhung the placid sea. Off the mouth of the fjord a fishing-boat lay motionless, her sad-coloured twin-lugsails glorified in the beams pouring from just above the northern horizon. Towards the fjord steamed the French cruiser *Le Lavoisier*, on fishery service, her far-projecting ram cutting cleanly through the water, her white funnels gleaming, and their smoke stretching in brown, unbroken trails for miles behind in the windless atmosphere. No other craft was visible on the vast expanse of ocean.

About the shores, which the *Haakon* was leaving at ten knots an hour, were dotted dwellings, some with narrow, peaked gables built of wood and painted in gay colours—gaudy greens, crude reds, and bright blues predominating. Many of these decorations had a fresh look, for in the last winter many of the homes had been wrecked by a blizzard from the Arctic, and now the upper floors were practically new. On the rough ground beside the houses men and women were busy haymaking. The Icelanders have a brief summer, and they must make the most of it. Few summer hours are too dark for haymaking, and the lengthy twilights and dawns as well as the long days of July and August find the dwarf scythe and rake at work.

For the Icelanders it had been a summer of plenty, so far as 'plenty' is understood in Iceland; but for the Norwegians who owned the whaling station in Sigluefjord, and for the owners of the stations in other northern fjords, the season had been lean indeed. Never had the great *blaahval* and his lesser cousin, the *finhval*, been so scarce; never had disgusted gunners taken so many slender *sejhvals*, in desperate endeavours to keep the blubber-tanks boiling and the factory hands employed. For the gunner, who is skipper, and all the crew of a whaler earn a certain bounty on each whale captured, and a *blaahval* means many kroner, but a *sejhval* few.

'I do not understand it at all,' Kaptein Schrœder remarked to the mate who was steering the *Haakon*. 'I do not understand it at all, Thorstein. In twelve years I have seen nothing like it.'

The mate, a huge Icelander, with shaggy, grizzled hair and beard and melancholy blue eyes, offered no response; and the captain, who was used to his fits of silence, continued: 'The manager has told me to-day that the hunting must close next week unless we get more whales. And last year we were getting good luck till the first week of September. I do not understand it at all. I remember when I came first to Island I killed many a *blaa* and many a *finhval* a few miles from the station. I killed a *blaa* that gave one hundred and sixty barrels not three miles from the mouth of the fjord. Since then the whales have been going farther and farther away, but we have always found them somewhere. Yet last week we went four hundred miles along the Greenland ice, and saw never a *blaa* and but one *fin*. And we have sought everywhere for them. I tell you, I do not understand it at all. It has been a bad season for us, and the company will pay no dividend.'

Styrmand Thorstein, steadying the wheel with his knees, produced a small snuff-flask of horn mounted with silver, and applied it to his nostrils. '*Ja*,' he said presently, 'it has been a bad season; but I knew it would be a bad season, kaptein. I

[*All Rights Reserved.*]

told you so in May. Be thankful it has not been worse.'

'Worse!' Kaptein Schrœder laughed shortly. 'It could not have been worse.'

The mate shrugged his shoulders and gave the wheel a half-turn.

'I say it could not have been worse,' the other repeated.

Thorstein stared gloomily ahead. 'Death is worse than life,' he said slowly. 'There have been no dead men on the *Haakon*,' he added under his breath; and aloud, 'Be thankful.'

'Ach, you dreamer!' said the captain good-humouredly. 'You have been dreaming again! Why do you never have good dreams?'

'A bad dream is a good dream if one takes warning from it, kaptein. To-day I had a dream which was a warning.'

'You were sleeping on shore to-day,' Schrœder remarked with a smile. 'I have noticed that your bad dreams come to you when you sleep on shore, Thorstein. Your wife gives you too good meals.'

The mate ignored this little pleasantry.

'It was a bad dream,' he said reflectively. 'We go to the ice to-night, kaptein?' he asked after a pause.

'*Ja*. North to the ice, and then west.'

'That is well. In my dream we went east, and not to the ice.'

'Dreams go by contraries,' said Schrœder, lighting his pipe.

Thorstein paid no attention to the observation.

'In my dream I saw Kap Langanaes, a great *knölhval*, and the *Haakon*. And I heard the sound of hearts weeping—the sound that one hears only in dreams. I say it is well that we go west, Kaptein Schrœder.'

'That shows what nonsense your dream was, my good Thorstein. But I should be glad to strike a great *knölhval* now. It is strange that all the season we have not struck one, not even a small one.'

'That is also well,' said the other solemnly. 'It is bad to kill the *knölhval* that is man's good friend. My great-grandfather'——

The skipper rose from the seat in the corner of the steering-box, and took the wheel from the *styrmand's* hands. He had heard about Thorstein's great-grandfather before. 'You had better turn in now, Thorstein. Go and dream a good, merry dream for a change.'

The Icelander stepped aside from the wheel, but did not leave the steering-box. 'When my great-grandfather, with his brother, was fishing sharks off Gjögr one day in the year 1784, his boat was surrounded by the little, fierce, toothed whales; and they were going to attack the boat and devour my great-grandfather and his brother'——

'Yes,' said the Norwegian impatiently. 'And then a *knölhval* came and beat and frightened the little, fierce whales, and kept them off till your great-grandfather was safe ashore. It is a very good story, my friend, a very good story! But I have heard other stories—of *knölhvals* being eaten up by little, fierce whales.'

'Such stories may also be true,' said the mate quietly. 'But my story is as my grandfather told it to me, and it is the truth. And there are others in Island who will tell you that the *knöl* is the good friend of man. Yes; and once, when I was at Isafjord, I met a traveller—a learned doctor—and he told me that himself had read of the very thing I tell you in a book written by a Franskmand a hundred years ago. So I say it is bad to kill the *knöl*, kaptein.'

Schrœder laughed and patted the man's shoulder soothingly. 'Yet you have helped to kill many a *knöl* in your time, Thorstein.'

'I have obeyed orders. But it makes me feel sick to see a *knöl* harpooned. Often he is so tame and friendly, and he comes so close to the steamer that is waiting to give him his death. And when the *knöl* is a mother, playing with her young one, it is—— Ah, I will turn in.' He left the steering-box abruptly.

'*Sov vel!*' the captain called after him. 'Dream of a *blaahval* this time—a great fat bull *blaahval*—and where it is to be found.'

But Thorstein shook his head and went slowly aft.

The sun had gone, and now the bare hills looked brown and cold, and shadows deepened upon them. But the twilight would linger to meet the dawn.

The French cruiser, entering the fjord at half-speed—for the channel requires cautious navigation—would pass the *Haakon* at close quarters. Kaptein Schrœder steered his little steamer to bring her within easy hailing distance of the big one. *Le Lavoisier* had come from the eastern coast, and perhaps she might have news of the whaling there. Schrœder, who had more than once taken the chief officer on a short hunting-cruise, now descried him waving his hand on the high bridge. Schrœder spoke into the tube on his right, and presently the engines stopped, and the *Haakon* glided onward, slower and slower, till she came to rest almost in the course of the cruiser. As the very prominent ram drew level with the whaler the Frenchman, leaning over the bridge, shouted in broken Norsk, 'Off Langanaes—at noon to-day—whales—*Nordkapers*.'

Kaptein Schrœder jumped. '*Nordkapers!*' he yelled. '*Er De vis paa det?*'

The Frenchman was positive. He had made some study of whales, and knew a *Nordkaper*, the cousin of the 'right whale,' when he saw one. '*Jeg er vis paa det!*' he called; adding, '*Bon voyage!*' as the cruiser slid onward.

Schrœder waved his fur cap and bawled his thanks. '*Tusinde tak! Farvel!*' The next instant his mouth was at the speaking-tube giving the order, 'Full speed ahead!' and other instructions.

As the little *Haakon* got into her twelve-knot

stride her bow swung round to the nor'-east and remained pointing in that direction.

'Kaptein!'

Styrmand Thorstein came up the steps to the steering-box.

Schrœder turned and smote him a hearty slap on the shoulder, and burst out laughing.

'Kaptein!' said Thorstein again.

'What now, dreamer? Ah! you heard what the Franskmand said. It was good, eh—very good? In the morning we strike a *Nordkaper!* Think of it! A *Nordkaper* after all those weeks of nothing but little *sejhvals!* Perhaps we take two—and a *Nordkaper* has not been brought to the station for years.' Once more he smote the mate's shoulder and laughed loudly.

Thorstein shook his head. 'I have heard tell of *Nordkapers* at Langanaes,' he said slowly, 'but I do not believe that the Franksmand saw *Nordkapers* to-day. He saw *knölhvals.* Will you not go to the ice, kaptein, and maybe we shall get a *blaahval?*'

Schrœder emitted an impatient clicking sound and looked up at the compass.

'Even if the Franksmand saw *Nordkapers* to-day, they will be away now. It is a hundred and thirty miles to Langanaes. We cannot sight it for ten hours. Kaptein,' the Icelander continued solemnly, 'in my dream I heard the sound of hearts weeping. Off Langanaes there is bad luck for us. I pray you'——

'*Hold op!*' Kaptein Schrœder was angry. 'Have done with this nonsense! It is my wish that we go to Langanaes, and if I find no *Nordkapers* and only one *knöl*, I kill him all the same. I tell you, Thorstein, I will kill him! I have my company to think of, also myself and my men. Do you want the men to laugh at you? Then tell them the foolishness you have told me. You Icelanders, you have too much time for dreaming in the winter. You should leave it in the summer. And what is a dream?' His voice became less harsh. 'Many a dream have *I* dreamed, and never aught has happened. A dream is but a warm breath on a cold glass—a nothing. Think no more of your silly dream, Thorstein.'

The *styrmand* hung his head and plucked softly at his grizzled beard. 'When it is well with you, kaptein, it is well with me,' he said at last very quietly. Then, as if rousing himself, 'I will sleep now.'

Kaptein Schrœder nodded kindly. 'After all,' he remarked, 'it is very likely that we shall get nothing but *sejhvals.* Send Sigurd to the wheel. At midnight you will take charge.'

Thorstein seemed to be about to speak, but turned away without doing so. When the seaman Sigurd had taken the wheel, the captain once more seated himself in the corner of the steering-box, puffing thoughtfully at his pipe, and glancing about him for weather-signs.

It promised to be a fine night. There was scarcely a ripple on the water; the evening breeze was of the faintest. Astern the mountains rose clear and cold in the twilight that was still too strong to allow the stars to be visible. Overhead, the sky was pale blue and cloudless; but above the northern horizon hung island-like masses of brilliant, burning orange. There was no sound save the regular thud of the engines and the rhythmic wash of the bow-waves.

Kaptein Schrœder exhaled a long stream of smoke and drew a big breath of the keen air in a manner betokening satisfaction. He was a comparatively young man and of sanguine temperament, but until to-night the poorness of the whaling had been depressing him. Now the bare possibility of securing a *Nordkaper*, whose baleen was of considerable value as well as its blubber, acted on him like a stimulant. He ignored the fact that at the fag-end of the hunting-season it would require an unprecedented run of luck in the shape of blue-whales and *Nordkapers* to make up for the leanness of the last three months. In the meantime it was pleasant to indulge in anticipations of killing a *Nordkaper* on the morrow, and as he thought of it he softly hummed a Norsk folk-song.

He bore Thorstein no ill-will. Many a time he had resented the *styrmand's* gloomy forebodings, but his resentment had never been of long duration. Thorstein was a good mate and trustworthy, though his moody nature had cost him his post on half a score of whalers ere he shipped on the *Haakon* under good-natured Kaptein Schrœder. He had been mate of the *Haakon* for seven seasons; whereas a single season had exhausted the patience of each of his previous skippers. Perhaps the length of his service on the *Haakon* surprised no one more than himself, he had been so used to changes in the past. For an Icelander he was well off. Few of his neighbours in Sigluefjord touched money once in the year; they bartered their stockfish for other necessities. But Thorstein and his wife possessed a little box of beaten brass, an ancient thing, a treasure of his ancestors for more generations than he could tell; and in it were many Danish and Norwegian five-kroner notes, a little gold, and some silver. They possessed, also, a son who was a poet—and a cripple. They believed he was a great poet, both in the Icelandic tongue and the Danish. The cripple's chief desire was to see the capitals of his own country and Denmark. And at the close of each whaling-season Thorstein and his wife counted up the money in the brass box, and smiled and sighed, and sighed and smiled.

'Reykjavik,' she would murmur.

'Kjöbenhavn,' he would answer.

And then they would bid the young man be of good hope.

For six springs Kaptein Schrœder had brought from Christiania a parcel of books for Thorstein's son, who frankly loved him. Thorstein himself said little on these occasions, and frowned when his spouse let loose a torrent of thanks.

'Sigridur,' he would say to her impatiently, 'we will now drink *kaffe*.' Nevertheless, the mate hoped his turn would come some day.

At midnight Thorstein came on deck, and another sailor relieved the man at the wheel. The night was now at its darkest, but not so dark that a ship required to carry lights. For many miles the eye could see whether aught moved on the ocean; but neither sail nor smoke was in sight. The orange hues in the north still glowed gorgeously, and from the higher heavens silver stars, encouraged at last by the dusk, peeped shyly forth. The breeze was still light, yet keen—a mere breath from the distant ice-fields.

'It will be fine, clear weather at the ice now,' the mate observed. 'We have had nothing but fog there this season. But now'——

'If we get no luck at Langanaes,' said Kaptein Schrœder, yawning, 'we must try the ice again. Did you dream about that *blaavhal?*' he inquired chaffingly as he stepped down from the steering-box.

'*Nei*, kaptein,' Thorstein soberly replied. 'I dreamed once more the dream I told you.'

Schrœder looked amused. 'That was not very clever of you, Thorstein,' he said.

The other put out his hand in a gesture of appeal. 'It is a warning! I tell you, kaptein, it is a warning! Again I have heard the sound of'——

'Well, well, we shall see what we shall see,' said the skipper with another yawn, and departed below for a four hours' spell.

When he came on deck again the *Haakon* had crossed the wide mouth of Axarfjord and was passing Rifstangi, one of the most northerly points of Iceland, about seven miles within the Arctic Circle. In the sunrise the distant inland hills, from which rose and melted weird, fantastic masses of vapour, assumed varying shades of purple and pink, and the green low land made a vivid contrast with the rock-bound shore and barren heights. At the end of a long, sneaking point stood an ancient beacon; at the end of another, scarce a mile away, lay the skeleton of a French fishing-schooner, one of the hundreds that have met destruction on Iceland's coasts. The sheer cliffs and the sea beneath them swarmed with birds, and in a little bay a school of small whales gambolled lustily, smashing the glassy surface into foam and sending up showers of glittering spray. And once, not five fathoms from the *Haakon*, a glistening, grayish, triangular fin appeared and went cutting keenly through the water till far astern.

'Shark,' remarked the captain to Thorstein, who was looking moodier than ever.

'*Ja.*'

The captain altered the course a little. 'We shall sight Langanaes in four hours,' he said cheerfully. 'I will get Karl to lookout until you have slept.'

'I will lookout,' said the mate. 'I do not wish to sleep. I am afraid of sleep.'

At this moment the cook appeared with two steaming mugs of coffee. The captain took one, and signed to Thorstein to follow him to the deck. They proceeded to the stern, and there the captain seated himself on a coil of one of the huge twelve-inch cables used for towing dead whales. After a sip or two of coffee he looked steadily at the mate, saying, 'Thorstein, you must stop this foolishness. If the others heard of it they would laugh—at first. Afterwards they would not laugh; they would begin to think it was not lucky to have you on board the whaler. And then there would be trouble. You understand?'

'*Ja. Jeg forstaar det.*' Thorstein's eyes looked seaward.

Kaptein Schrœder took a mouthful of coffee. 'Did you ever hear of harm coming from striking a *knöl?*' he asked.

'*Nei*, kaptein.'

'And you have seen many killed.'

'It is so.'

'Then why does the dream make you afraid? Have you ever dreamed a dream that came true?'

For a long minute Thorstein continued to stare at the water. '*Ja*,' he said at last, turning his sad blue eyes on the other. 'But I cannot speak of it.' His hand shook so that he spilled some of his coffee. 'I will go now and lookout,' he added abruptly, and went hastily forward.

A little later the captain saw him mounting the rigging to the crow's-nest on the foremast. 'What am I to do with him?' he asked himself.

At seven o'clock they breakfasted—the captain, mate, and engineer—on a stew of pork and onions, black bread, margarine, and more coffee. They had just finished eating when a call from above sent them swiftly on deck.

'Only *sejhvals*,' said Schrœder disappointedly after an inspection through his glasses.

'But you will hunt, kaptein?' said Thorstein eagerly. 'They are in our course.'

'Perhaps,' said the skipper doubtfully.

But he went forward to the gun, which he had loaded before breakfast, and examined its fittings carefully.

The whales—there were eight of them—were not far ahead, and their high dorsal fins showed plainly as they rose to blow.

Kaptein Schrœder was in a dilemma. The whole herd was not worth a single *Nordkaper;* on the other hand, one *sejhval* was better than nothing at all. In a good season he would have felt justified in taking his chance off Langanaes, but in present circumstances he could not afford the risk of returning to Sigluefjord without a catch. With a grunt of dissatisfaction he began to unscrew the bomb-point from the harpoon-head projecting from the stumpy red cannon. The mate, who had returned to the mast-head, witnessed the action with relief.

'You will hunt, kaptein?' he cried.

'*Ja*,' shortly replied Schrœder, carrying away the grenade to a safe place below. Upon the comparatively slim frame of a *sejhval* the explosion of a bomb is too shattering—from a business point of view. If the bomb does not pass through the unfortunate creature and explode on his far side, it is more than likely to rend him open from within. In bulkier whales the interiors alone are wrecked, and, happily, death is not infrequently instantaneous.

As the *Haakon* drew nearer the unsuspecting animals Thorstein from his porch selected a victim, and gave the steersman orders according to its movements.

The chase proved brief. The whale, when not at the surface blowing, swam at a leisurely pace not far beneath, and in the clear water Thorstein's eye followed him easily. Soon the *Haakon* drew so near to the bluish-black back that the oblong lighter blotches upon it were plainly visible, as were also the strangely small flippers.

At this point Schrœder took charge, instructing the steersman by quick signs with his left hand. Two men stood at attention by the double steam-winch, just behind the foremast.

Cautiously the *Haakon* crept upon the whale—nearer—still nearer—and yet nearer.

Kaptein Schrœder slewed the gun to starboard, depressing its muzzle a trifle. Suddenly his left hand went high above his head. 'Stop!'

With a hoarse sigh from his spiracles, the whale's head broke the surface, his back rose clear of the water, and the gun crashed out its dreadful bolt, nearly five feet in length and weighing over a hundred pounds. And even as the harpoon shaft plunged through the gaping wound in the blubber, his tail shot high into the air, and, with a gleam of white belly and a flourish of flukes over the boiling sea, the whale sounded. The fifty fathoms of 'forerunner'—that portion of the 'line' which is carefully coiled on the ledge projecting over the bow, just below the muzzle of the gun—ran out like a streak, and the remaining hundred and twenty fathoms of three-inch yellow hemp began to jerk after it. But ere half of this had gone overboard the rush stopped. Whereupon the *Haakon* was backed till another fifty fathoms ran out. Then the winch was braked; but the *Haakon* was kept backing—backing slowly, obstinately.

Somewhere in the green depths ahead of the whaler the *sejhval* was struggling for the surface. He had not been prepared for a long spell below, he was sorely wounded, and he had nearly a thousand feet of cable and a steamer with powerful engines to struggle against. And so they hastened his end by drowning him in his native element. After that they hauled up the carcass, pumped air into it, and lashed it alongside. It was little over forty feet in length, and its blubber was thin—a poor catch.

The other whales could still be discerned from the mast-head. Thorstein pointed in their direction.

'Langanaes,' said Kaptein Schrœder briefly.

(To be continued.)

LORD STRATHCONA AND LOUIS RIEL.

By Norman Murray, Montreal.

Then none was for a party,
Then all were for the state.

THE year 1837 was a year to be remembered by all loyal Britons both in Canada and Great Britain, for that was the year in which the late lamented and beloved Queen Victoria ascended the throne and the so-called Canadian Rebellion took place. It is a very rare thing in Canada now to come across any one who remembers that little turmoil or has seen any one who took part in it. I introduce this incident here merely to illustrate the long years that our Grand Old Man, Lord Strathcona, has been in the public service; for he came to Canada in 1838, the year after the ascension of Queen Victoria and the Canadian Rebellion already referred to, being then eighteen years of age. My prime object in connecting these two well-known names, Strathcona and Louis Riel, is to illustrate two types of character. A very good definition of a civilised man and a barbarian is that the one has his passions under the control of reason, while the latter has strong passions and a weak reason, and even a good education will not civilise the savage mind. I very much doubt if Donald A. Smith could have gained as many marks in an examination in the classics when he left school at Elgin, in the Highlands of Scotland, as Louis Riel could have got when he left the Montreal Grand Seminary of St Sulpice. To Louis Riel, however, a classical education meant the pride that comes before a fall, while the education of Donald A. Smith helped to develop a keen intellect.

The nearest parallel I can find to the manner in which Donald A. Smith handled the turbulent Riel on his first effort at rebellion in the winter of 1869 is the manner in which another Scotsman of immortal fame, David Livingstone, often succeeded in handling the savages of South Africa without shedding a drop of blood. When the Hudson's Bay Territory was transferred from the company to the Dominion of Canada in 1869, there was more or less disappointment among the subordinate officials of the company, and this helped to lead the misguided Louis Riel to the rash conclusion that there was now an opportunity for him to become a second Napoleon. Donald A. Smith had

been thirty-one years in the service of the company in Canada, and had risen from the position of clerk on a wild Labrador station to be the head officer of the company in Canada. Being always a man of broad ideas, he surveyed the situation from all points of view—the interest of the company, its servants, the misguided half-breeds, the Dominion of Canada, and the Mother-Country. The misguided Riel could only look upon the situation from one point of view—his own dream of becoming president of a republic composed mostly of half-breeds in the North-West.

The whole population of this vast region, nearly as large as European Russia, was only about twelve thousand souls at the time we are writing about, a little more than half of which were French half-breeds, or Metis, as they were called, who were the only class at all likely to accept Louis Riel as their leader. Mr Macdougall, who had been Minister of Public Works of the Canadian Government when the transfer of the North-West from the Hudson's Bay Company to the Canadian Government was made, was sent out as its first governor. The half-breeds, with Riel at their head, blocked the road and made a hostile demonstration; and under the circumstances the unfortunate Macdougall had no alternative but to turn back. Riel's policy had been to prevent any communications between the Canadian Government and the people. He did not wish them to hear anything but what he chose to tell them, and this is where our Grand Old Man's skill in tactics, determination, and diplomacy came into play. In the meantime Riel with about one hundred men took possession of the old Hudson's Bay post Fort Garry, in spite of the protests of Mr Cowan, the officer in charge. Riel was bent on proclaiming himself dictator of the newly formed province of Rupert's Land, and accordingly issued a proclamation to the people. Sixty of those who were not favourable to Riel's ambitions were arrested by his orders. A new flag was made with a representation of the Shamrock and Fleur-de-lis (the old French Royalist flag). The Union-jack was conspicuous by its absence from this new flag. And we know now what happened to that flag.

In the meantime Donald A. Smith surveyed the whole situation from Montreal, two thousand miles away. It was now the middle of a Canadian winter, with no means of communication for the longest part of the distance but dog-sleds. Another clear-headed Highlander, John A. Macdonald, was now Premier of Canada, and between them it was arranged that Mr Smith should undertake the difficult mission of explaining the intentions of the Canadian Government to the people. He was appointed a special commissioner to inquire into and report upon the causes and extent of the disaffection of Red River, to act as mediator amongst the inhabitants, and also to report on the best mode of dealing with the Indian tribes in the country—surely a large contract. This was, indeed, a wide-sweeping commission, and the responsibilities under it were truly immense. Mr Donald A. Smith, accompanied by his brother-in-law, Mr Hardisty, proceeded on his difficult mission from Ottawa on the 13th of December, and reached Pembina, a few miles outside of the settlement, on Christmas Day. There he left his most important documents in safe keeping until he could investigate matters at closer range. To the astonishment of the settlers who met him, as well as of the sentinels appointed by Riel, he drove in his dog-sleigh right up to the old fort, the gates of which were open, and requested to be shown into Governor Mactavish's house. Governor Mactavish, who was the Hudson's Bay Company's representative, was now a prisoner of Louis Riel. '*Comment appelle-tu?*' inquired a surly sentinel in French, garnishing his inquiry with an oath. '*Je me nomme* Donald A. Smith, *et je viens de Montreal.*' This was possibly not the first time that the grim Metis heard the name. The sentinel responded that he would inform 'President Riel.' The title president surprised the new-comer. After a few moments Louis Riel appeared. He said he had heard of Mr Smith's arrival at Pembina, and was about to send off a party to effect his capture. 'I then,' relates Mr Smith, 'accompanied him to a room occupied by about a dozen men whom he introduced to me as members of the "Provisional Government." I was then asked to take an oath not to attempt to leave the fort that night nor to upset their Government legally established. This request I peremptorily refused to comply with.' As a consequence Mr Smith found himself a prisoner for the next two months. On the 13th of January, as Mr Smith relates, he was awakened at three o'clock in the morning. Springing up in bed, he saw Riel, surrounded by a guard, at his bedside. The dictator demanded of his prisoner a written order for the delivery of his commission and official papers, which had been sent for. But Mr Smith was not to be terrified by vague threats, and emphatically refused to give any such order. The well-affected French party, becoming aware of what had happened, and beginning to have doubts concerning Riel's good faith, resolved to prevent the papers from falling into his hands. Bloodshed at one time seemed certain; but things calmed down, and finally, after a good deal of recrimination, it was arranged that a meeting of the inhabitants from all parts of the settlement should be called for the 19th, at which the papers bearing on the subject should be read, a guard of forty men remaining in the house to ensure the safe keeping of the documents.

Probably never before in history has a regularly ordained meeting been held in British territory under such conditions. This was the meeting that Donald Alexander Smith had come two thousand miles to hold with the people of Rupert's Land. 'The part I had to act was that of a mediator. Not only would one rash or unguarded word have

increased the difficulty, but even the pointing of a finger might have on more than one occasion been sufficient to put the whole country into a flame.' Thus he wrote afterwards in referring to this extraordinary affair. In the open air, with the thermometer twenty degrees below zero, in the teeth of a biting blast, this meeting was conducted with a respect for decorum and ancient parliamentary methods worthy of Westminster itself. Louis Riel, the so-called president of the Provisional Government, took a prominent part; and in due time Mr Smith rose, holding a packet of papers in his right hand. He began by reading the Secretary of State's official letter to him. We can only give short extracts from the address delivered by Mr Smith on this remarkable occasion. 'Although,' he said, 'I am personally a stranger to you, I am as much interested in the development of this country as others I could name. On both sides I have a number of relations in this land—(cheers)—not merely Scotch cousins but blood-relations. Besides that, my wife is a native of Rupert's Land. (Cheers.) Hence, though I myself am a Scotsman, you will not be surprised that I should feel a deep interest in this great country and its people. (Cheers.) I am here to-day in the interests of Canada, but only as far as they are in accordance with the interests of this country. As to the Hudson's Bay Company, my connection with that body is, I suppose, generally known; but I will say that if it could do any possible good to this country I would at this moment resign my position in that company. I sincerely hope that my humble efforts may in some measure contribute to bring about peaceably union and entire concord among all classes of the people of this land.' Mr Smith then read the documents, the contents of which Riel had so strenuously tried to keep from the people. In one of the documents reference was made to the fact that all complaints that any one had to make should be made to Her Majesty's representatives, and that the Imperial Government had no intention of acting otherwise or permitting others to act otherwise than in perfect good faith towards the inhabitants of the Red River District of the North-West. A great sensation was made when Mr Smith asked that additional letters sent by the Canadian Government through other parties be produced and read to the meeting. These documents had previously been seized by Riel and destroyed, but fortunately Mr Smith had copies of them, the reading of which made a profound sensation. The dictator was being undermined most effectively.

Next summer a military expedition under Sir Garnet Wolseley was organised; but when the redcoats reached Fort Garry the bird had flown in the night. Mr Smith had countered the would-be dictator, and he could not rally sympathisers enough to make even a show of resistance.

How this same Riel started another rebellion fifteen years afterwards, and how other methods were adopted, resulting in considerable bloodshed; how he was finally hanged, and how the hanging was made afterwards a political issue, are now matters of history; but, as Kipling would say, 'that is another story.' Sir Donald Alexander Smith is now Lord Strathcona. He belongs to no particular party, but to the whole State. His first appointment as Canadian High Commissioner in London was made by a Conservative Government, and he was urged by the Liberal Government which succeeded, with the greatest French Canadian, Sir Wilfred Laurier, at its head, to continue in office, and there was no dissenting voice. Among his monuments here in Canada we may mention the Royal Victoria Hospital and the Royal Victoria College (in connection with which the name of Lord Mountstephen must not be omitted). A great deal more might be said; but as the space at my disposal is limited, I can only refer the reader for further particulars to Wilson's *Life of Strathcona*.

THE HOUSE OF WHISPERS.

CHAPTER XXX.—REVEALS SOMETHING TO HAMILTON.

EDGAR HAMILTON sat with his eyes fixed upon the dingy, inartistic, smoke-begrimed windows of the chambers opposite. The man before him was acquainted with Gabrielle Heyburn! For over a year he had not been in London. He recollected the last occasion—recollected it, alas! only too well. His thin countenance wore a puzzled, anxious expression, the expression of a man face to face with a great difficulty.

'Tell me, Walter,' he said at last, 'what kind of place is Glencardine Castle? What kind of man is Sir Henry Heyburn?'

'Glencardine is one of the most beautiful estates in the whole of Scotland. It lies between Perth and Stirling. The ruins of the ancient castle, where the great Marquis of Glencardine, who was such a figure in Scottish history, was born, stands high above a deep, delightful glen; and some little distance away stands the modern house, built in great part from the ruins of the ancient stronghold.'

'And there are noises heard there the same as at Hetzendorf, you say?'

'Well, the country-folk believe that on certain nights there can be heard in the Castle courtyard distinct whispering—the counsel of the devil him-

self to certain conspirators who took the life of the notorious Cardinal Seatoun.'

'Has any one actually heard them?'

'They say so—or, at any rate, several persons after declaring that they had heard them have died quite suddenly.'

Hamilton pursed his lips. 'Well,' he exclaimed, 'that's really most remarkable! Practically, the same legend is current in South Hungary regarding Hetzendorf. Strange—very strange!'

'Very,' remarked the heir to the estate of Connachan. 'But, after all, cannot one very often trace the same legend through the folklore of various countries? I remember I once attended a lecture upon that very interesting subject.'

'Oh, of course. Many ancient legends have sprung from the same germ, so that often we have practically the same fairy-story all over Europe. But this, it seems to me, is no fairy story.'

'Well,' laughed Murie, 'the history of Glencardine Castle and the historic family is so full of stirring episodes that I really don't wonder that the ruins are believed to be the abode of something supernatural. My father possesses some of the family papers, while Sir Henry, when he bought Glencardine, also acquired a quantity. Only a year ago he told me that he had had an application from a well-known historical writer for access to them, as he was about to write a book upon the family.'

'Then you know Sir Henry well?'

'Very well indeed. I'm often his guest, and frequently shoot over the place.'

'I've heard that Lady Heyburn is a very pretty woman,' remarked the other, glancing at his friend with a peculiar look.

'Some declare her to be beautiful; but to myself, I confess, she's not very attractive.'

'There are stories about her, eh?' Hamilton said.

'As there are about every good-looking woman. Beauty cannot escape unjust criticism or the scars of lying tongues.'

'People pity Sir Henry, I've heard.'

'They of course sympathise with him, poor old gentleman, because he's blind. It is, indeed, a terrible affliction. Only fancy the change from a brilliant parliamentary career to idleness, darkness, and knitting.'

'I suppose he's very wealthy.'

'He must be. The price he paid for Glencardine was a very heavy one; and, besides that, he has two other places, as well as a house in Park Street and a villa at San Remo.'

'Cotton, or steel, or soap, or some other domestic necessity, I suppose?'

Murie shrugged his shoulders. 'Nobody knows,' he answered. 'The source of Sir Henry's vast wealth is a profound mystery.'

His friend smiled, but said nothing. Walter Murie had risen to obtain matches; therefore he did not notice the curious expression upon his friend's face, a look which betrayed that he knew more than he intended to tell.

'Those noises heard in the Castle puzzle me,' he remarked after a few moments.

'At Glencardine they are known as the Whispers,' Murie remarked.

'By Jove! I'd like to hear them.'

'I don't think there would be much chance of that, old chap,' laughed the other. 'They're only heard by those doomed to an early death.'

'I may be. Who knows?' he said gloomily.

'Well, if I were you I wouldn't anticipate catastrophe.'

'No,' said his friend in a more serious tone; 'I've already heard those at Hetzendorf, and—well, I confess they've aroused in my mind some very uncanny apprehensions.'

'But did you really hear them? Are you sure they were not imagination? In the night sounds always become magnified and distorted.'

'Yes, I'm certain of what I heard. I was careful to convince myself that it was not imagination but actual reality.'

Walter Murie smiled dubiously. 'Sir Henry scouts the idea of the Whispers being heard at Glencardine,' he said.

'And, strangely enough, so does the Baron. He's a most matter-of-fact man.'

'How curious that the cases are almost parallel, and yet so far apart! The Baron has a daughter, and so has Sir Henry.'

'Gabrielle is at Glencardine, I suppose?' asked Hamilton.

'No; she's living with a maiden aunt at an out-of-the-world village in Northamptonshire called Woodnewton.'

'Oh, I thought she always lived at Glencardine, and acted as her blind father's right hand.'

'She did until a few months ago, when'—— and Murie paused. 'Well,' he went on, 'I don't know exactly what occurred, except that she left suddenly, and has not since returned.'

'Her mother perhaps. No girl of spirit gets on well with her stepmother.'

'Possibly that,' Walter said. He knew the truth, but had no desire to tell even his old friend of the allegation against the girl whom he loved.

Hamilton noted the name of the village, and sat wondering at what the young barrister had just told him. It had aroused suspicions within him—strange suspicions.

They sat together for another half-hour, and before they parted arranged to lunch together at the Savoy in two days' time.

Turning out of the Temple, Edgar Hamilton walked along the Strand to the Métropole, in Northumberland Avenue, where he was staying. His mind was full of what his friend had said—full of that curious legend of Glencardine which coincided so strangely with that of far-off Hetzendorf. The jostling crowd in the busy London thoroughfare he did not see. He was away again on the hill outside the old-fashioned Hungarian town, with the broad Danube shining in the white moonbeams.

He saw the grim walls that had for centuries withstood the brunt of battle with the Turks, and from them came the whispering voice—the voice said to be that of the Evil One. The Tziganes—that brown-faced race of gipsy wanderers, the women with their bright-coloured skirts and head-dresses, and the men with the wonderful old silver filigree buttons upon their coats—had related to him many weird stories regarding Hetzendorf and the meaning of those whispers. Yet none of their stories were so curious as that which Murie had just told him. Similar sounds were actually heard in the old castle up in the Highlands! His thoughts were wholly absorbed in that one extraordinary fact.

He went to the smoking-room of the hotel, and, obtaining a railway-guide, searched it in vain. Then, ordering from a waiter a map of England, he eagerly searched Northamptonshire and discovered the whereabouts of Woodnewton. That night he left London for Oundle, and put up at the old-fashioned 'Talbot.'

At ten o'clock on the following morning, after making a detour, he alighted from a dogcart before the little inn called the 'Westmorland Arms' at Apethorpe, just outside the lodge-gates of Apethorpe Hall, and, making excuse to the groom that he was going for a walk, he set off at a brisk pace over the little bridge and up the hill to Woodnewton.

The morning was dark and gloomy, with threatening rain, and the distance was somewhat greater than he had calculated from the map. At last, however, he came to the entrance to the long village street, with its church and its rows of low, thatched cottages.

A tiny inn, called the 'White Lion,' stood before him. This he entered, and calling for some ale, commenced to chat with the old lady who kept the place.

After the usual conventionalities about the weather, he said, 'I suppose you don't have very many strangers in Woodnewton, eh?'

'Not many, sir,' was her reply. 'We see a few people from Oundle and Northampton in the summer—holiday folk. But that 's all.'

Then, by dint of skilful questioning, he elucidated the fact that old Miss Heyburn lived in the tiled house farther up the village, and that her niece, who lived with her, had passed along with her dog about a quarter of an hour before, and taken the footpath towards Southwick.

Ascertaining this, he was all anxiety to follow her; but, knowing how sharp are village eyes upon a stranger, he was compelled to conceal his eagerness, light another cigarette, and continue his chat.

At last, however, he wished the woman good-day, and, strolling half-way up the village, turned into a narrow lane which led across a farmyard to a foot-path which ran across the fields, following a brook. Eager to overtake the girl, he sped along as quickly as possible.

'Gabrielle Heyburn!' he ejaculated, speaking to himself. Her name was all that escaped his lips. A dozen times that morning he had repeated it, in a tone almost of wonder—almost of awe.

Across several ploughed fields he went. Leaving the brook, and skirting a high hedge to the side of a small wood, he followed the well-trodden path for nearly half-an-hour, when, of a sudden, he emerged from a narrow lane between two hedgerows into a large pasture.

Before him he saw standing together, on the brink of the river Nene, two figures—a man and a woman.

The girl was dressed in blue serge and wore a white tam o' shanter, while the man had on a dark-gray overcoat with a brown felt hat, and near-by, with his eye upon the sheep grazing some distance away, stood a big collie.

Hamilton started and drew back.

The pair were standing together in earnest conversation, the man facing him, the girl with her back turned.

'What does this mean?' gasped Hamilton aloud. 'What can this secret meeting mean? Why—yes, I 'm certainly not mistaken—it 's Krail—Felix Krail, by all that 's amazing!'

(To be continued.)

ANCIENT MARBLES USED IN MODERN TIMES.

By Mary Wineaels Porter, Author of *What Rome was Built with.*

IT is a curious fact that many of the marbles employed by the Romans, Greeks, and even Egyptians are those most highly valued by the architects and builders of the present time. Marbles and other decorative stones from the identical localities which were sought out by the ancients with so much care and patience, and used to such perfection in their sculpture and architecture, are now to be seen in most fine modern buildings in London and other cities. These ancient quarries, after having been lost to human knowledge for so many hundred years, have one by one been rediscovered within the last century and a half. In some cases these discoveries have been made accidentally by explorers or by engineers surveying for railways; but for the most part the quarries have been searched for and brought to light solely with an eye to their commercial value, and for the express purpose of putting again upon the market the materials so highly prized and extensively employed in former ages.

Marble was used in Egypt in predynastic periods, and the early Cretans had advanced so far in

civilisation as to make imitations and paint their cement dados to look like the genuine material so early as twelve hundred years before the Christian era. Sculptured slabs of marble have been found in Nineveh; but it is to the Greeks that the real introduction of decorative marble is due. When

> Greece, conquered Greece, her conqueror subdued,
> And clownish Latium with her arts imbued,

the Romans learned the use of marble, employing it far more lavishly than ever it had been used in Greece, and, alas! vying with the dishonest Cretans in their painted imitations, which survive to this day in Pompeii.

It is said that Quintus Metellus Macedonicus was the first to corrupt republican simplicity, introducing costly building materials into Rome about the year 144 B.C. When Cæsar reached Rome after crossing the Rubicon he found the treasury empty, and one of his most successful ways of replenishing it was to levy a tax on every column of imported marble. The great Cæsar himself was not free from the prevailing love of art and antiquities, and is said to have paid sixteen thousand pounds for two pictures!

It was not until the reign of Augustus, however, that the passion for marbles exceeded all bounds, and it was the boast of this emperor that he found Rome of 'unbaked brick but left it of marble.' The passionate desire to obtain marble for the ornamentation and decoration of temples, baths, forums, and private houses in the luxurious days of the Empire can hardly be exaggerated. The Roman baths were particularly ornate; and Seneca, in speaking of certain of them, says: 'What noble statues! What vast pillars supporting nothing, but placed there for mere ornament and the vain ostentation of expense! What large and far-sounding cascades! What! we are arrived to such a pitch of delicacy and extravagance that we cannot tread but upon precious stones.' Parts of the above quotation might well refer to certain hotels, clubs, and other buildings of the present day. The emperors themselves, moved by an inordinate desire of obtaining marble through confiscation or purchase, took possession of all the most celebrated and valuable quarries. Suetonius relates how Tiberius stole quarries both from private individuals and cities. No wonder that the prices of private mansions reached fabulous sums. For example, the house of Claudius had cost one hundred and thirty-three thousand pounds, and that of Scaurus was valued at eight hundred and eighty-five thousand pounds; and these were prices during republican times!

At the present day nine thousand whole columns of marble have been enumerated by Professor Lanciani in Rome, and he estimates the number of columns landed at Ostia in ancient times to have been four hundred and fifty thousand at least, and says there is no fear of exaggeration in this estimate, considering the amount of destruction, of breaking up, of burning into lime, that has been accomplished in Rome since the fall of the Empire, and columns represented but a small item in the marble trade of that city!

However, to return to the use of ancient marbles in England. It is a striking fact that in many gorgeously decorated hotels and clubs one sees in all directions, in the form of slabs and columns, marble of every colour and hue, of which not a small part had its origin in the quarries worked by the Greeks and Romans in some cases as early as 500 B.C., as, for instance, those of the famous *marmor Pentelicum*. This marble, exceedingly fine-grained and smooth, is even of a purer white than that of Carrara, and Pausanias alludes to its use many times. In one instance he states that its quarries were nearly exhausted in the construction of Herod's stadium. However, this is rather misleading, as even at the present time work in them is kept in full swing night and day, and about a thousand workmen are stated to be employed. Of greater interest is the fact that a few years ago half a million cubic feet of marble were supplied for the restoration of this same stadium, all from that wonderful Mount Pentelikon, where millions of tons yet wait to be quarried, and whence quantities are being shipped to England and to America. This marble has just been employed for an entire building in London, that of Mappin & Webb. Blocks weighing as much as twenty tons have been taken down to the port of Piræus and loaded on shipboard for export.

An interesting insight into the love and passion of the Romans for treasures of art and antiquity, relating to the above-named marble, may be found in the following quotation taken from one of Cicero's letters to Atticus: 'As to your Hermæ of Pentelic marble with bronze heads, about which you wrote to me, I have fallen in love with them on the spot. So pray send both them and the statues, and anything else that may appear to you to suit the place you wot of, my passion, and your taste—as large a supply and as early as possible. Above all, anything you think appropriate to a gymnasium and terrace. I have such a passion for things of this sort that, while I expect assistance from you, I must expect something like rebuke from others. If Lentulus has no vessel there, put them on board any one you please.' Pentelic marble was not used to any great extent in Rome, but was valued by the greatest of Greek sculptors. For, instance, Scopas and Praxiteles used it, and the Parthenon may be given as the most famous example of its employment.

Another marble greatly admired by the ancients and in vogue at the present day in England is the *marmor Scyrium*, or variegated marble from the island of Scyros. 'There are quarries of variegated marble called Scyrian; in appearance it resembles that marble which is described as variegated Lydian, a variegated stone,' writes Eustatius to Dionisius Periegetes. Statius also mentions this marble, and Strabo said that columns and large slabs of it were to be seen in Rome, 'with which the city is

embellished, both at the public charge and the expense of individuals.' This marble, which is known to the Italian stonecutter as *setis basi* (because it was first found in the ruins of the villa of Septimus Bassus), and also another variety which is called *semesanto*, were used to the greatest extent during the reign of Nero. The island of Scyros is honeycombed with the ancient Roman quarries, which are being reworked, and the marble is in great demand. The finest variety and the most valued in ancient times has a white ground stained profusely with a rich red, purple and yellow often appearing, the effect being most attractive.

A marble of great celebrity and quarried to an extent almost inconceivable by the ancients is the *marmor Carystium*, better known in modern times as *cipollino* (from *cipolla*, the Italian for onion, referring to its laminated structure, which resembles that of an onion), and used in considerable quantities in England. This marble, mentioned by Pliny, is supposed to have been the first coloured marble brought to Rome, and came from Carystus, in the island of Eubœa, and according to Pliny it was employed in building the house of Mamurra, the date of which is said to have been 48 B.C. Many inscriptions have been found proving the early use of this marble, and from one of them of Hadrian's reign we learn that a new quarry had just been opened. The numbers on rough blocks found in Rome, beginning with two, mount up to two thousand four hundred, and Corsi in 1845 enumerated five hundred and eleven whole columns still preserved in Rome. This most ancient and unique marble has a white ground banded and zoned with a sage-green of almost every shade. Sometimes the bands are almost parallel, and again they are wavy and distorted and often dislocated. It is said that, because the marking of this marble resembles the waves of the sea, Agrippa in dedicating the temple to Neptune ornamented it with Carystian marble. The quarries, perhaps the largest of antiquity, were worked by the Greeks and later by the Romans, when they were, of course, imperial property, and have been rediscovered by Mr Brindley after having been lost for nearly two thousand years. They are now being worked vigorously; and during the last few years, says Mr Brindley, over one hundred monoliths of large size have been sent to England, America, and Germany, shafts for columns being obtainable of practically any size. Great quantities of *cipollino* were used in the decoration of St Mark's at Venice, and *cipollino* of inferior quality is also found in Switzerland and Italy. Examples of both varieties are to be seen in Westminster Abbey.

A marble of beauty and note is the so-called Numidian marble, or *giallo antico* (antique yellow) of the Roman stonecutter of to-day, used so extensively of late years in England, but at the present moment not so much in fashion as some of the more recently imported marbles, which on this account are in vogue as presenting 'something new,' the beauty of the marble being merely a secondary consideration. This desire for the novel was likewise evident during the later days of the Republic and the early part of the Empire. It would seem that in many cases, then as now, the rarity and novelty of the object rather than its beauty was the attraction to the buyer. Pliny alludes to Numidia, the home of this justly famed marble, in northern Attica, as follows: 'This country produces nothing remarkable except its marble and wild beasts.' *Giallo antico*, so much beloved by the Romans, stands alone even to-day as the most beautiful of yellow marbles, so rich and deep are its colours, and so exquisite its compact texture, thus assuring a fine polish. Papinius Statius was indeed justified in saying 'the yellow stones of Numidia are resplendent.' This marble varies in colour from the faintest straw-tint to deep shades of rich yellow, usually broken by a few thin veins of purple, brown, or yellow slightly darker than the ground mass. Besides these are the flesh-coloured, called *giallo carnagione* (the flesh-tint is produced artificially by heat), and brecciated varieties. The last-named are of many shades of yellow, brecciated with golden brown, yellow, and white, and known as *giallo brecciato* (brecciated yellow). The most striking of the Numidian marbles is the *breccia sanguigna* (blood-coloured breccia), also known as *rouge Etrusque*, a startling combination of reds and yellows of deep shades, brecciated and confused, producing a handsome but somewhat gaudy effect. Numidia marbles are to be seen in Westminster Abbey, also in the wall-panellings of the National Gallery in London, and in decorations in Brompton Oratory. The name Numidian is incorrect, as the localities where the Romans obtained the stone were in the ancient provinces of Mauritania and Africa, and not in Numidia, although near it. Most of the material employed in Rome came from Simittu Colonia, the modern Chemtou, in Tunis, where the quarries are once more being worked; and Hadrian, on his first visit to Africa (about A.D. 128-29), constructed a road from them to Tebarca, where the stone was shipped to Rome. These stones were also found near Kleber, in the province of Oran, Algeria. Signor Boni tells me that he is led to believe, from pieces of *giallo antico* found in the sacrificial or expiatory stratification under the *niger lapis*, that this marble was brought to Rome as early as 200 B.C. Pliny, who (although he severely censured the use of marble) left us much valuable information concerning it, said: 'M. Lepidus, who was consul with Q. Catullus, was the first to have the lintels of his house of Numidian marble, a thing for which he was greatly censured. He was consul in the year of Rome 676 [about 78 B.C.]. This is the earliest instance I can find of the introduction of Numidian marble; not in the form of pillars . . . but in blocks, and that, too, for the comparatively ignoble purpose of making the thresholds of doors.' Hadrian ornamented his villas at Tivoli and Antium with Numidian, and gave twenty columns of it to the Gymnasium of Smyrna, the quarries of course being

imperial property. Under Marcus Aurelius new quarries of these stones were opened, described by Paul the Silentiary as 'those that the Libyan sun, pouring down his golden rays, tinges with hues of saffron and of gold.'

The most unique and distinctive in appearance of all the ancient marbles used at the present time in America is the *lapis Atracius* of the Romans or *verde antico* (antique green) of to-day. Paul the Silentiary completes his description of this marble, which he studied in the mosque of St Sophia, Constantinople, in the following words: 'It exhibits, in short, a combination of beauties,' which indeed is the case. This rock, outside of its historical interest, is particularly worthy of note from a geological point of view, and appears to be a breccia of white calcite, green talc, and serpentine. The ground mass is of every shade of green, and the fragments, which are mostly angular, are greenish black; and white calcite is conspicuous throughout the whole. The quarries are near Larissa, or ancient Atrax, in Thessaly; they were rediscovered some years ago by Mr Brindley, who describes a square block he saw there containing over four thousand cubic feet, and are worked again for the first time since the reign of the Emperor Justinian (A.D. 483–565). This stone, employed alike by the Greeks and Romans, is used frequently in England, in spite of the fact that it is difficult to work and expensive. Magnificent columns of it are to be seen in Westminister Abbey, also examples in Brompton Oratory.

The most important of all the marbles of ancient times and of to-day is that of Carrara—the *marmor Lunense* of the Romans, quarried at the ancient city of Luni, sixteen miles from the modern Carrara. The quarries of Carrara, the most extensive and celebrated in the world, were described by Strabo, and have been worked from the beginning of the Christian era, if not earlier, and at the present time supply Europe and America—the greater portion going to the last-named country—with thousands of tons of material annually. It is needless to describe the fame and beauty of the well-known Carrara marbles, seen at every turn, the supply of which appears to be inexhaustible. From the quarries, called by Statius 'quarries of snow,' came the marble so closely associated with the names of the great Augustus, of Michelangelo, of John of Bologna, Vasari, and Canova. Among other ancient marbles used in England are the *marmor Celticum*, or black-and-white marble of France (St Anne's), quarried by the Romans, and rediscovered in 1844 near the river Lez, in southern France; the *marmor alabastrum*, or Algerian onyx marble; the *marmor Tænarium*, or *rosso antico*, from the province of Mani in Greece, to be seen in Brompton Oratory and Westminster Abbey; and, finally, the green serpentine of Tinos.

It seems interesting that we deem it necessary, as did the Romans, to go beyond the seas in search of materials with which to enrich our homes and public buildings, 'in order that as much as possible may be lost whenever a conflagration happens,' says Pliny, who railed against the excessive use of marble in his day.

THE GERMAN NAVY.

THE extraordinary activity shown in the continued increase of the German navy has proved a cause of constant unrest to Europe. There are those who are convinced that this activity portends war; and that this idea is generally shared among the nations is clearly shown by the eagerness with which people watch the development, becoming now and then almost panic-stricken when extraordinary reports or rumours reach them. Whether or not the predictions of the pessimists may ever come to anything, we still have the fact before us that German naval activity has already had a very decided influence on European politics. As a direct consequence of it, England has entirely reorganised her fleets for home defence; France has been unwillingly forced to the admission that Germany has already usurped the place she once held; and Denmark has long since realised that an entirely new state of affairs has come into existence since she smashed Germany's commerce no farther back than 1848. There are some who tell us that this suspicion of Germany has actually crossed the Atlantic, and that the enthusiasm for building warships in America is really a counter-blast to the action of Germany. Though this sounds somewhat far-fetched, there are reasons for suspecting that there may be a grain of truth in it. Be that as it may, all this points to the fact that the German navy has come to be recognised as a power to be reckoned with.

A navy is one of those things which never evolves out of the process of development. The German navy is only just at the beginning of that interesting process; it is merely in its infancy, yet it is full of the greatest promise, and that is what causes the uneasiness and suspicion. Surely it was no empty compliment when an English sailor, whose judgment in these matters is respected, declared the German naval chief to be the greatest tactician in Europe. Similar compliments have been paid to the organisation, which has all the advantages of German thoroughness.

One of the things about the German navy which puzzles the English sailor is how it manages to train crews so well and to get so much out of them in the course of three years' training. It is no uncommon thing to hear British naval officers compare German

seamanship and discipline in the most favourable terms with the standard of other nations. Their marksmanship has so improved of late as to leave very little more to be wished for; it is questionable if it is not quite as good as British marksmanship. In fact, there is every evidence that the Germans are likely to prove themselves as good sailors as they have proved themselves soldiers. The only question is whether or not they will be able to adapt themselves to actual warfare at sea, and if their fine theories are likely to stand a practical test. One often hears the verdict passed that German sailors are lacking in grit; but such a judgment only proves ignorance. In any case, it is safest to assume that they are likely to show themselves ugly foemen, and to guard against underestimating this new power which has arisen.

Exactly how large the German navy is likely to be in the near future depends altogether upon how much money can be raised in the country. The financial outlook is certainly not favourable, and the burden of taxation is already weighing heavily upon the people; but every effort is being made to raise the necessary money by every possible means, and that in spite of the bitter grumblings of the people. Certain it is that if the Kaiser can have his way his navy will be the largest, if not the greatest, in Europe. He never makes any secret of the fact that this is the one ruling ambition and aim of his life. He is the central figure of all the schemes and plans which are on foot in the Fatherland for getting money for the navy and for making it popular. He has said to his people, 'Our future lies on the water;' adding that they must go forward into that future 'full speed ahead,' and he himself is leading the way.

These words are considered by the mass of the people to be very beautiful, though they do not altogether believe in them. Millions of those to whom the words are addressed have never seen 'the water,' and are not moved by the attempts to rouse their enthusiasm. So they refuse to grant naval budgets when some more than ordinarily large demands are made upon them. They go back upon their experience with the army, and they are somewhat afraid of the navy. They feel that they are embarking on a costly enterprise, and argue that they are already paying as heavy taxes as they can possibly bear.

But in Germany it is not altogether the will of the people that counts in the end. They are merely asked to vote sums of money for the navy out of politeness, for once the official mind is made up to raise the money, it is forthcoming whether the people consent or not. The latter have been well schooled during their military days into obeying the will of their superiors. If any man wishes to win favour at Court—and that is the secret of all political success—his surest passport is to say or to do something likely to prove helpful in furthering the naval movement. Consequently all the statesmen whom the Kaiser has gathered around him are enthusiasts for the navy. These men, much more than the people, are moulding the nation's destinies and helping the Kaiser in the attainment of his ambition. First they told the people they wanted ships to protect their coasts and to prevent the enemy from coming to their door, and the people grudgingly gave the necessary money. Then they said they wanted ships to protect their commerce, or else the people might starve, and more money was unwillingly granted. Then they said that Germany must be in a position and have sufficient ships to attack a foreign Power on the high seas, and part of the money was still more grudgingly voted. Now they say that Germany must have ships in order to find her 'future on the water,' to secure colonies, and the people will have to find the money.

A brief glance at the history of the German navy may better enable one to understand the situation, and to form his own conclusions. As far back as the Middle Ages most of the ships trading from the Hansa (or free) Ports were requisitioned by the authorities in time of war. It was not until the reign of the great Kurfürst that any attempt was made to raise a navy in Germany; but his schemes fell through at his death, and nothing more was heard of a navy until the middle of last century, in the year 1848. It was in that year, as already mentioned, that Denmark successfully blockaded German ports and damaged her shipping. Germany took the lesson seriously to heart, and decided to prevent similar disasters in future. A National Assembly at once elected a commission, which was presided over by a royal prince, and they succeeded in getting a few vessels, most of which were given by private persons. Unfortunately the promoters of this movement had failed to carry the people with them; and as no money was forthcoming for the maintenance of these vessels, the enterprise was given up suddenly at the end of 1852, and the fleet was sold.

Most of the ships were bought by Prince Adalbert, the president of the commission that had been formed, and the moving spirit in the affair. Less than a year later there was an agitation to found what was to be a purely Prussian navy with those ships still in the possession of the Prince. Bismarck, who at that time was ready to support anything that promised to make Prussia imposing in the eyes of the other German States, and thereby influence their union with Prussia, helped this new scheme in a half-hearted manner. At the time he had no conception of the ultimate magnitude of the scheme, and possibly it never would have assumed anything like its present greatness had he been able to prevent it, since he was avowedly more of a home than a foreign politician. However, under his patronage the new navy prospered so well that in 1869 a special harbour was built for it, and in the same year a sum of money was included in the Budget for the upkeep of the seventy-one ships of all kinds comprising the Prussian navy.

In the year 1871, at the union of the German States, the Prussian navy became the German navy, and in the course of the following year a Bill was brought into the Reichstag making allowance for the increase of the navy considered necessary 'to protect the increasing mercantile marine of the Empire.' But by that time interest in the navy had again died out. Bismarck thought no more of it, for it had served his purpose and helped him to realise his ambition of a United Empire. It had helped to make Prussia politically and economically the strongest State, and thereby in a very large measure the dictator. Many of the orders which had been placed according to the provision of the Budget were cancelled, the Government decided not to build any more armoured cruisers, and there were indications that the navy might again cease to exist. One reason for this neglect was that the authorities anticipated a great future for torpedo craft, concluding that they would decide the sea-fights of the future. This would seem only to have been an excuse for inactivity, for they did not build many torpedoes, and it was only after 1887 that a few coast cruisers were built. The Reichstag refused to listen when it was lectured that the possession of large ships of war was a necessity of a first-class Power which had its commerce as well as its coasts to defend, and as no pressure was brought to bear upon the Imperial Diet no money was granted.

It was not until the present Kaiser came into power that interest was again shown in the German navy. He took it seriously and thoroughly in hand, applying to it that enthusiasm which characterises everything that he does, with the result that the navy sprang into new life. He realised its usefulness, and, as he said, its necessity. What is more, he realised that in making the navy great he would also make himself great, for it appealed to his imagination as the only direction in which he might strike out and establish for himself a lasting fame by giving to the Empire a new service which he considered would add to its solidity and usefulness. The navy took in his affections the place of the army. This latter had been the work of his illustrious ancestors and was already an accomplished fact, whereas the navy was to be his creation. It became at once his idol and his toy; his interest in it is unceasing, and the amount of work he does for it with the object of increasing its efficiency could only be accomplished by a man of his temperament and energy. He executes with his own hand comparative drawings of the size of his navy alongside the fleets of England. These drawings are signed by him and exhibited in museums and other public places as object-lessons to the people. He sends models of ships to the various States, makes speeches on the navy, and in a number of different ways does all in his power to popularise it and to realise his ambition to see it the largest navy in Europe.

In spite of all his propaganda the nation does not share the Kaiser's enthusiasm. He has had to wrest each ship separately from the Reichstag; consequently he has never been able to introduce the systematic building of the navy on which his heart is set. Now, however, he seems to have fought down many of the difficulties, and money is more easily forthcoming. His determination to attain his object may be the better understood if we briefly survey what he has accomplished. His first step was to introduce a division of new ships of the line known as the Brandenburg Class. Then in 1894 came the Kaiser Class, and in the following year a number of new cruisers were begun. In 1898 a Naval Bill was passed sanctioning the increase of the strength of the navy to nineteen battleships, eight armoured cruisers, and twelve large and thirty small cruisers. A comparison of this modest fleet with the extraordinary increase granted by the second Naval Bill passed only two years later proves what a wonderful change had taken place in the views of the members of the Reichstag. Besides providing some cruisers for foreign service, the second Bill contained the following conditions: The German navy is to be composed of—(1) The fighting fleet, comprising two fleet flagships and four squadrons, each having eight battleships, eight large cruisers, and twenty-four small cruisers. (2) The foreign fleet, consisting of three large cruisers and eighteen small cruisers. (3) The material reserve, consisting of four battleships, three large cruisers, and four small cruisers. During 1905 provision was made for increasing the number of torpedo-boats from ninety-six to one hundred and forty-four, thus making twenty-four divisions. A sum was also granted for experimenting in submarines, and in the same year a Bill was introduced to double the number of cruisers on foreign service. As a result of the lessons learned after the Russo-Japanese war, it has been decided to increase the tonnage of the ships all round. In order to do this a new Naval Bill was passed in 1906, and confirmed by the Budget of 1907, by which the German navy is to double itself between now and the year 1920 in ships and in men, and in some instances in the tonnage of individual ships. But it is more than likely that this enormous increase will prove only the thin edge of the wedge, and that within the next few years another Bill will be introduced demanding still more ships. It must, however, be kept in mind that while the Reichstag has been compelled to give its consent to the various Bills, it has neither found nor granted all the money necessary for carrying them out; consequently the naval increase is really much greater on paper than it is in reality.

ORGANISATION OF THE GERMAN MARINE.

The Kaiser is the supreme Chief of the Marine, and can take over the command in person in war or in peace. Assisting the Kaiser are the Marine Cabinet, the Imperial Marine Office, and the Admiral Staff of the Marine. All these offices are

in Berlin, and are represented at Kiel (the Baltic Station) and at Wilhelmshaven (the North Sea Station). The men are drawn from what is officially known as the 'half-sea' population—that is, 'men who have been for at least twelve weeks on a sea-going vessel.' As a rule, the sailors are mostly men who have worked as fishermen or on the sea and river steamers. Engineers, bakers, and such like are often taken from inland districts. All are selected from the men called up to do military service, though they are as far as possible left to choose which branch of the service they will enter. The term of service is for three years active, four years in the naval reserve, five years in the second reserve, the men remaining in the third reserve until the age of thirty-nine has been passed.

BLAZING BEACH.

PON the coast of Maine, in the United States, is a little strip of sand and gravel about a hundred feet long. The people who live in the vicinity call it the 'Blazing Beach.' In appearance it does not differ from many other places on the shore of the ocean where the waves break upon a floor of sand, and the visitor is at a loss to understand why such a curious title is given it until he learns that the beach actually has been ablaze. More than this, the water near it has, so to speak, been on fire, flames leaping from its surface to a height of nearly a foot in the air. Twice this curious phenomenon has happened. On one occasion the guests at the hotel which is situated near the beach were startled by hearing a crackling sound. Those who happened to be gazing seaward saw the beach apparently on fire, while the water for a distance of nearly two hundred feet out from the shore-line was also in flames. The fire lasted nearly an hour, then died away as suddenly as it had appeared. On the second occasion only a portion of the beach and the water was ablaze, although at this time the tongues of flame apparently shot up higher than before, but disappeared as quickly.

The news that the beach had been on fire, of course, spread throughout the country, and attracted the attention of scientific men, many of whom visited Kittery Point, as the place is called. Some of them would not believe that a fire had occurred until they saw bits of charred wood lying here and there, and heard the stories of reliable witnesses of the scene. Most of those who endeavoured to learn the reason for this curious occurrence could find no clue whatever. At first it was thought that some one had accidentally dropped a lighted match in a pile of dried seaweed; but no one was upon the beach at the time the fire occurred, so it was proved that it was not caused by human hands.

The guests who were at the hotel when the fire occurred all stated that while the beach and the surface of the sea near it were ablaze a very strong odour filled the air—an odour very similar to that given out by what the chemist calls sulphurous acid gas. This fact gave some of the investigators a slight clue, and they began to examine the formation of the beach. It is an interesting fact that all of the New England coast is gradually sinking. It is estimated that the water of the sea is rising upon it at a rate of about two feet in every hundred years. Small as is this invasion of the ocean upon the land, it has an important connection with the fire, as has been learned, for it has aided in making a natural reservoir in which gas has been accumulating for centuries.

When the beach was dug up, the upper layer was found to be of sand about half a foot in thickness. As there is a difference of several feet between high and low tide on this part of the Atlantic coast, the beach at high-tide is almost entirely submerged, and the sand beneath the surface is continually wet, so that it is very compact. Below the sand was found a layer of four or five inches of what are called beach-pebbles—small stones ranging from a quarter of an inch to an inch in thickness. The pebbles were also massed very closely together, and rested upon a sort of flooring consisting of hard clay which was about a foot in thickness. When the investigators dug through the clay they were surprised to find that below it was a mass of decayed vegetation, such as grass, moss, and other fibre. This deposit was mixed with roots, twigs, and quite large branches of trees. In short, beneath the beach was a portion of what had once been the vegetation which is so often found in American forests. After the beach above low-tide had been examined, the scientists turned their attention to the bottom of the sea near it, and several feet below the sand and gravel which underlay the water they discovered more of this decayed vegetation. Here and there in the clay were found small openings which afforded another clue to the cause of the mysterious fire, for they had evidently been caused by some movement below the surface, and were not the work of animals or insects.

None of the stuff found under the beach or under the sea had been burned in any way; but where a small quantity of it was exposed to the air one detected the same odour that was so noticeable to the guests of the hotel when the fires occurred. Apparently the vegetation has been a natural gas-generator through gradual decomposition, the gas created being familiarly known as marsh-gas. How long this curious natural laboratory has been in operation the scientists cannot determine; but the

accumulation of gas must have been in progress for a long period, for at last so much of it was generated that it filled all the available space beneath the covering of sand, gravel, and clay, finally forcing its way upward through the little openings to which we have referred.

After they had decided that neither the water nor the sand actually took fire, but that the flames came from the gas forcing its way to the top, the next question which the men of science tried to answer was how the gas burst into flame without being ignited by a match or some other inflammable material. Samples of the gas were secured in air-tight receptacles, and by a simple experiment the problem was solved, for as soon as the gas was allowed to escape and mix with the air the contents of the receptacles burned brightly until entirely consumed, showing that this form of gas can be set on fire by what is generally called spontaneous combustion.

So far as is known, no other section of the sea-beach has ever been the scene of such a phenomenon; but geologists familiar with the formation of the Atlantic coast say that there are many other localities where gas may be formed in enormous quantities, as, for instance, along the shore of the Atlantic Ocean and the Gulf of Mexico in the Southern States, for in many spots dense forests reach almost to the water's edge, and there are a number of places where, at high-tide, sea-marshes, as they are called, and swamps are submerged daily. It is known that beneath the sea in these localities are enormous beds of vegetable matter, as deposits have been found many feet in thickness. Undoubtedly some of these have formed natural reservoirs of gas, but no one has ever seen them on fire.

The reason why Blazing Beach is so termed possibly serves to explain the origin of what the Japanese call the 'ghost-fire,' 'fox-flame,' and the 'badger-blaze,' all of which are considered by the peasants of Nippon to be supernatural. Among the Japanese legends is one to the effect that a lake in the province of Omi gives birth to movable balls of fire. The peasant says they spring out of the water at first but a few inches in diameter, but gradually move towards the hills in the vicinity, expanding as they go until they are as high as an ordinary man, but much thicker. Then, according to the legend, one can see two human beings closely embraced within the fire-ball—the figures of two men who apparently are wrestling. The natives do not dare to go near one of these balls, as they say that if a person tries to stop it he will be thrown down, because it moves so rapidly, and will probably lose his life. These wonderful balls always roll into a valley between two of the hills near the lake, where they disappear. This valley is, of course, supposed to be the abode of evil spirits, and no human being, so the story goes, has ever dared to enter it. The mysterious lights known as the corpse-candle, the jack-a-lantern, and the *ignis-fatuus*, so well known in connection with English folklore, probably have their origin in the spontaneous combustion of marsh-gas in small quantities.

That such fires as occurred in Maine have also occurred in the past ages is shown by discoveries which have been made near the city of St John in New Brunswick. Here is a very extensive bog. When a portion of the surface of the bog was excavated recently, it was found that the decayed vegetation, such as moss and grass, and even large pieces of wood, were charred and blackened. As there was no trace of any fire upon the surface, and no way by which the deposits could have ignited except from below, the naturalists who examined the material decided that it must have been caused by a subterranean fire originating by the contact of the marsh-gas with air which had probably reached the deposit through some hole in the surface made by a reptile or an animal.

PANTOUM OF THE MORNING WATCH.

The blue-black arching dome of sky,
The countless stars, our ceiling make;
The coast shows dimly to the eye,
Our ship is in the squadron's wake.

The countless stars our ceiling make,
The soft sea bears us on its breast,
Our ship is in the squadron's wake—
A black shape, phosphorescence-dressed.

The soft sea bears us on its breast
O'er billows shot with silver sheen—
A black shape, phosphorescence-dressed,
Astern of others, dimly seen.

O'er billows shot with silver sheen—
The setting moon's reflected beams—
Astern of others, dimly seen,
We chase their stern-lights' heaving gleams.

The setting moon's reflected beams
Touching the wavelets on the deep,
We chase their stern-lights' heaving gleams;
The day stirs from its shaken sleep.

Touching the wavelets on the deep,
The twilight, faintly seen, is here;
The day stirs from its shaken sleep,
O'er the sea's edge pale rays appear.

The twilight, faintly seen, is here,
The watchful sentry strikes the hour;
O'er the sea's edge pale rays appear,
The dawn shows up the lighthouse tower.

The watchful sentry strikes the hour—
Three bells!—the stars fade just the least;
The dawn shows up the lighthouse tower,
And streaks of gold break in the east.

Three bells! The stars fade just the least,
The coast shows sharper to the eye,
And streaks of gold break, in the east,
The blue-black arching dome of sky.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

PERHAPS it was Pindar, the old poet of Thebes, who was the first to remark that water was the noblest of all the elements. Such an expression of sentiment would be trite enough in these present days, although too seldom do we pause for consideration upon any of the wonderful circumstances of our employment of these elements. When a man or party of men go out to live at a place that has previously been uninhabited, their first care is, and must always be, as to the supply of water. The human being may live for days without food, and he may suffer little when the first pangs of hunger have passed away; but without water he is soon driven towards madness. Then it must surely be an attractive subject for thought as to how such a vast city as London, with its millions of people, is well and thoroughly watered when a full supply of this element is such an absolute necessity to each individual. One's attention was drawn particularly to this subject lately, when a new reservoir for the storage of London water was opened in one of the suburbs, having been in process of construction for some years. This reservoir, which is in South London, holds nearly sixty millions of gallons of water, which is equal to a day's supply for nearly two million people; and in order to make such a receptacle a hundred thousand yards of earth had to be dug out of the site. This reservoir is only part of a great scheme, the object of which is to guarantee the Londoner completely against any lack of water during times of drought; and one may gain some faint idea of what has to be done in order to effect such a guarantee when it is mentioned that, on an average, every person in London uses each day of his life over thirty gallons of water, weighing three hundredweight. When the storage-works for which parliamentary sanction has been obtained are finished, the Metropolitan Water Board will have reservoirs with a capacity of fifteen thousand million gallons. Vast as are the water-supplies of London, and extensive as are the resources of those whose business it is to attend to them, it is realised that the present sources can only be relied upon for eight more years. It happens, therefore, that the Board, which has six hundred square miles to provide for, is now giving its mind to the question of finding water for the next generation for a London which, with its environs, will probably have by 1960 a population of not less than sixteen millions. We were told a little while since that the Board had a scheme for doing this which involved the tapping of a tributary of the Thames, whose water, instead of flowing into the river, would be collected by means of a basin nine miles in area. Somehow, there has frequently been a prejudice by high authorities against water coming from the Thames. Its purity has been doubted; but reports from independent experts who have made continuous examinations show that Thames water in these days is becoming increasingly pure, and that the sources above Teddington have greatly improved. In this water there is almost an entire absence of bacteria that could be harmful to the community.

* * *

Of course it is well understood that London is dependent upon the outside for its water. Nature, when the earth was established, does not seem to have contemplated the possibility of such a mass of people concentrating at one spot; or we may put it that she knew that when people were thus concentrated their intelligence and knowledge would have advanced to a point that they could overcome all difficulties of this kind. If London had but a population such as would be an average for the surface of an inhabited country, or even if it were much more thickly peopled than this, it would have within its own boundaries, and independent of the Thames, which flows through it, a sufficient supply of water for all purposes. For deep down below the surface there are many wells, and some of these have from time to time been tapped, and

[*All Rights Reserved.*]

have been used for general purposes. It has sometimes been very difficult to get at them. The story is told that about fifty years ago the people of Hampstead, guided by expert geologists and engineers, went on for two years with the work of sinking a bore-hole, until a depth of over thirteen hundred feet had been reached, and still there was no water! Then they gave up their enterprise. Some time later the inhabitants of Richmond conceived the idea of being their own water-purveyors, and they too bored to a depth of over thirteen hundred feet, and spent sixty thousand pounds in doing it. At the finish their well supplied them with not quite six gallons of water a minute. On the other hand, modern engineering improvements have got over many difficulties that existed in the past, and we have heard that there are two bore-holes in Kentish Town which yield the local council for bath purposes some thirty thousand gallons an hour. Excavators are constantly coming across lakes, the existence of which had not been suspected, far beneath the surface of London. In ancient days there were many rivers running through the place. These have all been turned into the sewers; but it was impossible to treat all the little springs and rivulets that joined the brook in its course in the same way, and this water is still running far beneath the streets and houses. When an electric supply company was making a new power-station on the riverside at Millbank less than two years ago, the excavators struck a number of springs, only thirty feet down, which gave forth an immense volume of water. It was really an underground lake that had been tapped, and millions of gallons had to be removed before the contractors could go on with their work. In the same way, when the new Admiralty buildings were being put up, a pool of water ten feet deep and only fourteen feet below the surface was found under the Horse Guards parade, and this caused a delay in the building operations of several months. These silent pools, discovered again after having been hidden away in the dark for hundreds of years, have been aptly described as the ghosts of the rivers that once beautified the environs of London.

* * *

This is not a very bright and busy season in London. There is not the stir about town that there was last summer or the summer before. There are fewer foreigners spending their money in England, and, for certain reasons, the natives are all in a more or less gloomy mood, and not much inclined to festivities. It is the old tale: we are short of money. Trade is still bad, and despite the proclamations of some optimists, most people in the City think that it must remain bad for a long time to come. On the top of all our troubles comes this new and terrible taxation. Perhaps it could not be avoided, or it could be. We must have more *Dreadnoughts*, and they become expensive when their numbers have to be multiplied year by year. Perhaps old-age pensions and other items which have a Socialistic look about them were not quite so necessary. These are debatable points anyhow; but it is clear to the most unthinking person that we cannot go on much longer as we do now. There is a weakness in that old saying, so much respected during many years, that to be prepared for war is the best guarantee of peace—a weakness which has not been fully understood until lately. There is such a thing, says one, as having to make too many preparations for war without having the war, and people with a dread of battles and a full realisation of the horrors that would attend upon an armed conflict between two civilised Powers of the first magnitude have got into the way of saying to each other most significantly that a war, after all, would be cheaper and more humane than all these preparations for it, and that a war would obviate the necessity for continuing preparations. And they add, to themselves, that if there must be a war, as most people say there must, then it would be well if we had it quickly. Amidst all our troubles and taxation, it becomes clearer almost every day that in a little while we shall be taxed for airships as well as for ships of the sea. Heaven help the middle classes of Great Britain when they have to maintain their collection of war aeroplanes at a three-power standard!

* * *

There are things which people who have once cultivated certain habits will not deny themselves, however scarce money may be, even though such things are in a considerable sense unnecessary. Perhaps there was never more luxurious dining than there is in London at the present time, and almost certainly more money was never spent on curios, nor have there ever been so many curio-hunters as now. Almost every man you meet is a collector of something or other, and his collection is nothing if it is not an expensive one. Little wonder is it, then, that a class of persons have arisen who make vast sums of money out of these collectors, and not always by the most righteous means. There have never been so many frauds in curios and paintings as now, and never have such fancy prices been demanded and paid. Moreover, some of the frauds are so excellent as copies that it is extremely difficult even for experts to detect them. A little while since, an American consul in this country thought well to issue a warning in this matter to visitors from the United States. He told them that among the clever forgeries that were put on the market in wholesale lots were pieces of rare old-period furniture which were given the gloss and appearance of age by rubbing them with bone and pumice-stone; old hand-rolled copper plate, which has not been made since 1840, a thousand pieces of these having lately been examined without half-a-dozen genuine specimens being found; Spanish ivories skilfully 'aged' brown by acids; Queen Anne silver, superstructures of the pieces of which are

built upon the handles of old spoons bearing genuine marks; and so forth. This consul said that the British Isles had been searched up and down from door to door by experienced collectors for upwards of fifty years, and the thoroughness of the search indicates the great unlikelihood of anything good being picked up for little money at this late day. But in the meantime the most extraordinary prices are being paid for genuine curios. We remember that four or five years ago, at a memorable sale, the sum of six hundred and ninety pounds was given for a single silver spoon dated 1488; and a little while later four thousand nine hundred pounds was paid for a set of thirteen Henry VIII. silver apostle spoons. Again, not many years since, there was a duel in Christie's auction-rooms, as the result of which a pair of old mahogany chairs were sold for one thousand guineas; and two years back an inferior pair realised three hundred and seventy guineas. Already this season, despite all the taxation and all the fears and all the statements by great and titled landowners that they must give up some of their possessions, there are manifestations that this craze for curios is at least as strong as ever, and huge sums are being paid in the auction-rooms for bits of things more because they are old and rare than of the artistic and technical value they may possess. And all this time the modern artists complain that nobody will buy their work, however good, and that their best efforts will not yield them a bare living.

* * *

Recently there was published in London a book which was nothing else than one long tirade against America, Americans, and their character. The writer could see nothing good in this people. Some of the most careful reviewers of the book wisely and properly expressed their disapproval of it. Such a publication in itself could do little harm, and it is an easy matter to ignore it; but this book is only one of several of its kind that have been published in recent years, and, again, it is only one of many instances that are fast increasing of something in the nature of a strong racial feeling that is growing up between the two countries, and separating them farther than is desirable in the present state of the world's affairs. At the present time we hear day by day of the German menace, and yet it is a fact that Germans in this country find it easier to trade with us than Americans do. We use vast supplies of necessities from America, but generally speaking we seem to confine ourselves to necessities. It is disappointing that the efforts of statesmen, constant and sincere as they have been, to remove that mutual dislike between the nations as it exists have not had better results. It would be a good thing, perhaps, if something in the nature of a royal commission were set to work to inquire as to what are the causes for this somewhat unnatural state of things; because one may feel sure that the Americans' egotism and manners, although they may be such as do not commend themselves to people in this country, are not in themselves a sufficient reason for the tendencies which have been indicated. That definite reasons do exist is certain; and as royal commissions in these days are engaged upon almost every conceivable kind of investigation, one might very usefully be employed on such a one as that suggested. We are led to this idea by finding out, as has lately been done, that these definite reasons exist in America, where, so it has been positively stated, practically all the American text-books on history used in the elementary schools show hostility towards England; they are full of historical inaccuracies, the object of which is said to be the development of the patriotic instinct!

* * *

One of the most delightful books of reminiscences which have been published so far this season is that which bears the name of the Hon. Lionel Tollemache. It is a long series of rambling recollections by one who has been a close observer, has experienced many and most interesting phases of life, and is the possessor of a most excellent memory. The father of the writer was the first Lord Tollemache, and in the book there is a most charming description of this fine old Tory peer, who is said to have been 'three parts Sir Roger de Coverley and one part Cardinal Richelieu.' He had a horror of afternoon tea, and he refused to plant trees in the avenue at Helmingham because 'the young trees by the side of the very old ones would be an eyesore for many years, and very likely before they had time to grow up property would be made hay of.' When this rare old gentleman was eighty years of age he climbed on the box of his four-in-hand to show his 'young fool of a coachman' how to drive, and he used to say that if all Englishmen were like Lord Cholmondeley they would be religious and delightful, but the French would soon come and take London! It is good to read about this excellent Tory of the recent past. The author has tales of all kinds to tell. One is that an intelligent Englishman met Miss Swanwick on the Continent, and after the very slight acquaintance which suffices to draw such ex-Anglians into a rudimentary friendship, he begged leave to present her with the outcome of the labours of his life. She was at her wits'-end to guess what was coming. The gift proved to be quite portable, and in no way beyond acceptance from a comparative stranger. It was neither more nor less than a map of the world, a map in which the light and shade were distributed so as to mark the abundance, rarity, or total absence, not of Christianity, nor yet of coalfields, but of snails! The author quotes the story told by Mr Lecky in illustration of the very advanced religious life of Holland. It is that a Dutch peasant was in sore straits about the impossibility of making his hens observe Sunday. He came to his pastor with a present of eggs. He regretted, he said, that he could not prevent his hens from laying those eggs

on the Sabbath, but he made what amends he could by giving them to God's minister, that they might be handed over to the poor and infirm. There is in the book mention of one of the cleverest puns ever made. Canon Ainger took up a copy of Tischendorf's New Testament. In this book the 'various readings' are placed at the bottom of the page, being separated from the text by a horizontal line. 'I see,' said the Canon, 'the notes are partitioned off' (*par* Tischendorf).

THE HOUSE OF WHISPERS.

CHAPTER XXXI.—DESCRIBES A CURIOUS CIRCUMSTANCE.

TO Hamilton it was evident that the man Krail, now smartly dressed in country tweeds, was telling the girl something which surprised her. He was speaking quickly, making involuntary gestures which betrayed his foreign birth, while she stood pale, surprised, and yet defiant. The Baron's secretary was not near enough to overhear their words. Indeed, he remained there in concealment, in order to watch their proceedings.

Why had Gabrielle met Felix Krail—of all men? She was beautiful. Yes, there could be no two opinions upon that point, Edgar decided. And yet how strange it all was, how very remarkable, how romantic!

The man was evidently endeavouring to impress upon the girl some plain truths to which, at first, she refused to listen. She shrugged her shoulders impatiently and swung her walking-stick before her in an attempt to remain unconcerned. But from where Hamilton was standing he could plainly detect her agitation. Whatever Krail had told her had caused her much nervous anxiety. What could it be?

Across the meadows, beyond the river, could be seen the lantern-tower of old Fotheringhay church, with the mound behind where once stood the castle where ill-fated Queen Mary met her doom.

As the Baron's secretary watched, he saw that the foreigner's attitude was gradually changing from persuasive to threatening. He was speaking quickly, probably in French, making wild gestures with his hands, while she had drawn back with an expression of alarm. She was now, it seemed, frightened at the man, and to Edgar Hamilton this increased the interest tenfold.

Through his mind there flashed the recollection of a previous occasion when he had seen the man now before him. He was in different garb and acting a very different part. But his face was still the same—a countenance which it was impossible to forget. Hamilton was watching the changing expression upon the girl's face. Would that he could read the secret hidden behind those wonderful eyes! He had, quite unexpectedly, discovered a mysterious circumstance. Why should Krail meet her by accident at that lonely spot?

The pair moved very slowly together along the path which, having left the way to Southwick, ran along the very edge of the winding river towards Fotheringhay. Until they had crossed the wide pasture-land and followed the bend of the stream Hamilton dared not emerge from his place of concealment. They might glance back and discover him. If so, then to further watch Krail's movements would be futile.

He saw that, by the exercise of caution, he might perhaps learn something of deeper interest than he imagined. So he watched until they disappeared, and then sped along the path they had taken until he came to a clump of bushes which afforded further cover. From where he stood, however, he could see nothing. He could hear voices—a man's voice raised in distinct threats, and a woman's quick, defiant response.

He walked round the bushes quickly, trying to get sight of the pair, but the river bent sharply at that point in such a manner that he could not get a glimpse of them.

Again he heard Krail speaking rapidly in French, and still again the girl's response. Then there was a shrill scream and a loud splash.

The next moment he had darted from his hiding-place, to find the girl struggling in the water, while at the same time he caught sight of Krail disappearing quickly round the path. Had he glanced back he could not have seen the girl in the stream.

At that point the bank was steep, and the stillness of the river and absence of rushes told that it was deep.

The girl was throwing up her hand, shrieking for help; therefore, without a second's hesitation, Hamilton, who was a good swimmer, threw off his coat, and, diving in, was soon at her side.

By this time Krail had hurried on, and could obtain no glimpse of what was in progress owing to the sharp bend of the river.

After considerable splashing—Hamilton urging her to remain calm—he succeeded in bringing her to land, where they both struggled up the bank dripping wet and more or less exhausted. Some moments elapsed before either spoke; until, indeed, Hamilton, looking straight into the girl's face and bursting out laughing, exclaimed, 'Well, I think I have the pleasure of being acquainted with you, but I must say that we both look like drowned rats.'

'I look horrid,' she declared, staring at him half-dazed, and putting her hands to her dripping hair. 'I know I must. But I have to thank

you for pulling me out. Only fancy, Mr Hamilton —you!'

'Oh, no thanks are required. What we must do now is to reach some place where we can get our clothes dried,' he said. 'Do you know this neighbourhood?'

'Oh yes. Straight over there, about a quarter of a mile away, is Wyatt's farm. Mrs Wyatt will look after us, I'm sure.' And as she rose to her feet, regarding her companion shyly, her skirts clung around her and the water squelched from her shoes.

'Very well,' he answered cheerily. 'Let's go and see what can be done towards getting some dry kit. I'm glad you're not too frightened. A good many girls would have fainted, and all that kind of thing.'

'I certainly should have gone under if you hadn't so fortunately come along,' she exclaimed. 'I really don't know how to thank you sufficiently. You've actually saved my life, you know. If it were not for you I'd have been dead by this time, for I can't swim a stroke.'

'By Jove,' he laughed, treating the whole affair as a huge joke, 'how romantic it sounds! Fancy meeting you again after all this time, and saving your life! I suppose the papers will be full of it if they get to know—gallant rescue, and all that kind of twaddle.'

'Well, personally, I hope the papers won't get hold of this piece of intelligence,' she said seriously as they walked together, rather pitiable objects, across the wide grass-fields.

He glanced at her pale face, her hair hanging dank and wet about it, and saw that, even under these disadvantageous conditions, she had grown more beautiful than before. Of late he had heard of her—heard a good deal of her—but had never dreamed that they would meet again in that manner.

'How did it happen?' he asked in pretended ignorance of her companion's presence.

She raised her fine eyes to his for a moment, and wavered beneath his inquiring gaze.

'I—I—well, I really don't know,' was her rather lame answer. 'The bank was very slippery, and—well, I suppose I walked too near.'

Her reply struck him as curious. Why did she attempt to shield the man who, by his sudden flight, was self-convicted of an attempt upon her life?

Felix Krail was not a complete stranger to her. Why had their meeting been a secret one? This and a thousand similar queries ran through his mind as they walked across the fields in the direction of a long, low, thatched farmhouse which stood in the distance.

'I'm a complete stranger in these parts,' Hamilton informed her. 'I live nowadays mostly abroad, away above the Danube, and am only home for a holiday.'

'And I'm afraid you've completely spoilt your clothes,' she laughed, looking at his wet, muddy trousers and boots.

'Well, if I have, yours also are no further good.'

'Oh, my blouse will wash, and I shall send my skirt to the cleaners, and it will come back like new,' she answered. 'Women's outdoor clothing never suffers by a wetting. We'll get Mrs Wyatt to dry them, and then I'll get home again to my aunt in Woodnewton. Do you know the place?'

'I fancy I passed through it this morning. One of those long, lean villages, with a church at the end.'

'That's it—the dullest little place in all England, I believe.'

He was struck by her charm of manner. Though bedraggled and dishevelled, she was nevertheless delightful, and treated her sudden immersion with careless unconcern.

Why had Krail attempted to get rid of her in that manner? What motive had he?

They reached the farmhouse, where Mrs Wyatt, a stout, ruddy-faced woman, detecting their approach, met them upon the threshold. 'Lawks, Miss Heyburn! why, what's happened?' she asked in alarm.

'I fell into the river, and this gentleman fished me out. That's all,' laughed the girl. 'We want to dry our things, if we may.'

In a few minutes, in bedrooms upstairs, they had exchanged their wet clothes for dry ones. Then Edgar in the farmer's Sunday suit of black, and Gabrielle in one of Mrs Wyatt's stuff dresses, in the big folds of which her slim little figure was lost, met again in the spacious farmhouse kitchen below.

They laughed heartily at the ridiculous figure which each presented, and drank the glasses of hot milk which the farmer's wife pressed upon them.

Old Miss Heyburn had been Mrs Wyatt's mistress years ago, when she was in service; therefore she was most solicitous after the girl's welfare, and, truth to tell, looked askance at the stranger who had accompanied her.

Gabrielle, too, was puzzled to know why Mr Hamilton should be there. That he now lived abroad 'beside the Danube' was all the information he had vouchsafed regarding himself, yet from certain remarks he had dropped she was suspicious. She recollected only too vividly the occasion when they had met last, and what had occurred.

They sat together on the bench outside the house, enjoying the full sunshine, while the farmer's wife chattered on. A big fire had been made in the kitchen, and their clothes were rapidly drying.

Hamilton, by careful questions, endeavoured to obtain from the girl some information concerning her dealings with the man Krail. But she was too wary. It was evident that she had some distinct object in concealing the fact that he had deliberately flung her into the water after that heated altercation.

Felix Krail! The very name caused him to clench his hands. Fortunately he knew the truth; therefore that dastardly attempt upon the girl's life should not go unpunished. As he sat there chatting with her, and admiring her refinement and innate daintiness, he made a vow within himself to seek out that cowardly fugitive and meet him face to face.

Felix Krail! What could be his object in ridding the world of the daughter of Sir Henry Heyburn? What would the man gain thereby? He knew Krail too well to imagine that he ever did anything without a motive of gain. So well did he play his cards always that the police could never lay hands upon him. Yet his 'friends,' as he termed them, were among the most dangerous men in all Europe—men who were unscrupulous, and would hesitate at nothing in order to accomplish the *coup* which they had devised.

What was the *coup* in this particular instance? Ay, that was the question.

(To be continued.)

SOME GALLOWAY LOCHS.

By the Rev. C. H. Dick.

NEAR St John's Town of Dalry—a small place with a long name—is a tarn called Mossroddick, to which one ascends about a quarter of a mile from the village. 'Mossroddick' is probably 'Roderick's Moss,' and, Sir Herbert Maxwell thinks, may be 'commemorative of Rydderch Hael, the Christian king who defeated the pagans A.D. 573 at Ardderyd (Arthuret), near Carlisle, and whose name survives in several places.' Mr Lang has described this sheet of water under a thin veil of anonymity in his book of *Angling Sketches*. Nobody, he says, had 'ever dreamed of fishing here; but one day a rustic, "glowering" idly over the wall of the adjacent road, saw fish rising. He mentioned his discovery to an angler, who is said to have caught some large trout; but tradition varies about everything except that the fish are very "dour." One evening in August, a warm, still evening, I happened to visit the tarn. As soon as the sun fell below the hills it was literally alive with large trout rising. . . . The fish were rising actually at our feet; but they seemed to move about very much, never or seldom rising twice exactly at the same place. The hypothesis was started that there were but few of them, and that they ran round and round, like a stage army, to give an appearance of multitude. But this appears improbable. What is certain was our utter inability ever to get a rise from the provoking creatures.'

Mossroddick is a fascinating place. It lies on the top of the ridge which divides the valley of the Ken from the Garple Glen. Looking westwards from it, one beholds the superb panorama of the Kells Hills, some of which on a still day will be mirrored in the water at one's feet. The eye rests upon first one glen and then another that winds down from these hills towards the Ken. On a clear, sunny day a white speck on the side of Millyea, above the Garroch Glen, indicates the shepherd's whitewashed cottage of the Clenrie. The wooded hills on the other side of the Ken fill the nearer view, and close under this standpoint, but hidden by the slope of the ridge, is the clachan. No sounds, however, rise from it to this moorland water. The grouse cries, the whaup wails, and

> Sometimes doth a leaping fish
> Send through the tarn a lonely cheer.

But for these, there is silence, unless it be the wind rustling the reeds and grasses. On hot, still summer days, when it is useless to fish, it is good to sit there with a book and look often at the glorious landscape. Then the loch, which includes the inverted images of the distant hills and of the clouds overhead, reminds one of St John's picture in the Apocalypse of the 'sea of glass mingled with fire.'

To the angling history of this water I am able to make a modest contribution, having fished it several times. Mr Lang's account of the ways of the fish tallies exactly with what I have observed. The hypothesis that they ran round and round the loch like a stage army in order presumably to tantalise fishers with a delusive appearance of numbers is an entertaining suggestion. Many moral and mental characteristics have been attributed to fish as well as to fishers; but Mr Lang must be the first to credit them even for a moment with the tricks of the stage. No doubt he is right in discarding the theory. The loch is really full of large fish, but they are very rarely caught.

I had visited the place several times and brought nothing away, or at best a solitary quarter-pounder. On these occasions my hopes had been raised often to a high pitch in consequence of an actual delusion which is characteristic of this loch. What can be more disgusting when one is fishing where there are large trout than to get an unquestionable rise, and pull ashore an infant perch? Those very young fish, measuring two or three inches, seem to be numerous here, and take the fly greedily, and boys from the village may be seen fishing for older examples of the species.

It was not until a brilliant afternoon in June that I had any better sport. One would have said that the day was too bright; but there was a good ripple on the water, and I fished on with the dogged perseverance which such a water demands.

I had covered all the water within easy reach of the shore without rising a fish. Later I began to cast a very long line towards the island which lies near the north side, when a fish rose to the tail-fly, which was a grouse-wing with red-and-tinsel body, and missed it. I cast again for the same spot, and the fish rose and missed again. I cast a third time, and immediately the fish's mouth had closed over the hook, and after two breathless minutes I had a magnificent trout of over a pound whacking the grass on the bank. Five minutes later I had another about the same size safely landed. These fish were of a startlingly brilliant colouring, and the flesh a rich pink. Late one evening, when it was dark and a drizzle of rain was falling, I hooked a heavy fish with a heather-moth, but after I had run him for a minute or two the grip gave way. On a fine August evening, exactly like that which Mr Lang describes, when the fish were rising at my feet in the same way, I cast among them an enormous hackle-fly designed for use on Loch Dee in very stormy weather. I threw it again and again where they could not fail to see it. I saw them rising within an inch or two of my lure, but they would not have anything to do with it. The strange thing is that they were not scared by it. When a trout sees something which is rather like, but not sufficiently like, what he is looking for, he usually retires from its neighbourhood. It might have been thought that the huge hackle was too unlike anything in that evening's menu to arouse uneasiness in this way but that eventually a great fish took hold of it in dead earnest, and my experiment was justified. The steep, grassy bank with its fringe of reeds is very awkward for landing fish, and I had not brought my net. As I was hesitating whether to pull the fish straight against the bank or lead him along to some more convenient point, the grip in this case also gave way, and my line lay loose on the water. That was one of those incidents which cast a gloom over one's whole future.

A much larger loch with a famous name, Lochinvar, lies three miles across the moor to the north-east. A few trees stand behind the gamekeeper's cottage on the west shore, but all the rest of the neighbourhood is bare, swelling moorland, in a great hollow of which is the loch. The country was at one time covered by a great forest, and the loch would look more beautiful then. Now it has the charm which belongs to all open moorland waters, and in legendary associations it is richer than most.

On a small island near the middle there once stood a castle belonging to the Gordons of Lochinvar, of which only a few stones remain. Causeways connected the island with the shore, and in a dry summer, when the loch has shrunk, one's boat sometimes grates on the submerged cobbles.

In the reign of Alexander III. a wild boar terrorised the neighbourhood, destroying both men and cattle. Its notoriety spread far and wide, and the king offered knighthood and an estate to the man who should bring him its head. The laird of Lochinvar waylaid and slew the beast. Tired out with the combat, he lay down to rest, after cutting out and pocketing the boar's tongue, and fell asleep beside its carcass. A man named Maxwell happened to ride past the place, and, seeing what had occurred, resolved to make the most of the situation. Having quietly cut off the boar's head, he galloped off towards the capital.

When Lochinvar awoke he was astonished to find the animal lying headless. Suspecting a trick to forestall him, he started from Lochinvar on his swiftest horse and hastened to Edinburgh. Maxwell was in the royal presence, and was presenting the boar's head.

'Wait, sire,' cried Lochinvar; 'the reward must be mine!'

'How so?' asked the confident Maxwell.

'Because I killed the boar.'

'How comes it that you have not the head?' asked the king.

'Because while I lay asleep after killing the boar this fellow came and cut off its head.'

'But how am I to decide the truth of the matter?'

'Let this decide!' cried Lochinvar, throwing down the boar's tongue.

'Open the tusks,' said the king to an attendant.

When the boar's mouth was opened it was found to be tongueless.

'If that tongue,' said Lochinvar, 'does not fit the head I claim no meed.'

When the tongue was found to fit the root the king admitted Lochinvar's claim, and asked how he had managed to overcome the boar.

'I thrust my stout sword into his mouth,' said Lochinvar, 'and *gored* him *down*.'

'And have you any surname?'

'None. I am Adam of Lochinvar.'

'Kneel down,' said Alexander; then, striking his sword on Lochinvar's shoulder, 'Rise, Sir Adam Gordown of Lochinvar! Be thy surname for the future Gordown.'

That is the story of the origin of the name Gordon and of the winning of the lands to the east of Lochinvar which the king transferred from Maxwell to the slayer of the boar. Lochinvar continued in the possession of the Gordon family until 1787, and no doubt they appreciated the merits of their loch. There is excellent fishing all round the island on which the castle stood, and it must have been possible to drop a baited hook from a window into the water with good hope of success—an agreeable diversion for an idle, rainy day. It is possible that 'the lost bride of Netherby' beguiled some of her leisure in this fashion.

Baited hooks, of course, are not allowed nowadays; no lure but the fly is permitted. Three young men from Northamptonshire who visited the loch recently ignored this regulation, and, having attached a quill to their line, proceeded to angle with a large worm. The gamekeeper detected them in the act

of doing battle with a trout which they had hooked. The tackle broke, and the gamekeeper stopped their fishing. The break had occurred above the quill, which was now careering along the surface of the loch. The gamekeeper took a boat and followed it. When he had secured it he netted a trout of five pounds.

The next year the three young men from Northamptonshire wrote to him offering a substantial bribe if he would allow them to pursue their favourite tactics. I am glad to say that they received a reply to the effect that he would not do so for five times the amount. Such young men should remain among their native streams and not desecrate the lochs of Galloway with their unholy wiles.

It is said that the former glory of Lochinvar has departed somewhat, and this is attributed to the raising of the loch, which was effected a few years ago to supply Dalry with water.

If large fish are not taken so often as formerly it is not because there are not any there. I recall a day on the loch in the month of April. I had elected to fish from the shore, while the two other members of the party took one of the boats. I observed that the only fly visible among the heather was a small one with blae wings and a black body. It happened that none of us had such a fly on his cast; and when, later, I joined the others in the boat, I told them what I had observed. We had had no sport so far, and one of my companions attached to his cast a fly answering exactly to the description I had given. As the boat came close to the shore at the end of the drift he found that his line was engaged with something. There had been no splash or apparent indication of a rise. He tried in vain to free his line, and concluded that one of the hooks had caught fast in a submerged log or a stone. The boat was now aground, and my friend was about to step ashore in order to wade in and save his cast, when suddenly there was a splash and a wild rush through the water, and the line was snapped, all in the twinkling of an eye.

The trout here are of splendid quality and remarkable gameness. A half-pounder will make as much fight as a pound fish in most lochs; and when, after a prolonged contest, a fish has been netted one is often surprised by his comparative smallness.

It is delightful to spend a long summer day drifting over this loch listening to the water lapping against the boat and the cries of moorfowl or the astonishing imitations of these cries which the gamekeeper's children make as they play about the house. Every time that one comes to the end of a northerly drift one catches a glimpse of the distant Kells range through a depression in the moor.

If the fish in the loch are not moving, some entertainment may be found in casting over the little stream which enters at the north end. As it gets near the loch it becomes a deep, very narrow, winding 'lane,' a term applied in some parts of the country to those parts of a stream where the water runs slow, smooth, and deep. Rushes and many weeds grow in it, and the broad leaves of the water-lily, both yellow and white, float on a great part of the surface. Here may be found brown burn-trout and occasionally a silvery vagrant from the loch. Casting is very delicate work, and if a fish is hooked it must be landed by methods that are rapid and crude. If it be given the opportunity to dart among the weeds the case is hopeless. The frequency of the rises, however, and the attendant risks may provide one with a very exhilarating hour.

Some miles from Lochinvar is what the initiated know to be the best of all Galloway lochs. It lies in the depths of a great stretch of undulating moor, and is fortunately difficult of access. A hill rises above it on one side, and along that side is a thin plantation of spruce-trees. These trees make a screen through which one gets one's first sight of the loch as one comes towards it. They are disappearing gradually under the assaults of winter storms, and I am afraid that some have been cut down recently for the making of a fence. Perhaps it was with some thought of such uses that they were planted; but when all have been laid low it will mean the loss of a very pleasing feature in the scene. A consolatory reflection is that it will be much easier to fish from that shore, and that there will be no danger, as there is at present, of having one's hooks 'skied.'

In a suitable wind a good part of the east side of the loch may be fished from the shore, but the wind is rarely suitable. If it is blowing in the direction in which one would naturally wish to cast—that is, at right angles to the shore—the steep bank protects the nearer water, so that all within reach may be quite calm, while a tantalising ripple begins just beyond. If a fish rises at the natural fly in the calm water, one may, of course, hook it by casting over it promptly; but the sport is likely to be better if one uses the boat. When I first visited the loch, nearly ten years ago, I found that the boat was much the largest that I had ever seen on such a water. It was very heavy to row and very unseaworthy. It was really an old sea-fishing boat which must have been bought second-hand. It seemed then that if it were not broken up it must fall to pieces very soon of itself. But year after year, when I have returned, I have found it still on the water, and used it with a feeling of distrust that deepens every season. One never thinks of the place without counting the character of the boat among the sporting features of the loch.

The fish are as much finer than the ordinary Lochleven trout as Lochleven trout excel those of the burn. Some sportsmen of wide experience with whom I have talked on the subject agree in this opinion. The fish are exquisitely tinted, and the flesh has an unusually delicate flavour. I believe this is due to a light-green weed of which the loch

is full. In some parts the weeds reach quite to the surface, and there are very few places where the tops are more than a foot or eighteen inches below. This means that when a trout is hooked there is great danger that he will wind the casting-line around the weeds and get free. The behaviour of the fish sometimes suggests that this is done as the result of a deliberate calculation. If the danger is to be avoided one must hurry him into the landing-net with what must seem to him rather indecent haste.

The perils and consequent excitement are greatly increased on a dark night, when the great fish are rising quietly all around, and one has to judge everything almost entirely by the sense of touch. I remember a warm night in the month of July when there was a gentle ripple on the loch. A splash was heard occasionally, a prolonged, heavy splash, which brought before the mind's eye the picture of a monster. But for the most part the evidences of the rise were those dimples on the surface which one could just detect or suspect, and which indicated that a large trout had just sucked his prey under. My companion was using Mr Pennell's loch-flies, and I had on my cast a single white moth. Our sport made that night unforgetable. For an hour or two, as we drifted slowly through the darkness before the light breeze, we caught fish continually. While one man was busy with a pounder, the other was crying out for the landing-net, and sometimes had to wait in a state bordering on frenzy until the net could be handed to him. Not only were the size, strength, and gameness of the fish to be reckoned with, but the weeds were always below to aid their escape. Our tackle, of course, was very strong. Otherwise, misadventures would have been much more numerous than they were. Then, when the boat reached the end of the loch, there was a feverish seizing of the oars that we might row back and begin another drift before the rise should end. A few of the fish we took were an ounce or two under the pound, but all the rest were larger. Happy is the angler who visits Loch G—— on such a night!

Sport, of course, is not always fast and furious here any more than elsewhere. There are days when the fish rise short; there are days when they do not rise at all. There are brilliant days when the loch lies in a dead calm. The fish may be rising, but one tries in vain to deceive them. But disappointing days do not discourage one from returning in the hope of repeating such experiences as I have just described.

This loch is unique, but there are others on the moor between Dalry and Moniaive where excellent sport may be had by those who have received permission to fish. These are approached in the first instance by a second-rate road which climbs eastwards from Dalry. The use of a bicycle is to be recommended strongly over all other means of transit. It can be left anywhere, stowed in the shed of some cottage or concealed among the heather. It does not, indeed, greatly expedite the uphill journey in the morning, but it is of very great use on the return. It has, moreover, the supreme advantage that, when you have reached your loch after a long tramp across the moor, you can fish with an easy mind, knowing that you do not risk having to tear yourself away just when the best sport of the day may be beginning, and that you can remain till midnight, or early morning, or the next day if you like.

THE HUMPBACK.

PART II.

IT was near noon when they sighted the cape that, from a distance, looks like a gigantic breakwater built by man, with its level top and perpendicular sides, seven miles in length and never a tenth of that in breadth. Several leagues north of the cave-riddled point the *Haakon* began to cruise in search of the hoped-for *Nordkaper*. Here and there, their white hulls gleaming in the sunshine, lay French schooners taking toll from the fishing-banks. These were the laggards, the less lucky, for the majority of the Dunkirk and other fleets had already sailed for home with full holds of salted cod, the reward of six months' toil and peril.

Kaptein Schrœder brought the *Haakon* within hailing distance of one of the schooners, and bawled his question.

Yes, the Franskmand skipper had seen whales that morning early. The whales had gone. He pointed to the nor'-east.

Schrœder knew that the Frenchman wanted the whaler far away from the banks, but he decided to try nor'-east, and accordingly the *Haakon's* course was shaped in that direction.

The hour of *middag* had come, and he went below to the usual repast of sweet soup, followed by salt-beef, followed by a second supply of sweet soup. The engineer joined him; the mate was still in the lookout, by his own desire, with which Schrœder had not sought to interfere.

'You think we may get a *Nordkaper*, kaptein?' remarked the engineer.

'It is only a chance. I intend to try for two days, and if nothing comes of it we shall go west again.'

'It is worth while trying,' said the engineer. 'What is the matter with Thorstein?' he asked later.

Kaptein Schrœder wiped a drop of syrup from his yellow beard. 'Matter with Thorstein?'

'*Ja.* Have you not noticed how strange he looks?'

The other shook his head. 'Thorstein is always a little queer.'

'But he looks as if he were afraid of something. I thought perhaps he had got notice to leave the *Haakon* at the end of the season. It would be a pity for him. I do not think any other whaler would have him for *styrmand* now.'

'Thorstein has not got notice,' said Schrœder. 'Maybe he is not very well; maybe he is troubled about his son. Do not ask him any questions, Keller. He does his work well, and we have no business with anything else.'

The cook came clattering down the narrow stairway and put his head into the cabin.

'*En hvalbaad kommer*, kaptein.'

Schrœder finished his meal hurriedly, and went on deck. Far ahead was a trail of smoke.

From the mast-head Thorstein was peering through a telescope. '*Ja.* It is a whaler,' he said at last, 'and with a dead whale, for it is coming slowly.'

The captain went into the steering-box and slightly altered the *Haakon's* course. In a little while he was able to distinguish the approaching whaler through his glasses. Her hull was green, and her funnel pinky-yellow with a broad black top. She was not making more than four knots.

'They have two great whales astern,' shouted the *styrmand*. 'It is one of the Vopnafjord boats. It is the *Snorri*.'

'Good!' cried Schrœder. 'I know the kaptein well, and will speak to him.'

Thorstein took another long look through his glass, and when he made his next report his voice was higher than usual. 'They have *two Nordkapers!*'

'*Saa!*' muttered Schrœder, and cursed softly. And he cursed again, though he grinned, when his friend on the *Snorri*, beaming with satisfaction, informed him that he had been hunting the two whales for more than a day, and had killed both within two hours of each other. For the *Nordkaper* usually succumbs easily to the bomb-harpoon, and, moreover, does not sink when death takes him.

'It is good luck for our last trip of the season,' bellowed the Vopnafjord man gleefully. 'I suppose I shall see you in Tönsberg soon. I leave Island next week.'

'Are you not going after more *Nordkapers* when you have got these two to the station?'

'There are no more *Nordkapers*, my good Schrœder. There were but two, and I killed them both;' and the speaker roared with laughter.

Kaptein Schrœder bawled a friendly enough farewell, waved his hand, and gave the order for full speed. He believed his friend, and the disappointment was a heavy blow. It had been a wild-goose chase.

He altered the course to west, and descended to the deck, where he walked up and down for half-an-hour, casting many a disgusted glance at the dead *sejhval* wallowing alongside. It was indeed galling. Two great *Nordkapers*—and he had been a few hours too late. And the weather was not looking so well. Away in the north-west the horizon had taken on a brownish hue. In all probability he would reach the neighbourhood of the ice, only to get fog-bound. He went forward and climbed up the rigging.

Thorstein, peering over the edge of the barrel, did not take his gaze from the sea.

'You see I am going to the ice,' said Schrœder.

'*Ja*, kaptein.'

Schrœder looked over his shoulder. He could still perceive Langanaes, or at any rate the mountains beyond it.

'Where is your *knöl?*' he asked roughly.

A strange expression came into the mate's countenance, but he did not reply.

Schrœder, hanging on to the rigging, continued to search the water around him. All at once he made a quick movement and seemed about to speak, but checked himself.

Five minutes passed, and then he made another quick movement, while a savage look disfigured his good-natured features.

'Man! are you blind?' he exclaimed, gripping Thorstein's shoulder and shaking it. 'What is that yonder?' He relaxed his grasp on the mate and pointed.

Half a mile off the starboard bow a shining black and rounded object rose above the surface. Thorstein, as if unwillingly, turned his eyes to it. It disappeared.

'Are you blind? With my own eyes I saw him rise—twice. You fool! You have not been watching.'

'I have been watching, kaptein. He was only a very small *sejhval*.' The speaker was trembling.

'You lie! It was the head of a great'—— Schrœder stopped short.

The sea appeared to burst open, and a monstrous, unwieldy-looking, dripping creature, bearing a small hump in place of a dorsal, and gigantic pectorals, shot clear above the surface, and fell back with an amazing crash amid fountains of foam.

'*Hval! hval!*' yelled Schrœder at the top of his voice, and the crew hurried to their posts. Then he turned to Thorstein. 'So,' he said wrathfully, 'you would cheat me because of a crazy dream. You would cheat me of the greatest *knölhval* I have ever seen. Go on deck, and keep out of my way. Go to your bunk, you that are afraid of a *knöl*'——

'Kaptein'——

'I have no more to do with you. Only keep out of my way. Ugh!'

And Kaptein Schrœder descended rapidly to the deck, where he immediately selected a man to take Thorstein's place. Next he gave instructions for

letting the *sjöval* go adrift with a flag stuck in it.

Thorstein on reaching the deck looked appealingly in his captain's direction, but, being utterly ignored, went dejectedly aft.

The *knölhval*—or humpback, to use a more familiar name—continued to gambol in his ungainly ways while the *Haakon* drew near him. He rolled about at the surface, exhibiting his tremendous 'wings;' he stood upright in his element, poking his warty head above water; he made unexpected rushes here and there; and once more he hurled his hundred tons of bone, flesh, and blubber into the air.

'The greatest *knöl* I have ever seen,' said Schrœder to himself as he screwed a grenade on the harpoon. 'After all, I shall please them at the station tomorrow. Forty barrels will not be so bad.'

But he did not sing as he usually did while preparing for action. The thought of the mate's deception rankled. Besides, he missed the mate's assistance. The man now in the crow's-nest would do his best, but his experience was small.

However, Kaptein Schrœder hoped to fire a good first shot which would make the struggle a brief one. And certainly the humpback did his best to make it so, for, after a little more play, he came leisurely to meet the *Haakon*. Perhaps her bluish-gray bottom deceived him into thinking her a friend.

Schrœder held up his hand for 'stop.' As the *Haakon* lay, the humpback, if he continued his course, would cross her bows.

But suddenly the propeller-like motion of his flukes ceased; it appeared as if he were gathering himself together for another rush or a downward plunge.

Believing that he was going to sound, the gunner took a quick aim and pressed the trigger.

It was a long shot, and not a very good one. It struck too far abaft the flipper; and though a muffled thump, as the mighty tail flew up, told that the grenade had duly exploded, Schrœder knew that death was still far away.

The cable ran out spasmodically till its length was almost exhausted, when the winch brakes were applied, and the *Haakon* began to forge slowly ahead. Ere long the humpback appeared at the surface, roaring and grunting, and struggling frightfully to free himself, rolling to and fro, lashing about his flukes, and broaching half out of the water—an agony shocking and sickening for any man save a whaleman to witness. Then he took to 'bolting,' making violent diagonal rushes; till, finding that also vain, he set off at a little distance beneath the surface, towing the *Haakon* at several miles an hour.

Meanwhile the gun had been reloaded, and when the pace of the humpback began to slacken the winch was set going, and cautiously the cable was reeled in until once more the *Haakon* was within shooting distance.

Yet again the luck was against the gunner. His shot was a good one, but the bomb failed to explode. And the *knöl* sounded so violently that the first cable—the winch-man having let go an instant too late—parted with a loud snap close to the bow, while the *Haakon* quivered to her sternpost.

An hour passed, during which the *knöl* repeated his frantic efforts for freedom, and then came an opportunity for a third shot. As he stood by the gun Kaptein Schrœder threw an uneasy glance around him. A change in the weather was imminent. Bluish-black clouds were swiftly gathering, and the sun was already obscured. A breeze, light but very bitter, ruffled the gray ocean, and the ice-fog had changed to white and seemed nearer. A flake of snow fell on the red gun.

The winch clanked, and the *Haakon* forged towards the whale, now lying almost motionless. But when the bolt struck him he was off again, like a runner who has got his second wind. Yet it was a deadly shot, and a smaller whale would have died speedily. With three harpoons in him and two cables behind him, however, his spurt was of short duration. Within a few minutes he was up again, spouting crimson and roaring through his blow-holes.

'He dies!' said Kaptein Schrœder with a grunt of relief.

'*Nei*, kaptein. He dies not yet.'

The skipper wheeled round. 'Get away!' he snapped.

Thorstein's pallid face flushed momentarily, and he stepped from the gun-platform, but did not go far aft.

The captain signed to the men at the winches to wind in. They had not proceeded far when the humpback seemed to revive and resumed his struggles.

'Another harpoon—quick!' cried Schrœder, sponging out the gun, and nodding to the winchmen to continue winding. He shouted for half-speed ahead.

From his pocket he took a small cotton bag containing a charge of powder, rammed it home in the gun, and followed it up with a wad. Four minutes later the slotted shaft of the harpoon filled the barrel, the bomb was affixed, the Krupp's screw for firing the charge was adjusted, and all was prepared. This time no cable was attached to the harpoon.

Crash! went the gun at close quarters, and the muffled echo followed.

'*Now* he dies!'

'*Nei*, kaptein, he dies not yet. Kaptein, I will give you every kroner I have if you will let him go. Kaptein!'

'You fool! What do you mean?'

Thorstein hung his head. Every man on deck was staring at him.

'Go aft!' commanded Schrœder.

The mate hesitated, and then walked slowly away.

'He dies!' said Schrœder to the men. 'See, it is the flurry!'

The humpback was beating the water into scarlet froth. Presently he lay still, but he was not dead. He did not turn on his side, nor did he sink. Internally he must have been an awful ruin. Yet he lived.

The captain went to the galley and drank a cup of scalding coffee. Many whales had he killed; some had died quickly, others slowly. But none save one great cachalot had received four shots—three of them good—and yet clung to the ghost like this *knölhval*.

He returned to the platform in thickly falling snow. 'Now he dies! Bring me a lance.'

The winches were started, and soon the humpback was lying under the port bow. Now and then a shudder passed over the monstrous bulk; the tail-flukes moved feebly.

'*Now* he dies!'

Steadying himself against a stay, Schrœder grasped the long lance-pole with both hands and raised it preparatory to plunging the point through blubber and flesh into the mighty heart beneath him.

But the blow did not fall. In the twinkling of an eye the humpback's tail flew up, and came down with a shivering smash against the *Haakon's* hull.

'Full speed astern!' and back went the *Haakon* with a couple of her plates—upper ones, fortunately—badly started.

The whale rolled from side to side a dozen times, and lay still.

'Lower away the *pram*,' ordered Schrœder, cursing the snow and the freshening wind—and the dead *sejhval*, which was now nowhere to be seen.

The small double-bowed boat was soon lying alongside.

Schrœder chose a couple of men to go with him, and they dropped into the *pram*. He was about to follow when Thorstein gripped his arm. The *styrmand's* face was working terribly. 'Let me go. Let me lance him, kaptein,' he gasped.

'*Nei, nei!*' came the impatient answer.

'Kaptein, let me go. I have been a fool—I am sorry—I ask pardon. Let me go. I want revenge on the *knöl* that made me foolish.'

Schrœder pushed him aside, but again his arm was gripped.

'Kaptein, I will never ask another favour. I will leave your sight when you ask me. But let me go to lance this *knöl*. If—if you do not, I shall be a shamed man—a coward—all my days. My son will mock me.'

The captain was touched. 'You are not fit to lance a whale, Thorstein,' he said. 'I cannot'——

'I have lanced many whales. I have never made a mistake. What can I say, kaptein? You are a brave man. You must understand. Shall I go down on my knees to you? Let me go to lance this *knöl*. Then—then shall I dream no more foolish dreams; no more shall I deceive my good kaptein. Let me go.'

Schrœder wavered. 'Are you sure you can do it?'

'You will see!—you will see! Behold my hands! They are steady now! The madness has left me. And afterwards you, my kaptein, will tell my son that I did well. Let me go.'

Schrœder gave in.

With a ghastly smile Thorstein went over the side. As the boat was rowed towards the whale, which now lay quiet, seemingly exhausted, he waved his hand.

The captain would fain have called him back. He told two men to be ready with the second small boat in case of emergencies.

The rowers, with their oars poised for dipping, waited breathlessly for the final assault.

Thorstein stood erect, grasping the lance, as brave a figure of a man as ever faced death, knowing it to be death.

The whale scarcely moved.

Thorstein marked the vital spot with his eye, drew a deep breath, and drove in the lance. The *knöl* rolled over, away from the boat, the huge, fringed, pectoral fin, with its reach of some fourteen feet, waving stiffly aloft.

'Pull!'

An oar snapped. Back rolled the *knöl*, and down came the huge pectoral, a ton of bone and muscle. Men and boat disappeared.

The *Haakon* went back to Sigluefjord with her captures, but with her flag half-mast. She carried three dead men—dead men, cruelly broken and bruised. The living were ready to testify that the tragedy had been nobody's fault—an accident that might have happened to any whalemen.

It was some time before Kaptein Schrœder could talk about it, and it was not until the following year that he fully realised what had happened. He had gone one day to visit the widow and her son, for whom he had done many kindnesses since the disaster.

'It is strange,' said the widow just before he left—'it is strange that Thorstein did not dream of what was going to happen. I have been thinking of it all the winter. For he dreamed of it before our little daughter died; and he dreamed of it before our son fell from the cliff. Perhaps he could dream only of the evil that would happen to others that he loved. He loved not so many people. But myself and his children he loved; and you also, kaptein—you also.'

And Kaptein Schrœder, as he stood that night in the steering-box, waiting for a strange mate to relieve him, recalled certain words of his old *styrmand*: 'When it is well with you, kaptein, it is well with me.' And, perhaps, also—though he was no dreamer—he heard the sound of a heart weeping.

THE END.

THE MONTH: SCIENCE AND ARTS.

SIMPLE TEST TO DETERMINE ADULTERATED BUTTER.

ALTHOUGH paternal legislation, in order to protect the housewife from fraudulent practices, insists that butter which is not made wholly from milk must not be sold under this designation, the commodity is yet considerably adulterated. This result is to a considerable extent attributable to the fact that the greater proportion of our supplies of this article are of foreign origin. The favourite method of adulteration is the combination of other fats with the genuine substance, and so clever are the processes of the faker that it is extremely difficult for the imposition to be discovered. Yet there is a very simple method readily available, by means of which the base constituents can be easily detected. Take a tablespoon and place a small sample of the butter therein, afterwards holding the spoon over a hot flame such as that of a lamp or gas-jet, so that the butter can be boiled briskly. After boiling has commenced, stir the melted contents with a small piece of wood. If the article is genuine butter a mass of foam is produced, and the boiling is unattended with much noise; but if the article be adulterated it will sputter violently and very little foam will be observed. It is a simple and infallible test—one in which the absence of considerable froth should result in the article being regarded as spurious. The good housewife probably has very little idea of the extent to which she is defrauded, the despicable practice being more in vogue at those periods when fresh butter rises in price. Then the native dairyman is guilty of 'manufacture,' since, finding the genuine article so expensive, he sets to work to reap a little enhanced profit by purchasing the cheaper grades of butter and 'working it up' in general appearance so as to mislead his customers. While the fats used in the faked substance are practically identical chemically with those in genuine butter, there is a vast difference in their nitrogenous qualities, and this is where the real danger lies, for the pure edible possesses high nutritive qualities.

NEW SYSTEM OF PACKING PORTMANTEAUS.

Who has not experienced the exasperating difficulties attending the packing of a portmanteau, and how many are there sufficiently expert to compress the maximum of desired clothing in the minimum of space? Also, who has not suffered from the troubles incidental to the hasty search of some particular unit of clothing in a packed trunk? By means of an ingenious system recently introduced, however, all these worries are now overcome. The trunk, whether it be the small 'grip' packed for a week-end visit or the cumbersome article carrying the requirements for a long holiday, is divided into a series of trays. Each of these is destined to accommodate certain articles, which are held firmly therein by means of straps. The articles are thus merely packed methodically, the trays placed in the trunk one above the other, and the whole strapped up. When one desires a certain article, instead of rummaging throughout the whole portmanteau, one simply removes the trays with their contents until that containing the object of the quest is found. There is no disturbance of the other contents, the trays being simply replaced intact, so that the trunk is always kept in a tidy condition. The trays are very thin but strongly built, and will safely defy the efforts of even the relentless trunk-smashers of America. Even my lady's hats, which under present circumstances occasion considerable anxiety as to their condition, need suffer no derangement. There is a special cage for their accommodation, the headgear being secured to the sides of the cage by means of hat-pins, which hold them more firmly in position in the trunk than when secured to madame's coiffure.

AERONAUTICAL EXHIBITION IN GERMANY.

Now that the problem of human flight is so much in the air, great interest is being centred in the international aeronautical exhibition at Frankfurt-on-Main, beginning in July. A huge hall some four hundred and twenty-six feet in length by two hundred and thirteen feet in diameter has been erected at a cost of three hundred thousand pounds to harbour the monstrous creations of various inventors in the full panoply of inflation. In addition, other spacious sheds are individually available for such exhibits as the Zeppelin, Parseval, and other wonderful aerostats. A level stretch of ground has been obtained for trial flights, and a large supply of hydrogen prepared by a new process is laid on for inflation. There are pavilions for carrying out experiments in air-resistance and other problems incidental to aviation, as well as one devoted to the question of the most suitable attire for women. Those interested in the subject will have the opportunity of seeing the original Wright machine flying side by side with the latest production of those enterprising experimenters, and the irrepressible 'side-show' comprises a spirited battle between naval and aerial men-of-war decided in a special recreation-park. Other nations have held their own aerial exhibitions, but that in Germany is the most ambitious project of this nature which has yet been attempted.

A SIMPLE ICE-MAKING MACHINE.

At this period of the year there is a widespread demand for small quantities of ice for various purposes, such as icing drinks, the production of ice-creams, and the cooling or preservation of other

delicacies. One of the simplest of the devices for this class of work is that known as the Raplin, which has recently been perfected. This machine is constructed on the principle that water will freeze when rapidly evaporated by means of a vacuum pump and a powerful absorbent such as sulphuric acid. It is simple in design, contains few integral parts, so that liability to derangement is rendered very remote, and can be operated by any one of average intelligence. A carafe of water will freeze in three minutes or a solid pound-block of ice be made in about twenty minutes. Vacuumising is effected by means of a hand-wheel, or the machine can be worked by power if desired. The advantage of this handy little machine is that ice can be made anywhere and at any time, irrespective of the prevailing temperature, so that there is no loss arising from melting. Owing to its small dimensions, it can be conveniently stowed in a very small space; while the fact that no expensive chemicals for producing the freezing effects are required is a distinct characteristic. The cost of manufacture is merely dependent upon the expense of the absorbent, and sulphuric acid is always readily obtainable and at a low figure. One charge of acid (two quarts) is sufficient for from fifty to one hundred freezing operations, and approximately three pounds of solid ice can be made with each pound of acid. No danger need be entertained in regard to the safety of the machine, and so long as the simple instructions are followed failure is impossible. These machines have been subjected to severe tests in tropical countries, and their complete success in such climes testifies to the soundness and practicability of the principle adopted in their design.

AN INGENIOUS TYPE OF TIN.

For some time past considerable enterprise has been exercised by those engaged in industries where the product of their labour has to be packed in tins in superseding the old-fashioned hermetically sealed vessel. These are extremely dangerous to open, as a slip of the cutter will often produce an ugly and dangerous wound by the flesh coming into contact with the jagged edge of the cut metal. The lever-lid tin overcame this serious disadvantage, but it was far from perfect. Recently, however, a distinct improvement has been effected which overcomes the foregoing defects in a marked degree. The top edge of the tin, instead of being left raw, is properly finished by false wiring, so that it presents a smooth, clean surface, which may be handled without any fear of a wound being inflicted. The result of the development is that not only is a much stronger tin produced without any increase in the weight of the metal, but the mouth, being the full circumference and having no inside ledge, can be more easily filled and the contents more completely extracted. This ensures that there will be no waste. Again, a spring clip-on handle is provided, gripping the top and bottom edges of the opened tin, so that it is converted into a mug. In cases where the vessel is filled with such substances as paint and so forth, and there is no need to discharge the contents, it can be handled and carried about with as much facility as the ordinary pot, being sealed whenever desired merely by slipping in the lid, which forms an air and liquid tight joint. Or if the tin has been filled with something which can be cleanly emptied out, such as fruit, it will when empty prove a serviceable article, with its handy clip-handle, and be available for a large variety of purposes.

NEW DEVELOPMENT IN PLATE CAMERAS.

Though the great majority of amateur photographers have fallen victims to the handy and convenient roll-film camera, there are still a large number who yet adhere to their first love—the glass plate equipment. But the glass plates are bulky, heavy, and require to be handled with extreme care owing to their inherently fragile nature. Such enthusiasts will thus welcome the latest development, since it ensures their being placed on a level footing with the roll-film fiend, inasmuch as the glass plates are dispensed with. Instead, the camera is fitted with a special and simple adapter, into which can be slipped a pack of twelve flat films contained in a cardboard case. The principle of their use is the same as under the older system. The pack is slipped into the adapter. From one of its ends project a number of tabs, each of which corresponds to one of the twelve films within. When all is ready for exposure, the outer tab, which is that of the safety cover to the pack, is pulled out to the limit of its travel and torn off, leaving the surface of the first film free. Then the slide of the adapter is withdrawn similarly to the extent of its movement, as in the case of the old dark slide. The film is ready for exposure. After this operation, and when the slide of the adapter has been reclosed, the tab marked '1' is pulled out until a red line appears. The paper is torn off along this line, and then all is ready for the next exposure, since while the paper is being pulled out the exposed film is drawn simultaneously from its front position to the back of the pack. There is one of these shields between each successive film, so that the latter is protected from the light while that immediately in front of it is undergoing exposure. When the whole of the exposures have been made, a fresh pack of twelve films may be inserted in open daylight, the adapter working on the well-known book-principle of the old glass slide. The advantages of the idea are obvious. It dispenses with a bulky parcel of slides, and the packs of films can be stowed in the pocket without inconvenience. An idea of the saving in space and weight effected by this invention is obtained from the fact that twelve quarter-plate glass plates weigh four times as much as one twelve-film pack, and occupy three times as much space, irrespective of the dark slides, of which six would have to be carried to secure twelve exposures. The invention is one of

the most ingenious that has been introduced into photographic circles since the advent of the roll-film, and removes the greatest disability under which the glass plate advocate has laboured in comparison with his more fortunate *confrère*.

NOVEL ATTACHMENT TO THE TELEPHONE.

The telephone is undoubtedly one of the greatest time-savers in connection with commercial transactions, but its utility is often negatived by the absence of facilities to take down a message when requisite. Then there is a wild scramble for any handy piece of paper, which often is subsequently mislaid. To overcome this a handy little desk has been devised. It carries a continuous roll of paper, the end of which, coming under a guide-bar, presents a smooth, flat writing surface upon the deck of the attachment. The whole is so small that it comfortably fits upon the telephone-desk, and one can write down a message as it is received without the slightest inconvenience. When the message has been committed to paper it is only necessary to tear the paper off at the guide-bar at the bottom of the desk, and a new, clean, flat area of paper is presented ready for the next call. This little desk is one of those simple devices which serve to systematise business, since it is always at hand and is applicable to either a wall or pedestal instrument with equal facility.

INGENIOUS DRY CISTERN.

Though the authorities entrusted with the hygienic welfare of the community are naturally chary of considering new ideas in view of the well-tried efficiency of the existing facilities, favourable consideration has been bestowed by such officials upon the new dry cistern that has recently been devised. As its name implies, the cistern is normally empty, only being filled with water when the flush is pulled. In general appearance it does not differ materially from the orthodox equipment, there being the counterweight, float-ball, valve to inlet, siphon to outlet, and lever action. In pulling the flush the lever is caused to descend, lifting the counterweight. In so doing, a pawl is lowered to a point below a projecting tooth on the valve action. When the pull is released and the lever returns upwards it causes this pawl to engage with the tooth on the valve action, so that the inlet is opened and the water rushes into the cistern from the main. The float-ball now comes into action in keeping this valve open, and the water continues to flow into the cistern until the siphon commences to permit its escape. The escape being in excess of the inflow, the float-ball must descend, the pawl disengaging from the water inlet valve just as siphoning commences, and returning to its original position. Consequently the inlet is cut off and the cistern empties, remaining dry until flushing is again required. The advantages of the system are obvious. The cistern being empty, the troubles of cistern-freezing are obviated, the flush is certain under all and varying conditions (as the pawl must work as the operating lever is lowered under the pull), corrosion is entirely eliminated, and flushing is unaccompanied by the loud noise so disconcerting in existing appliances. The engineers of the London Water Board submitted the invention to exacting tests, and were so impressed with its advantages that they extended their approval to the idea, and now its introduction is being advocated in all directions. Another important point which should not be overlooked is that the float-ball cannot possibly become waterlogged. There is an entire absence of that sudden movement or shock which tends to disorganise the action of the mechanism. It is ingenuity such as this, carried out on sound mechanical lines, that contributes so materially to the efficiency of our sanitary systems, and relieves the householder of exasperating and often serious difficulties.

A NEW GLASS-POLISHER.

One of the little worries incidental to domestic and commercial life is the polishing of glass. While the old water and chamois-leather cleaning system holds extensive sway owing to its efficiency, still it is laborious and slow. Recently an excellent glass-cleaning medium has been evolved which should earn the approval of all to whom a bright, silvery polish on glass appeals. It is a liquid applied to the surface by means of a dry rag. It is extremely volatile, drying on the glass almost as rapidly as it is applied. The only other operation is light polishing with a dry rag, not laborious, heavy friction, as is essential to leather-polishing. Under the influence of the secret medium, all dirt and grease on the glass vanish as if by magic, and a brilliant gloss similar to that produced by continued application of powdered French chalk is obtained. One great advantage is that no smears are left, and when it is applied to mirrors the resultant gloss is similar to a bright metallic lustre. The cleanser is cheap and economical in use, and its constituents are such that no damage is inflicted upon surrounding surfaces.

THE DUKE OF WELLINGTON'S SPANISH ESTATE.

A recent visitor has described the Duke of Wellington's estate of La Torre del Molino del Rey, situated a few miles from Granada, near the small railway station of Illora. It was presented to the grandfather of the present owner by the Spanish nation as a token of gratitude after the close of the Peninsular war. The estate comprises nearly twenty thousand acres, a large proportion of which consists of rich *vega* lands, leased out to small farmers. The poorer lands on the hillsides are worked under the direct management of Mr M. J. Mostyn, olive-culture being the most important branch on land which cannot be irrigated. There are thirty-six thousand olive-trees, mostly of the *tempranillo* variety, on the estate. Eighty trees are planted to a Spanish acre. The olive is considered the most profitable crop for the poorer lands of the estate. Where irrigation is not possible, provision

is made for the retention of as much of the rainfall as possible by working the ground into a sort of semi-lunar dam on the lower side of the tree. This small mound is demolished and levelled at the second cultivation. A well-equipped olive-mill, fitted recently with the most modern machinery, deals with the produce of the *olivar*. The vineyard, about fifty or sixty acres in extent, is well planted and thoroughly cultivated. Before being planted, the vineyard was subsoiled three feet deep by hand-labour at a cost of nearly forty pounds per acre. It is situated on the low hills near the sides of the *vega*. The soil is marly and somewhat gravelly; in places it is very limy, some portions proving on analysis to contain as much as 60 per cent. of carbonate of lime. The vines are hand-cultivated, and vineyard labourers are here only paid one shilling and threepence per day, and provide their own food. The variety grown is exclusively the Pedro Ximenes, which here produces a very fair white wine, selling locally when a few months old at about eightpence a gallon. The wine, so far as crushing and pressing are concerned, is made in much the same way as the dry white wines of Australia.

ELECTRICITY IN AGRICULTURE.

The science of applying electricity to plants upon a large scale to stimulate their growth has received a decided impetus from the recent experiments of Sir Oliver Lodge, F.R.S., at the Bitton nurseries of Mr J. E. Newman. It may be remembered that the late Mr Thwaite carried out some investigations in this direction at the glass-houses of the Royal Botanical Society in London. The Gloucester investigations, however, were carried out upon a far more comprehensive basis. Fields of corn, strawberries, and other produce were treated. A network of electric wires was distributed over the fields, strung on posts disposed one to about every acre, and just high enough to afford sufficient clearance to wagons loaded with produce beneath. Current was furnished from a small oil-engine and dynamo, and transformed up to a pressure of about one hundred thousand volts. The negative wire is taken direct to earth, and the positive to the overhead wire network. A tremendous leakage results, which produces a stimulating effect upon the growth of the crops beneath. The current is supplied in accordance with a determined plan. In the 1906 season current was furnished for 621·75 hours spread over ninety days. The effect of electrification was an increase of 30 and 40 per cent. respectively in the yield from the plots so treated in comparison with another field where, although precisely the same conditions prevailed, electrification was not resorted to. In 1907 current was supplied for one thousand and fourteen hours on one hundred and fifteen days, the increase in yield again being 29 per cent. as compared with the unelectrified field, the crop representing 41·4 and 32 bushels per acre respectively. The electrified wheat was found to be brighter, and, moreover, realised prices some 7½ per cent. higher than the ordinary corn, several millers in baking-tests finding that it produced a better flour. The beneficial effects secured in regard to other products were equally striking, the augmentation in the case of mangolds being estimated at 25 per cent., with a corresponding increase in the sugar. Raspberries, tomatoes, and strawberries showed equal improvement under the influence of the current. The experiments are to be continued, and from the results so far obtained it is obvious that the utilisation of electrical propagation upon an extensive scale offers a ready means to the farmer for the increase of the yield from his land. It opens up new possibilities in farming, and once the fact is sufficiently appreciated we may look for the design and supply of inexpensive and substantially built electrical plants suitable for this industry.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

A SUMMER EVENING.

A RUSTIC bench against the setting sun,
My favourite retreat as day is done,
When saffron tints illume the golden west,
And Nature's world is sinking to its rest.

The swifts are busy feeding up on high;
Below, the swallows batten as they fly;
And overhead, to brooding mate, apart,
A loving thrush is singing out its heart.

Under the eaves the martins' callow brood
Is peeping out all eager for its food;
A timorous rabbit ventures out to play,
Espies me—hesitates, then scuds away.

To sylvan cote the cushats turn their flight,
The rooks are chattering their last good-night
Up in the elms, beneath whose leafy sway
A babbling brook goes murmuring on its way.

Now falls the dew, faded the western glow,
A bat steals forth and flitters to and fro;
An amorous glowworm lights her signal-lamp,
And all around is growing chill and damp;
Save that the owls their dusky vigil keep,
All notes are hushed. The feathered world's asleep.

J. T. JOHNSTON.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE SECRET OF THE SEBHAH.

By ALFRED COLBECK, Author of *The Dyserth Diamond*, &c.

CHAPTER I.

'LOT one hundred and fifty-six,' called out the auctioneer.—'Hold it up, John, and let the people see it.—Now, ladies and gentlemen, what shall I say for this? Come! give me a bid. The article is quite unique, and would suitably adorn a fashionable drawing-room.'

'A museum more likely,' remarked one of the company.

'Well, a museum,' consented the auctioneer. 'Will any generous person purchase it and present it to a museum? It must be sold. Shall I say thirty shillings for it?' and he glanced inquisitively round the audience.

'What is it?' asked a voice at the back of the room, and not without reason, for the article was certainly peculiar.

'A rosary, I think,' said the auctioneer, taking it from the hands of his assistant and scanning it through the glass. 'The beads are of wood, hard and smooth and neatly polished, divided by three larger beads of jet, or what looks like jet, and strung together upon a chain of white metal—silver doubtless. Yes, it must be silver, tarnished by age;' and he displayed the curiosity to the audience.

It had the appearance of a rosary. It was mounted upon a piece of thin board, to which the silver links were skilfully pinned by tiny staples. It lay within a square, sunken frame, apparently of old oak, the necessary depth having been obtained by the insertion under the inner edge of the frame of a heavy gilt beading. A sheet of glass covered it. There were rings at the back of the frame for hanging it like a picture. Indeed, it was a picture, with the triple round of beads in place of a painting, and in the centre, surrounded by the beads, on a slip of faded paper pasted to the board, certain dim characters in Arabic which neither the auctioneer nor any of the company was competent to decipher.

A young man, clean shaven, slim, alert, with a quickness of intelligence in striking contrast with the heavy, bucolic countenances about him, glanced at the auctioneer and nodded slightly. He was standing apart in the shadow of an angle between the window and a recess. He had already purchased freely, and yet his voice was seldom heard. The bids came in almost imperceptible signs, as if he were wishful to avoid observation. There was evidently an understanding between the salesman and himself.

'Thank you! One pound is bid for it,' for the slight nod meant a simple sovereign, and not the thirty shillings previously mentioned. 'One pound for the antique! One pound for the reliquary! One pound for the beads! Any advance upon one pound?' and he swept the audience for a second bid, but they stared at him with a sheep-like silence, and as unconcerned in the curious article as if they had been a flock of sheep and not a company of thinking men and women. 'Going for one pound! Going! Gone!' The little hammer clicked on the mahogany, and he passed on to the next lot.

It was the tag-end of the sale. The more substantial articles had been disposed of, and only the odds and ends remained. The interest of the audience was slackening. Many had left, and others were preparing to leave. But the young man who had bought the rosary, if rosary it were, stayed on.

The people overflowed in the hall and corridors, and explored with inquisitive eyes the almost denuded rooms. Outside, the lovely lawn was trampled by the heedless crowd. Bushes were broken. The wheels of numerous vehicles had worn ruts in the sand-covered drive. There was the rattle of harness, the click and pad of horses' feet, and men shouting farewells. Flanking it all was the façade of the old-fashioned manor-house, a long, low building with a partially trellised front, up which the scented roses, white and yellow and

[*All Rights Reserved.*]

crimson, were climbing, and with French windows opening on the lawn; and over it all was the peaceful evening sunshine, flecking it with shadows and sifting its rays in golden glories through the foliage of the tall elms, as if there were no tragedy in that sordid sale, and the morrow would creep on to find it but a dream.

The tragedy was hidden away in one of the secluded bedrooms. The door was closed, and outside it, with a grim face, marred by traces of bitter tears, but with a certain haughtiness nevertheless, an old servant stood guard like a female dragon, and warned off all who had the temerity to trespass in that direction. Inside, dimly aware of the babel, and smarting beneath it as if the sounds were lashes, two women bent, the elder in a chair, leaning over the younger, whose head was in the former's lap, while her body was crouched upon the floor. The picture was pathetic. The elder, still in middle life, was softly weeping; the younger, in the slimness of her budding womanhood, rested with closed eyes and a proud but calm face, tearless, and resigned to the inevitable.

'It is nearly over now,' remarked the mother.

'Like a nightmare,' said her daughter, with her eyes still closed; 'but the results will remain. I shall be glad when the time comes to leave it all behind us—glad, and yet sorry. We must make a new home, mother, in another place.'

'Oh dear!' exclaimed the mother under her breath. The idea of making a new home did not appeal to her. She had come to the manor-house a bride, and her happy wedded life had been spent there. As the wife of Cyril Denholme she had enjoyed the easy social consideration of the neighbourhood. As his widow she had unexpectedly passed into an appalling eclipse. To the surprise of all, and more than all to the surprise of his widow, he had died a bankrupt. Money was due everywhere, and when everything was sold there would not be enough to pay. From a specious competence she and her daughter were plunged into actual need. The severance from the manor-house and all its associations would not be so keen for her daughter; or perhaps Christine's young, fresh life, with its outlook on the future, would better enable her to bear it. Her own eyes were in the past. Yes, it would be easier for her daughter to make a new home. So the mother thought but did not say; she only repeated, 'Oh dear!' and continued querulously, 'Why did he die without telling me? He ought to have provided for us, Christine, and not left us in a difficulty like this.'

'Hush, mother!' Christine opened her eyes and spoke in a whisper. 'He was taken suddenly, and he did his best. We must not grieve him by refusing to do ours. He will expect it.'

This singular manner of speech, which since her father's death Christine had naturally adopted—a manner which implied the continuance and nearness of his personality—never failed to impress and subdue Mrs Denholme. It had the same effect now.

'It seemed a little unkind, dear—don't you think so?' said the mother, passing on to another topic—'not to accept Mr Lea's offer of hospitality. We should have been out of the turmoil then. One's ears would not have been assailed by these distressing sounds.'

'Not unkind, I hope,' returned Christine. 'We should have had to return, mother, to a nearly empty house. The litter of the sale would have met us, and that would have been quite as distressing as the noises.'

'Perhaps it would,' she assented, 'unless the hospitality had been extended to several days. Then the litter would have been cleared away. It was very good of him to ask us, and if we had gone we might have stayed.'

'Mother!' exclaimed Christine reproachfully, and reddening. 'We couldn't have stayed! How could we?'

'My pride has received a shock, dear. I am older than you, and more dependent; and I think I should have welcomed his house as a temporary refuge—at least, until our affairs are settled and we know what we are going to do.'

'We are going to stay here, mother, until our affairs are settled,' said Christine firmly. 'Then we must go to some seaside place, or into the suburbs of a large town, where lodgers may be had, or paying guests, as they call them now, and where I can find employment. I can teach, mother—painting and music and languages. Don't fear, we shall succeed somehow. Mary declines to be dismissed, so she will have to see to the lodgers, and you, mother, will entertain.' The firmness gradually slipped out of her tones, and she concluded in semi-cheerfulness and with a wan smile.

Mrs Denholme shook her head in mournful denial. The prospect was not alluring. She secretly hoped that a change so complete as this outline foreshadowed would be postponed indefinitely. The roots of her life were in The Shaws—Denholme Shaws, as the manor-house was called, and abbreviated to The Shaws. Transplantation for her might mean decay.

It had been decided that The Shaws should not be sold if a suitable tenant could be found. A forced sale would have involved a considerable sacrifice, and it would pay them better to retain and let it. The difficulty, however, was to secure a tenant who would be willing to take it at anything like a reasonable rental. Unsold it would still be their home, and they could remain in it until Christine's plans were more fully developed and a tenant appeared who would relieve them of its occupancy.

The noises slowly subsided, and silence reigned in the deserted rooms. The two sad women remained in exactly the same position. Through the window the golden sunlight fell upon them, irradiating their drooping forms and throwing their shadows athwart the fireplace. So peaceful was it that it seemed as if the turmoil of the last few

hours were unreal; and that, in response to the gong, they would presently descend to their evening meal, and find everything undisturbed and proceeding with the customary quiet orderliness which characterised their domestic life.

There was a tap at the door, and Mary came in.

'Please, ma'am, Mr Lea would like to see you. Can you receive him?'

'Here, Mary?'

'Yes, or elsewhere; but the other rooms are all upset.'

'I think we may;' and she glanced inquiringly at Christine, who had risen, and was now standing before her.

She was tall and willowy. Her head was well poised, and crowned by a wealth of dark-brown hair, glossy and waving. Her large hazel eyes were very bright and expressive, much brighter than her mother's. She had a healthy complexion, slightly tanned like that of a girl accustomed to outdoor pursuits and not afraid of the wind and sun. The compression of her ruddy lips enhanced the firmness indicated by her pose and manner, and showed that she had a will of her own, and was not easily turned from her purpose.

'I will retire,' said she.

'Why need you, Christine?' returned her mother with a touch of appeal. 'He wants to see you as well.'

'He said both,' put in Mary.

'There!' exclaimed Mrs Denholme in a tone of relief. 'It would be churlish, Christine, to refuse to see him.'

'Show him in,' said Christine, turning to Mary. She glanced at her skirt and shook out its folds, raised her hands to her hair and smoothed its wayward tresses, fingered the dainty bow at her throat, all half-consciously as the thought flashed through her mind that she might not be quite presentable—a natural thought, if unnecessary. These misplaced trifles would have appealed to Ferdinand Lea as the simple accessories to beauty—that is, if he had noticed them at all; but he would never have noticed them—they would have been lost in the satisfaction of beholding her face.

'I ventured to ask if I might see you,' said he, bowing to the mother, then to the daughter, 'on a matter of business. Your solicitor informs me that The Shaws is to let. I should like to rent it from you, if I may.'

'But, Mr Lea, you have a house already!' returned Mrs Denholme, not disguising her surprise; while Christine straightened herself suddenly, and glanced at him with an expression of mingled inquiry and doubt.

'From which I intend to remove,' he replied with a pleasing smile. 'It doesn't quite suit me. The lease, fortunately, is a short one, and will run out soon. I hope you will favour me. I can arrange with the solicitor about the terms.'

'When would you want to come in?' asked Mrs Denholme timidly.

'Not for a month or two—any time, in fact, that would be suitable to you,' said he. 'I am in no hurry.'

'What do you say, Christine?' and she appealed, with a warm flush upon her face, to her daughter.

'We must think about it, mother, and let Mr Pierce know. Or we can tell Mr Lea, say, to-morrow or Thursday, if he will kindly call again.—Have you spoken to Mr Pierce about it?' and Christine turned sharply to receive his reply.

'Not definitely.'

'But you will?'

'Certainly, if you wish it; only, Miss Christine, should you be willing to accept me as a tenant it would be practically settled. Mr Pierce would agree. The details, of course, could be arranged through him.'

'Our affairs are in Mr Pierce's hands.'

The flush had departed from Mrs Denholme's face. She was disappointed. Her inclination was to close with the offer at once. They would never get a more considerate tenant. The airy indefiniteness with which he had referred to the time of his removal had exactly suited Mrs Denholme's mood. She felt, also, that her daughter had been a little ungracious in the introduction of the solicitor's name, and the insistence, implied if not openly spoken, that the entire transaction should be conducted through him. Mr Lea was not a stranger. He was a neighbour and a friend, and they had known him intimately for many years. Christine herself had been quite free with him. It was only since her father's death and the change in their circumstances consequent thereon that her attitude towards him had altered—an alteration, however, not only toward him, but toward all. She had grown prouder and colder, as if in that calamity there had been an ice-like grip. But Ferdinand Lea had stood by them loyally, and was standing by them now. It was a chilly reception of a generous offer.

'Thank you,' said he quietly. 'I will call on Thursday.' But he secretly resolved to forestall any other tenant by seeing the solicitor that very night. And he bade them adieu.

Before leaving The Shaws he and Mary had a confidential chat in the dining-room. The old servant trusted him implicitly. She held him in high honour, too, and would have been delighted if Christine had received his advances more favourably and they had made a match of it. Not of this, however, did they speak, but of matters connected with the sale. Mary was wise as well as faithful, and kept a still tongue on some things, thinking the more maybe; and to no living person except Christine herself would Ferdinand have shown his inmost heart.

Of all his purchases he carried away but one—the chaplet of beads enclosed in its sunken oak frame.

(To be continued.)

SIMPLE-LIFE SLAVERY.

By Eustace Miles.

THERE is an old proverb, *Experto crede* ('Believe the man who has tried'). I doubt if it is so trustworthy a piece of advice as 'Believe the man who *is trying*.' At any rate, before you decide in favour of or against a course, take the opinion both of the man who has tried it and of the man who is trying it.

With regard to 'simple life' in the country for a person who is used to city life, I would like first to submit to the reader the opinion of one who found the 'simple life' in the country unsatisfactory when he had been trying it for some time, and also while he was beginning to try it. I could not quite gather from him at which stage he detested the life more. At the start, he said, there was more time needed, more labour, more thought; afterwards there was rather less time needed, rather less labour, rather less thought; but the monotony of performing the same tasks day after day, and the absence of educated companions, made the life perhaps even less tolerable than at the outset.

I think it would be best if I quoted his opinion in full. He says: 'Country life, to the relatively poor man, means that he is cut off altogether from town life, which (if he has been city trained) is his true intellectual centre. It means, further, that the struggle to live leaves him no leisure, but drives him remorselessly into a dull round of menial work that gets horribly distasteful and monotonous. You will see people at work as long as it is daylight out of doors, and then again by lamplight for hours after dark indoors, in these small holdings. It is work, work, and nothing else. And it is even worse for the wife. *The town simplicity gives more leisure and freedom.*'

Now, the 'Simple Lifers' who go about the country with a few clothes and many words, and live in caravans or in tents or huts, will be most indignant when they read this. They will probably say, 'Why, of course the man has found it a failure. He did not understand the dignity, the educative value, the spiritual significance of manual toil and contact with Nature.' Perhaps so. But out of our poor millions who live in cities how many individuals *do* realise this?

The mistake of these 'Simple Lifers' is that they appeal too much to the class which has not been trained in childhood (and that is the training-time) to realise the dignity of manual labour and so forth. The mind and habit of the sedentary brain-worker they do not comprehend. They point, perhaps, to the joy of children released from the slums into the open air at the seaside or in rural districts. Yes; but children are still in the educable stage; they are not yet fixed and set. They are, moreover, lovers of manual labour, lovers of forms of work like those of their elders. They are not sedentary book-workers with the city-spirit in their blood. When the reformers of the Gracchan and subsequent periods of Roman history tried to repopulate the country with the city poor and to encourage the growing of corn in Italy, why did the schemes fail? What were the factors? Partly the difficulty of competing in price with slave-worked Egypt and other lands which produced far cheaper corn, but chiefly the distaste of the townsman for the quiet rural existence.

In my brief journalistic life I have written much that I would now recall. I thank the Press for being ephemeral. (I wish that some of my books had a shorter life.) But one thing I am glad to say I have not stated. It is that if every one suddenly left the cities and went to live in the country there would be no more evils. I have faults enough to find with a city life. No one can pass through the streets of London without noticing, for example, the utter unattractiveness of almost every single place which is not connected with eating or drinking or 'amusement,' the closing of churches at night (when, Heaven knows! they are needed more urgently than ever), the pitilessness, the loneliness, the grime, the thieving (especially in business), and so on. But I have never pretended that a sudden and abrupt break of old ties and habits and surroundings, and a plunge into country life, where a person has to do everything—including his entertainment—for himself, was a panacea. Indeed, I have always thought and said that the man who was healthy and happy in a city, and who yet enjoyed the country when he had the chance to be there, was master of the situation, whereas the man who depended for his health and happiness upon a country life was still a slave.

City life is not ideal, except as a training-ground for the character and intelligence. And for this purpose I suppose every set of conditions is ideal. City life is full of obvious disadvantages for the person who likes to regard them as such. But, anyhow, it is a phase in the normal development of civilised man, and it pulls, attracts the individual. Few who have felt its glamour can shake themselves quite free again. Those who think they can generally find out their mistake when it is too late.

A cottage, a garden, open air—all this is a big step towards the simple life. Young enthusiasts believe that it means liberty. Yet how often it means abject slavery! Consider the not uncommon case of the man who risks his little all in the venture. Probably he has ridden on the crest of an emotional wave—Socialistic, Vegetarian, Humanitarian, or anti-something—towards this goal. Behind him, egging him on, is a whole fiery and active propagandist movement in which he has shared. He has been living in a whirl of excitement, an

atmosphere of ideals, as if the way of the slum-dweller were an unmitigated curse, to be swept off the face of the land at once as by fire, and as if the way of the village were a perfect blessing, to be universalised at once. He is town-bred. The city-spirit is in his very blood and lymph, in his tissues and cells. He does not realise this. He gives up the city. He is stranded in the dullness of an unsympathetic, muddy, alien country life, with the social side of which he has little in common. What point of contact has he with the petty scandals of the villagers, their narrow yet incessant routine of 'shop'?

Hence the inevitable reaction—the pull, the yearning, the cry, the reaching backward to the city and to all the stir, movement, and intellectual stimulus which the city means. It is perhaps almost as if the fiery Salvationist, with all the exciting whirl of the city life in his blood, the soul-stirring contact all day and all night with the living masses of humanity, should plunge himself into the ascetic life of the early Christian desert-hermit.

But when the new-comer to the country has sunk his little capital, having given up his former billet, there is small chance for him again in the city. His sole chance seems to be to 'hang on' and 'muddle through.' The common tasks which were a pleasure at first—partly because they were a change—become dull and monotonous, even as the so-called 'pleasures' themselves do in the city or elsewhere. The man drifts into being a mere hewer of wood and drawer of water, for only thus can he make ends meet. If he reaches out for sympathy, for social life, he almost must—unless he be an unusual person or unusually educated—play the hypocrite. He must go to the same church or chapel as the village folk; he must pretend to think as they do on nearly every matter, political, social, &c., or else there is no society for him—he is shunned as a 'queer character.' And he cannot really think as they think. He is the product of newspaper-reading, of streets, of offices, of restaurants, and of a quite different intellectual environment. His wife, if he is married, is probably in a similar plight. The countless petty economies of the small proprietor acquire more and more an air of horrible meanness. The life, the bustle is gone; no summer seaside holidays break the round of toil, no little occasional extravagances. It is back to the land and down to the land with a vengeance! The two are rooted there, maybe to grow physically as healthy as the beasts, but almost certainly (unless they are exceptional people) to lose the joy of living.

This simple life, when one has money enough to enable one to reach out from it occasionally to the city and its intellectual stimulus, its atmosphere of humanity, is well enough; but without money it is most monotonous slavery. Yet foolish men preach it indiscriminately; they preach it loudly and confidently as the one panacea, quite forgetting that there is a simple life without slavery quite possible and feasible for their audience. It is the simple life, I mean, that does not break with the past—that makes city life livable by attention to little things which count much—to food, baths, exercise, fresh air, sensible recreation, timely rest, thoughts of kindness, and so on. It is the simple life that returns to as much simplicity as is possible under the conditions of present-day city life. This simplicity one can get without wrenching one's self painfully away from old associations and friends, or closing the covers of one's books for good, and dropping out of the whirl of intellectual activity which gives forward-looking thoughts. It is quite easy to imagine, in the glow of new enthusiasm, that one cares for none of these things. It is horribly fashionable, among a certain class, to despise the people who find city life livable. But when an ordinary man has had his bit of land long enough to realise what the change has meant to himself and his wife in hard and ceaseless work, petty economies, few if any holidays, loss of sympathetic social life, and so forth, he sees how foolish was the enthusiasm and how hollow the sneer of the crank who turned his back upon the simple life and liberty and opportunity of the city for the simple life and slavery, and—except for the well-trained and sensibly educated—the stagnation of the country.

THE HOUSE OF WHISPERS.*

By William Le Queux.

CHAPTER XXXII.—OUTSIDE THE WINDOW.

LATE on the following afternoon Gabrielle was seated at the old-fashioned piano in her aunt's tiny drawing-room, her fingers running idly over the keys, her thoughts wandering back to the exciting adventure of that morning. Her aunt was out visiting some old people in connection with the village clothing club; therefore she sat gloomily amusing herself at the piano, and thinking—ever thinking.

She had been playing almost mechanically Berger's 'Amoureuse' valse and some dreamy music from *The Merry Widow*, when she suddenly stopped and sat back with her eyes fixed out of the window upon the cottages opposite.

Why was Mr Hamilton in that neighbourhood? He had given her no further information concerning himself. He seemed to be disinclined to talk about

* Copyright in the United States of America by the Authors' and Newspapers' Association, New York, 1908.

his recent movements. He had sprung from nowhere just at the critical moment when she was in such deadly peril. Then, after their clothes had been dried, they had walked together as far as the little bridge at the entrance to Fotheringhay.

There he had stopped, bent gallantly over her hand, congratulated her upon her escape, and as their ways lay in opposite directions—she back to Woodnewton and he on to Oundle—they had parted. 'I hope, Miss Heyburn, that we may meet again one day,' he had laughed cheerily as he raised his hat. 'Good-bye.' Then he had turned away, and had been lost to view round the bend of the road.

She was safe. That man whom she had known long ago under such strange circumstances, whom she would probably never see again, had been her rescuer. Of this curious and romantic fact she was now thinking.

But where was Walter? Why had he not replied to her letter? Ah! that was the one thought which oppressed her always, sleeping and waking, day and night. Why had he not written? Would he never write again?

She had at first consoled herself with the thought that he was probably on the Continent, and that her letter had not been forwarded. But as the days went on and no reply came, the truth became more and more apparent that her lover—the man whom she adored and worshipped—had put her aside, had accepted her at her own estimate as worthless.

A thousand times she had regretted the step she had taken in writing that cruel letter before she left Glencardine. But it was all too late. She had tried to retract; but, alas! it was now impossible.

Tears welled in her eyes at thought of the man whom she had loved so well. The world had, indeed, been cruel to her. Her enemies had profited by her inexperience, and she had fallen an unhappy victim to an unscrupulous blackguard. Yes, it was only too true. She did not try to conceal the ugly truth from herself. Yet she had been compelled to keep Walter in ignorance of the truth, for she loved him.

A hardness showed at the corners of her sweet lips, and the tears rolled slowly down her cheeks. Then, bestirring herself with an effort, her white fingers ran over the keys again, and in a low musical voice she sang 'L'Heure d'Aimer,' that pretty *valse chanson* so popular in Paris:

Voici l'heure d'aimer, l'heure des tendresses;
Dis-moi les mots très doux qui vont me griser,
Ah! prends-moi dans tes bras, fais-moi des caresses;
Je veux mourir pour revivre sous ton baiser.
Emporte-moi dans un rêve amoureux,
Bien loin sur la terre inconnue,
Pour que longtemps, même en rouvrant les yeux,
Ce rêve continue.
Croyons, aimons, vivons un jour;
C'est si bon, mais si court!
Bonheur de vivre ici-bas diminue
Dans un moment d'amour.

The Hour of Love! How full of burning love and sentiment! She stopped, reflecting on the meaning of those words.

She was not like the average miss who, parrot-like, knows only a few French or Italian songs. Italian she loved even better than French, and could read Dante and Petrarch in the original, while she possessed an intimate knowledge of the poetry of Italy from the medieval writers down to Carducci and D'Annunzio.

With a sigh, she glanced around the small room, with its old-fashioned furniture, its antimacassars of the early Victorian era, its wax flowers under their glass dome, and its gipsy-table covered with a hand-embroidered cloth. It was all so very dispiriting. The primness of the whatnot decorated with pieces of treasured china, the big gilt-framed overmantel, and the old punch-bowl filled with pot-pourri, all spoke mutely of the thin-nosed old spinster to whom the veriest speck of dust was an abomination.

Sighing still again, the girl turned once more to the old-fashioned instrument, with its faded crimson silk behind the walnut fretwork, and, playing the plaintive melody, sang an ancient serenade:

Di questo cor tu m'hai ferito il core
A cento colpi, più non val mentire.
Pensa che non sopporto più il dolore,
E se segu così, vado a morire.
Ti tengo nella mente a tutte l'ore,
Se lavoro, se velio, o sto a dormire . . .
E mentre dormo ancora un sonno grato,
Mi trovo tutto lacrime bagnato!

While she sang there was a rap at the front-door, and, just as she concluded, the prim maid entered with a letter upon a salver.

In an instant her heart gave a bound. She recognised the handwriting. It was Walter's.

The moment the girl had left the room she tore open the envelope, and, holding her breath, read what was written within.

The words were:

'DEAREST HEART,—Your letter came to me after several wanderings. It has caused me to think and to wonder if, after all, I may be mistaken—if, after all, I have misjudged you, darling. I gave you my heart, it is true. But you spurned it—under compulsion, you say! Why under compulsion? Who compels you to act against your will and against your better nature? I know that you love me as well and as truly as I love yourself. I long to see you with just as great a longing. You are mine—mine, my own—and being mine, you must tell me the truth.

'I forgive you, forgive you everything. But I cannot understand what Flockart means by saying that I have spoken of you. I have not seen the man, nor do I wish to see him. Gabrielle, do not trust him. He is your enemy, as he is mine. He has lied to you. As grim circumstance has forced you to treat me cruelly, let us hope that smiling fortune will be ours at last. The world is very small. I have just met my old friend Edgar Hamilton, who was at college with me, and who, I find, is secretary to some wealthy foreigner, a

certain Baron de Hetzendorf. I have not seen him for years, and yet he turns up here, merry and prosperous, after struggling for a long time with adverse circumstances.

'But, Gabrielle, your letter has puzzled and alarmed me. The more I think of it, the more mystifying it all becomes. I must see you, and you must tell me the truth—the whole truth. We love each other, dear heart, and no one shall force you to mislead me again as you did in that letter you wrote from Glencardine. You wish to see me, darling. You shall—and you shall tell me the truth. My dear love, *au revoir*—until we meet, which I hope may be almost as soon as you receive this letter.—Always your own

'WALTER.'

She sat staring at the letter. He demanded an explanation. He intended to come there and obtain it! And the explanation was one which she dared not give. Rather that she took her own life than tell him the ghastly circumstances.

He had met an old chum named Hamilton. Was this the Mr Hamilton who had snatched her from that deadly peril? The name Hetzendorf sounded Austrian or German. How strange if Mr Hamilton, her rescuer, were the same man who had been years ago her lover's college friend!

She passed her hand across her brow, trying to collect her senses.

She had longed—ah, with such an intense longing!—for a response to that letter of hers, and here at last it had come. But what a response! He intended her to make confession. He demanded to know the actual truth. What could she do? How should she act?

Holding the letter in her hand, she glanced around the little room in utter despair.

He loved her. His words of reassurance brought her great comfort. But he wished to know the truth. He suspected something. By her own action in writing those letters she had aroused suspicion against herself. She regretted; yet what was the use of regret? Her own passionate words had revealed to him something which he had not suspected. And he was coming down there, to Woodnewton, to insist on the truth! He might even then be on his way!

If he asked her point-blank, what could she reply? She dared not tell him the truth. There were now but two roads open—either death by her own hand, or to lie to him.

Could she tell him an untruth? No. She loved him; therefore she could not resort to false declarations and deceit. Better—far better—would it be that she took her own life. Better, she thought, if Mr Hamilton had not plunged into the river after her that morning. If her life had ended, Walter Murie would at least have been spared the bitter knowledge of a disgraceful truth. Her face grew pale and her mouth hardened at the thought.

She loved him with all the fierce passion of her young heart. He was her hero, her idol. Before her tear-dimmed eyes his dear, serious face rose, a sweet memory of what had been. Tender remembrances of his fond kisses still lingered with her. She recollected how around her waist his strong arm would steal, and how slowly and yet irresistibly he would draw her in his arms in silent ecstasy.

Alas! that was all past and over. They loved each other, but she was now face to face with what she had so long dreaded—face to face with the inevitable. She must either confess the truth, and by so doing turn his love to hatred, or else remain silent and face the end.

She reread the letter; then she lifted her pale face again to the window, gazing out blankly upon the village street, so dull, so silent, so uninteresting. The thought of Mr Hamilton—the man who held a secret of hers, and who only a few hours before had saved her life—again recurred to her. Was it not remarkable that he, Walter's old friend, should come down into that neighbourhood? There was some motive in his visit! What could it be? He had spoken of Hungary, a country which had always possessed for her a strange fascination. Was it not quite likely that, being Walter's friend, Hamilton, on his return to London, would relate the exciting incident of the river? Had he seen Krail? And, if so, did he know him?

Those two points caused her the greatest apprehension. Suppose he had recognised Krail! Suppose he had overheard that man's demands, and her defiant refusal, he would surely tell Walter!

She bit her lip and her white fingers clenched themselves in desperation.

Why should all this misfortune fall upon her, to wreck her young life? Other girls were gay, careless, and happy. They visited and motored and flirted and danced, and went to theatres in town and to suppers afterwards at the Carlton or Savoy, and had what they termed 'a ripping good time.' But to her poor little self all pleasure was debarred. Only the grim shadows of life were hers.

Her mind had become filled with despair. Why had this great calamity befallen her? Why had she, by her own action in writing to her lover, placed herself in that terrible position from which there was no escape—save by death?

The recollection of the Whispers—those fatal Whispers of Glencardine—flashed through her distressed mind. Was it actually true, as the country-folk declared, that death overtook all those who overheard the counsels of the Evil One? It really seemed as though there actually was more in the weird belief than she had acknowledged. Her father had scouted the idea; yet old Stewart, who had personally known instances, had declared that evil and disaster fell inevitably upon any one who chanced to hear those voices of the night.

The recollection of that moonlight hour among the ruins, and the distinct voices whispering, caused

a shudder to run through her. She had heard them with her own ears, and ever since that moment nothing but catastrophe upon catastrophe had fallen upon her.

Yes, she had heard the Whispers, and she could not escape their evil influence any more than those other unfortunate persons to whom death had come so unexpectedly and swiftly.

A shadow passed the window, causing her to start. The figure was that of a man. She rose from the piano with a cry, and stood erect, motionless, statuesque.

CHAPTER XXXIII.—IS ABOUT THE MAISON LÉNARD.

THE big, rather severely but well-furnished room overlooked the busy Boulevard des Capucines in Paris. In front lay the great white façade of the Grand Hotel; below was all the bustle, life, and movement of Paris on a bright, sunny afternoon. Within the room, at a large mahogany table, sat four grave-faced men, while a fifth stood at one of the long windows, his back turned to his companions.

The short, broad-shouldered man looking forth into the street, in expectancy, was Monsieur Goslin. He had been speaking, and his words had evidently caused some surprise, even alarm, among his companions, for they now exchanged glances in silence.

Three of the men were well dressed and prosperous-looking; while the fourth, a shrivelled old fellow, in faded clothes which seemed several sizes too large for him, looked needy and ill-fed as he nervously chafed his thin, bony hands.

Next moment they all began speaking in French, though from their countenances it was plain that they were of various nationalities—one being German, the other Italian, and the third (a sallow-faced man) had the appearance of a Levantine.

Goslin alone remained silent and watchful. From where he stood he could see the people entering and leaving the Grand Hotel. He glanced impatiently at his watch, and then paced the room, his hand thoughtfully stroking his gray beard. Only half-an-hour before he had alighted at the Gare du Nord, coming direct from far-off Glencardine, and had driven there in an auto-cab to keep an appointment made by telegram. As he paced the big room, with its dark-green walls, its Turkey carpet, and sombre furniture, his companions regarded him in wonder. They instinctively felt that he had some news of importance to impart. There was one absentee. Until his arrival Goslin refused to say anything.

The youngest of the four assembled at the table was the Italian, a rather thin, keen-faced, dark-moustached man of refined appearance. '*Madonna mia!*' he cried, raising his face to the Frenchman, 'why, what has happened? This is unusual. Besides, why should we wait? I've only just arrived from Turin, and haven't had time to go to the hotel. Let us get on. *Avanti!*'

'Not until he is present,' answered Goslin, speaking earnestly in French. 'I have a statement to make from Sir Henry. But I am not permitted to make it until all are here.' Then, glancing at his watch, he added, 'His train was due at Est Station at 4.58. He ought to be here at any moment.'

The shabby old man, by birth a Pole, still sat chafing his chilly fingers. None who saw Antoine Volkonski, as he shuffled along the street, ever dreamed that he was head of the great financial house of Volkonski Frères of Petersburg, whose huge loans to the Russian Government during the war with Japan created a sensation throughout Europe, and surely no casual observer looking at that little assembly would ever entertain suspicion that, between them, they could practically dictate to the money-market of Europe.

The Italian seated next to him was the Commendatore Rudolpho Cusani, head of the wealthy banking firm of Montemartini of Rome, which ranked next to the Bank of Italy. Of the remaining two, one was a Greek from Smyrna, and the other (a rather well-dressed man with longish gray hair) Josef Frohnmeyer of Hamburg, a name also to conjure with in the financial world.

The impatient Italian was urging Goslin to explain why the meeting had been so hastily summoned, when, without warning, the door opened and a tall, distinguished-looking man, with carefully trained gray moustache, and wearing a heavy travelling-ulster, entered.

'Ah, my dear Baron!' cried the Italian, jumping from his chair and taking the new-comer's hand, 'we were waiting for you.' And he drew a chair next to his.

The man addressed tossed his soft felt travelling-hat aside, saying, 'The wire reached me at a country house outside Vienna, where I was visiting. But I came instantly.' And he seated himself, while the chair at the head of the table was taken by the stout Frenchman.

'Messieurs,' Goslin commenced, and—speaking in French—began apologising at being compelled to call them together so soon after their last meeting. 'The matter, however, is of such urgency,' he went on, 'that this conference is absolutely necessary. I am here with a statement from Sir Henry—an alarming statement. Our enemies have unfortunately triumphed.'

'What do you mean?' cried the Italian, starting to his feet.

'Simply this. Poor Sir Henry has been the victim of treachery. Those papers which you, my dear Volkonski, brought to me in secret at Glencardine a month ago have been stolen!'

'Stolen!' gasped the shabby old man, his gray eyes starting from his head—'stolen! *Dieu!* Think what that means to us—to me—to my house! They will be sold to the Ministry of Finance in Petersburg, and I shall be ruined—ruined!'

'Not only you will be ruined,' remarked the man from Hamburg, 'but our control of the market will be at an end.'

'And together we lose over three million roubles,' said Goslin in as quiet a voice as he could assume.

The six men—those men who dealt in millions, men whose names every one of them were as household words on the various Bourses of Europe and in banking circles, men who lent money to reigning sovereigns and to States, whose interests were world-wide and whose influences were greater than those of kings or Ministers—looked at each other in blank despair.

'We have to face this fact, as Sir Henry points out to you, that at Petersburg the Department of Finance has no love for us. We put on the screw a little too heavily when we sold them secretly those three Argentine cruisers. We made a mistake in not being content with smaller profit.'

'Yes, if it had been a genuinely honest deal on their side,' remarked the Italian. 'But it was not. In Russia the crowd made quite as great a profit as we did.'

'And all three ships were sent to the bottom of the sea four months afterwards,' added Frohnmeyer with a grim laugh.

'That isn't the question,' Goslin said. 'What we have now to face is the peril of exposure. No one can, of course, allege that we have ever resorted to any sharper practices than those of other financial groups; but the fact of our alliance and our impregnable strength will, when it is known, arouse the fiercest antagonism in certain circles.'

'No one suspects the secret of our alliance,' the Italian ejaculated. 'It must be kept—kept at all hazards.'

Each man seated there knew that exposure of the tactics by which they were ruling the Bourse would mean the sudden end of their great prosperity.

'But this is not the first occasion that documents have been stolen from Sir Henry at Glencardine,' remarked the Baron Conrad de Hetzendorf. 'I remember the last time I went there to see him he explained how he had discovered his daughter with the safe open, and some of the papers actually in her hands.'

'Unfortunately that is so,' Goslin answered. 'There is every evidence that we owe our present peril to her initiative. She and her father are on bad terms, and it seems more than probable that, though she is no longer at Glencardine, she has somehow contrived to get hold of the documents in question—at the instigation of her lover, we believe.'

'How do you know that the documents are stolen?' the Baron asked.

'Because three days ago Sir Henry received an anonymous letter bearing the postmark of "London, E.C.," enclosing correct copies of the papers which our friend Volkonski brought from Petersburg, and asking what sum he was prepared to pay to obtain repossession of the originals. On receipt of the letter,' continued Goslin, 'I rushed to the safe, to find the papers gone. The door had been unlocked and relocked by an unknown hand.'

'And how does suspicion attach to the girl's lover?' asked the man from Hamburg.

'Well, he was alone in the library for half-an-hour about five days before. He called to see Sir Henry while he and I were out walking together in the park. It is believed that the girl has a key to the safe, which she handed to her lover in order that he might secure the papers and sell them in Russia.'

'But young Murie is the son of a wealthy man, I've heard,' observed the Baron.

'Certainly. But at present his allowance is small,' was Goslin's reply.

'Well, what's to be done?' inquired the Italian.

'Done?' echoed Goslin. 'Nothing can be done.'

'Why?' they all asked almost in one breath.

'Because Sir Henry has replied, refusing to treat for the return of the papers.'

'Was that not injudicious? Why did he not allow us to discuss the affair first?' argued the Levantine.

'Because an immediate answer by telegraph to a post-office in Hampshire was demanded,' Goslin replied. 'Remember that to Sir Henry's remarkable foresight all our prosperity has been due. Surely we may trust in his judicious treatment of the thief?'

'That's all very well,' protested Volkonski; 'but my fortune is at stake. If the Ministry obtains those letters they will crush and ruin me.'

'Sir Henry is no novice,' remarked the Baron. 'He fights an enemy with his own weapons. Remember that Greek deal of which the girl gained knowledge. He actually prepared bogus contracts and correspondence for the thief to steal. They were stolen, and, passing through a dozen hands, were at last offered in Athens. The Ministry there laughed at the thieves for their pains. Let us hope the same result will be now obtained.'

'I fear not,' Goslin said quietly. 'The documents stolen on the former occasion were worthless. The ones now in the hands of our enemies are genuine.'

'But,' said the Baron, 'you, Goslin, went to live at Glencardine on purpose to protect our poor blind friend from his enemies.'

'I know,' said the man addressed. 'I did my best—and failed. The footman Hill, knowing young Murie as a frequent guest at Glencardine, the other day showed him into the library and left him there alone. It was then, no doubt, that he opened the safe with a false key and secured the documents.'

'Then why not apply for a warrant for his arrest?' suggested the Commendatore Cusani. 'Surely your English laws do not allow thieves to go unpunished? In Italy we would quickly lay hands on them.'

'But we have no evidence.'

'You have no suspicion that any other man may have committed the theft—that fellow Flockart,

for instance? I don't like him,' added the Baron. 'He is altogether too friendly with everybody at Glencardine.'

'I have already made full inquiries. Flockart was in Rome. He only returned to London the day before yesterday. No. Everything points to the girl taking revenge upon her father, who, I am compelled to admit, has treated her with rather undue harshness. Personally, I consider mademoiselle very charming and intelligent.'

They all admitted that her correspondence and replies to reports were marvels of clear, concise instruction. Every man among them knew well her neat, round handwriting, yet only Goslin had ever seen her.

The Frenchman was asked to describe both the girl and her lover. This he did, declaring that Gabrielle and Walter were a very handsome pair.

'Whatever may be said,' remarked old Volkonski, 'the girl was a most excellent assistant to Sir Henry. But it is, of course, the old story—a young girl's head turned by a handsome lover. Yet surely the youth is not so poor that he became a thief of necessity. To me it seems rather as though he stole the documents at her instigation.'

'That is exactly Sir Henry's belief,' Goslin remarked with a sigh. 'The poor old fellow is beside himself with grief and fear.'

'No wonder,' remarked the Italian. 'None of us would care to be betrayed by our own daughters.'

'But cannot a trap be laid to secure the thief before he approaches the people in Russia?' suggested the crafty Levantine.

'Yes, yes!' cried Volkonski, his hands still clenched. 'The Ministry would give a hundred thousand roubles for the documents, because by their aid they could crush me—crush you all. Remember, there are names there—names of some of the most prominent officials in the Empire. Think of the power of the Ministry if they held that list in their hands!'

'No,' said the Baron in a clear, distinct voice, his gray eyes fixed thoughtfully upon the wall opposite. 'Rather think of our positions, of the exultation of our enemies, if this great combine of ours were exposed and broken! Myself, I consider it folly that we have met here openly to-day. This is the first time we have all met save in secret, and how do we know but some spy may be on the boulevard outside noting who has entered here?'

'*Mille diavoli!*' gasped Cusani, striking the table with his fist and sinking back into his chair. 'I recollect I passed outside here a man I know—a man who knows me. He was standing on the kerb. He saw me. His name is Krail—Felix Krail!'

'Is he still there?' cried the men, as with one accord they left their chairs and dashed eagerly across to the window.

'Krail!' cried the Russian in alarm. 'Where is he?'

'See!' the Italian pointed out—'see the man in black yonder, standing there near the *kiosque*, smoking a cigarette. He is still watching. He has seen us meet here!'

'Ah!' said the Baron in a hoarse voice, 'I said so. To meet openly like this was far too great a risk. Nobody knew anything of Lénard et Morellet of the Boulevard des Capucines except that they were unimportant financiers. To-morrow the world will know who they really are. Messieurs, we are the victims of a very clever ruse. We have been so tricked that we have been actually summoned here and our identity disclosed!'

The five monarchs of finance stood staring at each other in absolute silence.

(To be continued.)

BEYOND THE GREAT SOUTH-WEST.

By Grenville Holms.

THE tidal wave of humanity which has swept for six decades to the very confines of California give signs of breaking ere its goal is reached. California presents the aspect of a land where the honey is all carefully potted in fruit-jars and the milk flows only from well-conducted dairies. In fact, the army of industry has occupied the promised land, and the outsiders may spy its fertility but may not possess it.

The voice of the North, programmed by many-coloured and alluring railroad folders, has piped a few hundred thousand farmers into Canada, where they will sow wheat, wheat, and more wheat, with a reasonable certainty of heavy crops and profit, and an equally reasonable possibility of nip of frost or blight of blizzard. To-day the human wave is making for the Great North-West, partially because the twentieth-century pioneer prefers the narrow comfort of the four-foot-six-inch gauge to the boundless discomfort of the limitless prairie. He is a home-seeker, but he requires that the household gods to make his home shall be transported with him. It is not that the race is less hardy, but that it is better educated. You can ask a milkmaid to come forth from Arcady to chase vicarious fortune, but you cannot importune the sweet girl-graduate to renounce her sophisticated ways.

Roughly speaking, and perhaps speaking rather roughly, the Great North-West expects every man to do his duty, meaning his own share of manual labour. She is too short of hands for 'hired help' to fall within the province of a man's purse. Her climate, like most, requires to be classified according to the seasons. Her mines are few. Her staple crop depends on weather mainly, but its price is on

the knees of the Chicago wheat-pit. After all is said and done, the North-West is a great country and deservedly attracts her hundreds of thousands of men and capital.

The turn of the Great South-West is coming fast; but looming at the back of beyond there is a vast expanse of rich and fertile territory which seems destined to play a very glorious part in the annals of the Pacific slope. Striking down from Nogales, Arizona, a great trunk-line is being constructed by the Southern Pacific Railroad Company to the city of Guadalajara, eleven hundred and fourteen miles distant, and it will be completed within the next four years at a total cost of twenty-five million dollars. Independent of the late financial crisis, the Southern Pacific steadily continued its mighty work, employing over six thousand men on different sections of the route, and thus emphasising the steadfastness of its policy to hasten forward the hour of completion at any cost. With what interest the Mexican Government regards the line may be judged from the fact that it is granting the railroad company a subsidy of twelve thousand five hundred dollars Mexican currency for every kilometer of track completed. Costs, however, rise at points to as high as one hundred thousand dollars United States currency per kilometer, owing to the amount of bridge-work and tunnelling required. Directly, the railway will touch two seaports of the first importance, Guaymas and Mazatlan, while it will probably be connected with others by branches.

By September of the current year the city of Guadalajara, having a population of over one hundred thousand, will be connected with the Pacific port of Manzanillo. This apparently obvious route presented so many difficulties that the task of completing it had been spread over a lengthy term of years by the Mexican Central Railroad Company, the control of which was lately vested in the Mexican Government. These difficulties may be better appreciated when it is stated that a climb of five thousand feet is made in less than ninety miles, while numberless tunnels and bridges have had to be constructed in order to negotiate apparently impassable mountains or gorges. The approximate length of the line from the city to the coast is about two hundred and twenty miles.

The Kansas City, Mexico, and Orient Railroad crosses the Rio Grande at Presidio, entering the State of Chihuahua, and will eventually terminate at the Pacific port of Topolobampo, in the State of Sinaloa. The entire length of the line, from Kansas to the Pacific, is one thousand six hundred and twenty-nine miles. As is well enough known, this railroad opens up new sections in Oklahoma and Texas; while in its transit through Chihuahua it will serve many of the most important mining-camps in that richly mineralised state. The Hamburg-American Steamship Company has entered into a contract to establish a line of trans-Pacific steamers from the western terminus to the Far East as soon as the route is completed.

Sonora, the most northerly of the states affected by these railroads, has enjoyed the benefits of American investment for many years, and she has mines, such as the Cananea, which are known better in New York than in Mexico City. Trouble with the Yaqui Indians, magnified by distance and a yellow Press, has acted as a deterrent to enterprise, yet over four thousand mining titles, covering over one hundred and fifty thousand acres, are in force. The population is estimated at between two hundred and twenty thousand and two hundred and thirty thousand.

Sinaloa extends for four hundred miles along the eastern shore of the Gulf of California and the Pacific Ocean, with an average breadth of one hundred miles, covering an area of thirty-five thousand seven hundred and twenty-one square miles. Sinaloa has mines enough, and indications of mineral are so frequent as to attract the attention of even conservative miners. About a thousand mining titles, with an area of some twenty thousand acres, are registered; but it is its productiveness as an agricultural, fruit-growing, and cattle country that makes Sinaloa well worthy of investigation by capitalist and farmer. The whole country is intersected by rivers and streamlets, and reservoir sites can be seen on every hand. At present this wealth of water means simply irrigation crudely carried out; but it portends in the future canals and dams designed to fructify the land with well-planned care. Moreover, there will be power to turn the shafts of factories and to carry their produce on electrically driven tramway-lines.

The soil of Sinaloa is even richer than the soil of California, and fertilisers are as yet unknown there. Sugar matures in about a year, and yields from twenty to thirty tons per acre. Wheat is sown between November and January, and harvested in May, the crop averaging twenty bushels. Alfalfa is cut five or six times each year, giving ten tons, more or less, per acre. Barley, sown from November to December and harvested in May, yields fifty to sixty bushels. Oats are sown in February and harvested in June, and yield fifty to seventy bushels per acre. Corn, planted in February and reaped in June, and planted again in July and reaped in December, gives twenty to forty bushels at each crop.

Down in Tepic very similar conditions prevail; but that territory is only about one-third the size of Sinaloa, while the population (one hundred and fifty thousand and ninety-eight) is only about one-half as large.

Jalisco, of which the city of Guadalajara is the capital, is the most populous state, and one of the richest, in the whole Republic, boasting fully one million one hundred and seventy-five thousand inhabitants. Everything here has taken on a more modern aspect; real estate companies are in operation; men talk business; new deals readjust old conditions. For the man with the hoe Jalisco still offers land, but the rate will not be a sacrifice on the part of the owner.

Such agricultural development as there has been in the past is the work of a simple people, who had but to scratch the soil to seed the certainty of a harvest. What they have done is just enough to show what modern methods might do. To work with only daily needs in view is not the way to produce the surplus which will found a mighty commerce. Yet the agricultural produce of the State of Jalisco alone is valued at nearly forty million dollars Mexican currency, while it produces cattle to the value of thirteen million dollars Mexican money annually.

Guadalajara, a great and ancient city, old ere San Francisco or Chicago showed one stone upon another, dominates the coast and the railroad system. As far removed as possible from a 'boom' city, Guadalajara makes precisely the kind of picture one is apt to associate with long-established and unchanging ways. Its peace and calm is reminiscent of the quietude of an English cathedral town. The second city in the Republic of Mexico is known throughout the land as the 'Pearl of the Occident;' and the charm of its perfect climate, the beauty of its stately buildings, ancient palaces, and churches, and the glamour of its garden spots give truth to the title. One may stroll on the shady side of a cobbled street, lined with weather-beaten fronts of stone—mostly one-storied and pierced with windows closely barred—where vendors squat at every corner, lazily fanning the flies from their sticky wares. White-clad *peons*, topped with enormous palm-leaf hats, amble at their half-running dog-trot down the middle of the way. *Señoritas* step the scene almost as though they formed the demure chorus of some religious pageant. Horsemen in skintight trousers and jingling spurs clatter along with all the pride of Spain and satin horseflesh. *Padres* pass with downcast eyes, their great cloaks flapping behind them like sombre wings, and their shaven lips move constantly in silent prayer; and as they go by, the sidewalks are vacated for their passage by all good Catholics. A transverse street brings you face to face with the beginnings of modernity. From cruel cobbles you step to weltering, soft asphalt. An electric car hums its rising note, which never seems to reach its appropriate crescendo. Automobiles groan their song of speed. A thick telephone cable is spanned above. A lurid poster, done in yellow and red, proclaims the virtues of a beer. A five-story building rising on skeleton frame of steel affords, in this city of squat dwellings, a suggestion of the overtowering sky-scraper. Handsome windows of plate-glass display goods for the *peon* and the millionaire side by side.

Here is a city as interesting as any on the continent of North America to-day. It has grown to what it is merely by force of local trade. It is about to be juxtaposed upon the commerce-bearing tide of the Pacific. Heretofore the bulk of its freight has reached it through Tampico or El Paso, entailing a journey of seven hundred and twenty miles in the former case and of one thousand one hundred and sixty-five miles in the latter, over lines already heavily congested with main-trunk traffic. That freight has come from Middle Western, Gulf, and Atlantic states, and from the continent of Europe. By September freight will be coming into Guadalajara from the west instead of from the east. There will be a complete change of trade-route. California, Oregon, Washington, and British Columbia will supply the city with many necessities which it obtained before from other quarters. Europe may ship its goods across the Isthmus of Tehuantepec and up the coast to Manzanillo, or it may send them even round the Horn. The possibilities of direct trade with Australia and the Far East bring almost imperial ideas to view. This rail connection of a Mexican Pacific port with the hinterland, opening a commerce with two million people, may well stir interest even in markets at the remotest ends of the earth.

Manzanillo and Mazatlan must always be the feeders to the country lying behind them, and especially to Guadalajara. Climatic conditions prohibit their growth. It is noticeable on the east coast of the Republic that, while the city of Mexico has experienced a phenomenal increase in wealth and population, the ports of Vera Cruz and Tampico have not correspondingly augmented. They have been improved, so far as modern sanitation can improve them, but they remain torrid towns, where business must be indeed prosperous to enforce prolonged residence.

This, then, is what lies beyond the Great South-West. Comparing the country with the Great North-West, one finds:

GREAT NORTH-WEST.	BEYOND THE GREAT SOUTH-WEST.
Labour dear and extremely hard to get.	Labour cheap (18c. to 37c. gold per day) and plentiful.
Labour unions and strikes.	No labour unions. No strikes.
Seasons of short daylight.	Daylight hours about equal all the year.
Seasons of blighting cold. Great losses in crops.	Temperature varies from 59° to 78° Fahrenheit. No frosts in agricultural sections.
Depends on a few staple crops, and can reckon on only one crop a year.	Grows every possible variety of temperate, semi-tropic, and tropical produce. Often produces two crops or more each year.
Price of crop is largely controlled by speculators.	Little or no speculation in price of crops.
Nearer to manufacturing centres, and manufactured goods are cheap.	Far from manufacturing centres, but actual necessities of life are cheaper.
Mineral riches exist only in small section.	Mineral riches great and widespread.
Laws good and just.	Laws as good and as just.
Protection to alien excellent.	Protection to alien as excellent.

The comparison is not unjust. Will the stream which is splashing over into Canada begin to divert itself south to Mexico? Who will develop this imperial country? The Mexicans themselves are far too few in numbers. Will the Chinese do it, the Japanese, or the Americans? Can one have a doubt?

BETWEEN TWO FIRES.

THE estate was a large one, and the laird to whom it belonged, and who was a studious recluse, had never seen it; he was content to leave its oversight in the hands of another. If the rents came to him regularly, and if he was not overmuch troubled by requests for repairs, he was perfectly satisfied. As a natural result, there had been talk of improvements under the régime of the elderly factor; but any real reformation in the way of better steadings or more adequate accommodation for man and beast had never been seriously considered. When a new tenant entered on a lease, he had great expectations with regard to what was to be done for his farm, but he soon found cause to understand that his hopes had been built on very uncertain foundations. He had the conviction that promises with regard to many improvements had been made to him; but yet, when he pressed for them, and when there were no signs of them being set in operation, and when, with a view to force the pace somewhat, as he thought, he began to study the terms of the lease, he was compelled to admit that there was nothing in black and white to which, as he might put it, he could 'pin doon the auld chiel.'

As a general rule, the method adopted by the factor was a well-arranged system of delay. When a new door was needed on a stable or byre, the old one was made to serve if it could stand the strain of being patched. If the stable itself or the byre had become very dilapidated, the factor was always willing, on request, to make a most thorough examination of it. He appeared to be fully impressed by the necessity for radical measures, and from the remarks which the old gentleman made, the tenant was fairly well convinced in his own mind that he would soon be in possession of a better shelter for his horses or cows, as the case might be; but when the tradesmen came they would spend an hour or two tinkering here and there, and when it looked as if they had only been making preparations for a good start, they were gone, leaving the tenant too bewildered to question them as to the orders which they had received. If he appeared in his wrath at the estate-office to vent his grievance, he was given a most attentive reception; but all that he carried away with him was the vague idea that somehow he must have misapprehended the drift of the previous conversation. Sometimes, it is true, remarks were made which imputed to the factor a certain element of duplicity, although it was only by the gentlest hint that it was insinuated. For, was it not the wife of one of the most clamorous tenants who spoke of his apparent tardiness with a subtle mixture of shrewdness and charity? 'The auld man's failin',' she said; 'his memory's clean dune.' To which she added somewhat hastily, 'At least, as far as repairs are concerned.'

There was, naturally, a good deal of grumbling among the farmers themselves; but the factor was known to have his own ways, and it was common knowledge that the laird did not allow him much of a margin for estate repairs. Whatever the tenants and their wives thought of the absentee landlord, the man on the spot was well liked for his genial manner and pawky humour. In his drives round the estate he had always the gift of making each tenant feel that his farm was the factor's special care, and that it was his intention to set it in order at no distant date. Perhaps that particular tenant would not have been so cheerful over his prospects if he had heard the story which the old gentleman told to the next tenant at the neighbouring farm. It was to all intents and purposes the same; but as each was anxious to be served first, both kept their own counsel with reference to the expectations which the factor's visit had excited. And so it came to pass that, with such plausible talk, judiciously given, the factor was able to promise much and yet do little.

There were times, however, when the strain threatened to become too much for the patience of the tenants. At one of these seasons it was felt that some pressure must be brought to bear on the factor. The rent-day was approaching, and it was deemed a suitable time for such a purpose. The difficulty was as to who would 'bell the cat.' While the older men were inclined to favour what they called a 'deeputashon,' the problem was solved by a young farmer who had only recently come to the estate. He offered to take it upon himself to represent the general grievance to the factor. His neighbours knew him to be a man with 'a fair gift o' the gab,' and to the majority he seemed to be a fit and proper person to state the tenants' case with impressive fluency. Some of the more sagacious spirits may have had their suspicions with regard to his discretion. If they had, they held their peace and allowed the young and gallant defender of the rights of the tenants to be chosen to voice the general discontent. For some time before the rent-court he talked loudly at kirk and market of how he would 'make the auld man sit up.' By such a statement, and by others of a similar character, he desired to convey to the minds of his hearers that he would secure for himself and all others concessions far beyond anything which had ever been previously granted. He even went the length of asserting that if, by any possibility, he should be refused his demands, he would not pay his rent. The older men did not lay much stress on that part of his discourse. They had tried something perilously akin to that method in their own earlier days; but they had always left the rent-court, with their payments in the factor's bag, poorer and perhaps wiser men. They said nothing, but waited with a grim, and even—if the whole truth

were told—with a secretly pleasurable sense of expectation.

The day of the rent-court arrived in due course, and the young farmer was ushered in his turn into the factor's presence. He remained in the private room for a considerable time, and when he emerged there was a somewhat chastened appearance about his demeanour. When questioned, he was forced to make the best of a bad business. He had to admit, under cross-examination and no small degree of pressure, that he had not been so successful as he had expected. He could not conceal for long that he had paid his rent; and when the nett result of his efforts after reform, both public and private, was reduced to hard fact, it was found to consist in the promise of a new midden-wall for his own steading. It was a poor outcome of all the fine speeches in which he had indulged. The would-be reformer was the butt of the wits of the country-side for many a day. So far as the factor was concerned, a patriarch among the tenants confided to one of his cronies what he thought of the old gentleman's share in the whole affair. 'It's nae use,' he said in a tone of bitter contempt, 'for that callant tae gang tae the factor, for the auld man's that cunnin' that he wad wile a bird aff the bough o' a tree.'

So affairs had gone on. The laird in London knew little, and evidently cared less, about the needs of the tenants, and the old factor had long ago come to the conclusion that what the estate really needed would require more than he could ever expect to extract from the coffers of his superior, and that the battle to secure even a gradual system of reformation would involve a stiffer 'tussle' than he was prepared to undertake at his age. He knew in the depths of his heart that the condition of the estate was very far from what it ought to be; but he was beginning to feel that the end of his term was drawing near, and that his son who had come to his assistance would erelong step into his shoes. He was willing to leave to his successor the brunt of the battle which needed to be borne. He was well aware that his son would be, as he himself had been, between two fires. Although he was not a selfish man, he had always been ready to take the line of least resistance, and what was bred in the bone and had become a rooted source of action dictated his policy to the end. He discerned that his son was a man of a stronger type of character than himself; and sometimes, when he thought of the demands which could not be longer put aside, he said to himself, half in self-accusation, half in hopefulness for what he believed his successor would be able to accomplish, that 'the young one could work it.' It was the silent compliment of an easy-going man to a man of energy. It was also the prophecy of the reformation which the younger was erelong to work on the estate. For when the old man slipped away, and the reins of government were assumed by his son, the struggle which was destined to give rise to far-reaching changes began to cast its shadow before it.

The young factor was not so well known to the tenants as his father had been. The man who had gone had been one of themselves, and his 'couthy' Scotch manner had often made them feel, even when they grumbled most, that he was not without his share in the burden which lay on the shoulders of all. But his son had been educated at an English public school. He had taken his degree at Cambridge, and he had 'learned the law' in the office of a prominent but hard-driving firm of Edinburgh solicitors. These features of his training did not help to commend him to the untutored northern farmers and their wives. An English education did not conduce, in their eyes, to a practical knowledge of crops or of the best means by which they could be raised; while a legal training appeared to them as only an additional weapon in the hand of oppressive landlordism. 'If the lad kent something about neeps and the use o' slag it wad be mair tae the purpose than a heap o' book-learnin',' was the sage remark of one rural wiseacre, and his words were a fairly accurate expression of the esteem in which the young factor was held by the tenants. They had also the idea that he was 'a bit distant in his manner,' and they were under the impression that he was a man with whom it would not be difficult to quarrel. They felt, moreover, that he was one with whom they would not unwillingly 'have words,' and that without any particular regret on their part.

Elements such as these readily helped to bring to the surface the long-continued and steadily fermenting spirit of discontent, and the new factor had not been long in office before he found himself confronted on every hand with many demands. He listened quietly, courteously, and with the lines of his keen, cleanly shaven face drawn tightly to attention. At intervals he would ask a question or make some tentative remark to elicit further information, and in the end each tenant was sent away with a definite promise that his grievance would be duly considered. 'The lad may ha'e mair in him than we thoucht' was the furthest that these cautious farmers would commit themselves after the first interview. Yet his manifest courtesy as well as the air of decision which marked his attitude was not without effect. Men who had come with the firm conviction that they would not leave his presence without a quarrel found themselves going out of the office without a harsh word having been spoken on either side. Others who had laid their grievances before him with something akin to hopelessness went away with a strange and inexplicable feeling of hopefulness stirring within them. Some, too, who had approached him with requests which were by no means extravagant were more than astonished at the alert manner in which he at once seized the salient elements of the redress which they were seeking to secure. The way in which they had all been received might mean much or it might mean little, and the promise given to each that he would make a personal inspection of

the whole of the steadings on the estate might be nothing more than a pledge which, even if it were fulfilled, would not be productive of any real result. But they had waited so long that a little longer did not signify, and the general outlook at the beginning of their dealings with the new factor had been so different from what they had expected that they were content meanwhile to accept the pledge which had been given to them. In the magnanimity of their hearts, they solaced themselves with the reflection that 'the lad 's but young yet at the best, and maun ha'e his chance tae learn like the lave o' us;' although it was very evident to any one who listened to their talk that unless things went according to their liking his school of experience might be a somewhat bitter one.

The promised visit was soon made, and the factor heard within a few weeks a full and detailed account of the various needs of the different tenants. He was quick to grasp the respective situations which were set before him. At each farm he made jottings in a note-book. These seemed to the tenants to put in a very small space a large amount of talk on their part, and if they were at all tempted to measure their prospects of repairs by the minuteness of the notes, their hearts must at times have been at the sinking-point. Withal, they had the impression that they were getting nearer to the factor than they had ever dreamed was possible. It was noticed, too, that when some of the children at this or that farm had the courage to approach, he gave them a cheery word or two. 'A young man that cares for weans is no' a hard-hearted man,' an old grannie at one steading remarked, and the father and mother who had had hard thoughts of the new factor, and who had spoken bitterly of the treatment which they were likely to receive at his hands, had the uneasy feeling that their words had been said without knowledge. Less than justice had clearly been done to him; for, whatever else might be said of him, it was at least evident that he was not so stiff and starched as popular imagination had painted him.

It was only to be expected that the tour of inspection should create a certain measure of hopeful anticipation with regard to the future. Some months passed, however, and nothing was done. Had it not leaked out that the factor had been in London, the tenants might have been ready to suppose that the hopes which they had been beginning to cherish were not to be fulfilled. Little did they know the struggle which their intercessor had to wage with the laird. At the first onset, the laird would listen to no proposals involving a larger amount of expenditure than had been usual under the old factor's rule. It was useless for the man who was pleading the tenants' case to unfold the long tale of what was really required. The laird appeared to be immovable, and it was only after long and wearied argument that he consented to the most pressing needs receiving attention. The factor detected in this concession a certain amount of 'yield' on the part of his superior, and he was determined to press it to its utmost extent. He returned to the estate-office, but he gave no orders for the work which had been sanctioned. He set himself to make a full and elaborate statement as to how the needs which were most urgent could be met at once, and how, by a gradual scale of expenditure extending over a space of years, all would receive a due measure of attention. Armed with this new means of attack on the laird, and well aware that something would soon require to be done, he took a second journey south. The reception which was accorded to him threatened, in its earlier stages, to be somewhat similar to that which had been given him at his first visit. The laird was irritable, and came at times very near hinting that the new factor was promising to follow very badly in his father's footsteps; yet he could not fail to be impressed by the quiet dignity and calm persistence of the man who was pleading with him. Moreover, the care which he had evidently taken with the whole affair, the business-like fashion with which he set out details, the vivid picture which he painted of the marvellous change which the adoption of his method would work on the estate in a few years, all began to have weight with the laird. In the end, he felt that he could stand out no longer; and, somewhat to the factor's astonishment, he promised to travel back with him and see for himself how the land lay.

The factor readily accepted the offer, and a few days later the two were touring round the different farms on the estate, and the laird was learning for himself that much was needed to make the estate more in line with modern requirements. The outlay which had been allowed in the past might have been sufficient for fifty years ago, but time and weather had worked their own ravages. The advance of the science of agriculture and the birth of County Councils had touched the farmer's life at many points. The increase of foreign competition also was making it more and more incumbent that the best means of meeting it should lie ready to hand. 'A' that we ha'e tae buy is the very dearest, and what we ha'e tae sell gangs for the cheapest,' was a frequently recurring refrain in the farmers' talk with the laird. It was impossible to ignore all these considerations; and as the laird and factor sat long into the early hours of the morning for well-nigh a week, carefully discussing all the different items of reform which were essential, the factor's heart was cheered at the manner in which the laird gradually showed his readiness to accede to the requests which he had put before him. The progressive scheme for which he had been so anxious was finally allowed; and when the two men parted at the wayside station, after their days of conference, the one to his life of leisured retirement and the other to the execution of his ardently desired reforms, the warm grip of the hand which each gave to the other at parting caused both of them to feel better men. The laird had the comfortable in-

ward assurance, seldom experienced before, that he had been in touch with the actual facts and stern realities of a life different from his own and yet dependent on him for no small degree of consideration and sympathy. He had learned to sacrifice himself for others, and he carried with him the warm glow at the heart which all sacrifice invariably brings with it. The factor had the knowledge that the battle of personal conviction which he had fought had brought strength to his own soul. As month followed month and year succeeded year, and as steadings and outhouses throughout the estate took on new forms and features, he had it borne in upon him that the fires of conflict through which he had passed had firmed his powers of life and had made him stronger for daily duty. He was a man who cared little for popularity. For he was of too stern a stuff to be moved either by the praise or the blame of men. Yet he was conscious that the atmosphere of suspicion which had surrounded him when he entered on his duties had disappeared. The tenants came to him frequently for advice on matters which were often remote from his proper sphere. They had learned to know his worth, his alert mind, his quick sympathy, his dogged tenacity of purpose; and with such a man in their midst they were well satisfied to live the life of cheerful, contented industry, and to aid, as far as lay in their power, all his efforts to make the estate under his charge the pride of the county.

THE PHYSICAL ENERGY OF THE BLUE-BOTTLE.

THE kinematograph has recently been turned to highly valuable educational purposes in the projection upon the screen, with all the vigour of life and absence of restraint, of various phases of existence in the animal kingdom. Some of the most interesting films of this character deal with the life-history and habits of the much-maligned but little understood blue-bottle. By the average person this insect is regarded as nothing more nor less than an unmitigated nuisance, but yet, in common with many other members of its species, it possesses marvellous individuality and is gifted with prodigious strength. An excellent representation of these marvels of creation has recently been secured upon the kinematograph film by Mr Frank P. Smith, the well-known entomologist, who has devoted considerable time to the study of this diminutive specimen of Nature's handiwork. Instead of obtaining a purely technical pictorial representation, however, the investigator hit upon some novel means of illustrating a scientific fact which appeals to the popular taste. The fly is a highly developed organism, and owing to an extensive series of tracheal tubes ramifying throughout its body for respiration, oxygenation of the blood-fluid takes place very quickly, and consequently there is an enormous development of energy. In one instance a blue-bottle is seen lying on its back balancing and rotating a small cork sphere about as large as a pea with its feet, assisted by its wonderful trunk, in the approved juggler manner, while a second fly is maintaining its equilibrium upon the upper face of the ball. In another instance the ball is supplanted by a small revolving wheel, which the insect spins rapidly by the movement of its feet. Possibly, however, the most remarkable of this series of pictures is that where a fly, without any restraint whatever, is shown walking up the edge of a wheel and causing it to revolve in so doing. To induce the fly to accomplish this feat the entomologist had to exercise commendable patience and resort to artifice. A special apparatus, comprising a dark box with a small aperture at one end glazed with glass, was built. This glass door was attached to an escapement similar to that of a pendulum clock. The maddened fly, in its efforts to escape through the glass, received a slight tap on the head every time it struck the glass, and in course of time, under the repetition of these blows, abandoned the idea of flying, and instead attempted to walk up the wheel. When it became thoroughly tractable it was removed from the box and placed on the wheel in the open, and by dint of much patience the necessary pictorial record was made. It must be understood, however, that such success does not imply that the fly can be trained, since very often the insect, after incarceration in its prison for some twelve days, immediately flew away on being released, only a very few commencing to walk or turn the wheel when placed upon it. The feat was accomplished by the deception of the fly, which evidently thought it was walking over a fixed surface when turning the wheel, rather than by the development of any intelligence on its part; so that to maintain that such insects are capable of being trained, or to attribute any such term to this work of the entomologist, as is the general tendency, is absurd.

THIS WAS A ROSE.

THIS was a rose—this handful of dust!—
And I only weep because I must;
For it seemeth to me but yesteryear
That I made me a shrine and hid it here.

It had lain on her breast for a little while,
In the light of her eye, her lips' warm smile;
So I laid it away in this sacred place,
In the folds of her dainty kerchief's lace.

'Twas vivid then, like her own red mouth,
With the passion and glow of the sun-kissed south.
This was a *rose*—this handful of dust!—
And I weep—I weep—because I must.

SIXTH SERIES.

THE LEADING ARTICLE.

By MICHAEL MACDONAGH.

CARLYLE rails characteristically against the ready writer of the newspapers. Hear him growling in one of his splenetic moods: 'Consider his leading articles, what they treat of, how passably they are done. Straw that has been thrashed a hundred times without wheat, ephemeral sound of a sound, such portent of the hour as all men have seen a hundred times turn out inane; how a man with merely human faculty buckles himself nightly with new vigour and interest to this thrashed straw, nightly thrashes it anew, nightly gets up new thunder about it, and so goes on thrashing and thundering for a considerable series of years—this is a fact remaining still to be accounted for in human physiology. The vitality of man is great.'

So far as I know, Carlyle is the only master-mind that is scornful of the leading article; and there are few institutions in this world that he has not condemned and anathematised. Newman, in one of his charming and most suggestive essays upon literature, refers in the highest terms of praise to the great ability and skill of the modern daily press. Indeed, this great master of style goes so far as to say that much of the newspaper writing of his time is finer in point of style alone than a preface of Dryden or the pamphlets of Swift, or even the essays in the *Spectator* by Addison. It is the tribe of literary dilettanti who have always been most prone to affect disdain of the leader-writer. Only the other day I read an address by a minor poet in which there was one of the customary disparaging references to the press. He said that literature had been degraded by 'the mark of the inky thumb of the journalist.' There was the sneer of intellectual superciliousness, also, at 'the English of the leading article.' The poet, perhaps, was unaware of the adverse or uncongenial conditions under which the leading article is generally produced. To fashion and polish a sonnet the poet may devote a month's incubation and the cleanest and most delicate of hands, amid surroundings serenely calculated to inspire exquisite thoughts. Night after night for many years the journalist, running a race with the clock, dashes off his leading article in a couple of hours, with, perhaps, more than his thumb inky, and the bustle and rush of a newspaper office beating around his table, while messengers carry off his reflections, slip by slip, unrevised, to feed the compositors upstairs.

Yet it is a creditable piece of work as a rule, a sensible and sometimes weighty discourse on some topic of the day, making up by its freshness and virility of utterance for its inevitable lack of literary finish. Indeed, there is nothing more remarkable in the marvellous achievements of journalism than the ability, public spirit, and conscience that are expended worthily in the writing of leading articles.

Dr Johnson was once asked how he had acquired his extraordinary power of expressing ideas on any subject in conversation unhesitatingly and with force and felicity of diction. 'I always try to have something to say,' he replied, 'and to say it as well as I can.' That, it seems to me, is the golden rule of leader-writers. Have something to say on many topics, and be able to say it clearly, earnestly, and promptly. An 'all-round leader-writer'—that is, a man who is expected to write well or passably on a variety of subjects, and to write often against time—finds the work, if he aims at doing it conscientiously, very trying and very arduous, unless he is possessed of a well-informed and cultivated mind and has at command a skilful and ready pen. He must be widely read, especially in literature, history, and politics, and must carry in his memory a mass of varied, accurate, and well-assorted knowledge on these subjects, ready for use at a moment's call. He must be a careful observer of the drift of public opinion. He must be a man of sound sense and shrewd judgment, without crotchets, without conceit, of a liberal and thoughtful mind, capable of looking at a question from different standpoints. He must have that

[*All Rights Reserved.*]

ready command of language and facility for happy and forcible phrasing which are essential not only to clear and forcible presentation of ideas but to rapidity of composition.

A leader-writer must be, above all things, a ready writer. Charm and beauty of form, the qualities of literature, are not required in a leading article. Lord Morley, a brilliant leader-writer as well as a great littérateur, lays down what he calls a highly important maxim for those who pursue literature, which applies, I think, with even greater force to the writing of leading articles. 'It is a great mistake,' he says, 'to expend more time and labour on a piece of composition than is enough to make it serve the purpose in hand.' The purpose of a leading article is to express an opinion upon one of the public topics of the hour, political, religious, or social. As a rule it has but the briefest of existences. Published to-day, to-morrow forgotten. Frequently it has to be composed with the utmost haste. News of an unexpected occurrence, sensational in its relation to the political or social world, is often received in the newspaper office within an hour of going to press. The arrangements for the leading articles had, of course, been long ago completed. Nevertheless, it is absolutely necessary that the morning paper should have an editorial comment on this grave event, which happened without the slightest forewarning. A more common experience is that the leader-writer is compelled to wait until very late at night for the report of an important pronouncement by a leading statesman in Parliament or in the country, upon which he is to produce an article. It is obvious that in these circumstances bewildering speed must often necessarily attend the labours of the writer of the 'leader.' He must, therefore, have the gift of rapid composition. There must be no indecision as to what to say. There must be no fastidious choosing of words. He cannot afford to lose a minute for any consideration whatever. He must set to work quickly and decisively; and while he has, of course, to compose with inward care, he cannot afford to attempt to put a greater polish on the article than its intrinsic character and its purpose demand.

I know a very able university man who was engaged as a leader-writer on a London newspaper. He did varied and capable work on politics, social questions, historic anniversaries, topics of antiquarian interest so long as he received his subject in the afternoon, and had four or five hours in which leisurely to compose the article. But one night he happened to be the only man available in the office when news arrived of one of those startling occurrences which occasionally take the newspapers by surprise, and nevertheless demand treatment in a 'leader.' He sat down, in obedience to the hurried summons of the editor, to supply the essential comment. But he could not make up his mind swiftly, and he had not the faculty of ready writing. In that sudden emergency he found himself incapable of saying anything with point on the subject. The latest minute at which the printers could take copy, and send the paper to the machines at the fixed hour, inexorably struck, and found him with only a few cold sentences on a single slip of paper. His slow-moving though powerful mind was unable to cope with the ruthless conditions of daily journalism.

Be it said that the hesitation of the philosopher, fearful of pronouncing a rash judgment, the leisure of the scholar, anxious to verify his facts, and the fastidiousness of the stylist, pondering over and weighing every word, are unsuited to the circumstances under which the 'leader' is normally produced. The leader-writer must have go and dash. It is his fate not to be studied, but simply to be read. A piece of composition which is perfunctorily discussed at the breakfast-table, or quickly scanned in train or tram, is perhaps best written rapidly. William Arnold, for many years a leader-writer on the *Manchester Guardian*, used to say very aptly that if those who ran might read, then it was best to write running. Therefore, in leader-writing rapid composition is the most valuable of all qualities. Without it no amount of those excellent gifts, knowledge and capacity and experience, will make leader-writing anything but drudging and exhausting hack-work. At any rate, without it, it is impossible to put knowledge and capacity and experience to account in leader-writing. Capable leader-writers are men who, first and foremost, can write fast. William Arnold, as we are told by his colleague, Mr C. E. Montague, composed a leading article as fast as the pen could move. Sir Wemyss Reid was one of the most successful of journalists. He climbed from the lowest to the highest positions in the newspaper world. His good fortune was to be ascribed mainly to his readiness as a writer. I have heard him boast that he could dictate a leading article of fifteen hundred words at the phenomenal speed of twenty minutes, and write one in three-quarters of an hour. What is more remarkable is that he could write his 'leader' with people talking around him, and felt no difficulty in joining in the conversation. The articles of this untiring and versatile journalist were capable and honest journalism. At least, they fully served the purpose for which they were intended, and that is their sufficient justification. Another swift leader-writer was Sir J. Fitzjames Stephen, who in the sixties and seventies wrote 'leaders' for the *Pall Mall Gazette*. It was his custom after an early breakfast to dash off the article and leave it at the newspaper office on his way to the Law Courts. His brother, Leslie Stephen, says: 'Articles came from him as easily as ordinary talk. The fountain seemed to be always full, and had only to be turned on to the desired end.' This readiness in conception and rapidity in execution is often the result of a habit of mind which may gradually be acquired. With practice, the brain can be made to work rapidly almost as well as it can work

slowly. Indeed, I have heard a very ready journalist declare that the work he rapidly dictates to a shorthand writer is far superior in dash and finish to work which he writes himself and on the composition of which he spends a great deal more time and thought.

Another faculty indispensable to the leader-writer is the power of detachment and complete concentration in the midst of distractions. At a Press Club dinner in London a few years ago Lord Morley made a most interesting autobiographical confession. 'It was whilst I was writing a leading article for a certain periodical that I received a letter from an illustrious statesman, offering me a post in his Cabinet,' said he. 'Gentlemen, so strong in me was the journalistic instinct that, after accepting the illustrious statesman's offer, I went back and finished that leading article! And I can assure you,' he added when the cheers which greeted this statement had died away, 'that neither the grammar nor the style of the latter half of the article fell short of my usual standard.' Surely the concluding passages of that 'leader,' written under the exultation of a great personal triumph, must have immensely exceeded its opening in weight and animation and eloquence. But, unhappily, it is not to radiant and inspiring interruptions of such a nature that leader-writers are usually subjected. They have not only to work against time in the jaded hours of the night, when the physical and mental capacities are at their lowest vitality; but to work within earshot of noisy machinery, amid the banging of doors, the rush of many feet along the passages, the shoutings of sub-editors and printers, and the periodical visits of the messengers of the composing-room on the search for 'copy.' Some leader-writers, indeed, find in the atmosphere of the newspaper office the frame of mind or the train of thought best suited for the production of a 'leader.' The very distractions of that busy hive inspire them. The smell of printers' ink mounts, like wine, exhilaratingly to their brain.

Dr Johnson had a deeply rooted prejudice against those who in his day were called 'news-writers,' the predecessors of the leader-writers of our time. In one of his *Idler* papers the Doctor says: 'I know not whether more is to be dreaded from streets filled with soldiers accustomed to plunder or from garrets filled with scribblers accustomed to lie.' How ridiculous it seems to associate in any way the blameless citizens who now preach to us from the editorial columns of the newspapers with a licentious soldiery unloosed upon the community! Many a man who calls himself 'we' in a morning newspaper lives the most retired and obscurest of existences in a flat or a small house in the suburbs. Probably the worst that his neighbours can say against him is that he looks at things, no matter how apparently trivial, through his glasses with eager inquisitiveness. But that is simply a manifestation of the fear of the journalist, for whom there is 'copy' in all things, that an idea or fact worth having should pass by him unnoticed. He dresses ordinarily. Nor is he above discussing the weather with a neighbour. It may be that the neighbour has not the faintest suspicion that this man, who asks him over his garden-paling whether he thinks it will rain, is the main spokesman of that great daily paper the *Leader*, the writer of those earnest and weighty reflections and admonitions on public affairs in the editorial columns. The identity of the leader-writer is merged absolutely in the individuality of the journal for which he writes. The controlling minds of the daily newspapers are, even in this age of publicity, unknown so far as the general public are concerned. In a few instances the editor may be a personality, but the writers of the articles which help so powerfully to form public opinion are almost without exception written by men whose names even have never been heard of by their readers. George Charles Brodrick, who wrote about sixteen hundred leading articles in the *Times*, 'fantastic in their variety,' as he says, complains, in his *Memories and Impressions*, of the sense of isolation induced by the maintenance of a strict anonymity. Occasionally this self-obliteration greatly depressed him. He pined for recognition. But if his services brought no public acknowledgment, he found consolation in the thought that he was 'doing the work of an unrecognised statesman, and exercising a greater influence on public opinion than any politician except a very few in the foremost rank.'

But it is not only that the leader-writer is denied the pleasure of public distinction. His work is quickly overtaken by oblivion. Harriet Martineau wrote for the *Daily News* as many as sixteen hundred leading articles, at the rate, for months in succession, of six in a week. These productions were thought so valuable that it was once proposed to republish twelve volumes of them. But the writer did not favour the proposal. 'Three volumes would be enough, as so many of the articles are merely temporary,' she modestly said. However, none of the articles were reprinted. With the countless productions of thousands of other untiring journalists, they lie buried and unknown in many a dust-laden newspaper file. But Frederick Knight Hunt, editor of the *Daily News*, was most enthusiastically appreciative of Harriet Martineau's leading articles. He told her brother that they moulded public opinion through Parliament. 'They are read in the clubs,' he said. 'They precede the debates, and mollify the *Times*. The *Daily News* leads.' On another occasion he declared, 'These are not newspaper articles, but poems.' Yet in a letter to Harriet Martineau herself he indulges in some interesting reflections on leading articles and their writers which show that his standard of excellence was high. 'Our contributors,' he says, 'never write more than four articles a week at most. It is all the best of them

could fairly do. And political writers commonly deteriorate. The first article is excellent, and we think we have found a treasure. The second is less striking. But we are not surprised that so high a standard cannot in every instance be maintained. At the third we say, "Have we not read something like this very lately?" The next is so manifest a falling off that we desire no more.'

The life of every day is now so full, so busy, and so interesting that few readers are able, without an effort, to recall at its close what was said in the morning paper. At any rate, as the leader-writer goes to his work he finds the public engrossed in the evening papers. What he writes to-night is obliterated from the minds of his readers at the longest the day after to-morrow. But, after all, a short memory in his readers, and its consequent quick forgetfulness of his articles, has its compensations for the leader-writer. He is compelled to deal often with the same topic. He must, therefore, necessarily repeat himself; but, thanks to the merciful oblivion to which his work quickly passes, for its readers it always possesses freshness and originality. The shortness of the public memory is in many things a curse. To the leader-writer it is a blessing in disguise.

THE HOUSE OF WHISPERS.

CHAPTER XXXIV.—SURPRISES MR FLOCKART.

'WELL, you and your friend Felix have placed me in a very pleasant position, haven't you?' asked Lady Heyburn of Flockart, who had just entered the green-and-white morning-room at Park Street. 'I hope now that you're satisfied with your blunder.'

The man addressed, in a well-cut suit of gray, a fancy vest, and patent-leather boots, and still carrying his hat and stick in his hand, turned to her in surprise.

'What do you mean?' he asked. 'I arrived from Paris at five this morning, and I've brought you good news.'

'Nonsense!' cried the woman, starting from her chair in anger. 'You can't deceive me any longer.'

'Krail has discovered the whole game. The syndicate held a meeting at the office in Paris. He and I watched the arrivals. We now know who they are and exactly what they are doing. By Jove! we never dreamed that your husband, blind though he is, is head of such a smart and influential group. Why, they're the first in Europe!'

'What does that matter? Krail wants money; so do we; but even with all your wonderful schemes we get none.'

'Wait, my dear Winnie; remain patient, and we shall obtain plenty.'

It was indeed strange for a woman within that smart town-house, and with her electric brougham at the door, to complain of poverty. The house had been a centre of political activity in the days before Sir Henry met with his terrible affliction. The room in which the pair stood had been the scene of many a private and momentous conference, and in the big drawing-room upstairs many a Cabinet Minister had bent over the hand of the fair Lady Heyburn.

Into the newly decorated room, with its original Adams ceiling, its dead-white panelling and antique overmantel, shone the morning sun, weak and yellow as it always is in London in the springtime.

Lady Heyburn, dressed in a smart walking-gown of gray, pushed her fluffy fair hair from her brow, while upon her face was an expression which told of combined fear and anger.

Her visitor was surprised. After that watchful afternoon in the Boulevard des Capucines, he had sat in a corner of the Café Terminus listening to Krail, who rubbed his hands with delight and declared that he now held the most powerful group in Europe in the hollow of his hand.

For the past six years or so gigantic *coups* had been secured by that unassuming and apparently third-rate financial house of Lénard et Morellet. From a struggling firm they had, within a year, grown into one whose wealth seemed inexhaustible, and whose balances at the Credit Lyonnais, the Société Générale, and the Comptoir d'Escompte were possibly the largest of any of the customers of these great corporations. The financial world of Europe had wondered. It was a mystery who was behind Lénard et Morellet, the pair of steady-going, highly respectable business men who lived in unostentatious comfort, the former at Enghien, just outside Paris, and the latter out in the country at Melum. The mystery was so well and so carefully preserved that not even the bankers themselves could obtain knowledge of the truth.

Krail had, however, after nearly two years of clever watching and ingenious subterfuge, succeeded, by placing the group in a 'hole' in calling them together in Paris. That they met, and often, was undoubted. But where they met, and how, was still a complete mystery.

As Flockart had sat the previous evening listening to Krail's unscrupulous and self-confident proposals, he had remained in silent wonder at the man's audacious attitude. Nothing deterred him; nothing daunted him.

Flockart had returned that night from Paris, gone to his chambers in Half-Moon Street, breakfasted, dressed, and had now called upon her ladyship in order to impart to her the good news.

Yet, instead of welcoming him, she only treated him with resentment and scorn. He knew the quick flash of those eyes; he had seen it before on other occasions. This was not the first time they had quarrelled; yet he, keen-witted and cunning, had always held her powerless to elude him, had always compelled her to give him the sums he so constantly demanded. This morning, however, she was distinctly resentful, distinctly defiant.

For an instant he turned from her, biting his lip in annoyance. When facing her again, he smiled, asking, 'Tell me, Winnie, what does all this mean?'

'Mean!' echoed the Baronet's wife. 'Mean! How can you ask me that question? Look at me—a ruined woman! And you'——

'Speak out!' he cried. 'What has happened?'

'You surely know what has happened. You have treated me like the cur you are—and that is speaking plainly. You've sacrificed me in order to save yourself.'

'From what?'

'From exposure. To me, ruin is not a matter of days but of hours.'

'You're speaking in enigmas. I don't understand you,' he cried impatiently. 'Krail and I have at last been successful. We know now the true source of your husband's huge income, and in order to prevent exposure he must pay—and pay us well, too.'

'Yes,' she laughed hysterically. 'You tell me all this after you've blundered.'

'Blundered! How?' he asked, surprised at her demeanour.

'What's the use of beating about the bush?' asked her ladyship. 'The girl is back at Glencardine. She knows everything, thanks to your foolish self-confidence.'

'Back at Glencardine!' gasped Flockart. 'But she dare not speak. By heaven! if she does—then—then'——

'And what, pray, can you do?' inquired the woman harshly. 'It is I who have to suffer, I who am crushed, humiliated, ruined, while you and your precious friend shield yourselves behind your cloaks of honesty! You are Sir Henry's friend. He believes you to be such—*you!*' And she laughed the hollow laugh of a woman who was staring death in the face. She was haggard and drawn, and her hands trembled with nervousness which she strove in vain to repress. Lady Heyburn was desperate.

'He still believes in me, eh?' asked the man, thinking deeply, for his clever brain was already active to devise some means of escape from what appeared to be a distinctly awkward dilemma. He had never calculated the chances of Gabrielle's return to her father's side. He had believed that impossible.

'I understand that my husband will hear no word against you,' replied the tall, fair-haired woman. 'But when I speak he will listen, depend upon it.'

'You dare!' he cried, turning upon her in threatening attitude. 'You dare utter a single word against me, and, by heaven! I'll tell what I know. The country shall ring with a scandal—the shame of your attitude towards the girl, and a crime for which you will be arraigned, with me, before an assize-court. Remember!'

The woman shrank from him. Her face had blanched. She saw that he was equally as determined as she was desperate. James Flockart always kept his threats. He was by no means a man to trifle with.

For a moment she was thoughtful, then she laughed defiantly in his face. 'Speak! Say what you will. But if you do, you suffer with me.'

'You say that exposure is imminent,' he remarked. 'How did the girl manage to return to Glencardine?'

'With Walter's aid. He went down to Woodnewton. What passed between them I have no idea. I only returned the day before yesterday from the South. All I know is that the girl is back with her father, and that he knows much more than he ought to know.'

'Murie could not have assisted her,' Flockart declared decisively. 'The old man suspects him of taking those Russian papers from the safe.'

'How do you know he hasn't cleared himself of the suspicion? He may have done so. The old man dotes upon the girl.'

'I know all that.'

'And she may have turned upon you, and told the truth about the safe incident. That's more than likely.'

'She dare not utter a word.'

'You're far too self-confident. It is your failing.'

'And when, pray, has it failed? Tell me.'

'Never, until the present moment. Your bluff is perfect; yet there are moments when it cannot aid you, depend upon it. She told me one night long ago, in my own room, when she had disobeyed, defied, and annoyed me, that she would never rest until Sir Henry knew the truth, and that she would place before him proofs of the other affair. She has long intended to do this; and now, thanks to your attitude of passive inertness, she has accomplished her intentions.'

'What!' he gasped in distinct alarm; 'has she told her father the truth?'

'A telegram I received from Sir Henry late last night makes it only too plain that he knows something,' responded the unhappy woman, staring straight before her. 'It is your fault—your fault!' she went on, turning suddenly upon her companion again. 'I warned you of the danger long ago.'

Flockart stood motionless. The announcement which the woman had made staggered him.

Felix Krail had come to him in Paris, and after

some hesitation, and with some reluctance, had described how he had followed the girl along the Nene bank and thrown her into the deepest part of the river, knowing that she would be hampered by her skirts and that she could not swim. 'She will not trouble us further. Never fear!' he had said. 'It will be thought a case of suicide. Her mental depression is the common talk of the neighbourhood.'

And yet the girl was safe, and now home again at Glencardine! He reflected upon the ugly facts of 'the other affair' to which her ladyship sometimes referred, and his face went ashen pale.

Just at the moment when success had seemed certain after all their ingenuity and all their endeavours—just at a moment when they could demand and obtain what terms they liked from Sir Henry to preserve the secret of the financial combine—came this catastrophe.

'Felix was a fool to leave his work only half-done,' he remarked aloud, as though speaking to himself.

'What work?' asked the hollow-eyed woman eagerly. But he did not satisfy her. To explain would only increase her alarm and render her even more desperate than she was.

'Did I not tell you often that from her we had all to fear?' cried the woman frantically. 'But you would not listen. And now I am—I'm face to face with the inevitable. Disaster is before me. No power can avert it. The girl will have a bitter and terrible revenge.'

'No,' he cried quickly, with fierce determination. 'No; I'll save you, Winnie. The girl shall not speak. I'll go up to Glencardine to-night and face it out. You will come with me.'

'I!' gasped the shrinking woman. 'Ah, no. I—I couldn't. I dare not face him. You know too well I dare not!'

CHAPTER XXXV.—DISCLOSES A SECRET.

THE gray mists were still hanging upon the hills of Glencardine, although it was already midday, for it had rained all night, and everywhere was damp and chilly.

Gabrielle, in her short tweed skirt, golf-cape, and motor-cap, had strolled, with Walter Murie at her side, from the house along the winding path to the old castle. From the contented expression upon her pale, refined countenance, it was plain that happiness, to a great extent, had been restored to her.

When he had gone to Woodnewton it was to fetch her back to Glencardine. He had asked for an explanation, it was true; but when she had refused one he had not pressed her. That he was puzzled, sorely puzzled, was apparent.

At first Sir Henry had point-blank refused to receive his daughter. But on hearing her appealing voice he had to some extent relented; and though strained relations still existed between them, yet happiness had come to her in the knowledge that Walter's affection was still as strong as ever.

Young Murie had, of course, heard from his mother the story told by Lady Heyburn concerning the offence of her step-daughter. But he would not believe a single word against her.

They had been strolling slowly, and she had been expressing her heartfelt thanks for his action in taking her from that life of awful monotony at Woodnewton. Then he, on his part, had pressed her soft hand and repeated his promise of lifelong love.

They had entered the old, grass-grown courtyard of the castle, when suddenly she exclaimed, 'How I wish, Walter, that we might elucidate the secret of the Whispers!'

'It certainly would be intensely interesting if we could,' he said. 'The most curious thing is that my old friend Edgar Hamilton, who is secretary to the well-known Baron Conrad de Hetzendorf, tells me that a similar legend is current in connection with the old château in Hungary. He had heard the Whispers himself.'

'Most remarkable!' she exclaimed, gazing blankly around at the ponderous walls about her.

'My idea always has been that beneath where we are standing there must be a chamber, for most medieval castles had a subterranean dungeon beneath the courtyard.'

'Ah, if we could only find entrance to it!' cried the girl enthusiastically. 'Shall we try?'

'Have you not often tried, and failed?' he asked laughingly.

'Yes; but let us search again,' she urged. 'My strong belief is that entrance is not to be obtained from this side, but from the glen down below the old castle.'

'Yes; no doubt in the ages long ago the hill was much steeper than it now is, and there were no trees or undergrowth. On that side it was impregnable. The river, however, in receding, silted up much earth and boulders at the bend, and has made the ascent possible.'

Together they went to a breach in the ponderous walls and peered down into the ancient river-bed, now but a rippling burn.

'Come,' said Murie, 'let us descend and explore.'

So they retraced their steps, and when about half-way to the house they left the path and went down to the bottom of the beautiful glen until they were immediately beneath the walls of the old castle.

The spot was remote and seldom visited. Few ever came there, for it was approached by no path on that side of the burn, so that the keepers always passed along the opposite bank. They had no

necessity to penetrate there. Besides, it was too near the house.

Through the bracken and undergrowth, passing by big trees that in the ages had sprung up from seeds dropped by the birds or sown by the winds, they slowly ascended to the frowning walls far above—the walls that had withstood so many sieges and the ravages of so many centuries.

Half-a-dozen times the girl's skirt became entangled in the briars, and once she tore her cape upon some thorns; but, enjoying the adventure, she went on, Walter going first and clearing a way for her as best he could.

'Nobody has ever been up here before, I'm quite certain,' Gabrielle cried, halting, breathless, for a moment. 'Old Stewart, who says he knows every inch of the estate, has never climbed here, I'm sure.'

'I don't expect he has,' declared her lover.

At last they found themselves beneath the foundations of one of the flanking-towers of the castle walls, whereupon he suggested that if they followed the wall right along and examined it closely they might discover some entrance.

'I somehow fear there will not be any door on the exposed side,' he added.

The base of the walls was all along hidden by thick undergrowth; therefore the examination proved extremely difficult. Nevertheless, keenly interested in their exploration, the pair kept on struggling and climbing until the perspiration rolled off both their faces.

Suddenly Walter uttered a cry of surprise. 'Why, look here! This seems like a track. People *have* been up here after all!'

And his companion saw that from the burn below, up through the bushes, there ran a narrow, winding path, which showed little sign of being used.

Walter went on before her, quickly following the path until it turned at right-angles and ended before a low door of rough wood which filled a small breach in the wall—a breach made, in all probability, at the last siege in the early seventeenth century.

'This must lead somewhere!' cried Walter excitedly; and, lifting the roughly constructed wooden latch, he pushed the door open, disclosing a cavernous darkness.

A dank, earthy smell greeted their nostrils. It was certainly an uncanny place.

'By Jove!' cried Walter, 'I wonder where this leads to;' and, taking out his vestas, he struck one, and, holding it before him, went forward, passing through the breach in the broken wall into a stone passage which led to the left for a few yards and gave entrance to exactly what Gabrielle had expected—a small, windowless stone chamber probably used in olden days as a dungeon.

Here they found, to their surprise, several old chairs, a rough table formed of two deal planks upon trestles, and a couple of half-burned candles in candlesticks which Gabrielle recognised as belonging to the house. These were lit, and by their aid the place was thoroughly examined.

Upon the floor was a heap of black tinder where some papers had been burnt weeks or perhaps months ago. There were cigar-ends lying about, showing that whoever had been there had taken his ease.

In a niche was a small tin box containing matches and fresh candles, while in a corner lay an old newspaper, limp and damp, bearing a date six months before. On the floor, too, were a number of pieces of paper—a letter torn to fragments.

They tried to piece it together, laying it upon the table carefully, but were unsuccessful in discovering its import, save that it was in Russian, from somebody in Odessa, and addressed to Sir Henry Heyburn.

Carrying the candles in their hands, they went into the narrow passage to explore the subterranean regions of the old place. But neither way could they proceed far, for the passage had fallen in at both ends and was blocked by rubbish. The only exit or entrance was by that narrow breach in the wall so cunningly concealed by the undergrowth and closed by the rudely made door of planks nailed together. Above, in the stone roof of the chamber, there was a wide crack running obliquely, through which any sound could be heard in the courtyard above.

They remained in the narrow, low-roofed little cell for a full half-hour, making careful examination of everything, and discussing the probability of the Whispers heard in the courtyard above emanating from that hidden chamber.

For what purpose was the place used, and by whom? In all probability it was the very chamber in which Cardinal Setoun had been treacherously done to death.

Though they made a most minute investigation they discovered nothing further. Up to a certain point their explorations had been crowned by success, yet the discovery rather tended to increase the mystery than diminish it.

That the Whispers were supernatural Gabrielle had all along refused to believe. The question was, to what use was that secret chamber put?

At last, more puzzled than ever, the pair, having extinguished the candles, emerged again into the light of day, closing and latching the little door after them.

Then, following the narrow secret path, they found that it wound through the bushes, and emerged by a circuitous way some distance along the glen, its entrance being carefully concealed by a big, lichen-covered boulder which hid it from any one straying there by accident. So near was it to the house, and so well concealed, that no keeper had ever discovered it.

'Well,' declared Gabrielle, 'we've certainly made a most interesting discovery this morning. But I

wonder if it really does solve the mystery of the Whispers?'

'Scarcely,' Walter admitted. 'We have yet to discover to whom the secret of the existence of that chamber is known. No doubt the Whispers are heard above through the crack in the roof. Therefore, at present, we had better keep our knowledge strictly to ourselves.'

And to this the girl, of course, agreed.

They found Sir Henry seated alone in the sunshine in one of the big bay-windows of the drawing-room, a pathetic figure, with his blank, bespectacled countenance turned towards the light, and his fingers busily knitting to employ the time which, alas! hung so heavily upon his hands.

Truth to tell, with Flockart's influence upon him, he was not quite convinced of the sincerity of either Gabrielle or Walter Murie; therefore, when they entered, and his daughter spoke to him, his greeting was not altogether cordial.

'Why, dear dad, how is it you're sitting here all alone? I would have gone for a walk with you had I known.'

'I'm expecting Goslin,' was the old man's snappy reply. 'He left Paris yesterday, and should certainly have been here by this time. I can't make out why he hasn't sent me a wire explaining the delay.'

'He may have lost his connection in London,' Murie suggested.

'Perhaps so,' remarked the Baronet with a sigh, his fingers moving mechanically.

Murie could see that Sir Henry was unnerved and unlike himself. He, of course, was unaware of the great interests depending upon the theft of those papers from the safe. Sir Henry was anxious to hear from Goslin what had occurred at the urgent meeting of the secret syndicate in Paris.

Gabrielle was chatting gaily with her father in an endeavour to cheer him up, when suddenly the door opened, and Flockart, still in his travelling-ulster, entered, exclaiming, 'Good-morning, Sir Henry!'

'Why, my dear Flockart, this is really quite unexpected. I—I thought you were abroad,' cried the Baronet, his face brightening as he stretched out his hand for his visitor to grasp.

'So I have been. I only got back to town yesterday morning, and left Euston last night.'

'Well,' said Sir Henry, 'I'm very glad you are here again. I've missed you very much—very much indeed. I hope you'll make another long stay with us at Glencardine.'

The man addressed raised his eyes to Gabrielle's. She looked him straight in the face, defiant and unflinching. The day of her self-sacrifice to protect her helpless father's honour and welfare had come. She had suffered much in silence—suffered as no other girl would suffer; but she had tried to conceal the bitter truth. Her spirit had been broken. She was obsessed by one fear, one idea.

For a moment the girl held her breath. Walter saw the sudden change in her countenance, and wondered.

Then, with a calmness that was surprising, she turned to her father, and in a clear, distinct voice said, 'Dad, now that Mr Flockart has returned, I wish to tell you the truth concerning him—to warn you that he is not your friend, but your very worst enemy!'

'What is that you say?' cried the man accused, glaring at her. 'Repeat those words, and I will tell the whole truth about yourself—here, before your lover!'

The blind man frowned. He hated scenes. 'Come, come,' he urged, 'please do not quarrel.—Gabrielle, I think, dear, your words are scarcely fair to our friend.'

'Father,' she said firmly, her face pale as death, 'I repeat them. That man standing there is as much your enemy as he is mine!'

Flockart laughed satirically. 'Then I will tell my story, and let your father judge whether you are a worthy daughter,' he said.

(To be continued.)

POSTAL DERELICTS.

AS is generally known, there is periodically a sale by public auction of all articles which, having passed through the delivery departments of the various post-offices, fail to reach their destination, and find their way back to what is known as the 'Dead' or 'Returned' Letter Office of the London General Post-Office. At first sight one is amazed at the vast number of articles thus returned in the course of a single year.

For instance, no less than 31,278,000 such articles, which include letters, post-cards, newspapers, and parcels, were sent back to the Returned Letter Office, as being undeliverable, during the year ending 31st March 1908. But when we discover that during the same period the number of similar articles actually dealt with by the staff was 4,972,070,000 one's amazement takes another direction.

In view of the immense number of postal packets passing through the department every year, and allowing for the inevitable, the postal authorities deserve the highest praise, and we can readily sympathise with them in their complaint as to the carelessness shown by the general public in addressing their correspondence. It would be well if the lesson contained in the following figures was taken to heart:

The number of letters dealt with and undelivered were in 1906–07, 11,120,695 and 980,960; in 1907–08, 11,745,992 and 1,145,551. The number of parcels dealt with and undelivered were in 1907–08, 244,406 and 14,722.

'The undeliverable registered letters and letters containing articles of value numbered 393,298. . . . These letters contained £19,378, 16s. 6d. in cash and bank-notes, and £636,680, 17s. in bills, cheques, money-orders, postal-orders, and postage-stamps.'

All this is bad enough; but something far worse follows. We can all understand the young (or old) man in a hurry who in his haste fails to put a sufficiently explicit address upon his letter; but what is to be said of him who drops his missive into the ubiquitous pillar-box without having put *any* address upon it at all? Yet there are such persons, as is evidenced by the fact that 379,426 such unaddressed communications were posted in the ordinary way during 1904, and, as a result, were 'run in' to the Returned Letter Office. The odd thing about these letters is that 4190 contained valuable property, including £345 in cash and bank-notes and £9685 in various forms of remittances, while one unaddressed letter contained a cheque for £1500! It is pleasant to read, in connection with these unaddressed letters, that 'it was found possible to restore the greater number of them to the senders,' by sending a form to banks, and by tracking the name and address of senders.

The owners of the loose money appear to have been more fortunate in this respect than the owners of the large quantity of loose goods which was found in the post during the year, and which subsequently came under the auctioneers' hammer in Covent Garden.

The difficulty in connection with returned letters and their enclosures is, however, slight in comparison with that experienced with goods, &c., as in the former case there is generally some clue to the sender, while in the case of goods there is seldom anything to indicate from whom the articles come; and thus it is that a very large amount of property—some of it perishable—has to be disposed of by the authorities, who cannot be expected to warehouse it at the public expense for any length of time.

So it comes about that there is an annual general clearance sale, all such goods being sent to some well-known auctioneer—generally Messrs Debenham & Storr—and advertised for sale on a given date, when they are sold for what they will fetch.

In consequence of information received, the writer attended one of these sales lately, and, from what he saw of the class of goods transmitted through the post now and again, it is doubtful whether any other establishment in England (not excluding pawnbrokers) had such a motley collection of wares to dispose of as was then scattered about the ground-floor at King Street, Covent Garden.

As there seems to be a wonderful similarity in the nature of the articles sent for sale annually—the manager assured the writer that the lots seldom vary in quality—it will be as well to quote from the printed catalogue of that sale, which was represented as having a strong family likeness to all its predecessors.

In this formidable document, with its sixteen closely printed pages, this notice appears in a conspicuous position: 'The following one hundred and thirty lots are from the Returned Letter Office, to be sold by order of H.M. Postmaster-General.' Then follows the official description of each lot, some of which are here given as they were scheduled by the auctioneer:

1. The Dragon of Pekin, Out in the Forty-five, Everyday Battles, Folly and Fresh Air, Sanford and Merton, and 15 others.
2. Infelice, Richard Dred, Ashes of the Empire, Donald and Dorothy, South Africa and Transvaal War (3), and 12 others.
3. British Empire, Sir Hector, Poor Jack, The Fair Imperialist, My Ladies Three, and 15 others.
4. Britons at Bay, The Briton's First Duty, Adam Bede, Flames, Children of Hermes, Across the World for a Wife, and 13 others.
5. The Valiant Runaways, Nellie Arundel, Harold the King, Cynic's Conscience, Memoirs of Marshal Oudinot, Barbara Leybourne, and 14 others.
6. History of the English Turf, Little Women and Little Wives, Babe in Bohemia, and 28 others (various).

Turning over to the next page of the catalogue, quite a different kind of ware presents itself, and we find that some 'two hundred and forty pieces of operatic, vocal, and instrumental music' having been made to do duty as a headline, the following prosaic list is thrust upon our attention, and it certainly is in the highest degree symptomatic of much not calling for annotation here:

60. About 85 children's picture-books (various), 70 blotters, pocket-books, views, &c.
61. 9 pairs of pants and 10 undervests.
62. 24 white and coloured shirts (various).
63. Pair of flannel trousers and vest, 4 jackets, 7 vests, 4 pairs of trousers, and mackintosh.
67. Brown Raglan overcoat, trousers, and vest, &c.

Ladies' attire, as might be expected, forms the major portion of these errant garments, and such announcements as the following constantly appear among the various lots: 'Blue dress, 2 silk skirts, 8 others, 12 blouses and bodices, in sheet;' '80 articles [unspecified] of women's underclothing, &c., in sheet;' '20 remnants (various);' '3 costumes, 9 skirts, 7 petticoats, and 2 print dresses;' '25 bodices and blouses and skirt;' '50 articles of women's underclothing in wrapper,' &c.

Many of the articles intended for some fair shoulders, but thus flung loose upon the world, must be of considerable value; for we find such items as 'Blue silk opera-cloaks,' 'Large quantities of lace,' 'Irish lace collarettes,' and no end of eider-down quilts, furs, astrakhans, and other valuable goods.

Some of the announcements are very vague and indefinite, such as lot 298, which appears to be composed of a 'large quantity of sundries, in sheet,' while there are three 'odds and ends' and one marked 'similar lot.' As for corsets, antimacassars, hats, handkerchiefs, and mufflers, their name is legion. Then again we have 'about 160 bottles of scents, drugs, and soaps,' and 'boxes of chocolate enclosed in pale-blue satin and hand-painted outer case, with other fancy cases enclosing sweets.'

Whilst gold, silver, and precious stones are conspicuous by their absence, the supply of gaudy plated goods is enormous, and one gets wearied of the constant iteration of 'imitation jewellery, chains, studs, &c., in box;' one lot tells us of '4 silver-mounted match-stands, flower-vase, plated goblet, kettle, 12 pairs of tongs, vegetable-dish, 12 other plated articles, and quantity of imitation jewellery.' But it *is* 'imitation' and not the genuine article.

Other lots included '5 bottles of whisky and 4 bottles of port wine;' and, almost check-by-jowl with this, '48 Bibles and Testaments, 20 hymn and prayer books, with sundry umbrellas.'

Another lot is composed of '33 tins and 12 packets of tea and coffee, weight about 66 lb.' The smoker is strongly represented here, and one can almost catch the aroma of '100 pipes and cigarette tubes, 800 cigars (in 17 boxes) and 656 cigarettes (in 10 boxes, some deficient)' all blazing away at the same moment under Messrs Debenham's baton. In this category, too, we must include a lot wherein there are 'a rare quantity of cigars, 6 tins of loose tobacco, box of ditto, 50 packets of ditto, 5 tins of cigarettes, 100 packets of ditto, quantity of loose ditto, and quantity of plug tobacco.'

There seems to have been a strange fascination in lot 322 for some person or persons, as the catalogue is crossed here as in no other part. Mayhap the miscellaneous character of the bundle operated on some minds, and certainly it is a regular Joseph's coat in its way. Here it is in full: 'Waterproof, 24 white handkerchiefs, 5 hand-bags, 2 remnants of flannel, pair of boots, 2 pairs of slippers, piece of linen, 10 pinafores, hand camera, two pairs of hose, 6 spoons, and pair of sheets.' It is not easy to see how such an infinite variety of material could be scraped together and wrapped up in one 'bundle.' But the Post-Office people, or, as is more likely, the auctioneers' people, have a wonderful faculty for assimilating incongruities. For instance, lot 358 was made to consist of '4 night-dresses, 6 silk scarves, 30 handkerchiefs, 2 door-mats, quantity of braces, belts, and sundries in bag, and a bundle of wall-paper, engravings, &c.' After such an amalgam as that we are prepared for anything, and shall close this inventory of Post-Office curiosities by noting the pithy, sententious description of lot 422—namely, 'Bundle of sundries.'

On inquiry at the superintendent's office of derelict letters and parcels in Edinburgh, we found a similar state of matters on a small scale. The month of December, before and after Christmas, leaves a great legacy of undelivered parcels, owing to missing addresses. Poultry had to be quickly dealt with, and were sold for a nominal sum with little delay. The list of derelicts is of the most miscellaneous character, including curling-tongs, cognac, oxo, oatcakes, buns, tea, coffee, golf-balls, and the other thousand and one articles of daily use and consumption.

THE SECRET OF THE SEBHAH.

CHAPTER II.

ON Thursday afternoon, when Lea turned in at the gates of The Shaws, he saw Christine in the garden; and, instead of entering the house, he ventured across the lawn to speak to her. The smooth, velvety surface was spoiled by the indentations of ruthless feet; the bushes had not recovered; and Christine at the moment was examining and bemoaning the flower-borders, which had not been spared, but trampled upon like the rest.

'Your grounds have suffered severely, Miss Christine, from the vandalism of the crowd,' said he. 'But a little careful attention, with the ready assistance of nature, will soon repair the damage.'

'I hope so, Mr Lea, for your sake,' she replied, turning to greet him. He was close upon her before she knew. The turf had deadened his footsteps, and she had been intent upon the inspection of the flowers.

'For your sake too,' said he.

'While we remain;' and she began, rather disconsolately, to pluck the petals from a bruised pansy and let them fall upon the path.

'It is settled, then?' he asked.

'That you are to be the tenant, of course. It was as good as settled on Tuesday, and would have

been quite but for my rudeness. I must apologise, Mr Lea. My heart was bruised, like the pansy'—and she dropped the denuded calyx—'by the noises at that horrid sale; and so, I am sorry to say, I was horrid to you.'

'Don't distress yourself about that.' He nearly said 'dear,' and would have liked to say it, but added 'Miss Christine' instead. 'A pansy cannot be horrid, however bruised it may be. And I wouldn't treat your heart as you have treated the flower.'

'Poor flower!' said she, looking at the ruin she had made. 'That was horrid too, to pluck it to pieces. I might have given it a chance to revive. But we are growing sentimental, Mr Lea. Will you not come in and see mother? She is expecting you.'

'Presently, Miss Christine. But I want to ask you something. I bought an article at the sale'——

'You bought a good many articles,' she interrupted. 'When are you going to take them away?'

'There is no need to remove them. They can remain until I come. It will be better so, if they are not in your way, and you and your mother can use them. I am selfish, you see. They might be damaged by a double removal—would be, to a certainty; but if they remain here Mary will keep them in order.'

Christine viewed the selfishness from another standpoint. It would be an immense convenience to them for the furniture to remain. The Shaws would continue home-like. He must have known that. It was a feigned selfishness that the favour might seem to be conferred by them, when in reality he was the benefactor. She did not dispute his method of putting it; but, both grateful and abashed, she waited for him to continue.

'There was an article I did remove—a rosary, or something of the kind, protected by a glazed frame. Can you tell me anything about it, Miss Christine? If you value it, I will bring it back again.'

'No; it is yours. You have bought it. Ever since I can remember it has been hung in the library. It was brought by my great-grandfather from the East, and he set great store by it, I believe, as a memento of an event which happened while he was out there.'

'Then it is an heirloom, Miss Christine. You must certainly have it back.'

'No, no!' said she, with a blush, and vigorously disclaiming any right to what he had fairly purchased. 'You must keep it. It is no more an heirloom than the other things—the ornaments and pictures and books—which have gone we know not where. They all had their associations, for they were all *lares* and *penates*, like the beads you have bought; but we could not keep them on that account. No; the rosary is yours.'

'Is it a rosary, Miss Christine?'

'Of a kind, but not the usual kind. It was given to my great-grandfather by an Arab sheikh, a Mohammedan.'

'Indeed! That explains the faded writing in the centre. It is Arabic. I thought in my ignorance, not knowing how old the picture was, that it was some form of shorthand. Has the writing ever been interpreted?'

'Yes; but I cannot remember the interpretation. Father told me once, and grandfather told him. It is nothing important, only three veiled maxims such as all Oriental people are fond of. My great-grandfather served under various admirals in the Napoleonic wars.'

'And what was the event of which the rosary is a memento?'

'When Napoleon was approaching St Jean d'Acre my great-grandfather was sent with a company of marines into the Lebanon to interview the Druse leaders, and to persuade them, if possible, to stand aloof. Because of their complicated quarrels with the rapacious and cruel governor, no assistance could be expected from them in the defence of the fortress; but it was important that they should be detached from any alliance with the enemy, and remain perfectly neutral. Napoleon had already tampered with them; but, on religious grounds, and in opposition to the Maronites, their local foes, who favoured the French invasion, their response to his overtures had not been cordial. They had refused to declare themselves, and the purpose of Sir Sidney in promoting the interview was to prolong the vacillation.

'The mission succeeded beyond his highest hopes. My great-grandfather saw the Druse leaders at Ebtedeen. They would not pledge themselves to an open alliance with the English, but they did pledge themselves to harass the convoys of the French. Supplies from the Lebanon or from the fertile plains beyond should not reach the French if they could cut them off. All through the siege they were in sympathy with the English; and so impressed was Sir Sidney with the value of their services, and with the justness of their complaints, that afterwards he intervened on their behalf with the Sublime Porte.

'But that does not concern the rosary. Foraging parties had been sent out in the direction of the Lebanon; and on his way back my great-grandfather and his men fell in with one of them. They were defiling into the open from one of the narrow mountain passes, when they heard tumultuous shouts, and beheld, a short half-mile away, a struggle going on between a company of Arabs and some of these French foragers. The Arabs were manfully defending themselves, but manifestly weakening under the French attack. Muskets were deadlier than spears. The camels had stampeded, and were scattering over the plain. The brown tents were tumbling together, riddled with shot, and their owners were collecting in a circle, back to back, for a last desperate stand.

'The marines cheered, and ran to their assistance. Soon they were in the mêlée, and speedy work they made of it. The French were driven off; some were slain, others were captured, but they had wrought serious havoc among the Arabs. The French captain, at the very close of the contest, rushed in a rage at a young Arab who had strenuously opposed him, and attempted to cut the young man down. My great-grandfather instantly intercepted the stroke, and barely saved the Arab's life. Glancing from his upraised weapon, the sabre—its force fortunately broken—took my great-grandfather across the cheek and forehead, and inflicted an ugly wound. He carried the mark of it to his dying day. But the young man was saved; and the captain, ere he could strike again, was seized by one of the marines, forcibly disarmed, and taken prisoner.

'Buried beneath the tents was an old man, the sheikh, the father of the Arab whose life had been snatched from the slash of the sabre. He was not in hiding; he had simply been caught in the collapse of the canvas. When the people had drawn him out, and he saw how matters stood, he was very grateful, and doubly grateful when it was explained to him that the leader of the rescue-party had sustained the sabre-cut in the quick and effectual defence of his favourite son.

'"What shall I give him?" said he, as my great-grandfather was presented to him, with the fearful gash across his face, and nearly fainting from loss of blood. "Alas! we have nothing with which to recompense so worthy a deed."

'"Give him the sebhah," returned his son, picking up the beads from the litter of the tents which was scattered over the ground.

'"If he will deign to accept it," said the old man, taking it from his son and handing it to him. "And I will write out for him the scrip that should accompany it. Maybe it will serve him in an hour of need."

'They remained until the following day. The camels were caught and the tents folded. The Arabs turned eastward with grateful farewells, and the marines resumed their journey to the coast. My great-grandfather brought away with him his wound and the sebhah, with the scrip traced in Arabic characters, as permanent souvenirs of the rescue.'

Ferdinand listened to the recital without a word of interruption. He became quite absorbed in it. But for Christine's decided negative, and the knowledge that it would hurt her, he would have urged again the return of the rosary. It was an heirloom after all, associated with the heroic conduct of one of her ancestors, and he secretly resolved to send it back, and in such a way that she must accept it, if only to save from extinction this interesting touch of adventure in the records of her family.

First, however, he intended to satisfy his own curiosity in regard to it. Surely the gift was valuable, else the sheikh would not have concurred so readily in his son's proposal, nor would they both have thought it adequate in some degree as an expression of their gratitude. The clouded maxims, too, carefully written out, but in ink which had faded to a saffron hue, must have some important relation to the sebhah itself. He swiftly decided, even while he was listening, to submit the beads to the inspection of an expert, and to secure the decipherment of the Arabic characters. There might be more, very much more, under a gift apparently so simple, than Miss Christine imagined or had ever been thought of by her forebears. The sheikh had said, and not without reason, 'Maybe it will serve him in an hour of need.'

'It is a stirring story, Miss Christine. Thank you for telling it. Your great-grandfather was a brave man, and you have every reason to be proud of him. No wonder that he preserved the sebhah so carefully, and passed it on in its glass case to his children. It is a pity that any one should have bought it. You ought to have kept it in your own hands.'

They were now walking toward the house. She shrugged her shoulders ever so slightly, and made a little grimace. What could they do? she seemed to imply. Their position compelled them to part with it, and with many another treasure besides. That she could make the grimace and shrug her shoulders was some comfort to him. He took it as a proof that the trouble was sitting more lightly upon her, and that in time the sunshine would break through the cloud.

Mrs Denholme welcomed him almost effusively. It was a satisfaction to her that the tenancy of The Shaws had been settled so amicably, and she was quite willing, knowing Ferdinand's generous nature, to leave the arrangement of all the details between him and Mr Pierce.

When he departed, he crossed the lawn again, and, stooping, picked from the path the plucked petals of the pansy, and placed them in his pocket-book. 'Heart's-ease!' he whispered to himself; 'I need it.' It was a return to the sentiment which Christine had dismissed.

'Yes,' said the dealer in antiques when Ferdinand submitted the rosary for inspection two days later, 'it is a sebhah used by devout Moslems at their extra prayers. You will notice that there are ninety-nine beads, divided into three thirty-threes, and each thirty-three is separated from the rest by a special bead which in this specimen is of some black substance rather like jet; but it cannot be jet;' and he fingered the three black beads curiously.

'What are the others made of?'

'Cedar, very neatly made, too,' returned the dealer. 'The twisted chain by which the beads are held together is evidently silver, very much tarnished, but silver nevertheless. The links would rub up easily and form a pleasing contrast to those black beads;' and again he fingered them, then

smelt at them, and finally touched them with the tip of his tongue. But the tests were futile.

'Is it worth much?'

'N-o-o!' replied the dealer with hesitation. 'It is just the usual form of sebhah, with the exception of these black beads. They mark it off from the ordinary. I could offer you five shillings for it.'

'Only?' and Ferdinand smiled. 'The silver must be worth that. I am not anxious to part with it. And you really cannot tell me what the black beads are?'

'No; they puzzle me. I have not seen any like them. A mineralogist might tell you, but I cannot.'

So, thanking him, and bidding him farewell, Ferdinand sought out a mineralogist.

'Do you mind my chipping off a bit from one of the beads?' said he after examining them.

'If you can do it without breaking the bead or causing any serious damage to the rosary.'

'You may rely upon that;' and, with a sharp instrument, he nipped away the point of one of the angles. 'Now I can soon ascertain what the material is.' He placed it beneath a powerful lens, and carefully scrutinised the fractured edges. 'Ah, I thought so! See, Mr Lea!' and he took a florin out of his pocket and put it upon the table. In the centre of the coin he placed the tiny black nodule. Striking a match, he touched the nodule with the flame, and immediately it blazed up, burnt fiercely for a moment, subsided into liquid pitch, and then vanished. The coin was discoloured, that was all.

'It is very inflammable,' said Ferdinand.

'Very,' returned the mineralogist. 'It is bitumen, a strange substance, certainly, to fashion into beads. May I ask, Mr Lea, if the rosary came from Syria?'

'Yes.'

'Ah, then this bitumen is from the neighbourhood of the Dead Sea. Curios are worked from it, I know, because the material can be easily carved; but this is the first time I have met with it in the beads of a rosary.'

Ferdinand had detached the beads from the back of the frame, and left that, with the pasted paper upon it, safely locked away in his private desk at home. He declined to run any risk with the paper. He was anxious to keep it undamaged and intact. The next step was to secure its decipherment. Those mystic Arabic characters were connected somehow with the larger dividing beads of black bitumen. The singularity and distinction of the rosary depended entirely upon them, and if he could only trace the relation between them and the writing he hoped to be able to solve the secret of the sebhah.

(To be continued.)

DEATH VALLEY.

SPOT which the traveller in both the Old and the New World has called the 'most desolate place' on the earth's surface is a valley in the south-western part of the United States. It is a part of the great American desert, but really is a desert in the centre of deserts, where so little moisture is in the air that not a living thing in the way of grass or shrubs springs from the soil. There is absolutely nothing which will afford nourishment to man or beast. Only in a little corner of this valley does any water exist; but it is a mockery to call the salt, alkaline liquid water, for it is poison to man or beast or bird, and unfit for any use.

Well do the people of the south-west call the place Death Valley, for most of those who have dared to venture into it have never returned to its borders. Thus far only a few persons have gone its entire length and escaped to tell of the suffering they endured in this hole in the world, hemmed in by mountains which prevent the smallest raincloud from ever passing over it; and the mountains are also suitably named, for one range is termed the Funeral Mountains. As we have stated, Death Valley is a desert within deserts. It is surrounded by Ralston Desert on the north, Panamint Desert on the west, Mojave Desert on the south, and the Amargosa Desert on the east; and its depression being lower than any of the others, need we wonder that it should be a centre of misery when the hot rays of summer pour down upon it and the refracted heat strikes it from the Panamint and Funeral Mountain ranges? During the three summer months and first month of autumn the heat in Death Valley rises to one hundred and thirty-seven and one hundred and thirty-nine degrees, higher probably than anywhere else in the world. Not only does this heat exist there during the day, but also during the night, for the mountains on either side and the hard surface of the middle valley, during the day heated like the walls of a furnace, do not have time to cool perceptibly until the sun again rises in a copper sky, and thus for weeks and months, unfavoured by moisture, this great central isolated region literally burns, a land of silence and desolation.

Few who have dared to make the journey into this literal inferno on earth have cared to make another attempt, for unless an ample supply of water for man and brute is carried one must perish of thirst if not starvation. Yet over half a century ago gold-seekers and home-seekers tried to cross the valley, and recently several scientists have taken

their lives in their hands and gone into this desert of deserts. Here is the tale of one of them, as related by himself:

'I had crossed Panamint Valley, and after spending some days in a mining-camp of Panamint, I, in company with two others, reached the summit of the Panamint Range, and from there looked down on Death Valley. The summit of Panamint Range rises seven thousand feet above sea-level, and the view from the high altitude in a rarefied atmosphere is one never to be forgotten, although the region looked down upon is as desolate and forbidding as would be an equal area of the moon. On the west lies the Panamint Valley, to the eastward Death Valley, to the north the mountains around Darwin and Wild Rose Cañon, and to the south and east the deserts of the Mojave and Amargosa, and, rising up in beauty though desolate, the Calico Range of hills, that shows a richer colouring than did Joseph's coat of old.

'Death Valley, as seen from the summit of the Panamint Range, presents in the month of November a long, gray waste of desert, in which there are narrow bands of white made by thin deposits of borax; and to the south end of the desert one can see a thin line like a blade of steel, which is the faint outline of the Amargosa River, as it dies away upon entering Death Valley sink. This stream flows in from the south, then turns east and west, and flows around to the north. It is a sluggish, dead stream, that takes its rise in the State of Nevada. On its course it furnishes water for a few ranches and farms in the Amargosa Valley, and flows onward through a bitter, alkaline country until, when it reaches the point where nature seems to have intended that it should supply a vast reservoir, it has no water to give.

'It was as the sun was rising that we began our descent from Panamint Range to take our way across Death Valley. The mountain surface is in rolls and drifts until it reaches the edge of the valley, where we arrive at the forbidding gray flat, level as a billiard-table, save where here and there an encrustation of soda in some form permitted the foot of man or beast to break through its thin crust. Upon reaching Death Valley, what to us was most striking on that occasion was the tremendous height which the Panamint Range, which we had just descended, seemed to present. I distinctly remember that as I looked back upon them, and then upon the bleak, gray desert valley before us, with the Funeral Range of mountains in the distance to the eastward, I recalled at once to mind that celebrated Valley of Diamonds into which Sindbad the Sailor descended for crystallised wealth, as described in the *Arabian Nights' Entertainments*.

'Our route lay directly across the sterile desert, and before us ran wagon-tracks that were made by miners and adventurers who came to the silver-mines of Panamint. Old Tex, our guide, said that one could see on that desert waste the tracks of the wagons owned by the early emigrants, of whom a number perished for want of water in the years 1849–50. When about seven miles out on the desert we came across the bones of three oxen, cracked, worn, and weather-beaten, and three spokes near them. A little farther away lay the tire of this wheel, but little rusted although it had lain there almost fifty years. Yet a little farther on we picked up near the trail the sole of an old boot; it was curled and distorted into a queer shape, and the heel was sloping to the sole, and the wooden pegs had so shrunken in the leather of the soles that when we took up the old relic they fell out. Then we found a broken china tobacco-pipe, a few porcelain buttons, and four flat, old-fashioned brass coat-buttons. As we found these relics of former travel over the dreary and forbidding waste, old Tex said that they were part of the remains of the party who in the year 1849 or 1850 started to cross this desert without a guide. They had separated from a larger party, who had taken a course south from what is known as the State of Nevada. The unfortunate few believed that they could take a more direct route across the desert and over the Panamint Mountains. In taking this new route, the emigrants found it easy for a time, but soon their troubles began. Their descent from the Funeral Range into Death Valley was difficult, compelling them to abandon much of their property; and when upon the unknown desert they were without water, night was upon them, and the days that followed saw the destruction of most of their number; for, in taking their way across the desert, the party became crazed with thirst and wandered in various directions; becoming delirious, some of them stripped themselves of all clothing, and, like wild beasts, began to burrow in the hard desert sands with their bare heads. Two men named Towne and Waite, and nine other persons, escaped by reaching the Panamint Mountains and finding a spring. The remaining eighteen persons, men, women, and children, who composed the party left their bones in the desert. One of the survivors named Bennett gave it the name of Death Valley.

'Our own journey across this desert seemed slow. Though it was the month of November, the atmosphere was sultry, the air dry, and by noon the heat was oppressive. A smothering sensation would at times make itself felt. We were now midway in the desert; and our saddle and pack animals showing signs of extreme thirst, we gave each of them a gallon of water, which we had brought with us in kegs on the pack-animals before starting across this barren waste. We had taken for each man two one-gallon canteens from Panamint, and three gallons for each horse; but we soon consumed the entire measure, and our horses were mad with thirst when we reached the camp-ground that evening. The desert is perfectly level, but not everywhere smooth, as in places there are weary areas where sal, soda, and borax crystals extend over

the surface to the depth of several inches; but the wealth of this desert is wholly mineral in its nature. Nothing pertaining to the vegetable kingdom is found on its central area, and the approaches to it on either side show but a straggling of trees and shrubs of cactus, greasewood, and arrow-weed.'

Yet at some time in the past ages this spot, where even a drop of water is precious, was the bed of a great inland sea probably hundreds of feet deep; for, strange as it may seem, the rock walls which rise so abruptly on either side of the valley bear on their surface impressions which the geologist says were made in them by the action of the waves. There are also distinctly visible traces of beach on which the waters rose and fell; but all this was probably thousands of years ago, and little by little the awful heat of the sun dried up the sea until now not a particle of its water remains. This fact alone shows how Nature has made a great furnace of Death Valley. For fully two-thirds of the year it is unsafe to enter it no matter how much water and food may be carried, because the temperature is so high even at midnight as well as noon, for from sunset to dawn the sand and rock are continually radiating the heat with which the sun has permeated the formation during the day. Those who have ventured into this wilderness, in truth, have done so during what is called winter, when the tops of the higher mountains surrounding the depression are covered with snow; but even in January the sun's rays are almost unbearable, and years may pass without a cloud even the size of a man's hand appearing in the sky. At all times there is danger of sand-storms, which, created by the hot winds, come up as suddenly as those of the Sahara, and such masses of sand are whirled about that one may be buried in it if he remains in the same spot.

And yet the Death Valley is but a small section of the American desert. Situated in southern California, it is only about fifty miles long and thirty-five miles across. A person with good eyesight can look from one of the mountain ranges that hem it in and distinguish the faint, dark line which marks the mountains on the other side. The distance across it being so short is one reason why the desert has claimed many human victims. They do not realise the power of the sun and the fearful dryness of the air, for there is scarcely a trace of moisture in it night or day. Often have they realised the danger when too far from either side to return, and dropped down upon the glaring white surface never to recover.

As already stated, no human being can stay in Death Valley itself and remain alive; but the mountains and deserts which border it are also almost uninhabited. As to society of the human type, it is confined to a few miners in the Funeral, Calico, and Panamint Mountains, who mine for gold, silver, lead, and copper; a few who mine borax; and a few roving bands of Piute Indians who hunt the jack-rabbit and gather the pine-nut in the high parts of the surrounding ranges. There are a few 'squaw-men' leading a sort of isolated life on mountain ranges, owning cattle and horses, and in a small way interested in mining. At Ash Meadows, to the eastward of Death Valley, is a man (who has a cattle-ranch) with his wife and one or two hired men, and he rules the destinies of about three hundred square miles of country.

'UNFORTUNATE.'

AN EPISODE IN THE AMERICAN WAR OF INDEPENDENCE.

By A. C. Campbell Swinton.

THE incident of which the following is a description is of itself so dramatic, so strange, and so connected with interesting portions of history that, being hardly known, it is worth preservation.

There was an Alderman of the City of London who amassed a large fortune and was created a baronet by George the Third, by name Charles Asgill. This gentleman married a daughter of Daniel Pratviel, who was then secretary to the Embassy at Madrid, and had a son Charles and two daughters. The son entered the army and went to America as a captain in 1781, under the Marquis Cornwallis. It was the period of the American War of Independence. He went through the whole of the campaigns, and was taken prisoner at the siege of Yorktown, in Virginia, with five thousand of the British army.

Some time previously a rebel captain—or what we would now call an American—named Huddy, had captured, whilst patrolling at night, Captain Lippincott, an officer in command of a British patrol, and for no other cause but that the latter was a loyalist, hanged him without trial. Lippincott's brother shortly after the occurrence took Huddy prisoner, and in retaliation for his brother's murder he executed Huddy. Consequent on this General Washington ordered that thirteen British officers (prisoners) should draw lots, and the one on whom the lot fell should be selected to suffer death in retaliation for Huddy's death. The officers assembled at Lancaster, Pennsylvania, and the names of the thirteen were placed in one hat, and in another twelve blank pieces of paper and a thirteenth

piece of paper on which was written the word 'Unfortunate.' That piece fell to Captain Asgill of the Guards. What a fate, condemned to an ignominious death, suddenly and for no cause that he had the remotest connection with! He was conveyed, strongly guarded, to a prison in the Jerseys, and there suffered many hardships for six months, daily expecting his execution.

One of the fortunate twelve who did not draw the fatal lot was Sir Charles Gould, afterwards Sir Charles Morgan. He returned to England, his family having procured an exchange of prisoners, thus effecting his release, and he was the bearer of the news concerning Captain Asgill to his family. Strange to say, he wrote no letter to prepare them nor even to make himself known, but was ushered into the drawing-room of Lady Asgill's house, and found her and another lady sitting there; and on hearing the fatal intelligence they both swooned and fell senseless on the floor. Captain Gould, filled with dismay, summoned the servant, who instantly thought the captain had killed his mistress. When poor Lady Asgill realised the position of her son she did not remain helpless and inactive. She resolved to write to Count Vergennes, who was in a post of high authority at the court of Louis XVI. and Marie Antoinette. The letter was long, so I only give some portions of it. She was unknown to him:

'My son, an only son, as dear as he is brave, amiable as he is deserving to be so, only nineteen, a prisoner under articles of capitulation of York-town, is now confined in America an object of retaliation. Shall an innocent suffer for the guilty? Represent to yourself, sir, the situation of a family under these circumstances, surrounded as I am by objects of distress, distracted with fear and grief. No words can express my feelings or paint the scene—my husband given over by his physician a few hours before the news arrived, and not in a state to be informed of the misfortune; my daughter, seized with a fever, raving in delirium about her brother. Let your feelings, sir, plead for my inexpressible misery. . . . Say but a word to General Washington, and my son will be released. His honour carried him to America. He was born to affluence, independence, and the fairest prospects.'

Count Vergennes was so moved by this letter that he showed it to the King and Queen; they, to whom so soon after no pity was shown, but brutal contempt of their sufferings, were deeply moved.

'The goodness of their Majesties' hearts induce them to desire,' writes Vergennes to Washington, 'that the inquietudes of an unfortunate mother may be calmed and her tenderness reassured.' He wrote at length and very forcibly, urging on Washington that if it were possible to avoid extreme rigour and pardon Mr Asgill it would be very agreeable to their Majesties. 'The danger of young Asgill, the tears, the despair of his mother, affect them sensibly, and they would see with pleasure the hope of consolation for the unfortunate family.'

The ill-fated Queen at that time was still all-powerful. Washington, in league with France, was glad to save Asgill, thus pleasing the Queen and answering the dictates of his own heart, ever inclining to clemency and humanity. He moved his release in Congress, and sent a notification of the same with a very kind letter to Captain Asgill, in which he said that reprisals were distasteful to him, and that he had all along felt for his painful situation, but had delayed writing till he was sure of his release, not wishing to raise false hopes. The letter, after telling him of his freedom, concludes thus: 'It is no greater relief to you than it is to, sir, your most obedient humble servant, G. Washington.'

Not a moment did Asgill lose, when the joyful news reached him, in journeying with all speed to comfort and cheer his 'distracted family.' He hurried to New York only to find that the ship had sailed; but, undaunted, he set sail to chase her in a small boat. Sometimes she is in sight, sometimes lost to view. On he ploughs the waves in his little craft, his home and all he loves, which for six weary months he never expected to see again, to be soon reached if only he can overtake the good ship *Swallow*. Fortune favours him, and four leagues out to sea he scrambles up her side without baggage or servant, a free and joyous man.

What a home-coming that must have been! And after a happy time spent with his family he set out for France, and there tendered his grateful thanks to the beautiful and benevolent Queen; and again a picture rises before us of the Court of Versailles, then in all its grandeur and beauty. A young and gallant Guardsman is ushered in, and bending before Marie Antoinette, thanks her for his honour and his life.

SUMMER.

I laugh, from where I lie 'mid grass and dew,
To see the apple ripe against the blue;
Fair, fair, fair,
Red wine and caress of the air.
With a ripple of leaf, and the strength of the bough,
And the haunting, the murmuring laughter and sough
Of the wind—
The merry, mad wind—
That steals from the south to find
What thing a beautiful world can show
When Summer—the Summer 's ablow!

The curving apple hangeth sweet and high,
Rose-red it leans 'gainst deep cerulean sky:
Green, green, green,
Spreads verdure in delicate sheen;
And the harvest is golden, it sings in the grain;
While the carol of lark falls in exquisite rain;
And the sun—
The glorious sun—
Springs from his kingdom to run
Where a maiden hath hid from his gaze,
And Summer—the Summer 's ablaze!

HEALTH AND COMMON-SENSE.

AN old clergyman was once asked by a young and inexperienced brother for some advice on certain points. 'No, sir,' was the reply; 'if you lack common-sense, then you won't take my advice; and if you have it there is no need of your receiving any advice from me.' A friend once asked Thackeray, who had alluded to one of those illnesses which were the bane of his life, if he had ever received the best medical advice. Certainly he had, was the reply; 'but what is the use of advice if you don't follow it?' he continued. 'They tell me not to drink, and I *do* drink. They tell me not to smoke, and I *do* smoke. They tell me not to eat, and I *do* eat. In short, I do everything that I am desired *not* to do, and, therefore, what am I to expect?' That a man is either a fool or a physician at forty is probably as untrue as most proverbs. Only, one wonders why all the ills that flesh is heir to are not banished for ever by the amount of medical advice crystallised in books and ever increasing in volume, by fees paid to medical men and for consultations, by accumulating experience of the ages, and by health-foods, not to speak of advertised remedies, quack and otherwise. It is not so much advice that is lacking as the acting up to the best we know.

Here we have a Yorkshire-American, Dr Woods Hutchinson, on good terms with himself and in boisterous good humour, adding to our stock of good advice in *Health and Common-sense* (Cassell & Co.), in which he makes slashing attacks on food-faddists of every kind and degree. He offers a strong plea for the following of the healthy instincts of the average man in regard to food and drink. If we wish to keep on the high-road of robust health, we must, according to Dr Hutchinson, cultivate life in the sunshine and fresh air, have little to do with patent foods or quack medicines, lean towards time-tested foods, cultivate a healthy omnivorousness, and avoid monotony. The American title of the book, *Instinct and Health*, supplies a key to the writer's point of view. Cherished diet-delusions are brushed aside like cobwebs, while he throws the dry searchlight of his knowledge and experience on all matters of health.

A hotel proprietor once termed cookery the leading science in the world, which is equivalent to saying that hunger is the great driving-power of all our activities. The cookery-teacher joins hands with the medical man; there should in the future be less waste and extravagance in lower and middle-class as well as in upper-class homes when we have a well-balanced dietary for building up and keeping the body in working trim. An overweening attention and curiosity in regard to diet may be evidence of ailing health. Still, we are all less or more interested in food and feeding; and, as Dr Johnson says, if a man is not interested in his dinner he will not be interested in anything else.

Dr Hutchinson, in effect, tells us that instinct in the matter of food is often superior to reason; that the man on the street who follows his God-given instincts, and plods peacefully along with special favour for rich meat, fats, and sugars, is on quite good lines; for he contends that the basal problems of diet were long ago settled in the farm-house kitchen and laboratory, and says 'there is little more room for difference of opinion upon them than there is about the coaling of engines.' In regard to prejudice against pork and the comparative longevity and low mortality of the Jews who abstain from its use, he says: 'Deprived of pork, our Jewish brethren have made up for it by eating every other kind of digestible fat that they can secure—butter, suet, fat fish, oil, the fat of geese, &c., so that their dietary is probably richer in fat than that of any class of the Gentile population surrounding them. Any physician of experience will confirm the statement that the diet of his Jewish patients is one of the richest in fats and sugars, most abundant in quantity, and most attractively cooked of any of his families, in proportion to their income.'

Even though it takes pork a long time to digest, it is 'one of the surest foods that we have to give off all its energy to the body.' Dr Hutchinson says he has seen more cases of dyspepsia cured by the use of breakfast-bacon than by any kind of drug or

[*All Rights Reserved.*]

restricted diet. He says pork, including ham and bacon, is easily our second most valuable meat-food, and has laid the foundation of Western civilisation. It is possible Dr Josiah Oldfield may get on his track and challenge some of these statements. This gentleman prefers to be called a Fruitarian rather than a Vegetarian, and lives happily and healthily on what some people would think was a restricted diet. Dr Oldfield does not think so, and states his side of the question temperately in a paper, 'The Diet of the Future,' in *Chambers's Journal* for 1907. As fruitarian dietary includes milk, butter, eggs, cheese, and honey, along with fruits, nuts, and vegetables, healthy existence is quite possible for Dr Oldfield and his followers.

In following his healthy instincts in regard to food, it is pointed out that the white man of to-day has a lower death-rate, a higher average length of life, is taller, heavier, and stronger, than any of his predecessors or any known race of savages. Dr Hutchinson has his joke, and tells us if we wish to be healthy and strong we must begin with our ancestors. All past generations have helped us to gather resisting-power, and have made us what we are. The human body is now, we are told, 'the toughest, most resisting, most marvellously adaptable, and most ferocious organism that the sun shines on.' It is indeed the best fighting animal in the world, and can live on anything that is digestible by any other animal.

Put plenty of good coal under the boiler in the shape of good food is Dr Hutchinson's advice. Live vigorously and joyously in the open air, sleep in a draught, and you will be warm in any kind of clothing, provided there is not too much of it. For 'every particle of the energy which sparkles in our eyes, which moves in our muscles, which warms our imaginations, is sunlight cunningly woven into our food by the living cell, whether vegetable or animal. Every movement, every word, every thought, every aspiration, represents the expenditure of precisely so much energy derived from food. 'Cut off our supply of second-hand sunlight, and our human lamps go out like an arc-light when the current is broken. We are literally what we have eaten.' Sunlight, air, and food, therefore, are the secrets of life. Food, he thinks, rather produces energy first, and heat incidentally as a waste product. Plants can do more wonderful things than we can in constructive work without giving off a particle of appreciable heat.

And so Dr Hutchinson goes on to tell us that it is a superstition that particular things are good or bad for particular things or effects—that fish-diet is good for the brain, and such-like. The best way to nourish the brain is by exercise through the muscles. Mustard and spices are valuable intestinal antiseptics, checking and preventing putrefaction and fermentation of food in the alimentary canal. Meats and fats, contrary to what some people say, are not too heating for the blood in the tropics. As regards the question of Fruitarianism or Vegetarianism, the best results in building up the body, he thinks, are attained by mixed diet. He has a word to say on oatmeal, which he dethrones from its proud position. The most convincing proof, he thinks, the Scotch have given of their greatness has been their ability to live on oatmeal at all. The secret of their wonderful success, both mental and physical, lies in the fact that any nation trained to survive a diet of oatmeal and the Shorter Catechism could survive anything and flourish anywhere. Oatmeal has some value as a food, which is largely minimised by its capacity as a stirrer-up of acid fermentations and intestinal disturbance. The constant struggle of rising humanity has been towards the securing of meat, and also of white bread, and as much of both as possible. Concentrated foods are styled failures, and cannot support life alone. Disturbances in digestion are more likely to have been caused by the rush and hurry in which food has been eaten than by the nature of the food. 'The widest variety of old-fashioned foods is still the best; we can safely leave the newer foods and patent improvements alone.

Long, grinding, treadmill hours of labour are degrading and benumbing to all that is best in human nature. In spite of all that is said in praise of the country, under proper conditions the finest adult development, physical and intellectual, is secured in the city. Civilised man is a far superior animal to any savage, lives longer, and is healthier and happier. As regards sleep, the majority of vigorous adults require nine hours, and getting muscularly well-tired is the best means to sleep well. Insomnia is most frequently the curse of a sedentary life. No air that ever blew out of doors is so dangerous or poisonous as that inside a bedroom with closed doors, and thus open windows are recommended. Few ever get too much sleep or fresh air. Cold water without soap used daily will keep the skin cleaner and healthier, and in a more comfortable condition, than hot water and soap once a week. 'Cold in general, and cold water in particular, where there is reaction, is a superb tonic, worth all the bitters and drug tonics in existence.

A man of middle-age is advised to keep up his interests; nothing does more to keep a man in health than a hobby. Hutchinson says: 'Don't begin to cut down on things until they cut down on you. Keep on full steam ahead until you feel a bump, or at least a distinct grating. You'll go farther and happier and far more usefully than by anxious straining on the lookout for rocks and shoals which often don't exist, though they may be down on the charts. There are plenty such. First and most vital, keep up your exercise and recreations, *especially* the latter. Don't drop any of your out-door interests unless you can acquire new ones in their places. Change your sports in quality if you must (but not till then), but never in quantity except to increase. Drop tennis when you find it

exhausts you, or hurries your heart afterwards, or disturbs your sleep; but take an hour a day more golf in its place. . . . As long as you like to take active exercise and sport, and feel exhilarated and refreshed, even if a little stiffened by them, keep them up; they are doing you good. When you feel that they are getting a little too much for you, when you don't feel fresher for them next day, cut down on them a little in intensity.' By virtue of reserve-power, momentum, and trained expertness the body machine may do more work, in proportion to its fuel, from forty-five to fifty-five or even sixty than in any previous period.

For other matters of hygiene there treated we refer readers to the book.

If the lower animals live five times the length of the period that they take to come to maturity, why, asks another doctor, does the higher animal man not do the same? The reply rests with every reader of the book and of this notice.

THE HOUSE OF WHISPERS.

CHAPTER XXXVI.—IN WHICH GABRIELLE TELLS A STRANGE STORY.

GABRIELLE fell back in fear. Her countenance was blanched to the lips. This man Flockart intended to speak—to tell the terrible truth—and before her lover, too! She clenched her hands and summoned all her courage.

Flockart laughed—laughed in triumph. 'I think, Gabrielle,' he said, 'that you should put an end to this deceit towards your poor blind father.'

'What do you mean?' cried Walter in a fury, advancing towards Flockart. 'What has this question—whatever it is—to do with you? Is it your place to stand between father and daughter?'

'Yes,' answered the other in cool defiance, 'it is. I am Sir Henry's friend.'

'His friend! His enemy!'

'You are not my father's friend, Mr Flockart,' declared the girl, noticing the look of pain upon the old gentleman's face. 'You have conspired against him for years, and you are actually conspiring with Lady Heyburn at this moment.'

'You lie!' he cried. 'You say this in order to shield yourself. You know that your mother and I are aware of your crime, and have always shielded you.'

'Crime!' gasped Walter Murie, utterly amazed. 'What is this man saying, dearest?'

But the girl stood, blanched and rigid, her jaw set, unable to utter a word.

'Let me tell you briefly,' Flockart went on. 'Lady Heyburn and myself have been this girl's best friends; but now I must speak openly, in defence of the allegation she is making against me.'

'Yes, speak!' urged Sir Henry. 'Speak and tell me the truth.'

'It is a painful truth, Sir Henry. Would that I were not compelled to make such a charge! Your daughter deliberately killed a young girl named Edna Bryant. She poisoned her on account of jealousy.'

'Impossible!' cried Sir Henry, starting up. 'I—I can't believe it, Flockart. What are you saying? My daughter a murderess?'

'Yes; I repeat my words. And not only that, but Lady Heyburn and myself have kept her secret until—until now it is imperative that the truth should be told to you.'

'Let me speak, dad—let me tell you'——

'No,' cried the old man; 'I will hear Flockart;' and, turning to his wife's friend, he said hoarsely, 'Go on. Tell me the truth.'

'The tragedy took place at a picnic, just before Gabrielle left her school at Amiens. She placed poison in the girl's wine. Ah, it was a terrible revenge!'

'I am innocent!' cried the girl in despair.

'Remember the letter which you wrote to your mother concerning the deed. You told Lady Heyburn that you hated her. Do you deny writing that letter? Because, if you do, it is still in existence.'

'I deny nothing which I have done,' she answered. 'You have told my father this in order to shield yourself. You have endeavoured, as the coward you are, to prejudice me in his eyes, just as you compelled me to lie to him when you opened his safe and copied certain of his papers.'

'You opened the safe,' he protested. 'Why, I found you there myself!'

'Enough!' she exclaimed quite coolly. 'I know the dread charge against me. I know too well the impossibility of clearing myself, especially in the face of that letter I wrote to Lady Heyburn; but it was she and you who entrapped me, and who kept me in fear because of my inexperience.'

'Tell us the truth, the whole truth, darling,' urged Murie, standing at her side and taking her hand confidently in his.

'The truth!' she said in a strange voice, as though speaking to herself. 'Yes, let me tell you! I know that it will sound extraordinary, yet I swear to you, by the love you bear for me, Walter, that the words I am about to utter are the actual truth.'

'I believe you,' declared her lover reassuringly.

'Which is more than any one else will,' interposed Flockart with a sneer, but perfectly confident. It was the hour of his triumph. She had defied him, and he therefore intended to ruin her once and for all.

The girl was standing pale and erect, one hand grasping the back of a chair, the other held in her lover's clasp; while her father had risen, his expressionless face turned towards them, his hand groping until it touched a small table upon which stood an old punch-bowl full of sweet-smelling pot-pourri.

'Listen, dad,' she said, heedless of Flockart's remark. 'Hear me, before you condemn me. I know that the charge made against me by this man is a terrible one. God alone knows what I have suffered these last two years, how I have prayed for deliverance from the hands of this man and his friends. It happened a few months before I left Amiens. Lady Heyburn, you'll recollect, rented a pretty flat in the Rue Léonce-Reynaud in Paris. She obtained permission for me to leave school and visit her for a few weeks.'

'I recollect perfectly,' remarked her father in a low voice.

'Well, there came many times to visit us an American girl named Bryant, who was studying art, and who lived somewhere off the Boulevard Michel, as well as a Frenchman named Felix Krail and an Englishman called Hamilton.'

'Hamilton!' echoed Murie. 'Was his name Edgar Hamilton—my friend?'

'Yes, the same,' was her quiet reply. Then she turned to Murie, and said, 'We all went about a great deal together, for it was summer-time, and we made many pleasant excursions in the district. Edna Bryant was a merry, cheerful girl, and I soon grew to be very friendly with her, until one day Lady Heyburn, when alone with me, repeated in strict confidence that the girl was secretly devoted to you, Walter.'

'To me!' he cried. 'True, I knew a Miss Bryant long ago, but for the past three years or so I have entirely lost sight of her.'

'Lady Heyburn told me that you were very fond of the girl, and this, I confess, aroused my intense jealousy. I believed that the girl I had trusted so implicitly was unprincipled and fickle, and that she was trying to secure the man whom I had loved ever since a child. I had to return to school, and from there I wrote to Lady Heyburn, who had gone to Dieppe, a letter saying hard things of the girl, and declaring that I would take secret revenge—that I would kill her rather than allow Walter to be taken from me. A month afterwards I again returned to Paris. That man standing there'—she indicated Flockart—'was living at the Hôtel Continental, and was a frequent visitor. He told me that it was well known in London that Walter admired Miss Bryant, a declaration which, I admit, drove me half-mad with jealousy.'

'It was untrue!' declared Walter. 'I never made love to the girl. I admired her, that's all.'

'Well,' laughed Flockart, 'go on. Tell us your version of the affair.'

'I am telling the truth,' she cried, boldly facing him. 'One day Lady Heyburn, having arranged a cycling picnic, invited Mr Hamilton, Mr Krail, Mr Flockart, Miss Bryant, and myself, and we had a beautiful run to Chantilly, a distance of about forty kilometres, where we first made a tour of the old château, and afterwards entered the cool, shady Fôret de Pontarmé. While the others went away to explore the paths in the splendid wood I was left to spread the luncheon, setting before each place a half-bottle of red wine which I found in the baskets. Then, when all was ready, I called to them, but there was no response. They were all out of hearing. I left the spot, and searched for a full twenty minutes or so before I discovered them. First I found Mr Krail and Mr Flockart strolling together smoking, while the others were on ahead. They had lost their way among the trees. I led them back to the spot where luncheon was prepared; and, all of us being hungry, we quickly sat down, chatting and laughing. Of a sudden Miss Bryant stared straight before her, dropped her glass, and threw up her arms. "Heavens! Why—ah, my throat!" she shrieked. "I'm poisoned!"

'In an instant all was confusion. The poor girl could not breathe. She tore at her throat, while her face became convulsed. We obtained water for her, but it was useless, for within five minutes she was stretched rigid upon the grass, unconscious, and a few moments later she was still—quite dead! I shall never forget the scene! The effect produced upon us was appalling. All was so sudden, so tragic, so horrible!

'Lady Heyburn was the first to speak. "Gabrielle," she said, "what have you done? You have carried out the revenge which in your letter you threatened!" I saw myself trapped. Those people had some motive in killing the girl and placing this crime upon myself! I could not speak, for I was too utterly dumfounded.'

'The fiends!' ejaculated Walter fiercely.

'Then followed a hurried consultation, in which Krail showed himself most solicitous on my behalf,' Gabrielle went on. 'Aided by Flockart, I think, he scraped away a hole in a pit full of dead leaves, and there the body must have been concealed just as it was. To me they all took a solemn vow to keep what they declared to be my secret. The bottle containing the wine from which the poor girl had drunk was broken and hidden, the plates and food swiftly packed up, and we at once fled from the scene of the tragedy. With Krail wheeling the girl's empty cycle, we reached the high-road, where we all mounted and rode back in silence to Paris. Ah, shall I ever rid myself of the memory of that fatal afternoon?' she cried as she paused for breath.

'Fearing that he might be noticed taking along the empty cycle, Krail threw it into the river near Valmondois,' she went on. 'Arrived back at the Rue Léonce-Reynaud, I protested that nothing had been introduced into the wine. But they declared that, owing to my youth and the terrible scandal

it would cause if I were arrested, they would never allow the matter to pass their lips; Mr Hamilton, indeed, making the extraordinary declaration that such a crime had extenuating circumstances when love was at stake. I then saw that I had fallen the victim of some clever conspiracy; but so utterly overcome was I by the awful scene that I could make but faint protest.

'Ah! think of my horrible position—accused of a crime of which I was entirely innocent! The days slipped on, and I was sent back to Amiens, and in due course came home here to dear old Glencardine. From that day I have lived in constant fear, until on the night of the ball at Connachan—you remember the evening, dad?—on that night Mr Flockart returned in secret, beckoned me out upon the lawn, and showed me something which held me petrified with fear. It was a cutting from an Edinburgh paper that evening reporting that two of the forest-guards at Pontarmé had discovered the body of the missing Miss Bryant, and that the French police were making active inquiries.'

'He threatened you?' asked Walter.

'He told me to remain quiet, and that he and Lady Heyburn would do their best to shield me. For that reason, dad,' she went on, turning to the blind man—'for that reason I feared to speak when I discovered him with your safe open; for that reason I was compelled to take all the blame and all your anger upon myself.'

The old man's brow knit. 'Where is my wife?' he asked. 'I must speak to her before we go further. This is a very serious matter.'

'Lady Heyburn is still at Park Street,' Flockart replied.

'I will hear no more,' declared the blind Baronet, holding up his hand, 'not another word, until my wife is present.'

(To be continued.)

TRANSFORMING PEAT INTO COAL.

By FREDERICK A. TALBOT.

ONE of the most fascinating and ambitious projects of the scientist to-day is to devise some process whereby raw peat, which abounds in such quantities in all parts of the world—in Ireland alone there are over one million acres of peat-bogs—may be transformed into a new, cheap, and efficient fuel for both industrial and domestic purposes. Needless to say, the realisation of such a dream would have far-reaching effects upon commerce as a whole. But there are innumerable difficulties to be surmounted. The substance is so heavily impregnated with water that unless the greater proportion of this combination of hydrogen and oxygen is eliminated the substance is impossible of combustion with any degree of efficiency. The proportion of dry substance to water is approximately 12½ to 87½ per cent. At first sight it would seem an easy matter to eliminate the excess of liquid by heavy compression; but although the bulk of water can thus be reduced, owing to the highly absorbent nature of the material sufficient is not extracted to render the resultant product a satisfactory fuel. On the Finnish railways, where peat is almost exclusively employed, the proportion of water allowed is 25 per cent.; and though a fair measure of success is thereby obtained, it cannot be considered in comparison with coal.

There are several processes extant for the conversion of peat into a fuel; but they comprise exposure to sun and air, so that the greater part of the water with which the material is impregnated may be driven off by evaporation, and obviously such a course has its limitations. In this temperate zone such outdoor drying can only be maintained during the hottest months of the year, which period is on the average about three months, so that for the greater part of the year work is brought to a standstill. Consequently any system for the conversion of the peat into fuel, to be of any real commercial value, must be one which can be carried out at any time of the year independently of wind and weather. Hitherto but little success has been accomplished in this direction; but now a well-known Swedish scientist, Dr Martin Ekenberg, after many years' research and ceaseless experiments, has apparently solved the problem, and has produced at the manufactory erected upon his own peat-bogs in Sweden a peat-fuel which in appearance, combustibility, and heat-raising properties compares very favourably with coal.

What is peat? Briefly, it is coal in the partially developed condition. The accumulation of decaying vegetable matter in swampy or boggy areas has settled down into more or less compact masses. But Nature has only partly completed her work. She has failed to impart that enormous pressure arising from the deposit of soil and rock upon the decayed vegetable substance which is necessary to compress it into a hard material; nor has it been carbonised and the water eliminated by the interior heat of the earth. A natural upheaval whereby the peat-bogs were buried under immense accumulations of rock and soil would achieve this end. If, therefore, one could, as it were, reproduce the cycle of operations carried out by Nature—compress the peat and drive off the water by a steady heat—coal would result from the operation. This is the secret of Dr Ekenberg's process. By minute study of the natural evolution he has succeeded in perfecting an artificial process, the fundamental characteristics of which are the elimina-

tion of the water by heat and the application of pressure by mechanical agency.

The process is simple and inexpensive, the heaviest initial outlay incidental to the erection of the plant being the most serious factor; but even this expense can be quickly recouped. There is a series or nest of horizontal pipes or retorts, intercommunicating at one end, ranged over the furnaces, together with a pumping-plant to ensure the steady and continuous supply of crude material to this oven. The peat is taken from the bog by any of the means generally adopted, and dumped into a specially constructed disintegrator, the knives of which tear, cut, and knead the peat-lumps into shreds, so that finally it becomes a homogeneous pulp. No effort is made to eliminate the water, the presence of which, in fact, is necessary to the subsequent operations. From this pulping-machine it passes to the centrifugal pump, which forces the mass in a steady semi-liquid condition into the oven. Here, under the influence of a moderate heat and pressure, the water becomes separated from the stable substance though not converted into steam, the peat is charred without any loss of the volatile combustible constituents, and by the time it has reached the end of its journey through the pipes is practically dry. Moreover, its nature is completely transformed. Whereas at the entry to the oven it was an absorbent, spongy substance, it is now of hard texture, and quite different from the raw material. Its absorbent qualities are completely destroyed, so that when it issues into the open air, no matter how long it is exposed or immersed in water, it fails to soak up any moisture. What little loose water may be present is easily and quickly removed by pressure, and the product is a solid, rock-like, homogeneous, coal-black material.

The carbonising process—for such the treatment in the oven is called—is designed upon a recuperative principle; that is to say, during the passage of the peat through the retort, as the moisture is eliminated the charred peat itself becomes hot; consequently, when approaching the end of its journey through the oven the peat in turn radiates a large portion of its heat, which is thus caused to assist in the carbonising process. While the peat is in the retort a pressure ranging from two to three hundred pounds per square inch is maintained, the temperature ranging from one hundred and fifty to two hundred degrees centigrade. At the inventor's experimental factory the heat is generated by the combustion of air-dried peat, which is excellent for the purpose, as it forms the uppermost or surface layer of the bog. It must be remembered that in this process the loose, mossy surface material or peat-litter is not used, but only the black or brown peat underneath, since the former is of no use for the purpose. In the production of a ton of peat-coal approximately 14 per cent. of its weight is used for the purpose of supplying the heat necessary for the carbonisation; but such a proportion is very low in comparison with other methods, since raw peat—containing, as it does, only 12½ per cent. of solid matter—cannot be artificially dried in order to supplement natural drying, for the simple reason that the amount of fuel required to dry a prescribed quantity of peat would exceed the percentage of solids in the latter.

The secret of this new process lies in the absence of any preliminary treatment of the bog or peat. The bog need not be drained, and no matter how swampy it may be in character, the raw material on removal from its bed is thrown at once into the disintegrator. Manual labour is, moreover, reduced to the minimum, since the smallest number of attendants requisite for the running of the machinery will suffice. So far as production-capacity is concerned, this is purely dependent upon the plant, but that in Sweden is capable of carbonising four hundred tons of raw peat every twenty-four hours. Further, the original quality of the peat is of no importance, except in point of yield, so that the age or ripeness of the bog is immaterial.

One important point, however, that exercises far-reaching influence upon the peat-coal produced by this means is the temperature at which carbonisation is carried out. For instance, if the carbonisation-oven temperature registers one hundred and fifty-five degrees centigrade, the heating value of the briquettes is five thousand one hundred and thirty-six calories. By raising the carbonisation heat, however, to two hundred degrees centigrade, the heat-value is increased to over six thousand calories. The briquettes thus produced are of ebonite colour, so very hard that little breakage ensues during transport, clean to handle, and bulk for bulk compare favourably with coal.

The question as to the combustibility and efficiency of such peat-coal is of vital importance, and upon this point some highly valuable testimony has been secured by eminent chemists and engineers, since the commercial practicability of any such fuel depends entirely upon the possibility of its application to both industrial and domestic purposes with the smallest modification of existing conditions. The moisture proportion is very low, being from 4½ to 14 per cent., according to the completeness of the carbonisation in regard to pressure and heat. The proportion of volatile matter, on the other hand, is very high, while the resultant ash and clinker does not aggregate more than 10 per cent. The fuel burns with a bright flame, with no smoke or fumes, and the heating value is about ten thousand British thermal units. The proportion of sulphur is insignificant, approximating no more than ½ per cent., while the coke does not cement together as in the case of coal. It will burn as readily in the open drawing-room grate or kitchen-range as in the boiler-furnace under forced draught.

The fuel should have great possibilities in those industries in which the absence of sulphur in the fuel is greatly to be desired, while it offers an excellent solution of the smoke-problem. It can

readily be applied to the stoking of railway engines, as tests have demonstrated. In this connection an interesting trial was undertaken. A locomotive hauling a train of trucks was supplied with twenty-five hundredweight of the briquettes. In order to warm up the engine at the start and raise the steam-pressure to between one hundred and thirty and one hundred and forty pounds of pressure, four hundredweight were consumed; the same quantity of coal was required for the self-same purpose upon this particular engine. During the run seventeen and a half hundredweight of briquettes were used, evaporating twelve hundred gallons of water to the required steam-pressure. The total quantity of ash residue remaining after the consumption of nearly twenty-two hundredweight of fuel was one hundred and two pounds, with ten pounds of clinker, the small quantity of which is particularly noticeable. These figures, therefore, show a steam-raising capacity under pressure of six and one-fifth pounds per pound of peat-coal, which is only about half a pound less than is obtainable with ordinary cheap coal. A special feature is that, owing to the small percentage of clinker and the facility of combustion, no change is requisite in the construction of the fire-boxes or grate-bars. It is merely a question of price as to whether the fuel can compete with coal in this particular application.

And the cost of production is the governing factor in the commercial utilisation of the process. In this respect, however, it should offer serious competition to coal. The average price, inclusive of all expenses, including wages, maintenance, and administration charges, averages about six shillings per ton per hundred tons output, which productive cost naturally fluctuates higher or lower according to the capacity of the carbonisation plant. When it is remembered that the ordinary air-dried peat briquettes cost between eight and nine shillings per ton, the effect of the lower cost incidental to this new process may be appreciated. Of course its great advantage in comparison with the air-drying process is that the fuel can be manufactured the whole year round irrespective of weather and climatic conditions. It must not be overlooked, moreover, that in briquetting no paraffinous or other foreign substances are required to bind the carbonised peat together, so that a pure peat-coal substance is produced. Considering the immensity of the peat-bogs in various parts of the world, and the fact that no expenses in connection with the transportation of the raw material from the bog to the factory need be incurred, manufacturing costs are confined within a small compass.

The invention also opens up great possibilities as a rival to the generation of electrical energy by water-power. In those countries deficient in natural coal-deposits a vast aggregate of water-energy in the form of waterfalls is available, such as, for instance, in Norway, Switzerland, Italy, and India. Consequently the horse-power running to waste is now being harnessed. With modern gas-engines using the carbonised peat the productive cost is reduced to twenty-seven shillings per horse-power year; and inasmuch as the valuable by-products, sulphate of ammonia and so forth, are secured, the cost of production is finally reduced to a very low figure. Power-gas can be secured from this wet carbonised peat as easily as from the fuels generally employed. In such a case briquetting is dispensed with, the peat-coal upon its exodus from the carboniser being merely pressed and then used. In such application from 4 to 5 per cent. of sulphate of ammonia, together with the valuable paraffin-tars, is recovered.

Illuminating gas can also be easily and cheaply derived from this peat-coal. The process is the same as that adopted for the manufacture of gas from coal. The carbonised peat is distilled in the dry retort, and the volatile constituents are secured, scrubbed, washed, and dried in the usual way, while the ordinary by-products are also obtained. The gas has a high illuminating intensity, comparing very favourably with coal-gas, while the coke residue is superior to that resulting from coal distillation, owing to its very low sulphur percentage. This opens up new possibilities, as owing to the insignificant proportion of sulphur contained therein, this coke is eminently adapted to metallurgical processes; and it can also be used in place of charcoal to a very considerable extent, with the additional advantage of being much cheaper.

It will thus be seen that a scientific method of reproducing the tedious and protracted evolution of nature in the transformation of peat into coal has at last been effected, and the result is as closely allied to that of nature as artificial agency can at present make it. At any rate, the perfection of the process has marked a decided advance in the utilisation of what is now practically a waste substance, and in such a way as to render it commercially applicable. In view of the constantly increasing price of coal and the demand for a cheaper and equally efficient substitute, this process must soon be generally adopted, and thus one of the greatest problems, at least of modern times, will be completely solved—the overcoming of the smoke nuisance.

THE SECRET OF THE SEBHAH.

CHAPTER III.

FEARING to tear the paper, or by damping it to obliterate the writing, Ferdinand removed entirely the back of the frame, and sent it, just as it was, by registered parcel-post, to Oxford. A letter accompanied it to one of the professors, an Orientalist with whom he was intimately acquainted, asking him if he would examine it, and favour Ferdinand with a translation.

Within a week the professor replied, saying that he had experienced a little difficulty in deciphering the scrip. The characters were rudely traced by a trembling hand with a reed, he should think, and not with a quill, and in ink hastily improvised from materials on the spot. The lapse of time, and exposure perhaps, had changed the ink to a faint yellow. Three short riddles were written out, or mottoes, or maxims—he knew not what to call them—and might be read in the order in which he gave them :

At the core of darkness—light.
In the heart of sorrow—sympathy.
Behind the blackest cloud—heaven.

For whatever purpose Ferdinand wanted the translation, he hoped it would help him, and he would be only too delighted to render any further assistance if Ferdinand would kindly let him know.

The reply came in the morning, and all day long Lea pondered over the three mysterious lines. So often did he repeat them that they were dinned into his brain ; and at last, by the very persistency of their recurrence, they seemed to hinder instead of help in the solution of the puzzle. What had they to do with the sebhah ? They marched through his mind in single file, but endlessly ; the first line beginning again where the last had ended, tramp, tramp, tramp, until he was sick of the repetition, and ready to abandon the search as foolish and useless. To the old Arab the words might be significant, and serve to illuminate some experience of his own, an experience which his prayers might recall as he ticked them off by the beads of the sebhah ; but of what possible use could they be to others, to whom the sebhah was simply a curious memento, and his experience unknown ? Light there might be at the core of darkness, and sympathy in the heart of sorrow, and heaven behind the blackest cloud. They were excellent reminders, doubtless, to those who needed them, and not without comfort ; but how were they related to the ninety-nine cedar beads and the three of black bitumen which divided the ninety-nine into equal groups ?

Night came, and he decided to sleep upon it. But when his head was on the pillow and all else shut out, the three lines renewed their march with a vigour quite relentless, and sleep was out of the question. *At the core of darkness—light.* 'I wish it were,' said he with open eyes, gazing into the blankness of the bedroom. 'The feeblest glimmer would be welcome ;' and he stared, and thought, and listened, until the tramp of the lines became uncanny. There was a lilt in the first and second lines which produced the effect of audible feet. The lilt was broken in the third line as if the feet were shuffling to recover their regular beat again, and this tortured him. It was a waking nightmare. Sleep ! How could he sleep ? He threw back the clothes, switched on the light, dressed himself, and went down to the library.

With the sebhah in his hand, he braced himself to think afresh, and to shake off the deadening repetition of the lines. The lines were three. So were the beads of black bitumen. He could afford to ignore the cedar beads. They were common, and did not count. But the bitumen beads were rare. Each one corresponded to a line of the triplet. The secret was in them. But where ? He held them up to the light. They simply reflected it from their polished surfaces. He fingered them, searching for a ridge, and wondered whether they were in two parts. He could feel no jointure, and no jointure was revealed to his scrutinising eyes when he placed them under a glass. They seemed solid enough. What did the lines say ? At the core, in the heart, behind the blackness. Perhaps they were hollow. What then ? Light, sympathy, heaven could not be concealed in three hollow black beads. Their symbols might. What were their symbols ? He did not know. To the Oriental imagination of an Arab they might be something entirely different from the conception of a matter-of-fact Englishman.

Should he break the beads ? That was the question which now faced him. They were his, and he could break them if he pleased. Solid or hollow, if once they were broken he could not mend them, and he could not replace them. The curio would be spoiled. He could not return it with the black beads broken. But if the secret were solved there might be no need to return it. Its purpose, in the help it would render, the help referred to by the Arab sheikh, might be fulfilled.

The beads must be broken.

The shape and size of the beads suggested that a suitable instrument for the deed would be a pair of nut-crackers. With these he could exert a slow and even pressure ; and if the beads were hollow, as soon as he felt the bitumen crackle he could relax his grip and save the article concealed within, should there prove to be any, from possible injury. Better so than, by striking the beads with a hammer, break whatever they might hide, and scatter the fragments of bitumen all over the room.

Ferdinand was surprised when, beneath the

increasing pressure, the brittle bitumen suddenly smashed into a hundred pieces; but more than surprised, amazed beyond measure, was he when, released from its hiding-place, a really magnificent diamond dropped upon the table. At the core of darkness—light, crystallised light! There it lay, gleaming superbly like a living eye, throwing back from every facet the electric radiance of the room, a stone so precious that he gasped as he beheld it, and did not dare for the moment to stretch out his hand and take it lest it should elude him and melt away.

When he did recover sufficiently to pick up the gem and hold it in the hollow of his hand, it sparkled there like a tiny pool of light. He gazed at it fascinated and overcome. What did this mean? Had he bought this for a simple sovereign? No, it was not his; it was Mrs Denholme's and Christine's, and it meant that their wants were relieved. They could stay on at The Shaws. In this single stone there was wealth enough to free them from their cruel position, and to provide them with a moderate competence for the years to come.

But what about the other beads? He was so taken up with the diamond that he had forgotten them. Had they similar surprises in store for him? He tried the crackers tremulously upon the next. The bitumen splintered like glass, and there, between the jaws of his instrument, was a sapphire blue as the firmament, shining like a summer sky. It was not so large as the diamond, but of great value nevertheless. He had hit upon the bead of the third line, not the second—the bead that represented the blackest cloud, with heaven behind it; for the gem which its broken folds revealed seemed to have gathered into its wonderful crystallisation the translucent azure of the deeps of heaven.

The second remained. What would it yield? He did not delay, but cracked it, and a ruby dropped out as red as blood, but blood on fire, the symbol of sympathy. The ruby, also, was not so large as the diamond. It was a stone, however, of remarkable purity, and lay in the hollow of his hand like a living flame.

With all the three jewels before him, and the beads that had covered them, black as night, broken into fragments, he marvelled that he had not sooner discovered the meaning of the screed, and he realised that the old Arab sheikh had recompensed his benefactor handsomely for saving the life of his favourite son. Such jewels were safer, perhaps, hidden as he had hidden them, and, fortunately, through the purchase of the sebhah by a trusty friend, they were destined to answer their purpose by succouring the rescuer's descendants in their hour of need.

The following morning, with the jewels in his purse, Ferdinand walked over to The Shaws.

The intervening days had been a time of reflection and heart-searching to Christine. Mr Pierce had called and explained the terms of the tenancy. So favourable were they that, novice though she was, she knew that no other tenant would have proposed them. By their acceptance she and her mother would be placed above actual want. It was a delicate method of befriending them quite in keeping with Ferdinand's character. He loved her, or had loved her; and he had tried to win her before the trouble came, when she was young and foolish, and scarcely knew her own heart; and she had refused him. Did he love her still? If he renewed the offer, would she now accept him? She knew not. The reversal of fortune had steadied her. Very little older was she in years, but in experience she had become a woman. It seemed mean to her, very mean, to take in her poverty what she had rather scornfully declined in her wealth. He might not understand that her heart had changed. Shrinkingly sensitive, she shuddered at the idea that either he or any one else should suspect that she was capable of trading upon his love.

'You are an early caller, Mr Lea,' said she, as she entered the room and shook hands with him.

'Yes, pardon me; but it was a matter that could not well wait;' and his grave face was illuminated by a momentary smile. Christine's sharp eyes detected that he was paler than usual and trembled a little. She wondered why.

'I am sorry mother is not down. But if the business is urgent'——

'I would rather discuss it with you first,' he broke in. 'I want to show you the sebhah;' and he drew the beads from his pocket and placed them in her hands.

'Why, the black ones are smashed!' she exclaimed.

'Purposely,' he answered; and she turned upon him swiftly with inquisitive eyes.

'Purposely!' she repeated. 'I do not understand you. Will you please explain?' Then, as he hesitated, her eyes dropped to the beads again, and she said, examining the fragments, 'They are only shells.'

'With very precious kernels,' he replied. 'What should you say, Miss Christine, if I told you that the kernels of those shells represented a fortune?'

'Impossible!'

'Not quite. Your story set me searching for them. I found out first that the black beads were made of bitumen. Then I sent the writing of the old Arab to a friend of mine, an Orientalist in Oxford, and asked him to furnish me with a translation. Here it is;' and he opened his pocket-book to extract it, when the petals of a pansy fluttered out and fell upon the floor.

So excited was he that he did not notice them. But Christine watched their descent. They distracted her attention. She took the letter, but her mind was on the flower. A soft blush, which she could not suppress, overspread her features, and she looked at the letter without seeing it. He observed the heightened colour, the inattentive eyes, and he

was nonplussed. What did this perturbance mean? Unaware of the escape of the petals, he could not account for it, nor did he see the petals blending so closely with the colours of the carpet as they lay strewn about his feet.

'What is this?' said Christine, in the effort to recover her equanimity. '"At the core of darkness —light"'——

'Yes, yes!' he exclaimed excitedly; 'read on.'

'It is very curious,' said she, after perusing the whole epistle.

'Very. You have no idea how those lines drummed their way through my brain;' and he told her all that had happened. Then, opening his purse, he placed upon the table, one by one, the three resplendent jewels.

'Oh!' and for a moment she forgot the petals; 'how fine they are! And how wonderful!'

'I could not delay, you see. I brought them early. You must keep them in a safe place until you can dispose of them to advantage.'

'But—but—they are not mine. They are yours.'

'Nay, Christine'—for the name slipped out without the prefix—'I bought the sebhah, not the gems. They belong to you. What would the old Arab say if they did not serve their purpose? The hour of need has come, and they are yours.'

The old Arab was dead long ago, and could say nothing; but he had met Christine upon her own ground. He spoke of him as she would have spoken—as she did speak—of her own dead father.

The prefix was happily lost, and she let it go. Stooping, she picked up the petals of the pansy, and held them before him in her extended palm.

'Ferdie'—it was the name his mother had given him, the name Christine herself had used when they were young together, before the time of her refusal—'Ferdie,' and there was a look in her eyes he had never seen before, 'these poor petals are more to me than all the jewels in the world.'

'Christine!' and he gazed at her almost in fear, but in another moment he had clasped her to his breast.

He removed to The Shaws sooner than he expected, and the terms of the tenancy were absorbed in vows which rendered them obsolete.

THE END.

ZANZIBAR.

WE have all read of a 'heaven-kissed isle,' and perhaps we have conjured up in our imaginations visions of a lovely island set amidst a tropic sea, of waving cocoa-nut palms, of perpetual sunshine, of white-crested breakers curling over a coral strand, and of a silvery strip of beach whereon could be discerned the dusky forms of the natives.

In the foreground of this picture paint in the quaint beauties of an old Oriental city whose buildings crowd down to the very water's edge, clothe the natives in the flowing robes of the East, and you may then be able to form some conception of the scene which meets the eye of the voyager as his ship casts anchor in the roadstead of Zanzibar.

Scarcely has the vessel come to a standstill when it is surrounded by a shoal of strange-looking native craft, the occupants of which are all bent on extracting pecuniary benefit in some manner from the new-comers. Some wish to row you ashore; others have their boats laden with bananas, pine-apples, limes, mangoes, besides many strange-looking fruits which one cannot classify at all, all of which they offer for sale to the passengers, stringing together in the most ludicrous fashion broken scraps of English, German, French, or Italian, according to that which they conceived to be the nationality of the individual addressed.

There are little cockle-shell 'dug-outs' in which are seated a couple of half-naked boys, one of whom is paddling the craft along, whilst the other is engaged in constantly bailing out the water which somehow finds its way in. So grotesquely tiny is the appearance of these craft that the occupants seem in momentary danger of being precipitated into the water—an occurrence, however, which would not seriously incommode them, for they are now earnestly soliciting you to throw a coin in order that they may dive for it. Steamers of various nationalities are moored in the roadstead, and amongst them may be observed the sleek, gray forms of two or three cruisers.

Looking towards the shore, the eye roams over an extensive conglomeration of flat-roofed buildings, jumbled together in closely packed though picturesque confusion. Here and there a lofty cocoa-nut palm rears its delicate crest above the house, or the cupola of a mosque stands out against the clear blue sky, whilst from various buildings float the flags of the European consulates. In the foreground is the palace of the Sultan, with its terrace abutting on to the beach, and flanked by an old battery of heavy and obsolete cannon. Beyond the confines of the town on either side stretches a low-lying shore, covered to the water's edge with luxuriant vegetation. The whole scene is full of variety and animation.

Nor is this pleasing impression dispelled when you make a closer acquaintance with the town. Selecting a guide from the clamouring crowd which importunes you as you step ashore, you proceed by way of a narrow and tortuous lane into the heart of the

town, when you find that the thoroughfare you have just traversed is in reality one of the widest and most important streets in the place. None of the streets are more than a few yards wide, whilst the houses—tall, white, and irregular—form at times an agreeable shade, and shut out all but a narrow and winding strip of the bright-blue sky overhead. Hundreds of shops may be seen here, a shop very often consisting of a few piles of goods displayed on a kind of sloping counter, which frequently encroaches on the street. On this counter, behind the goods, sits, cross-legged, a patriarchal-looking old Arab or Swahili. All day long he remains in this position. Sometimes he is reading his Koran in a dreamy, nasal monotone, rocking himself to and fro the while; or, again, he sits immovable as a bronze statue, drawing long whiffs from his narghile, and gazing meditatively at the varied stream of humanity which flows past his door. What business he does, and how he contrives to do enough to support himself and a family out of the microscopic-looking stock-in-trade displayed in front of him, is a mystery beyond the power of the visitor to solve.

So many and so diverse are the types and costumes to be met with in the streets of this quaint old town that one could almost imagine that every nation of the East had contributed towards the population. The predominating race is the negroid Swahili. These people wear a long, white garment reaching to the feet, and a small *cofin* on the head. Then there is the Arab, of piercing eye and stately mien, who generally carries a curved dagger in a jewelled sheath at his waist. There are traders from Cutch in baggy white breeches and smocks, and wearing on their heads low-crowned, embroidered fezes. There are Parsees, bespectacled and smug-looking, wearing the curious head-dresses which so strongly resemble bishops' mitres, and carrying in their hands the inevitable tightly rolled umbrellas. Dapper Goanese, veiled women of the harem, scantily clad negresses, fat and pious-looking Hindus, effeminate-looking Cingalese, and many others too numerous to mention are all rubbing shoulders in the narrow and winding thoroughfares of this old town.

Here you come to a fruit-stall, and your guide, who is very proud of his smattering of English, stops and tells you the names of the many products on view, not omitting gravely to point out tomatoes and potatoes! Next you come across quite a batch of Goanese tailors' shops. Inside and out sit rows of the little men busily plying their needles, whilst the air is merry with the rattle of sewing-machines. Then there are the warehouses of the more important merchants, who trade with the African interior. Looking inside one of these, one may see stacks of ivory and huge piles of skins and hides, great heaps of cloves, and bags of rubber. The assistants are bustling about; clerks are scribbling away, seated, not on high office-stools, but cross-legged on cushions; while the shrewd-looking Hindu merchant walks about with a superintending eye.

The fate which overtook so many of the great slave-trading centres when their nefarious commerce was stopped did not fall in full measure upon Zanzibar, for it had the resources of commerce and agriculture to fall back upon. Nevertheless, the abolition of slavery and the laying by the heels of such gentry as Tippoo Tib dealt a serious blow to her prosperity. The island produces great quantities of cloves and copra, whilst ivory, hides, and rubber are brought over from the opposite coast.

Perhaps the most remarkable commercial feature of this part of the world is the extensive and flourishing trade still carried on by the dhows. It is little short of marvellous to think that these most ancient and primitive vessels should be able to compete successfully in certain classes of trade with the modern steamship, in spite of all that is heard of rate-cutting and of profits reduced to a minimum. The fact is that the expenses of navigating a dhow are practically nil, and time to a native counts for little. To the keen old Arab sailor the stars are nautical instruments, past experience a barometer, and the free winds of heaven motive-power. These vessels ply all along the coast as far north as Aden and as far south as Madagascar; and at certain seasons of the year they go even to Bombay and up the Persian Gulf.

Of the early history of Zanzibar nothing is known. It was under the rule of a Swahili dynasty when in the tenth century the Arabs, who at that time swept the eastern seas, came down and seized it, established a colony, and built the town. Since that time its fortunes have been varied and sanguinary enough. At the end of the fifteenth century, when Vasco da Gama sailed round the Cape with his brave old buccaneers, it was not to be supposed that a wealthy place like Zanzibar should escape his attentions. The Portuguese took it without much difficulty, and held it with a good deal of difficulty for about two hundred years. Then, when they were finally dislodged and their influence on the north-eastern seaboard of Africa was broken up, it reverted to the Arabs once more. Next we find it under the dominion of the Imam of Muskat, and in 1856 it once more becomes an independent state under the son of one of those potentates. In 1890 Zanzibar drifted into the peaceful waters of British protection. The present Sultan is a quiet, well-behaved young gentleman, who was educated at Harrow. He is styled Highness, lives in a 'palace,' and draws a comfortable annuity from the British Government. All real power lies in the hands of one of those shrewd British administrators who pass under the unassuming title of 'agent.'

The name of Zanzibar is familiar to most people as the base and starting-point of many of the African explorers; and the works of Burton, Speke, Stanley, and a host of others all contain something in the shape of a description of this place. How many books of African travel there are with an opening

chapter, 'London to Zanzibar'! Then follows a description of the natives, with all the delighted interest of one who sees them for the first time: the visit to the Sultan, the hospitality of the British consul, the slaves, the ivory, Tippoo Tib, the engaging of the porters and soldiers. Then the journey in dhows to Bagamoyo, on the opposite coast. After this comes all the weary routine of African travel: the toilsome marches on foot, the exactions of the petty chiefs, the squabbles, the miscalculations, the fever, the mutiny of the porters, the despair, and at last the arrival once more in civilised parts, ragged, emaciated, but triumphant. What a number of brave fellows have started for that mysterious interior, with stout hearts and high hopes, never to return!

The sun sinks down towards the western horizon, throwing into relief the far, dim line of the African coast, and laying down across the waters a broad and golden pathway. A dhow, hitherto unnoticed, crosses this zone of radiance, and shows up for a moment all on fire, with a sail of beaten gold and immortals for a crew.

Let us imagine ourselves scudding across from the mainland a few years ago with a flotilla of just such vessels as this. The dhows are filled with chained and wretched humanity, for we are returning from a successful trip with Tippoo Tib. Far ahead can be seen the delicate outlines of Zanzibar; the leaders of the expedition are anxiously scanning the horizon for a sign of the hated man-of-war. At length we draw nigh to our destination, and the white buildings of the city seem to grow up out of the glassy sea. An expectant crowd is thronging the beach, and the Arab raiders begin to don their gayest attire. What must be the feelings of the wild-eyed wretches chained together on the decks? What a mockery must this fair scene be to them! Take, for instance, that fine-looking fellow at the end of that gang. He is trying to piece together the events of the last two months, and it all seems like some horrible dream. He remembers the day—it seems years ago—when he and all the other villagers were busily hoeing their fields, for it was the season when the young crops begin to grow up. They had just left off work for a spell, and were resting from the noonday heat under the shade of a great tree, whilst a number of maidens were approaching the spot bearing on their heads calabashes of a cooling drink made from the juice of the banana. Suddenly a great shout was heard, and, before they had had time to realise what was happening, a horde of fierce-looking men had broken through the surrounding bush and borne down upon them with such force and in such overwhelming numbers that resistance had been hopeless from the first, and they had been quickly overpowered and bound together. Of the horrors which followed—of the burning of the village; of the ruthless slaughter of all those who were deemed incapable of standing the long and rigorous march to the coast, and of that journey performed under the joint influence of the slave-yoke and the lash, with the constant spectacle of the weaker ones falling out by the wayside to die; of the embarkation on the dhows—of all these things he has but a blurred and indistinct recollection. His mind is occupied with speculation as to what will happen next.

Happily this order of things has passed away in Zanzibar, and on the site of the former slave-market stands the Anglican church built by Bishop Steere.

Our meditations are interrupted by the sunset-gun which booms from the terrace. The notes of 'retreat' float out from a neighbouring cruiser. Down comes the white ensign; the merchant-ships follow suit, and the day is over. Over is also our brief visit, for our ship, whose lights now begin to gleam across the darkening waters, sails at midnight. So, stepping into a boat, we push off and bid farewell to Zanzibar.

IN A GARDEN.

By S. BALLARD, Author of *An Open Door*, &c.

A SUNNY morning in September. Deep shade was cast by the big chestnut-trees whose branches spread over a low fence into the road. Under this shade two children were searching for the unripe, fallen chestnuts. The nurse who was sauntering up and down with a mail-cart was evidently in charge of the little pair.

So intent were the children upon their search that they had not noticed that an old gentleman had come out of the big iron gates leading to the manor house, and was coming towards them.

'Oh Nana,' called out the small girl, 'I see such a beauty just on the other side of the fence! Mayn't I poke it out with a stick?'

'What is it you are looking for?' said the old gentleman, pausing beside the children.

'Chestnuts,' said the little girl. 'Look, Ernie has got quite a lot.'

The little boy held out a small and grubby handkerchief full of treasures. I have got more than Enid to-day,' he said triumphantly.

'You surely don't eat these nasty things?' said the old gentleman anxiously.

'Eat them!' screamed Enid with peals of laughter. 'Why, no; they are our soldiers, and we should have such a lovely army if only we might pick up the ones on the other side of the fence; but you know that would be stealing. But we may take the ones that drop on the road.'

'Have you never been on the other side of the fence?' asked the old gentleman.

'Oh no!' answered the children together; and Enid explained that there was an old gentleman who lived in the house inside the gates who would be extremely angry if he saw them inside or picking up the chestnuts. 'Though I don't believe he really cares for them,' she added, 'for we never see him gathering the chestnuts. But perhaps he is waiting till they get ripe.'

The old gentleman walked up to the nurse and said a few words to her; then, returning to the children, he said, 'Come with me. I will take you inside the gates.'

'Are you allowed to?' said Enid. 'Is the old gentleman a friend of yours?'

'Oh yes,' said the old gentleman; 'I may do anything I like here.'

The trio passed through the iron gates and walked up the drive. As they approached the big, silent house, about which there was no sign of life, the children became somewhat alarmed, and they each seized a hand of the old gentleman.

It was years since Sir Walter Graham had been held by children's hot little hands, and he felt as if he were walking in a dream; time seemed to be annihilated by the clinging touch, and as he reached the door he would hardly have been surprised if the wife of his youth had come forward to meet him.

The footman in the hall gasped with astonishment when he saw the trio, who passed into the library, the children treading on tiptoe with serious faces, their usual chatter silenced by the solemnity of their surroundings.

Once in the library, Enid found courage, and broke the silence. 'It's all very grand, isn't it?' she said in a timid voice.

Sir Walter did not seem to know what to reply to this remark; but the rather awkward pause was brought to an end by a shriek from Ernie. 'Fountains! Enid, look!' and he gave one bound to the window.

'Fountains!' said Sir Walter. 'Where?'

'See!' they exclaimed; and at that moment a gardener who was watering the beautiful, velvety turf turned up the hose, which sent out a jet of glittering water.

'Oh, might we go out there?' said the children.

For answer, Sir Walter opened the French window, and the children darted forth. They had forgotten the unknown old gentleman and their shyness. Sir Walter, their benefactor, too, was forgotten; there was room for nothing in their minds but this absorbing excitement.

'Isn't it beautiful?' said Ernie.

'Perhaps the young gentleman would like to hold the hose in his own hand,' said the friendly gardener, who, having a large family of his own, was better able to anticipate the child's wish than was Sir Walter, to whom such an idea would never have occurred.

The little boy was speechless with excitement when he found himself actually with the hose in his own hand. The water poured out in a shining stream, and it seemed to the child as if he had passed into a region of magic.

It was only fair that Enid too should have her turn; and she, being a thoughtful little creature, was determined that the 'old gentleman' should have a share in those tremendous excitements. 'And mayn't he have it for a little too?' she said appealingly to the gardener, who in her eyes was the sole possessor of the hose.

The gardener blushed under his sunburnt skin. To be appealed to to allow his master to hold the garden-hose was a trying position for a well-trained servant; and when relating the tale to his deeply interested family he stated that 'any one might have knocked him down with a feather, he was so taken aback.'

'Oh, another day will do for me,' said Sir Walter. 'Don't you want to take a look at the garden?'

This was a new interest, and the children darted off. In a moment there came a piercing scream from Enid from behind the shrubs.

Sir Walter hurried forward in alarm.

'Oh Ernie, look! it's the kind that crackles when you put them in the fire.—May we have some? We would like them so much?'

Sir Walter, reassured by seeing the child all safe, looked round in rather a bewildered way. He did not see what there was to have.

'They do crackle so beautifully,' said Enid, holding up a fallen cone.

'Why, of course you may have as many as you like,' said Sir Walter when he had grasped what the longed-for treasures were.

Enid began to gather them up and to make frantic endeavours to force some into the pockets of the small boy. The pockets had not been intended to hold fir-cones, and gave unmistakable signs of bursting. The sympathetic gardener, who had followed his master, again came to the rescue with a murmur of 'A basket.'

'A basket! Of course—the very thing, Williams. Get one at once.'

The fir-cones having been satisfactorily gathered into the basket, the children were content to return to the lawn, where they found the nurse discreetly seated under a tree awaiting her charges.

'Oh Nana! we have had such a splendid time,' said Enid.

'And we have never seen the cross old gentleman at all,' added Ernie.

'Don't talk nonsense,' said the nurse severely. 'I don't know what you mean.'

'Why, Nana,' said Enid, 'you told us yourself that we were not to pick up the chestnuts because of the cross old gentleman who lived in this house.'

It was the nurse's turn now to feel that she might be knocked down with a feather.

'I am sure, sir, there was no disrespect meant,' she stammered, with a scarlet face; 'but really they do go poking about so that one says anything to keep them out of mischief.'

'Oh, no harm done,' said Sir Walter. 'Who are the children?'

'They are Captain Percival's children, sir,' said the nurse. 'The master is still in India; but Mrs Percival brought the children home, and has taken lodgings here for some months. But there is not much garden for the children to play in, so we mostly walk up and down the road.'

'Give Mrs Percival my compliments—Sir Walter Graham's compliments—and say that I hope she will allow the children to come and play in here every day. Every day, mind you,' he repeated.

When the children had gone Sir Walter dropped into his chair with the sensations of a man who has been through a variety of unexpected experiences. Was it possible, he thought, that he and those children belonged to the same order of beings? Was it conceivable that he too had once been a creature to whom a garden-hose meant breathless joy, and from whom fallen fir-cones could bring forth screams of delight?

Moved by a sudden impulse, he rose to his feet, and, crossing the beautiful old hall, entered the drawing-room. It was full of fine furniture and ornaments, but had the sad look of a room which lacks a woman's daily presence. Sir Walter walked up to a large oil-painting which hung at the end of the room. It represented a lady with a small boy leaning against her, a jolly, round-faced little fellow not so very unlike the small Ernie from whom he had just parted.

'By Jove!' said Sir Walter half-aloud, 'it really looks as if I might have enjoyed the garden-hose and fallen fir-cones as much as they did. Why does the Almighty not let us keep some of that capacity for enjoyment? Those children get more pleasure in one day out of nothing than I get in a year out of an income of a few thousands and a place.'

Sir Walter's wife had died quite young, leaving him with one son, round whom all his hopes centred. That his son should marry and come and live at home, and fill the big, old house with grandchildren, was the dream of his life; but it did not seem as if this dream were likely to be fulfilled. When young Captain Graham came to spend his leave at home the house was always filled with guests, and a variety of charming young women were invited, from among whom Sir Walter hoped that his son might choose a bride. The young ladies were always very willing to come, for both father and son were popular; but they came and went without apparently making any impression on Captain Graham.

Poor Sir Walter gathered from some words let drop by his son that 'there *had* been a girl;' and though he would have given anything to know what had happened to the girl, and why she was not now reigning at the manor house, yet he did not venture to press his son to further confidences.

'If the lad's mother had been alive,' said he to himself, 'we should have known the whole story. What useless creatures we fathers are!' His thoughts often dwelt on the unknown girl, sometimes in anger, sometimes in pity, wondering if she knew what she had lost. Had his son proposed to the girl? he wondered. But he could not believe that any girl would refuse his son. What was to be done to get hold of this girl and put things to rights; or, failing that, how was she to be obliterated from his son's memory?

He longed to have little ones, like the children who had just left him, living in the house with him. When Sir Walter took his solitary drives in the big carriage, with its pair of handsome horses, he often passed down the ugly, dull-looking streets of the neighbouring country town. As the carriage approached, groups of dusty, rosy children would scatter to the right and left, and here and there a mother would rush from a doorway to snatch up a straggling infant. The streets were of the type that people look down and sigh, and then talk of the monotonous life of the poor. But Sir Walter knew better. He knew that monotony cannot exist where all around there is restless, energetic young life grasping with interest and curiosity at the commonest things of the wonderful world on whose threshold it stands.

Those who passed the manor house often paused and sighed as they looked at the glimpses of tranquil beauty that could be seen through the great iron gates. They sighed to think how serene and lofty must be the life led amid such surroundings, how apart from that which is led by ordinary mortals. But Sir Walter knew that his life was a veritable stagnation compared to that of the busy parents of the children who played in the dull streets. He realised that we must live in the lives and interests of others, else we cease to live at all.

The following day the little Percivals appeared at the door and greeted him quite as an old friend.

'I hope it's not intruding, sir,' said the nurse apologetically; 'but they said you had told them to come, and they would give me no peace till I brought them.'

'Quite right! quite right!' said Sir Walter. 'Remember that I shall expect them every day.'

These daily visits of the children became a source of great pleasure to Sir Walter. He had occasionally asked his guests to bring a child or two with them to stay; but people were always so afraid of 'disturbing dear Sir Walter' that any child brought to the house was so terribly kept in order by its parents that the result was distinctly disappointing on both sides.

The Percival children were cheerful little mortals, who were not in the least troubled with shyness. That they should suddenly have access to this enchanted spot was a piece of luck which they were quite ready to accept and make the most of. To

watch the plants being pressed into the soft, brown earth in their pots, to sweep up the masses of golden leaves that came fluttering down in the September wind, to tie the chrysanthemums to their neat little sticks were all occupations which appealed to that love of nature which is to be found in every true child's heart.

It gave Sir Walter grim amusement to see what a subordinate place he held in the children's estimation. The under-gardener had been a person of importance from the very first, being the visible possessor of the garden-hose; but the head-gardener was looked upon as the real ruler of the place. It was in his pocket that reposed the magic key that opened the doors of those glasshouses, through which the children walked on tiptoe, sniffing up the hot, scented air. Even Sir Walter apparently could not enter those sacred regions without a message being sent to the 'gentleman with the key,' as Enid always politely called him.

The nurse's office became a sinecure; from the time she entered the gates she considered that the children were off her hands, and she resigned herself with great satisfaction to a seat under the trees and mild flirtations with passing gardeners.

October brought some wet days, during which the children were unable to go to the manor house. Their mother returned from her visits, and they had the great excitement of the arrival of Aunt Lilian. She had not been many minutes in the house before the tale of the beautiful garden was being poured into her sympathetic ears.

'And whom does it belong to, this delightful place where you find so many wonderful things?' asked Aunt Lilian.

'At first we just called him the old gentleman, but now we call him by his proper name, Sir Walter Graham,' answered Enid.

'Margaret,' exclaimed Aunt Lilian, putting down her tea-cup, 'you don't mean'——

'Oh Aunt Lilian,' broke in Enid in reproachful accents, 'you have spilt half your tea!'

'Time for you children to be going to the nursery,' hastily interposed Mrs Percival; and amid loud protests she hurried them from the room.—'Yes, dear,' she said, returning to her sister, 'it is Captain Graham's father. I had not realised when I took this house that we should be so near the manor house. Not that it makes any difference. Sir Walter knows nothing about us, I expect, and Captain Graham is always away, more's the pity, for I would give anything—yes, Lilian, I would indeed—for you two to meet again. It breaks my heart to think that your life should be spoilt by a girlish freak. I never did quite understand what happened. Did he think you were in love with some one else?'

'Oh Margaret!' moaned Lilian, 'I don't know quite well myself what did happen. You know what lots of men father always had to our house in Simla, but none of them were to be compared to Walter Graham. He was really in love with me, and I cared awfully for him; but, just for fun, one day I thought I would carry on a little flirtation with Captain Baker, and turn the cold shoulder on Walter. I wanted to see how he would take it. But he chose to take it as a sign that I dismissed him, and next morning there was just a note to say that he had returned to his regiment, and I never saw him again. How can men be so stupid? He ought to have known quite well that I was only in fun.'

'Well, you see, he would never have carried on with another girl in your presence, so he could not understand your doing it. But was there no way of sending him a friendly little note?'

'How could I?' said Lilian. 'For the first few days I never dreamt that he had gone for good, and then, just as I realised what had happened, the crash came. Father died, and I knew that I was nearly penniless. I was not going to throw myself on his mercy as a poverty-stricken damsel.'

'You are both of you so proud that you would rather suffer all your lives than take a first step towards reconciliation.'

'It's not a case of taking a step at all, for I imagine he does not care a rap about me now,' said the weeping girl. 'How I lie awake at night and go over the lovely times we used to have in India, and now I am a governess and can merely stand by and watch other people having lovely times! Oh, if father had only thought a little of the future and left me enough to keep myself! It is so hard to live in other people's houses and obey them after being mistress of a house such as we had in India.'

'But you will have good times again, dear,' said Mrs Percival soothingly. 'You know that Jack and I have always planned to have you out in India to live with us.'

'Never!' said Lilian. 'Do you think that I would come to be a burden on you and Jack? You know quite well that you must save all you can for the chicks. Don't leave Enid penniless, as father left me. No; I shall go on in this gray, colourless life to the end of the chapter.'

The next morning Lilian Maxwell plied the nurse with questions as to the visits to the manor house. She found out that the children never saw any one but Sir Walter.

'From what the gardeners tell me, miss, I understand that the old gentleman does not care for visitors unless his son is at home.'

'And when is he expected?' asked Lilian breathlessly.

'I don't know, miss,' replied the nurse; 'there wasn't any talk of his coming. I did hear it said that he was in Scotland, visiting.'

In Scotland, visiting! What delightful visions the words called up! She could imagine the houses he would go to, places where laughter and mirth and gay dresses were everyday matters, and he would be a welcome guest at each, while the utmost she could hope for in her year of

crowded work was a few weeks' holiday to visit her sister.

Lilian felt that she could not resist the temptation of going to see Captain Graham's home. There seemed no possibility of his finding her there, and Sir Walter would have no idea of who she was even if he knew anything of what had passed between his son and her.

The children were delighted to act as guide, and talked gaily as they walked up the drive, though their aunt paid them but scant attention. The big trees were brilliant with their autumn covering of gold and brown; the Virginia creeper on the house blazed red in the morning sun; a great staghound on the doorstep rose to his feet, and, stretching himself lazily, walked to meet them. The tranquil beauty of the place positively made her ache. This, then, was what she had lost by a foolish little flirtation carried on with the wrong man! She could have cried to think of her folly and her utter helplessness to remedy its consequences.

'Sir Walter's wishes are that we should just go round to the gardens and play there till he comes out,' explained the nurse.

It was fully an hour after their arrival when Sir Walter stepped out of the French window and walked round the garden in search of the children. He found a little group under an apple-tree assisting in the fascinating task of gathering apples, the nurse firmly refusing their entreaties to be allowed to climb the tree.

'Well, children,' said Sir Walter, 'and have you seen my son? He must be somewhere in the garden.'

'We didn't know till to-day that you had a son here,' said Enid.

'I dare say not,' said Sir Walter. 'You see, he only arrived last night. Where has he gone?'

'We brought my aunt Lilian to see your garden,' said Enid, 'and your son is with her somewhere over there.'

'And they're quite good friends,' said Ernie seriously, ''cos I saw him kissing her as I came here.'

'Lor'!' exclaimed the gardener, and he then discreetly dropped on his knees with the pretext of searching for a fallen apple, but really with the desire to efface himself as far as possible in this painful predicament.

'Master Ernie, you wicked little boy!' cried the nurse, seizing the child by the shoulder, 'how dare you tell such'——

At that moment the figures of Miss Maxwell and Captain Graham were seen to emerge from the shrubbery. There was an indefinable something in the way in which he bent towards her in absorbed conversation that made the nurse's hand fall to her side and stopped her flow of words.

'Oh nurse,' protested Enid, 'Ernie's not telling lies! He was kissing Aunt Lilian, for I saw him too; but he was doing it quite nicely, with his arm round her waist, just the way Tom does when he comes to see you on Sundays.'

The nurse's face was scarlet, and she vowed in her heart that there never had been such children; but her agitation was quite unobserved.

Sir Walter, on hearing the child's statement, had stood as if petrified; but when he saw the advancing pair a light appeared on his face. 'The girl!' he murmured as he moved slowly to meet them.

A SONG OF THE SCANDINAVIAN WOMEN.

We saw our men sail westward,
Dry-eyed we sent them down
The streaming wind-swept highways
To meet the storm-god's frown.
Across the flying cloud-wrack
Their quivering masthead reeled,
And shorewards swept the clamour
Of straining shield on shield.

As birds along the coastline
We gathered, like the mist;
And calm the eyes that watched them,
And firm the lips they kissed.
But Freyja knew us women
In terror of the seas,
And marked the arms that trembled
To be about their knees.

We saw the leaping foam-line
Flung backward from the oar,
We heard the wheeling sea-gull
That wailed 'No more! no more!'
Our bodies ached with longing,
Our hearts were big with pain,
While laughing leapt our loved ones
To dare the sea again.

Oh Islands of the Westward,
White cliffs and pastured ways!
Oh swinging seas of summer,
Jewel-blue in southern bays!
Give up the spells that bind them;
What charm have we to keep
Our men what time your magic
Shall call across the deep?

What power have we to fetter?
They are not ours to hold;
With wandering winds we share them,
Long days our arms are cold.
Then, storm-flung from her bosom,
The sea hurls back our gift
To lie among the sandhills
With wrack and scattered drift.

But since the Norns have spun it,
And since the web is wet
With sea and blood and sorrow,
Our tears behind we set.
And down the shrieking seaways
Dry-eyed we saw them go,
And strong our voices hailed them
Since Odin willed it so.

RIVETT'S WHEAT.

By A. R. ROSE-SOLEY.

CHAPTER I.

THE wheat had been reaped; the ripe sheaves stood in loose shocks on the stubble. Beyond, a belt of dark trees rose in black outline against a blue-gray sky, across which stole the first peach-tint announcing sunset. A fair expanse, suggesting calm and comfort! So thought the lanky, strongly built young American who drew rein at the gate and gazed on the scene.

'Kind of upliftin',' he muttered softly, his glance roving from sheaves to horizon, thence back to horse and cart where the corn was loading. 'England seems a trifle cramped, but I allow she 's mighty soothin'.'

''Ev'in', sir; foine daay fur carryin',' observed the wagoner, watching him surlily.

'Carryin'?' queried the stranger.

'Ay, ay, we 've abin carryin' the daay. Belikes thur bean't no corn carryin' in yer furrin parts?'

'That so? I appreciate yo',' drawled the horseman. 'I 'd like to walk yo' in the shadow of our corn; then yo' might talk! But I admire yo' views.'

The man grinned. 'I doan't understand that talk mysel'. Carryin' be enuf fur me. Views is fur the loikes o' Missy thur.' He jerked his thumb backwards, and the American caught the sound of childish voices rising behind a distant shock.

'What is it—a bee?' he asked eagerly.

'Bain't no bees,' growled the wagoner. 'Be just Missy hersel' aguvin' tha children a coop o' tay in tha fields. Yer ain't got no call to goa,' he persisted; 'her doan't knaw yer.'

Cassius Crewe, U.S.A., felt a distinct call. The feminine element seemed the one thing lacking to the landscape, and his curiosity was awakened. Dismounting and leading his horse, he walked ahead, to find himself confronted by a small party of youngsters.

They had tossed some sheaves down for seats, and were luxuriating on bread-and-jam, tea and cake, besmeared mouths and pinafores. Resting against a shock was a young girl in faded print, her old straw hat thrown on the stubble, her hair gleaming like yellow silk on the mauve-brown background of the wheat. Apparently Missy. She looked up in surprise, her cheek flushing shyly.

Cassius raised his hat, and stood unexpectedly embarrassed. This was not the kind of girl he was accustomed to. 'I—I—was admirin' yo' prospect,' he said haltingly. 'Yo' country-side is beautiful.'

Missy's blue eyes glanced at him curiously, her mouth curved in a slight smile. She also was puzzled. His speech betrayed him for an American; but the soft drawl and cultured accent differed from the Yankee twang she had occasionally heard. Cassius inherited the ways of his Southern mother.

'It seems beautiful to us, who have always lived here,' she answered in low, sweet tones; 'it may strike a stranger even more forcibly.' Then she bent toward one of the children to attend to its wants.

The American stood spell-bound. He longed to continue the conversation, but could not think of a pretext. Who on earth was this village girl with the air and speech of a queen? Were all English country girls like this? As he stared uncompromisingly at the golden-crowned head, against its background of wheat, he had a sudden vision of how it would look adorned with the tiara which his father had bought only the other day for his mother.

The girl glanced up again, resentful under his steady gaze.

He had a sudden inspiration. 'I was starin' at yo' wheat,' he said mendaciously; 'it looks kind of different from corn on our side. This is almost bronze, like—well, I guess I don't know anythin' just like it. Now, our corn 's the colour of yo' hair.'

She flushed again a delicate pink. Missy was not accustomed to strangers making remarks about her hair. But she answered in the same sweet voice, 'I believe the farmers call it Rivett's Wheat; perhaps it is not so pretty as the traditional golden grain of the poets. I am afraid it destroys one of

 [*All Rights Reserved.*]

your illusions.' Rising swiftly, she gave him a slight, stately bow, and busied herself gathering up the fragments of the feast.

Cassius felt himself dismissed. He walked away pensively. Surely there never was such a lovely girl as this one, with her wild-rose complexion, forget-me-not eyes, and chiselled features! If he only had the skill of his chum Harvard, the artist, he would paint a portrait of her that would take the world by storm! Had Cassius but realised it, there were many English girls as fair and stately; only, in this particular instance, a small personage armed with a bow was ensconced among the sheaves directing arrows at his susceptible heart. He overtook the wagoner starting on his homeward trip.

'Who is Missy,' he asked eagerly—'schoolmarm?'

'Noa, that she bain't; 'tis her koindness,' growled the wagoner, scowling indignantly.

'Oh, why, then, farmer's daughter?'

'Noa.'

Cassius reconsidered his English readings. That faded print could scarcely belong to the rector's daughter. 'Do you mean that she is a cottager?'

The man looked exasperated. 'Missy? Why, if our Missy had ur roights an' no danged furriners aboot—— Well, thur, she be just our Missy wi'out ur own, Lord love ur!—Whooa thur, gee-oop!'

He cracked his whip and tramped on sulkily. There was no more to be got out of him.

Cassius looked back, sorely perplexed. Missy was emerging through the gate, children frolicking round her. The peach-coloured sky, already deepening to crimson, shed a warm light on hedge and undulating meadow, on cattle gathering under oak and elm. 'Just our Missy' stood out in the rosy glow, her faded cotton and shabby hat transfigured, a picture by Greuze in the gathering glory. He rode away, one of those little arrows rankling in his heart.

The girl watched him, a quiver of pain on her proud face. 'I suppose he belongs to those people who have taken the Abbey,' she murmured wistfully. 'Well, I am sorry they are Americans.'

And Missy sighed.

They were a silent trio in the Abbey dining-hall that evening. Cassius, as he ate his meal mechanically, was pursued by the feeling that surroundings were out of harmony. It was not the liveried servants and semi-state that oppressed him. His father's 'pile' was made ere he was born, and luxury had become a habit. But something more than money was required to fit in with this 'pile' of another kind—this old baronial pile where an ancient race once held sway, where abbots caroused in days of yore, and monks slowly paced the adjoining cloisters now in ruins. What business had shoddy wealth from the New World to come and strike a jarring note? When dessert was on and the lackeys had left, he glanced up at the ancestral portraits.

'We are somewhat out of tune with that sort of thing,' he said, pointing to a knight in armour. 'How they must despise us!'

Mrs Crewe came out of her reverie. She gloried in her old Virginian blood, and resented the remark. 'They have no call to look down on you, Cassius,' she said proudly; 'some of yo' ancestors could hold their own with any of these people. Never forget your descent, especially in England.'

'Waal, I reckon he needn't blush for the dollars he gets from the other side of the house,' snapped Crewe, senior; 'they're of almighty account over here, ma'am. Strikes me, your English blue blood takes as kindly to our Murrikan dollar as though it were native; makes us fork up, too. Airs or no airs, money talks to-day.'

'Mr Crewe, sir!' protested his wife.

'Waal, I ain't saying nothing against your Ole Virginny stock; guess I'm proud of it and glad the boy has it. But you don't tell me that it would go far without the gilding. No, sir! And it's common-sense, too. They need our money badly. Look at their estates, like this, shut up for want of money. Look at their cottages; we wouldn't keep a Murrikan pig in some of them.'

'And look at their cottagers,' broke in Cassius. 'I saw a girl to-day who is, I su'mise, a cottager's daughter. I allow her clothes were wo'th two cents; but she looked a queen, and a beauty at that.'

Cyrus Crewe suddenly put down his bunch of grapes and stared at his son. 'That so?' he asked shortly. 'Waal, I reckon you'll have to quit admiring the cottage-queens. Look here, sir, I mean our glorious Murrikan name to be respected; there are to be no common village flirtations round our way. See?'

'Flirtations!' ejaculated Cassius, remembering his bow of dismissal.

'No, nor serious nonsense neither. We can't afford it. We're bound to climb, we Crewes; there must be no stooping to low'——

'This was a lady,' interrupted Cassius. He was feeling very sore.

'I shouldn't wonder. I'm used to all women being ladies if they behave straight. But there's class here, and don't you forget it. Your father's climbed for you, sonny, and now it's your turn. You marry blood, or money, or both.'

'No need for both,' put in the mother softly, as she watched her son's rising colour. She recalled some of the reckless infatuations of her race, and trembled lest this only child should be developing a mad romance. 'No need for both, Cyrus; there is enough money on our side. But he must marry blood when he gives me a daughter. As for the cottages, they are bad enough round here; but Lord Fellon has put up some perfectly elegant houses for his labourers. I'd just admire to imitate him. Can't we buy this place and improve it?'

She sank back dreamily, seeing herself as the

beneficent chatelaine of Thurnton Abbey. The broad park, with its smooth sward, spreading trees, and antlered deer, appealed to her aristocratic instincts; the low, battlemented house, with its historical heritage, stirred all the latent poetry in her nature. She wanted the place for her own, not on a short tenancy.

'Guess there 's no chance of buying,' her husband answered; 'it 's all in Chancery. Sir Bertrand can't touch a stick; lives in one of his own cottages, and is allowed five hundred dollars a year—as much as he used to give his cook, they say. And darned if he don't hold his head as high as King Edward. We were introduced to-day.'

'Yo' mean that he insulted yo'?' asked Cassius, suddenly sitting up very straight.

'Not much. Folk don't sneeze at Cyrus Crewe these days. And I allow that these old-time Britishers have a grand way of being polite; but it's a way that kind o' sorter makes you feel small potatoes. I just asked him to pot-luck here; said we could give him better cooking than he tastes nowadays. He thanked me quite civilly, and made me feel as if the iced water had gone the wrong way—down my back instead of my throat. That dose can last me a fair time.'

Cassius glanced up at the old knight and shrank a little. Mrs Crewe drew herself up coldly. Even diamond tiaras had not reconciled her to some of her husband's ways.

'There is no Lady Penmaur?' she asked.

'No lady and no child living. I hear there's a granddaughter knocking around somewhere.—See you don't cotton to her, my boy, or you'll be looking for trouble. I don't hold with folk that treat our gold like dirt.'

'A granddaughter knocking around somewhere!' Cassius pulled himself together with a start. The truth came in a flash. 'Just our Missy' was Missy of the old Abbey—Missy, whose rights he had usurped; Missy, the descendant of that grim old knight. And this same Missy was going to prove the one woman in the whole world for him! He was sure of it!

He had been looking for trouble, indeed.

But he did not find it for days, save in his own restless heart. His rambles, whether on foot or horse, bicycle or motor-car, never brought him nigh the fair queen in faded print. His sympathetic mother, silently watchful, divined that something was wrong, and kept him with her as much as possible. Those twain had many things in common, and the trouble must be serious that Cassius could not share with the graceful, languid Virginian.

One Sunday she bade him come to church with her in the adjoining village. Her son was no churchgoer, but she knew that the building would appeal to him—such a church as is only to be seen on old seigneurial soil, where the villagers still cherish a feudal sentiment. Cassius felt the influence of the place as soon as he entered. 'Tis homelike,' a cottager had said to Mrs Crewe, and homelike it was to the simple folk who lived under the wing of the old family which had sheltered their ancestors, and now cared for them. Roomy, as befitted the gathering-place of four parishes; simple and venerable, as suited their reverential spirit, its sole evidences of luxury were to be found in chancel and side-chapel. The chancel was paved in marble, a tribute to that Lady Fellon whose hands had worked the religiously preserved altar-cloth. The side-chapel, still and solemn, held the remains of generations of Fellons and Penmaurs, intermingled by marriage. Stately tombs, heavily adorned with armorial bearings, upheld the sculptured effigies of those who had lived and laboured centuries ago. Great ladies of many quarterings, with features as rigid as their coifs and ruffs, lay with folded hands in the place where they had been wont to pray and give thanks. Grim lords of the manor, who had gone forth to fight, rested in their stone armour beside the dames who held their honour. A huge marble canopy sheltered the figures of a noble pair of later date. And the sunshine, filtering through Gothic, diamond-paned windows, cast upon them its pale glory. It was like a miniature Westminster Abbey.

Cassius gazed and held his breath. Small wonder if the peasants reared in such an atmosphere believed in 'blood' with fervent awe and despised the upstart stranger. Small marvel if the noble, born to such a heritage of stately record, held the family escutcheon high and refused to sully it. How petty modern aspiration and modern wealth appeared in the presence of those calm dead who were born to rule! A great wave of self-depreciation swept over him; he listened to the village service as humbly as the simplest cottager.

An unwonted feature in the service suddenly arrested his attention. A venerable gentleman of military bearing, in civilian attire, stepped up to the lectern, and read the lesson in clear, ringing tones. Who could this be? Not Lord Fellon—the family were away. Not Sir Bertrand Penmaur—Cassius knew him by sight. As he listened and speculated the lesson abruptly ended, and the American's glance, idly following the reader back to his pew, lighted first on a comely old lady, then on a golden-haired girl, simply dressed but with birth and refinement stamped on every feature. At last! 'Just our Missy' of the corn-field!

What happened during the rest of the service he neither knew nor cared. His eyes rested so persistently on that pew that at length, as though by magnetic influence, the girl's gaze turned in his direction, and a slightly heightened colour showed that she recognised him. That was all. It was enough for young love to feed upon.

'Mater,' he asked as they entered the motor-car, 'who was that lady you bowed to just now?'

'Lady Bentley. A lovely woman; she called'——

'Yes, that so? I mean who is the girl with her?'

'Ah'—Mrs Crewe's glance followed wistfully the graceful figure disappearing through the churchyard—'it seems a real pity, now! That is her young cousin, Sir Bertrand's granddaughter.'

'And my beautiful cottager!'

The Virginian started and looked very grave. Eleonore Penmaur of many quarterings, albeit penniless, would have been a daughter-in-law after her own heart, one to be creditably presented at Court and pave the social way for the Crewes; but she foresaw complications. And Cassius was hot-headed.

The complications arose and thickened. Foremost came the fact that Eleonore, proud and reserved, gave no sign that her American lover's devotion was returned. If he called at Lady Bentley's, hoping for a glimpse of her, she was absent. If he mysteriously discovered her favourite walks, she betook herself to others. If he met her out driving with her cousin, a slight flush and distant bow were his sole comfort. On occasions when speech became unavoidable the speech was frigid. Was ever ardent wooer so damped in his wooing? Cassius fumed and despaired in alternation. 'She despises us,' he would bewail, 'and I don't blame her. A parcel of shoddy occupying her lawful heritage, I reckon that's about the size of it.' Then he would look up at the old portrait and groan aloud.

And there was Papa Crewe, whose observant eyes detected the state of affairs. He raged furiously. 'Drop that,' he said to his son, 'or I guess you'll never handle a dollar of my making—no, sir! Why, I tell you that on the hunting-field that grandfather of hers is so tall he can scarce see me. And he allows I can't ride to hounds like a gentleman. It's come round to me. Yes, sir, that's so. Curse him! A beggar who can't own a hunter of his own, and has to borrow from friends. You drop it sharp, or I'll know the reason why.'

'The girl's the reason,' retorted Cassius. 'I don't ask to marry the grandfather.'

'I say nothing against the girl; she's a proud minx, but it's born in her. And she's pretty. Only she ain't my future daughter-in-law, and don't you forget it. Reckon you think she makes the world go round. It's a way we have when we're young. But I tell you she ain't the only pebble on the beach, not by a long sight; and, anyway, she ain't your particular pebble. That's straight.'

Finally, there was Grandpapa Penmaur. He also got an inkling of the young American's views, and his proud old blood boiled. 'Don't let me hear of that rascally Yankee ever speaking to you,' he told Eleonore with his grandest air. 'We may be as poor as Job, but we are not reduced to that kind of company. If I had my way that class of person should be kept blacking our boots, instead of passing muster in society. I don't know what the world is coming to—upstarts received everywhere, washerwomen presented at Court, and all because they come from abroad and bring some money with them. Faugh! it is time I cleared out of it all.'

'The mother is a lady, grandpapa,' protested Eleonore, whose sense of justice was strong.

'So I hear. But the father is an unmitigated cad, and the son has the father's blood in his veins. Now, remember, no dealings with him whatsoever.'

'I cannot be rude, grandpapa, if we meet.'

'No lady can be rude, but she may be equally proud. It comes to the same thing. I shall look upon you as a disgrace to the family if I ever hear of your being seen together.'

Which was perhaps the best line to take for advancing Cassius's interests, had Sir Bertrand studied human nature.

Still, the young wooer had two women on his side. Mrs Crewe might not have roused herself to exertion had Eleonore's personality alone been in question; other girls, as well-born and fair, could be dazzled by American gold. But there was Cassius. Cassius, his mother's idol, had never been refused anything in his life, and was not likely to accept the innovation calmly. There had been love-tragedies in her family the very thought of which made her shiver, and she had no mind to risk a repetition. If Cassius wanted this girl he must have her, Cyrus Crewe or no Cyrus Crewe. Consequently that irate gentleman was subjected to a course of persistent cold-water droppings which produced endless domestic storms, but were calculated in time to wear away his obstinacy.

And Lady Bentley, who 'loved a lover,' had penetrated Eleonore's shy reserve; she saw that the girl's fancy, if not her heart, was caught. Pride stood in the way. Now, Lady Bentley saw no valid reason why pride should stand in the way. She wanted Eleonore, reared in poverty, to make a marriage that would give her the surroundings suited to her birth. A London season was out of the question, there was no satisfactory mate in all the country-side, and the future loomed darkly for this fair girl. Eleonore might do worse in later years. After all, the mother was a lady and the young man's personality attractive.

When two women are minded to bring an event to pass it generally occurs. In this case circumstance helped.

(To be continued.)

THE ROAD AND THE POWER-VEHICLE.

By the Right Hon. Sir J. H. A. MACDONALD, K.C.B., LL.D.

IT was said in a former article, 'Motoring To-day,' in June *Chambers's Journal:* 'The matter of real public interest now is the road. . . . The question of power-locomotion is already finally settled.' It is purposed to emphasise these two assertions.

The development of power-traction on roads has brought the highway itself once more into prominence as a subject demanding public attention. For half a century the road was of secondary or even third-rate importance only, in the life of the community. Traffic was no longer a lively phase of country life. In the early seventies the writer made more than one horse-driving excursion through England and Scotland, finding often that for miles and miles not a vehicle was to be seen, unless it might be a farmer's cart or an itinerant butcher or grocer visiting farms and hamlets, and now and again a badly appointed mail-gig with a sorry nag doing its six miles an hour between the railway town and an outlying district. My horses were baited at many a large posting inn, where the long range of stables on the ground-level, and the long range of bedrooms above them, deserted and shuttered, spoke sadly of departed glory of the past, when every stall was full, and the travellers took lodging, or came in to a comfortable English dinner, until the horn proclaimed that they must once more mount the coach. All was desolation; a tap-room, a commercial-room, and a few bedrooms being all that remained in active use, and the chances of being able to obtain a good meal by no means great. As for the roads, in dry weather the surface was of loose stones and dust, in wet weather deep puddles and thick mud. The roadman was too often an aged rheumatic labourer with bent back and stiff limbs, put to road-making in his old age because he was no longer fit for anything else, as his presence there would relieve the local poor-rate. His time was spent in scraping the mud off the road in wet weather, and mending the road in dry weather by putting down stones in quantities, to be left to form themselves into a road surface by the horses and carriages passing over and rolling them in. The roadman did not make the road. He piled stones on it, and left them to be forced into a road-surface by the vehicular traffic, wearing out horses' legs and vehicle springs and wheels. When a part of the way began to consolidate, the so-called roadman every morning dragged wooden horses, each consisting of a log and short wooden legs, on to the made parts, so as to compel all drivers to zigzag back and forward over the places where the stones were still unbedded, until they in turn were forced together. It was a weary round, as the small amount of traffic caused the consolidation of the road to take months of time; and as the road-stones got their edges rounded by the protracted crushing they bound badly, so that when a dry spell came they were pushed out to the surface, to act as crushers to break up the surface still more, making the road uncomfortable for man and beast, horses getting a bad foothold and frequently being lamed by stones jamming into the hollow of the hoof. And thus, as the road consolidated only after a long period, it necessarily took in much water below the stones in wet weather; the drying up in summer loosened the surface and made it break up; while in winter frost did terrible havoc, causing infinite mud when the thaw came, and consequently infinite dust when the mud dried up.

For some years before the advent of the motor-vehicle the road-roller had been introduced, to the great saving of horseflesh and coachbuilder's charges. But the way in which it has been used has not been satisfactory. Being made to run over stones on which a soup of dirt has been poured, it almost never produces a flat road. The roller squeezes up a small ridge in front of it, and when the resistance of the mound increases, the roller rides over it and begins to push up another ridge. The result is that the surface is a series of waves, as may be seen when a road is drying up after rain; showing as it does a succession of dark, damp hollows with dry ridges between—a hopeless condition for a road to be in, for water lying in a road is ruin to its durability.

The advent of the power-vehicle has drawn attention to the road question once more. It has added in a very marked degree to the amount of traffic, the number of vehicles being often five times or even ten times as great as has been the case since the railway carried off the larger portion of the traffic. And as the power is applied direct to the wheels, it is inevitable that if there is a substantial quantity of detritus on the road it will rise more than will be the case where the wheels only roll upon the road and do not press against it, particularly if the speed be higher than has been usual. This is seen in the case of the bicycle, which, small as it is, throws up a long tail of dust in dry weather. Accordingly, the most grievous complaint against the power-vehicle is that it is a bad dust-raiser, and the complaint is one that is reasonable. It must be met, and it will be met. It was most satisfactory to notice at the recent road conference in London how reasonable was the general tone of the discussion, and how it is recognised on all hands that the road has once more assumed a position of paramount importance nationally, socially, and commercially. And equally gratifying was it to hear with what confident tones the representatives of the road authorities spoke of the possibilities of road improvement,

at reasonable expense, by which the dust nuisance could be mitigated—indeed, practically cured—and the road rendered less destructive to vehicles and the engines that move them, whether these engines be animal or mechanical.

But speaking of the subject of dust, it requires to be impressed upon the public that it is quite unreasonable to treat the matter as so many do, as if the discomforts of dust were something novel, created by autocar traffic and unknown in former days. In the time when the roads were in active use by the mail-coach, the post-chaise, and the wagon, the complaints regarding dust were as bitter as they are now. Who has not seen the sporting pictures of the mail-coach 'tooling' along with clouds of dust rising from the horses' feet and the wheels? Objection was seriously taken to the introduction of the macadam road-surface because of the quantity of dust that was thrown up by the traffic. Thus we read in the Glasgow *Mechanics' Magazine* of the year 1830: 'Doubt has been entertained of the expediency of Mr Macadam's new system of road-making . . . from the great annoyance felt by the quantity of dust thrown up in those places where the experiment has been tried.' So serious was it that when there were about seventy coaches running daily upon the London to Bath road it was found necessary to water the whole road from end to end every day. The pumps set at every two miles to provide the water may be seen standing to this day. This makes it plain that if a road, made as macadam roads have been made for so long, was much used by traffic, dust in serious quantity was the necessary sequel, as is testified by Bob Acres regarding this very Bath road, speaking as he does of a 'tail of dust as long as the Mall.' The writer remembers in the fifties arriving in Bâle after a day's drive from Berne in a diligence, his black coat as white all over as the paper this article is written upon, and his face like that of a corpse. Reading lately, he came across the following, which from his experience he might have penned himself. The writer quoted, speaking of a time about seventy-five years ago, moans thus: 'Woe to white gowns! Woe to black! Drab was your only wear. If we happened to meet a carriage coming along the middle of the road what a sandy whirlwind it was! What choking! What suffocation! No state could be more pitiable, except indeed that of the travellers who carry their misery about with them. I shall never forget the plight in which I met the coach one evening in last August, steeds and driver, carriage and passengers, all in dust!'

Thus the reason why the dust-problem is once more found demanding solution is not because it is something new, but because the revival of road traffic in a degree unknown for half a century has once more brought it about that a remedy is necessary, as it was found to be necessary on the Bath road eighty or a hundred years ago.

It may be safely said that the remedy has been found, and the only question is how long a time will be required before it has been applied to all our main roads. People only think about dust when they see it and feel it. When there is no dust they do not think about it. But let any one who still looks upon the motor-vehicle as a producer of dust, and not merely a raiser of dust where there is dust ready to be raised, go to the Thames Embankment at the busy hour of the forenoon. If the weather is dry the motor-traffic passing along by hundreds of vehicles in every hour would throw up dust, the road being laid on the macadam principle with small broken stones. But he will see no dust, although often he will observe six or seven power-vehicles following one another at very short intervals. The motors, if the road was such that the traffic tended to produce dust, would certainly throw it up in clouds. The fact that they do not throw up dust makes it plain that the traffic does not create dust; 'argal,' as Dogberry would say, a mode of road-making has been found which will rid the public of the dust nuisance.

It would be highly improper to besmirch the pages of *Chambers's Journal* by any allusion to politics; but there can be no harm in saying that it appears probable that very soon the great highways of the country will no longer be treated as mere matters of parochial or even county district concern, but will be looked upon as a general matter of public interest—an object for national and not merely provincial attention. The sooner that day comes the better. Dustless and—what is more important—mudless roads would be worth millions of gold, apart altogether from mere questions of comfort; every horse and every motor can accomplish more work at a cheaper rate if the road is dustless, mudless, and free from pits and ruts. The percentage to be deducted annually for wear and tear from the initial value of haulage animals or machines, and of the vehicles they drag or push along the road, would be substantially diminished if the roads were in proper condition. Accordingly, the expense of haulage would be sensibly diminished, and if the price of haulage is diminished the goods hauled can be sold at a cheaper price or greater profit. He is wealthier than he was who can buy cheaper than he did; and he is wealthier who, being able to haul more cheaply and over greater distances, can get an extended range of market, and can more easily sell his wares by lowering his prices or can make a better profit by his outlay being lessened. Thus it is not too much to say that good roads over which haulage is easy must spell proportionately increased national wealth, as it is certain that bad roads diminish earnings or eat into them, and so affect financial prosperity.

It would be most important to ascertain what is the effect upon roads of horse-traffic and motor-traffic respectively. At present there are no means available for ascertaining how each affects the road surface, the state of the roads being the result of both modes of haulage combined. On every road both are in daily use, and comparison is not pos-

sible. Every motorist will frankly admit that a road which is subjected to the hammering and picking action of draught animals, and to the pressure of narrow-tired iron wheels, will, when motor-traffic is added to horse-traffic, show signs of wear and disintegration in an aggravated form, if the road is not so constructed as to resist the deleterious action of the horse and the horse-drawn vehicle. What the motorist does dispute is the constantly asserted fallacy that motor-traffic is the cause of undue injury to the road apart from the horse-traffic. This dispute should be put an end to by experiment, and the experiment could be easily made. Let a place be selected where there is considerable traffic of both kinds, and where it is possible to make a loop road some two or three hundred yards long, running parallel with an existing road. Let the roads on both sides of the loop be laid down in exactly the same manner, and then cause all the horse-traffic to take one side of the loop and all the mechanical traffic the other side. Both roads would then be inspected from time to time, and the effect of the traffic upon the surface noted. The result is certain, and would much surprise those who condemn motor-traffic as being destructive to roads. After a few months the arrangement should be reversed, and it would then be seen how the horse-traffic had so injured the road that the motor-traffic would complete the destruction, while the horse-traffic being turned on to the side of the loop that had been used for motor-traffic would soon pick into it with the hoofs, and crush into it with the narrow iron wheels. It is sincerely to be hoped that such an experiment may be tried. The result is not doubtful, and would tend to inform the public mind and prepare the way for effective road improvement. It would also convince all whom it may concern that as the motor supersedes the horse more and more, so will the expense of upkeep of roads diminish. The comforts of a road without dusty holes in dry weather and muddy puddles in wet weather will make the road more and more a place of pleasure where often it is a place of annoyance and discomfort.

It will not be cause for surprise if many a reader should smile at such words as the above which speak of the motor 'superseding the horse more and more.' There are probably few in the community to whom such an idea will not seem absurd. People are slow to realise what is passing before their eyes day by day. There are even many who still think that the use of the power-vehicle is a thing of pastime only—a passing craze like ping-pong or diabolo, and will soon come to an end. A gentleman of intelligence and much human experience was heard only a few months ago to say with a serious face—as if stating what must be accepted implicitly—that 'in another ten years there would not be half the number of motor-cars on the road that there are now;' and in so speaking he must have voiced the belief of many thousands who either have no observation of what is passing around them, or who, seeing, do not see, because their understanding is darkened.

Not only such people, but also the great mass of the community, will be astonished at the facts now to be stated, and for the accuracy of which the writer can vouch. First, it has long been true that everywhere throughout the land, whether in town or country, the number of private power-vehicles upon the road is largely in excess of the number of private horsed-vehicles, and this in an increasing proportion month by month and year by year. It is equally true that in London the motor-cab is crushing the hansom-cab out of existence. A hansom-cab can be bought to-day for twenty shillings (!), and Lord Rosebery has been moved to promote a fund for relieving the distress and providing for the training of those hansom-cabmen who are not too old to learn how to drive the horseless vehicle. That fund was not started a moment too soon, as the latest statistics presently to be given will show.

In the former article the last words were as quoted above: 'The question of power locomotion is already finally settled.' But, as has been said already, there are some people—indeed, not a few—to whom this has not yet come home, and to whom it will only come home, to use Mrs Browning's words, 'by reiteration chiefly.' But fortunately in this case the reiteration of the statement can be made telling by the increased power of the facts, and some of these facts shall now be brought to notice.

The writer remembers well how, before 1900, being much interested in mechanical traction, he used to be elated when he could count six motor-vehicles in one day in London, and an occasional figure of five or four only was disappointing. Two or three years later he began to note the motor-carriages and the horse-carriages, and was much pleased when the former reached a figure equal to or over one-third of the latter. The following year it took one-half to content him. In two or three years more an equality sometimes gave delight. Then came majorities gradually increasing until there was not contentment with less than double, and three to one gave elation. Now three to one is, in its turn, merely what is to be expected, and four to one not uncommon. The following are the results of some comparative tests made in April of the present year on the Thames Embankment for an hour at a time:

	Private Motors.		Private Carriages.		Taxicabs.		Hansoms.

Thus there were 2031 motor-vehicles passing along the Embankment, as against 471 horsed-vehicles, or considerably more than four to one. The percentages of the two classes are remarkable. It adds to the

significance of these figures when the fact is noted that they were taken at the go-to-business hour—9.30 A.M. to 10.30 A.M.—and therefore they indicate how mistaken is the idea still so firmly fixed in the minds of many that the autocar is nothing but a luxury-vehicle of the idle pleasure-seeker. Practically the whole of these vehicles were conveying business men to the great centre of business of the land—the City of London.

It was thought that something instructive might be learned by testing the traffic at such a place as the junction at the bottom of the Haymarket. And this was done between twelve and one o'clock on the 19th of April. The test first made was confined to passenger-conveying carriages—private carriages, omnibuses, and cabs. The result was: motor passenger-vehicles, 763; horse passenger-vehicles, 260. Another test was made at the same place, in which all motor-vehicles, whether carrying passengers or not, were counted as against all similar horsed-vehicles moving at more than a walking pace. The numbers were: motor-vehicles, 887; horse-trotting vehicles, 639. These results were so striking that a still further test was made, the motor-vehicles being pitted against *all* horsed-vehicles, including carts and lorries moving at a walking pace. The result of the first test for an hour was: all motors, 894; all horsed-vehicles, 865. It was matter of great surprise, when the figures were made up, to find that even on such an absolute test of motor against horse there was a majority for the mechanical vehicle. It seemed astonishing that to-day, nine years from the time when the start of about seventy motor-vehicles for the thousand miles' trial was an exciting event, gathering crowds at eight clock in the morning, the public should be looking on at the London traffic without surprise, when already the number of power-vehicles has become practically equal to the whole animal-traffic at the busy hours of the day. It was, therefore, thought well to make some further and more extended tests. Accordingly, on three separate occasions the numbers were tested over long distances and at all hours of the business day, the routes including the whole length of the Thames Embankment from Charing Cross to Blackfriars Bridge and by Haymarket and Piccadilly to the top of Sloane Street. The figures when they were added up brought out conclusively that the first test had been accurately conducted, and that it is the fact that the motor-vehicle has been steadily and rapidly displacing the horsed-vehicle, until *to-day there are at least as many power-vehicles passing any given point in busy London as there are horsed-vehicles of every class, including those which move at only three miles an hour.*

The following are the figures:

	Motor-Vehicles.	Horsed-Vehicles.
First Test	1345	1334
Second Test . . .	1095	1096
Third Test . . .	2563	2558
	5003	4988

Thus, putting the whole together, nine thousand nine hundred and ninety-one were seen, and so near were the numbers each time that on the first occasion the motors were in a majority of eleven, on the second occasion the horsed-vehicles were in a majority of one, and on the third occasion the motors were in a majority of five; the majority of the motors on the three occasions taken together being fifteen on a total number of nearly ten thousand! These facts are the more remarkable, seeing that the number of commercial motor-vehicles is still inconsiderable, being on the three occasions only fifty-seven in all, and for that reason the motor-vehicles could only be in a majority by the passenger motor-vehicles being so largely in excess that they practically equalled the horsed-vehicles of *all* classes.

It may be said with assurance that if any one had expressed himself on the morning of the start of the one thousand miles' trial to the effect that in nine years the motor-vehicle would in London be a practical rival to the horsed-vehicle, by the number of the motor-vehicles being brought to equal those drawn by animal power, he would have been laughed at as a hare-brained enthusiast. It may be doubtful if even the most sanguine of those who rode out on that long journey harboured any such idea in his mind. But surely such facts as these must bring it home to the most obstinate opponent that mere obstructive tactics are not only useless but foolish, and that he must make up his mind to accept the inevitable, and had better accept it with a good grace. One thing is quite certain, that motor traffic is now looked upon by the general public as a thing of course. No one can stand for a few moments at a busy corner in any great city without having the demonstration before his eyes that the traffic is—in itself and as generally conducted—not a cause of alarm to the foot-passenger, and no more dangerous than any other traffic; while, on the other hand, the more the power-vehicle displaces the horsed-vehicle the fewer will be the delays and blocks of traffic at busy hours. Let any corner-superintending constable be interrogated on the subject, and he will say unhesitatingly that when cross-traffic has been stopped to clear what was being detained in the cross-road, the way is cleared on resumption in half the time that used to be the case when only horsed-vehicles occupied the streets.

As it has thus become certain that the power-vehicle will in a year or two attain an absolutely predominant position, it becomes all the more clear that whatever is necessary to be done to make the road suitable for that traffic must be done, and must be done at once. It is, therefore, the more satisfactory to know that this matter is being taken up vigorously by the road authorities throughout the country. The necessity for a central authority to control the management of the main roads of the country is now practically recognised, and it is satisfactory to know that the road-money to be provided by the new taxes on

motors and petrol will not be frittered away parochially, but will be applied imperially for the general good under the highest skilled advice.

We may, therefore, look forward to efficient roads carrying an efficient passenger and goods traffic in the near future, and that such a development will conduce much to the national welfare there can be no doubt. Good roads and speedy conveyance are aids to national wealth that are not to be despised. The advent of the power-vehicle will force on the construction and maintenance of the one and will supply the other. Those who have been votaries of the new traction from the first have had to bear much obloquy during past years, partly undeserved, partly deserved because of the misconduct of some. They can forget all that in realising that already mechanical traction is becoming a normal and regular phase of road use, and they feel that they are not too sanguine in believing that its advantages for the good of the community are being gradually appreciated, so that it is becoming the dominant factor once and for all of road transit.

THE HOUSE OF WHISPERS.

CHAPTER XXXVII.—INCREASES THE INTEREST.

'BUT, dad,' cried Gabrielle, 'I am telling you the truth! Cannot you believe me, your daughter, before this man who is your enemy?'

'Because of my affliction I am, it seems, deceived by every one,' was his hard response.

To where they stood had come the sound of wheels upon the gravelled drive outside, and a moment later Hill entered, announcing, 'A gentleman to see you very urgently, Sir Henry. He is from Baron de Hetzendorf.'

'From the Baron!' gasped the blind man. 'I'll see him later.'

'Why, it may be Hamilton!' cried Murie, who, looking through the door, saw his old friend in the corridor, and quickly called him in.

As he faced Flockart he drew himself up. The attitude of all made it apparent to him that something unusual was in progress.

'You've just arrived at a very opportune moment, Hamilton,' Murie said. 'You have met Miss Heyburn before, and also Flockart, I believe, at Lady Heyburn's, in Paris.'

'Yes; but'——

'Sir Henry,' Walter said in a quiet tone, 'this gentleman sent by the Baron is his secretary, the same Mr Edgar Hamilton of whom Gabrielle has just been speaking.'

'Ah, then, perhaps he can furnish us with further facts regarding this most extraordinary statement of my daughter's,' the blind man exclaimed.

'Gabrielle has just told her father the truth regarding a certain tragic occurrence in the Forest of Pontarmé. Explain to us all you know, Edgar.'

'What I know,' said Hamilton, 'is very quickly told. Has Miss Heyburn mentioned the man Krail?'

'Yes, I have told them about him,' the girl answered.

'You have, however, perhaps omitted to note one or two small facts in connection with the affair,' he said. 'Do you not remember how, on that eventful afternoon in the forest, when searching for us, you first encountered Krail walking with this man Flockart at some distance from the others?'

'Yes, I recollect.'

'And do you remember that when we returned to sit down to luncheon Flockart insisted that I should take the seat which was afterwards occupied by the unfortunate Miss Bryant? Do you recollect how I spread a rug for her at that spot and preferred myself to stand? The reason of their invitation to me to sit there I did not discover until afterwards. That wine had been prepared for *me*, not for her.'

'For you!' the girl gasped, amazed.

'Yes. The plot was undoubtedly this'——

'There was no plot,' protested Flockart, interrupting. 'This girl killed Edna Bryant through intense jealousy.'

'I repeat that there was a foul and ingenious plot to kill me, and to entrap Miss Heyburn,' Hamilton said. 'It was, of course, clear that Miss Heyburn was jealous, for she had written to her mother making foolish threats against Miss Bryant. Therefore, the plot was that I should drink the fatal wine, and that Miss Gabrielle should be declared to be the murderess, she having intended the wine to be partaken of by the girl she hated with such jealous hatred. The marked cordiality of Krail and Flockart that I should take that seat aroused within me some misgivings, although I had never dreamed of this dastardly and cowardly plot against me—not until I saw the result of their foul handiwork.'

'It's a lie! You are trying to implicate Krail and myself! The girl is the only guilty person. She placed the wine there!'

'She did not!' declared Hamilton boldly. 'She was not there when the bottle was changed by Krail, but I was.'

'If what you say is true, then you deliberately stood by and allowed the girl to drink.'

'I watched Krail go to the spot where luncheon was laid out, but could not see what he did. If I had done so I should have saved the girl's life. You were a few yards off, awaiting him; therefore you knew his intentions, and you are as guilty of that girl's tragic death as he.'

'What!' cried Flockart, his eyes glaring angrily; 'do you declare, then, that I am a murderer?'

'You yourself are the best judge of your own guilt,' answered Hamilton meaningly.

'I deny that Krail or myself had any hand in the affair.'

'You will have an opportunity of making that denial in a criminal court ere long,' remarked the Baron's secretary with a grim smile.

'What!' gasped Flockart, his cheeks paling in an instant; 'have you been so indiscreet as to inform the police?'

'I have—a week ago. I made a statement to M. Hamard, of the Sûreté in Paris, and they have already made a discovery which you will find of interest and somewhat difficult to disprove.'

'And pray what is that?'

Hamilton smiled again, saying, 'No, my dear sir; the police will tell you themselves all in due course. Remember, you and your precious friend plotted to kill me.'

'But why, Mr Hamilton?' inquired the blind man. 'What was their motive?'

'A very strong one,' was the reply. 'I had recognised in Krail a man who had defrauded the Baron de Hetzendorf of fifty thousand kroners, and for whom the police were in active search, both for that and for several other serious charges of a similar character. Krail knew this, and he and his friend—this gentleman here—had very ingeniously resolved to get rid of me by making it appear that Miss Gabrielle had poisoned me by accident.'

'A lie!' declared Flockart fiercely, though his efforts to remain imperturbed were now palpable.

'You will be given due opportunity of disproving my allegations,' Hamilton said. 'You, coward that you are, placed the guilt upon an innocent, inexperienced girl. Why? Because, with Lady Heyburn's connivance, you, with your cunning accomplice Krail, were endeavouring to discover Sir Henry's business secrets in order, first, to operate upon the valuable financial knowledge you would thus gain, and so make a big *coup*; and, secondly, when you had done this, it was your intention to expose the methods of Sir Henry and his friends. Ah! don't imagine that you and Krail have not been very well watched of late,' laughed Hamilton.

'Do you allege, then, that Lady Heyburn is privy to all this?' asked the blind man in distress.

'It is not for me to judge, sir,' said Hamilton.

'I know! I know how I have been befooled!' cried the poor, helpless man—'befooled because I am blind!'

'Not by me, Sir Henry,' protested Flockart.

'By you and by every one else,' he cried angrily. 'But I know the truth at last—the truth how my poor little daughter has been used as an instrument by you in your nefarious operations.'

'But'——

'Hear me, I say!' went on the old man. 'I ask my daughter to forgive me for misjudging her. I now know the truth. You obtained by some means a false key to my safe, and you copied certain documents which I had placed there in order to entrap any who might seek to learn my secrets. You fell into that trap, and though I confess I thought that Gabrielle was the culprit, on Marie's behalf, I only lately found out that you and your accomplice Krail were in Greece endeavouring to profit by knowledge obtained here, at my private house.'

'Krail has been living in Auchterarder of late, it appears,' Hamilton remarked, 'and it was evidently he who, gaining access to the house one night recently, used his friend's false key, and obtained those confidential Russian documents from your safe.'

'No doubt,' declared Sir Henry. Then, again addressing Flockart, he asked, 'Where are those documents which you and your scoundrelly accomplice have stolen, and for the return of which you are trying to make me pay?'

'I don't know anything about them,' answered Flockart sullenly, his face livid.

'He'll know more about them when he is taken off by the two detectives from Edinburgh who hold the extradition warrant,' Hamilton remarked.

The fellow started at those words. His demeanour was that of a guilty man. 'What do you mean?' he gasped, white as death. 'You—you intend to give me into custody? If you do, I warn you that Lady Heyburn will suffer also.'

'She, like Miss Gabrielle, has only been your tool,' Hamilton declared. 'It was she who, under compulsion, furnished you with means for years, and whose association with you has caused something little short of a scandal. Times without number she has tried to get rid of you and your evil influence in this household, but you have always defied her. Now,' he said firmly, looking the other straight in the face, 'you have upon you those stolen documents which you have, by using an assumed name and a false address, offered to sell back to their owner, Sir Henry. You have threatened that if they are not purchased at the exorbitant price you demand, you will sell them to the Russian Ministry of Finance. That is the way you treat your friend and benefactor, the man who is blind and helpless! Come, give them back to Sir Henry, and at once.'

'You must ask Krail,' stammered Flockart, now so cornered that all further excuse or denial had become impossible.

'That's unnecessary. I happen to know that they are in your pocket now, a fact which shows how watchful an eye we've been keeping upon you of late. You have brought them here so that your friend Krail may come to terms with Sir Henry for their repossession. He arrived from London with you, and is at the Strathavon Arms in the village, where he stayed before, and is well known.'

'Flockart,' demanded the blind man very seriously, 'you have papers in your possession which are mine. Return them to me.'

A dead silence fell. All eyes save those of Sir

Henry were turned upon the man who until that moment had stood so defiant and so full of sarcasm. But in an instant, at mention of Krail's presence in Auchterarder, his demeanour had suddenly changed. He was full of alarm.

'Give them to me and leave my house,' Sir Henry said, holding out his thin, white hand.

'I—I will—on one condition: if I may be allowed to go.'

'We shall not prevent your leaving,' was the Baronet's calm reply.

Flockart fumbled nervously in the inner pocket of his coat, and at last brought out a sealed and rather bulgy foolscap envelope.

'Open it, Gabrielle, and see what is within,' her father said.

She obeyed, and in a few moments explained the various documents it contained.

'Then let the man go,' her father said.

'But, Sir Henry,' cried Hamilton, 'I object to this! Krail is down in the village forming a plot to make you pay for the return of these papers. He arrived from London by the same train as this man. If we allow him to leave he will inform his accomplice, and both will escape.'

Murie had his back to the door, the long window on the opposite side of the room being closed.

'It was a promise of Sir Henry's,' declared the unhappy adventurer.

'Which will be observed when Krail has been brought face to face with Sir Henry,' answered Murie, at the same time calling Hill and a gardener who chanced to be working on the lawn outside.

Then, with a firmness which showed that they were determined, Hamilton and Murie conducted Flockart to a small upstairs room, where Hill and the gardener, with the assistance of Stewart, who happened to have come into the kitchen, mounted guard over him.

His position, once the honoured guest at Glencardine, was the most ignominious conceivable. But Sir Henry knew that at least he had got back those documents and saved the reputation of his friend Volkonski, as well as that of his copartners.

(To be continued.)

TIGER DUNLOP, AN ONTARIO PIONEER.

AS the traveller in Canada, be he wandering journalist or eager emigrant, is swiftly carried through the fertile fields and past the cheerful homesteads of the province of Ontario, he may sometimes wonder and ask if it was always such a bright, smiling land. Some native will then inform him, with a touch of pride, that less than a century ago Western Ontario, from the shores of Lake Erie and Lake Ontario to Owen Sound on Georgian Bay, was a region of solid bush and forest denser than the ten-acre clumps which still stand on every farm as a fuel-reserve. Every acre of this land had to be cleared before the fertile soil could be cultivated; the trees had to be cut down, the brushwood cleared away, and the stumps burnt or ploughed out. He will then wonder what manner of men were the pioneers who carved homes for themselves and their children out of the wilderness and raised up the foundations of a great new nation by their labours. To our mind Western Ontario is one of the most pleasing and most tangible monuments of the enterprise, hardihood, and tenacity of the British race, and we feel flattered in the knowledge that Scots, both Highland and Lowland, were by far the foremost element in this pioneer struggle.

The Scotch element in Ontario is preponderatingly strong. Glengarry is Highland to a man, the district of Zorra was settled by exiled crofters from Sutherland, the county of Perth is largely a Lowland settlement, Huron teems with West Country place-names and descendants of Paisley weavers, and Bruce (whence the finest men in Canada are said to come) drew immigrants alike from both sides of the Forth.

The history of the early settlement of Ontario would fill volumes, but it has so far received little attention from students, and the scarcity of documentary evidence in many cases renders the task of compiling a local history difficult. A large part of it would be a record of severe hardships and hard work; but intermingling with this would be found many incidents of adventure and romance, and many interesting tales of the early pioneer days. In these early times there were many famous characters in Western Ontario; but none was more famous than Dr William Dunlop, whose memory lingers to this day, after the lapse of half a century, in the province he helped to create.

Dr William Dunlop was a cadet of the ancient family of Dunlop of that ilk, long located in the parish of the name in North Ayrshire. The name, however, is not uncommon in the West Country, and there are numerous branches of the original stock scattered throughout the British Empire.

William Dunlop was educated at Glasgow University, and, graduating at an early age as a Doctor of Medicine, determined to join the army service. He obtained a commission in the Connaught Rangers, and saw active service in the campaigns against the Americans (1813–15), during which he not infrequently laid down the lancet for the bayonet, and played a conspicuous part in three engagements. When peace had been arranged between Britain and the United States, he went with his regiment to Calcutta, where he was stationed for some time. Shortly after his arrival there he contracted to

exterminate the tigers which infested a certain island in the Ganges Delta, called Sangor; and as a memento of his achievements in killing an immense number of these animals he was by universal consent of the natives called 'The Tiger,' a name which adhered to him for the rest of his adventurous life.

While in India, Dunlop was seized with a severe attack of fever, which resulted in his returning home and being invalided on half-pay. To secure a living, he first of all lectured on medical subjects, and then devoted himself to newspaper work. He was for a short time editor of a paper called *The British Press;* but his journalistic success was not great, his style being somewhat quaint and unique. He had, it may be explained, a bigoted and lifelong hatred of France and Frenchmen.

For a few years he led a somewhat unsettled existence at home, and was always anxious to go abroad at the earliest opportunity. Accordingly, when the famous Canada Company entered upon its operations, under the guidance of that strange genius John Galt, the novelist, Dr Dunlop was eager to emigrate, and set sail for Canada in 1826, to join his friend in the new enterprise.

The Canada Company was formed in 1825, with the object of opening up and colonising with settlers Western Ontario, or more particularly the territory known as the Huron Tract, and the promoters had secured a grant of one million one hundred thousand acres of land, or, rather, wooded wilderness.

The Doctor was, of course, more or less familiar with the country as the result of his early fighting in the American war; and on his joining Galt at his new headquarters, the latter was able to secure for him an appointment as Warden of the Woods and Forests. The two men had been great friends at home, and their common literary tastes and sympathies bound them still closer in the new colony. For some years Dunlop was employed in a variety of duties—clearing the forest, making roads, and assisting settlers to locate. His energy and enthusiasm were unbounded, and one standing monument of his industry is the highway between Goderich and Toronto, which he cut through the thickest of bush and swamp. He was a splendid organiser and pioneer; and, under the guidance of spirits like Galt and himself, the new settlement prospered. By 1832 settlers were coming in rapidly, and the Huron Tract was being transformed into cheerful homesteads. The place was dear to Dunlop's heart from the first, and for the last twenty years of his life his energies were taxed to the uttermost in the service of the colony.

He kept up a regular correspondence with his friends and relatives at home, and extracts from his letters are very interesting, especially in the light of subsequent developments. He says in 1837: 'Canada is a valuable colony; in fact, she is at the head of all the colonies, for she has the means to protect all the rest and give a consequence to Britain not to be sneezed at.' And again: 'While so many poor people at home are in a state of starvation, I could easily set eighty thousand families in a fair way to make themselves independent.' And this before the North-West was dreamt of.

Goderich, so called after a British Premier of the day, was the headquarters of the colony, and within a few miles of this place the Doctor took up a block of land and built a house which he called Gairbraid, after the Dumbartonshire home of his mother. A few years after his arrival, his brother Robert, who had been one of Nelson's captains, and had lately retired from the navy, came out and joined him, to his great delight.

Captain Robert Dunlop was of a different type from his brother, a bluff, hearty sailor, but a less interesting and original personality. He was created 'pound-keeper' to the settlement—a necessary office in new countries where there are no fences—and devoted himself chiefly to the management of the farm, with a view to leaving his brother free for his forestry duties.

Attracted probably by the presence of gentlemen like Dunlop and Galt, there had by this time settled in and around the town of Goderich a considerable number of people of good family and education, who had been driven forth from the old country by financial losses or pressure of circumstances. Among others were Mr Hyndman, a Scotch barrister, with his family; the Lizars, an Edinburgh family; Major Strickland, an ex-officer of the army; and Colonel von Egmond, another military man, of Belgian extraction. These few, and some others whose names were less prominent, formed a strange little clique in the wilderness, the bulk of the settlers being Highland crofters and Ulster Irish—the best of colonists, but illiterate to a degree. The story of the life in the settlement is admirably told in a book entitled *In the Days of the Canada Company*, and a fine picture of these early days is drawn by the authoress, Miss Lizars, whose one fault is a somewhat prolix and ornate style.

Gairbraid was a comfortable house, built of solid logs in the form of the letter H, and there the two brothers resided, with their various retainers. Captain Dunlop had a famous black butler, Jimmy Thompson, who was a familiar figure in the community. Their home contained a surprising quantity of good furniture for the time and place, and was admirably equipped to be the scene of convivial hospitality that it was. There was an enormous round table, at which the Doctor presided over what he called his 'Noctes Ambrosianæ,' and among his most valued possessions was a set of twelve large decanters irreverently dubbed 'The Twelve Apostles.' They kept open house, and the Doctor's favourite query, 'Will ye tak' a drink?' was always supplemented by 'No man must go from my house either hungry or dry.'

Their establishment in the early days, in the absence of any womenkind, was, if comfortable, somewhat crude and badly managed; but in 1833 a new personage came on the scene. From

Keppoch, in Dumbartonshire, there was sent out to the two brothers a housekeeper in the shape of one Louisa M'Coll, a buxom Highland lass, who was for the rest of their lives the mainstay of the household management at Gairbraid. She was the most skilful of housewives, and made a comfortable home for her 'deare gentlemen' from the day of her arrival. But Mrs Grundy appeared in the settlement a few years after, probably as the result of various factious quarrels, and the housekeeper wanted to leave them. Dismayed at the prospect, the Doctor suggested that one of them ought to marry her, and that they should toss for the responsibility. He afterwards declared that he made the proposal to adopt the matrimonial lottery in fun, and, finding that his simple and kind-hearted brother took it in earnest, allowed it to proceed to its dénouement as a good solution of a delicate problem. It was agreed that the Doctor should toss the coin three times; he was to cry 'Heads' and his brother 'Tails,' and the winner was to be clear of the responsibility of matrimony. Heads turned up each time, and the Doctor's brother married the lady; though he might not have done so had he known that the Doctor, in his anxiety for his brother's welfare, had used a coin picked up somewhere in his wanderings which had a head on both sides. In justice to the culprit it must be said that he knew the lady would make an excellent wife, as the result proved. The pair so strangely united lived a happy life for many years, and the old *ménage à trois* was not broken up. Dr Dunlop lived on at Gairbraid; and Louisa, 'wife to the one and good friend and close companion to the other,' ministered to their wants, alternately chiding and coddling the brothers.

Many good stories were told of Mrs Dunlop, who was quite as much of a character as her brother-in-law. She retained her Highland speech all her days, but from the first comported herself well in her new dignity as mistress of Gairbraid. On her elevation some of the servants were evidently inclined to be wanting in deference to her behests, and one day the Doctor heard his sister-in-law's voice raised in anger in the kitchen. 'Lou,' he cried out, 'what is all the row about? Now, what's the guid o' flyting?' 'Hech!' was the reply, 'they will not pay sufficient respect to my reverence.' Dunlop was never tired of teasing her and of playing upon her idiosyncrasies, but he entertained the deepest respect and affection for her. He always said that he cared not where he died, as 'Lou' would be sure to find his bones and lay them beside his brother's. 'Lou,' on the other hand, tried hard to repress the convivial tastes of the Doctor; and though she never failed to provide liberally for the guests at his numerous parties, she was always scolding him and telling him what a task it was 'to fill these greedy hounds from town.'

The first years of the settlement were the best; after the departure of John Galt the régime of the Canada Company gradually declined in popularity, and its policy was opposed at every point by a strong party. Through it all, Tiger Dunlop still retained his place as a leader of public opinion in the district; and on the death in 1840 of his brother Robert, who had been the first member for Huron in the legislature, he was elected to succeed him, and filled the office with credit. The loss of his brother was a severe blow to him, but he lived on with 'Lou' at Gairbraid, and continued to be the central figure in this oasis of culture in the backwoods. He still corresponded with his relatives at home, and wrote at intervals several excellent articles to British magazines; they were mostly descriptive of the country and the life in Canada, and a series in *Fraser's* attracted considerable attention. But perhaps the most interesting work that stands to his name is his will, which is a far-famed testamentary document, and ranks high as a literary curiosity. No account of his life would be complete without it, and it runs as follows:

'In the Name of God, Amen.

'I, William Dunlop of Gairbraid, Western Canada, Esquire, being in sound health of body and mind, which my friends who do not flatter me say is no great shakes at the best of times, do make my last Will and Testament as follows, revoking of course all former Wills: I leave the property of Gairbraid and all other property I may be possessed of to my sisters Helen Boyle Story and Elizabeth Boyle Dunlop, the former because she is married to a minister, whom (may God help him!) she henpecks; the latter because she is married to nobody, nor is she likely to be, for she is an old maid and not market-rife. And also I leave to them and their heirs my share of the stock and implements upon the farm, providing always that the enclosure round my brother's grave be reserved; and if either of these should die without issue the other is to inherit the whole.

'I leave to my sister-in-law Louisa Dunlop all my share of the household furniture and such traps, with the exceptions hereafter mentioned.

'I leave my brother-in-law Allan my big silver snuff-box, as I am informed he is rather a decent Christian, with a swag belly and a jolly face.

'I leave my silver tankard to the eldest son of old John as the representative of the family. I would have left it to old John himself, but he would have melted it down to make temperance medals, and that would have been a sacrilege. However, I have left him my big horn snuff-box; he can only make temperance horn spoons out of that.

'I leave to my sister Jenny my Bible, the property formerly of my great-great-grandmother Bethia Hamilton of Woodhall, and when she knows as much of the spirit as she does of the letter she will be another guise Christian than she is. I leave my late brother's watch to my brother Sandy, exhorting him at the same time to give up Whigging and Radicalism and all other sins that do most easily possess him. I leave my brother-in-law Allan my

punch-bowl, as he is a big, "gausy" man and likely to do credit to it. I leave to Parson Chirussie my big silver snuff-box I got from the Simcoe Militia, as a small token of my sister Maggie, whom no man of taste would have taken.

'I leave to John Cadell a silver teapot, to the end that he may drink tea therefrom to comfort him under the affliction of a slatternly wife. I leave my books to my brother Andrew, because he has been so long a "jungle wallah" that he may yet learn to read with them. I leave my silver cup with the sovereign at the bottom of it to my sister Janet Graham Dunlop, because she is an old maid and pious, and therefore given to horning; and also my grandfather's snuff-box, as it looks decent to see an old maid taking snuff.'

(Signed) 'WILLIAM DUNLOP.'

As a reward for his political services, and possibly, too, as a means of ridding the authorities of a stern and capable critic in the legislature, Dunlop received an appointment as superintendent of the Lachine Canal, then in course of construction in Eastern Ontario. The work was arduous, and the rigorous life he had imposed on himself could not have failed to impair his magnificent constitution. He was taken seriously ill while discharging his duties, and rapidly sank, though he scoffed at the idea of anything serious. 'It was maybe a sair trouble, but it wasna death yet,' he said. But it was, unfortunately, the dread summons. His sister-in-law, the faithful 'Lou,' was sent for, and, travelling post-haste, arrived in time to see him and receive a last pathetic teasing ere he died. There at Lachine, in the fall of 1848, Tiger Dunlop passed away, full of years and honours, and worn out by a too strenuous life in many a varied clime.

When he revisited his native land he was always welcomed in the literary circles of Edinburgh, and found that society more congenial than that of the merchant gentry of Dumbartonshire. But he never could stay in Scotland, much though he loved it; he felt that Canada was his country and he was needed there. His shrewd good sense and cheery optimism made him an invaluable counsellor to the struggling settler, and the standard of life which he set did not fail to leave its mark in the backwoods; throughout the early hardships he always knew and said that better times would come. Many a poor Scot, Highland crofter and Lowland weaver alike—for many of these exiled Radicals were among his protégés—who lived to own a fine farm and found a prosperous Canadian family, had good cause to bless the name of William Dunlop.

VOLCANOES AND VOLCANIC DISASTERS.

By DAY ALLEN WILLEY.

A VOLCANO and a volcanic region are to be avoided. Zorion estimates that since earthquakes and volcanic eruptions were first recorded by man more than thirteen million people have lost their lives through them. The damage to property caused at the same time can never be estimated.

The eruptions that build up mountains are periodical wellings-over of molten lava, and are comparatively harmless. The eruptions accompanied by violent explosions, occur irregularly and bring widespread destruction. It is easy to see in the building-up process how each streaming-over of lava makes a mountain grow; each fresh outgush hardens as it pours, and forms a new shell of lava for other shells to form on; and, finally, when a certain height is reached—one, two, three miles—we may suppose the impelling force beneath to be no longer equal to the task of lifting this great column, and the crater crusts over at the top. And so generations pass, and men—with their short lives and shorter memories—say that the volcano is dead. But the fires are there at the core, so much latent energy ready to be stirred; and if something stirs them it is like rousing a thunderbolt. The fact that the natural vent above is blocked through the cooling of centuries only makes the discharge the more terrible when it comes, just as hard-rammed bullets make powder more effective.

The cause that rouses the volcano's latent energy is the same as that which makes a boiler burst: the sudden and excessive generation of steam when the hot part of the volcano comes in contact with water. This contact may be due to various causes—as, for instance, the readjustment of strata or materials beneath, so that a lake or watercourse is turned into the crater. It may even be due to an irruption of the sea, as at Krakatoa in 1883.

According to Professor John Milne, one of the great authorities on volcanoes, there are volcanoes in the world at present—in Europe and in the United States—that will one day or another 'blow their heads off,' although there is no telling when they will do it. Great Britain has at least a dozen basal wrecks of volcanoes, mostly in the western Highlands, regarded as extinct; but Bandaisan has shown us what extinct volcanoes can do. On July 15, 1888, Bandaisan, having slept for ages, hurled a cloud of flame and smoke to the Japanese sky. Then its 'head' blew off, and sent, according to Professor Milne, sixteen hundred million cubic yards of rock and earth into the valley beneath. When Bandaisan vented its wrath on the earth a river of agglomerate poured down the valley at the rate of forty-eight miles an hour, and in twenty minutes had spread itself to a depth of one hundred

feet over a region from twelve to fifteen miles long and from five to seven miles wide.

Bandaisan changed a Japanese landscape of green into one of brown, burying houses and fields. Where no lake had been, one was created by the damming of a mountain stream. This lake grew so rapidly that the peasants in its vicinity abandoned farming and took to fishing. The boulders which were hurled from the volcano weighed four and five tons each, and some were hurled eight and ten miles from the crater. Professor Milne declares that they fell with the velocity of a falling star.

Landgrelle, an authority, regards the explosion of Asama, in Japan, in 1783, as one of the most frightful eruptions in the history of volcanoes. Asama rises to a height of over eight thousand feet, and in its great paroxysm it sent down a river of mud from five to ten miles broad that overwhelmed forty-two villages. In some places the mud was so hot that it did not stop boiling for twenty-four days. In the Tonezawa River immense masses of lava remained red-hot even in the river itself. In Kurogano a stone one hundred and twenty by two hundred and sixty-four feet fell into a river and formed an island. Two rivers were sucked up into the mud torrent, and their places taken by dry land, and the noise of the explosion was like a thousand thunders. The lakes were poisoned and fish sickened; the rivers were full of dead dogs, deer, and monkeys, with the hair singed from their bodies. The crater of Asama as it stands to-day measures a mile and a quarter in circumference, and never ceases to belch forth pungent, suffocating odours of hydrochloric acid and sulphurous anhydride, to breathe which is to die. The depth of the crater as now constituted cannot be determined. It is supposed to be eight thousand feet to the bottom of its cup.

Krakatoa gave the earth a shock beside which the eruption of even Mount Pelée was insignificant. In 1883 Krakatoa was an island in the Strait of Sunda, between Java and Sumatra. No one lived there; no ships touched it. The island had a peak three thousand feet high, a petty thing alongside of the forty-nine towering volcanoes of near-by Java, some twelve thousand feet high. Science had never paid attention to Krakatoa. It was too insignificant in appearance. Science might have ascertained that the crater of the island was largely submerged, and included not only Krakatoa but several other islands in the strait. As a matter of fact, ages ago Krakatoa was a gigantic mountain joining Java and Sumatra, and it was of enormous height, with a base-girth of at least twenty-five miles. That was the real volcano Krakatoa after the work of its building up with layers of lava had been completed and before the phase of self-destruction had begun.

But the pride of Krakatoa overcame it. Swollen beyond control, it proceeded to tear itself to pieces, blowing its head and shoulders off, scattering its body far and wide, and finally leaving itself only a wreck to rest upon, and that half under water. Still, after all this occurred, so long ago that man had ceased to remember it, Krakatoa remained the most dangerous volcanic focus on the surface of the earth.

It was nearly two hundred years before Krakatoa spoke again. On Sunday morning, May 20, 1883, it began to rouse itself, just as Pelée did, with ample warning to the world. And the world, as at Martinique, would not be warned. Krakatoa first sent up a gush of steam and ashes, and roared so loudly that the sound was heard at Batavia, a hundred miles away. Then followed three months of silence. During this time a second and a third crater opened; there were white-hot chasms below the level of the sea, sending up to the waves their hissing challenge. After a time millions of tons of water surged downwards, and the battle was raging. This was Sunday afternoon, August 26, 1883. For a few hours the earth-fires and sea-water produced terrific explosions. Black columns were sent miles into the air, carrying with them steam, smoke, ash, and pumice. As night came on, an eye-witness has described the scene:

'Krakatoa was a terrifying glory. From a distance of forty miles it looked like an immense wall, with bursts of forked lightning darting through it, and blazing serpents played over it. These bursts of brilliancy were the regular uncoverings of the angry fires. As the hours passed, the sea gained an advantage through fresh breaks in the crater-walls that offered new points of attack. The explosions became more and more frequent until about midnight they sounded to the people of Batavia and Buitenzorg like one continuous roar, the noise making it impossible for the inhabitants of these places to sleep. The concussion shattered stone walls, upset lamps, tore gas-meters from their fixings. And yet Batavia is as far from Krakatoa as London is from Portsmouth.'

Through all that Sunday night electricity did wonderful things in the heavens. Sailors saw balls of fire resting on the mastheads of their ships, and lightning struck the mainmasts. The climax came at ten o'clock the next morning. What caused the frightful shock is yet a problem. Did the earth open in one gigantic fissure and call the sea down for a final desperate encounter, or was there a sudden subsidence of strata to fill in the hollows left by what had been ejected? The question has not been answered. But there came an explosion so loud, so violent, that it made what had gone before seem as child's-play in comparison, and made all other explosions known to the earth in historic times dwindle into insignificance.

This explosion set in motion air-waves that travelled around the earth four times one way and three times the other. Every self-recording barometer on the globe was disturbed. These air-waves travelled around the earth once in about thirty-six hours, or at the rate of seven hundred miles an hour, which is somewhat slower than sound-waves travel. The sound-waves carried the noise of the explosion over distances far beyond anything

else known in human experience of sound transmission. All over Sumatra and Java the sounds were distinctly heard. At St Lucia Bay, eleven hundred and sixteen miles distant, the noise of the eruption was heard. It was heard at Tavoy, fourteen hundred and seventy-eight miles distant; at Perth, nineteen hundred and two miles away; at Diego Garcia, two thousand two hundred and sixty-seven miles away; and at Rodriguez, two thousand nine hundred and sixty-eight miles from Krakatoa. The sound of the Krakatoa explosion was heard over a zone covering one-thirteenth of the earth's surface. But the sea-waves did more than the air or sound waves. Two lighthouses in the Strait of Sunda, all the towns and villages on the shores of Java and Sumatra bordering the strait, and all the boats and vessels there were destroyed. A tidal-wave rose which was fifty feet high at Java, and one hundred and thirty-five feet at Merak. The man-of-war *Berouw* was carried a mile and three-quarters inland up a valley, and left in a forest thirty feet above sea-level. The sea-waves were recorded at Colombo, seventeen hundred and sixty miles distant; at Bombay, two thousand seven hundred miles distant; and at Cape Horn, five thousand miles away. They travelled three hundred and fifty miles an hour, and their average height as shown by the gauges was from six to eighteen inches.

On the day of the explosion a large part of the Indian Ocean, covering an area of about half a million square miles, was showered with lava-dust and mud. The observers say that a great quantity of the finer dust projected into the air remained in suspension for over a year, and by a refraction of light caused the red and purple sunsets, the blue moons, and the copper suns that were seen all over the world from September 1883 to the close of 1884. The whole northern portion of the island of Krakatoa, with an area of nearly six square miles and an average height above sea-level of seven hundred feet, was submerged, and remains so to this day, under one hundred and fifty fathoms of water. Two new islands thrust up their heads, and the whole configuration of the channel was changed.

All of which confirms one in the opinion that when this old earth begins to fire off her heavy artillery—that is, blow off the heads of her mountains—it makes human battles and explosions in powder and dynamite factories and the like look rather small.

How many lives Mauna Loa, of Hawaii, has taken in the past is not known. The crater of Mauna Loa is the largest of active volcanoes in the world. The last eruption, ten years ago, sent out a vast stream of lava that almost reached Hilo, but only a few lives were lost. Still, the explosions were so great that Los Angeles suffered from the severest earthquake in its experience, and in Lake Superior an enormous tidal-wave rose on the south shore. The Alaska coast also received a shock, and about one-fifth of the earth's area was affected by the eruption of Hawaii's volcano. The Hawaiian group of islands is entirely of volcanic formation, and it is the current belief of the natives that as the islands rose from the waters by fire, so will they eventually disappear beneath the waters again.

Monte Epomeo, in Ischia, one of the volcanoes classified as extinct, after lying dormant for seventeen hundred years, exploded in 1302. Cosequina, of Nicaragua, cast forth such clouds of ashes in 1835 that utter darkness prevailed thirty-five miles distant, and eight miles from the crater the ground was covered to a depth of ten feet. Some of the ashes fell at Kingston, Jamaica, seven hundred miles away. Cotopaxi hurled a two hundred-ton boulder nine miles one summer day. Mauna Loa belched forth a solid fountain of lava one thousand feet wide and nine hundred feet high.

Below is a list of the greatest volcanic disasters during a period covered by medieval and subsequent history:

	Year.	Deaths.
Catania	1137	15,000
Cilicia	1268	60,000
Naples	1456	40,000
Lisbon	1531	30,000
Lisbon	1755	60,000
Lisbon	1623	70,000
Naples	1693	100,000
Sicily	1703	200,000
Yeddo, Japan	1703	15,000
Abruzzi, Italy	1706	20,000
Algiers	1716	20,000
China	1731	100,000
Lima, Peru	1746	18,000
Grand Cairo	1752	40,000
Kasahan, Persia	1755	40,000
Syria	1759	20,000
South Italy	1851	14,000
Peru	1868	25,000
Java	1882	170,000
China and Japan	1891	30,000
Pelée, Martinique	1902	30,000
Vesuvius, Italy	1906	300

A SUMMER IDYLL.

By Sir George Douglas, Bart.

The rich clusters wreathing
This red-thorn are breathing
A perfume too heady—it mounts to the brain;
As once for a bay-tree,
So now for the may-tree
The fervours of Phœbus prove hard to sustain.

In the trim-shaven pleasaunce
His worshipful presence,
With fan of faint silver, the white peacock screens;
His bearing is stately,
He ponders sedately—
His breed is Olympian, his livery a queen's.

Around on the brightness,
Now firm, now with lightness,
In shade, as in pigment of China, is traced,
Like veins in fair marble,
A sketch the winds garble
Of leaf-laden branches and boughs interlaced.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

THE minds of contemplative people, fond of the political reminiscences of the past, have been turned pleasantly towards remembrances of a great period in the history of Parliament by the recent establishment of a 'Cave of Adullam,' the second that has gone by the name. It was Mr John Bright who, speaking of the little band of malcontents who had established themselves in opposition to the other members of their party at the time of the debates on the great Reform Bill which was introduced by Mr Gladstone, likened their doings to those of David in the Cave of Adullam, to which was invited 'every one that was in distress, and every one that was discontented; and he became a captain over them.' The days when this simile was put forward were among the greatest in the modern parliamentary era. There was Gladstone at his best, and making in the course of one of his speeches one of the finest passages that any orator has ever delivered at Westminster. The House is not often thrilled at the present time as it was when he exclaimed to it, 'You cannot fight against the future. Time is on our side. The great social forces which move onward in their might and majesty, and which the tumult of our debates does not for a moment impede or disturb—those great social forces are against you; they are marshalled on our side; and the banner which we now carry in this fight, though perhaps at some moment it may droop over our sinking heads, yet it soon again will float in the eye of Heaven, and it will be borne by the firm hands of the united people of the three kingdoms, perhaps not to an easy, but to a certain and to a not far-distant victory.' At this time Disraeli was cast somewhat in the shade, and he viewed with almost contemptuous unconcern this episode of the establishment of Robert Lowe's little party. Lowe himself was hardly the man to be a leader of any party. His voice grated upon the ear, and his articulation, as we have been told, was so imperfect that frequently it became difficult to understand him. His sight was so short that any paper which he had to read had to be held only a few inches from his eyes, and even then was perused in a very slow and painful sort of way. His presence and his manners were somewhat ungainly. This was the man who, for a short season and with the utmost disadvantages, set up successfully in debate against such orators as Gladstone and Bright, and it is of him we are reminded now when we come to talk again of a new 'Cave of Adullam.' John Bright had another description for that cave which deserved to have been better remembered than it has been. He said, 'This party of two reminds me of the Scotch terrier, which was so covered with hair that you could not tell which was the head and which was the tail of it.' Bright, indeed, was one of the best coiners of phrases and descriptions that we have had. There was a great picturesqueness in some of his ideas, most succinctly expressed. He it was who first referred to 'England, the mother of Parliaments.' He spoke of the 'Angel of Death which had been abroad throughout the land,' when they might almost 'hear the beating of his wings;' he said that force was not an argument, and he was the first to speak of 'muddling through,' though Mr Chamberlain has often been given credit for the phrase. Bright used it in reference to the Northern States in the American Civil War. It will seem to many minds that there has been no other coiner quite so good as John Bright since his days were over, although Lord Rosebery has done very well with his 'clean slate,' his 'ploughing of his lonely furrow,' and so forth. Mr Winston Churchill has his 'terminological inexactitudes' to his credit, and there is Mr Lloyd George 'robbing his henroosts;' but we do not frequently now coin in Parliament such crisp, delicate, and often beautifully fashioned phrases as we heard in the latter period of the Victorian era, or in much earlier times than that. Perhaps they would not be so well appreciated. Canning once ventured on Parliament, somewhat riskily, one of the most finely expressed ideas of its

 [*All Rights Reserved.*]

kind that have been uttered, but its fate hung in the balance for a moment, until the intelligence of the hearers came to the rescue and gave fame to his phrase. 'I called,' he said, 'the New World into existence to redress the balance of the Old.' There was some tittering at first, but the House saw the greatness of the thought, and cheered.

* * *

It is something to believe, on the authority of a very convincing and interesting Blue Book which was lately compiled by the instruction of the Local Government Board from a great mass of the best statistics that are available, that the chances are in favour of our living longer than our grandfathers did. It may be hard to do so, because we have been brought to feel that the conditions of modern life, although they may be healthier in some respects than they used to be, inflict a greater strain upon the human system than did those of the simple, delightful old stage-coach days, before telegraphs or telephones or anything else had been invented that helped to make the world smaller and life so much quicker. But the Government department gives us the plainest and best evidence that this is a fact. It shows us that the average duration of life has been prolonged, and that the death-rate has declined. It furnishes facts to show that tuberculosis, enteric-fever, and smallpox have become far less prevalent than they used to be, and that some other dread diseases of the past, such as typhus-fever, are now almost extinct. The waste of infant life has been reduced to a most remarkable and highly gratifying extent, for we are shown that whereas the death-rate per thousand children under the age of five in 1857 was 67·8, it was reduced in 1907 to 40·9. The reason given for this wonderful reduction is simply the better administrative measures which are now adopted, combined with the greater attention which is paid to the subject generally. As an example of the modern system, it is to be mentioned that in ten towns at the present time there are milk depôts for the supply of pasteurised milk for infants, and in a hundred and fifty districts the local authorities have 'health visitors' in their service, whose business it is to call on working-class mothers and give them wise and beneficial advice on the feeding of their children. There is only one country in Europe which has a lower rate of infant mortality than ours, and that is Holland. Figures on the death-rates per million people in the period 1871–75 and in 1901–5 show that the mortality from all diseases has been considerably reduced, except in the cases of pneumonia and diphtheria. We find that whereas in the earlier period the smallpox rate was 410, in the later era it was reduced to 21. In the case of phthisis the reduction was from 2218 to 1215, while in the case of bronchitis it was 2220 to 1237. As regards pneumonia and cancer, the latter of which shows an increase of nearly double, it is suggested that much if not all of this apparent increase may be due to changes in medical nomenclature or to improved medical diagnosis, meaning that diseases are now classed as pneumonia or cancer which in the olden days were called something else. We discover in this really fascinating book of health that the man has the best chance of long life whose parents had him trained to be a clergyman. The next most healthy occupation is that of the gardener, and the gamekeeper follows him closely, while the farmers come after them. These circumstances are much as we might have expected; but it is a little surprising to find that, next to the farmer, the occupation of engine-driver on a railway is most conducive to long life. Afterwards, farm-labourers, brickmakers, and schoolmasters have the best—that is to say, the longest—time of it. It is put forward that the factors which have promoted the great sanitary improvement during the last half-century are the Acts which have provided for the clearance of insanitary dwellings, the notification of infectious diseases, the Sale of Foods and Drugs Acts (which have led to a gradually increasing control over the adulteration of food), and the duties fulfilled by the Home Office under the provisions of the Factories and Workshops Acts in securing due regard to the health and safety of employés. But while all this is vastly heartening, there are some items in this collection of facts which may not be so much liked by those who yearn for the betterment of the nation in every respect. The birth-rate per thousand fifty years ago was 33, while in 1907 it was 26; but it was to the good that the death-rate in the same period declined from 22 to 15. It has been calculated that in the period from 1876 to 1880 the number of persons annually married was 52 in every thousand marriageable persons, and that in the period from 1901 to 1905 the number had fallen to 48. It is clear that the fifty years' fight against disease, with all the new implements that modern science and domestic engineering have given us, has been enormously successful, and that to-day we are a far healthier Britain than we used to be.

* * *

It is at this time of the year, at the end of July and in the early part of August, that some of the semi-public places in London get their annual autumn cleaning, because the busy folks who inhabit them generally are for the time being away on holiday at the seaside, on the golf-links, and up on the moors of Scotland. The chambers of Parliament get something of a dusting. If we turn aside on a hot afternoon from the Strand—which does then smell somewhat of the warm pitch with which its floor is cemented—and take a turn through the empty corridors of the Law Courts, we may see a good many things which are not visible there at any other time, including the celebrated Law Courts' cat, which wanders disconsolately from the Court of the Lord Chief into the Court of Appeal, and thence into King's Bench V. All is silent and still; the prosecution of great causes is stayed; litigants

are doing a little to forget their troubles; the lawyers are spending some of the heaps of the money that they have been making from them. But it is in the clubs of London when they are being cleaned that the most interesting things are to be seen, and tales to be told by the old servants who are left in some sort of charge while the cleaners do their duty. On such occasions it is the custom, as is well understood, for the members of one club to be taken in as guests by the members of another, the compliment being returned another year. We find these exchanges made only between clubs which are in some sort of sympathy with each other (though one should say that there is an impression that no two clubs in London can have a quite common feeling with each other), so that their memberships blend properly during the cleaning-time. The visitors sometimes have interesting experiences, and there are quaint stories told about the things they have said and done, one of the most famous of which was that concerning the old Major who was one of the members of the Guards' Club who were given hospitality by the Oxford and Cambridge when the establishment of the former was burnt down. Now, we need hardly pause to observe that the Oxford and Cambridge is one of the most dignified and superior of all the clubs. At no very distant date it will be a hundred years old, which is very old for a club. It is not an easy club to which to gain admission, and it is not an inexpensive club either. But the Guards' Club is a little older, and the members of the Guards' have every right to 'think a great deal of themselves,' as such, as they are reputed to do. The burnt-out Guards were given of the best by their Oxford and Cambridge hosts, and this old Major showed a considerable appreciation of the Haroun-al-Raschid port which was stored in the club cellars. On the first occasion on which he sipped it most contentedly he was led to remark, 'I had no idea the middle classes did themselves so well.' It is said that some clubs look with many misgivings upon the raids made on their cellars by the visitors whom they admit on such occasions as these, and it has even been unkindly suggested that at times special wines of a cheaper and less rare character than those which they generally use for their own consumption are got in. Some clubs find themselves in such a difficult position that they never have any other homes to go to when their own places need cleaning, and so such cleaning has to be done piecemeal. There is one such club which is particularly unhappy in the circumstance that while it has to bear an annual visitation from another, the members of which are devoted to the same interests but are supposed to be of a more distinguished class, its members have never the privilege of a return visit. And there is one club at least that never harbours visitors and is never found in any other house, its high austerity preventing it from any interchange of hospitality. This is the Garrick. It is said that the ghosts of old actors clean out its rooms in the small hours of each morning. And the Garrick certainly is generally a very clean place. It is a big business, this cleaning of some of these establishments. For instance, at the Carlton, we have been told, there is a full acre in area of walls to be cleaned; there are thirteen thousand square feet of floors and entrances, eight thousand square feet of ceilings, and over two thousand square feet of windows; and there are ten thousand books to dust! Happy are the members upon their return to their favourite haunts and chairs when the days are beginning to shorten, and there is some comfort in a fire as the chilliness of late autumn is felt to be approaching.

THE HOUSE OF WHISPERS.

CHAPTER XXXVIII.—'THAT MAN'S VOICE!'

STOKES the chauffeur had driven Murie and Hamilton in the car down to the village, where the last-named, after a conversation with the police inspector, went to the Strathavon Arms, together with two constables, who happened to be off duty, in plain clothes.

They found Krail sitting at the bar, calmly smoking, awaiting a message from his accomplice.

Upon Hamilton's recognition he was, after a brief argument, arrested on the charge of theft from Glencardine, placed in the car between the two stalwart Scotch policemen, and conveyed in triumph to the castle, much, of course, against his will. He demanded to be taken straight to the police-station; but as Sir Henry had ordered him to be brought to Glencardine, and as Sir Henry was a magistrate, the inspector was bound to obey his orders.

The man's cruel, colourless eyes seemed to contract closer as he sat in the car with his enemy, Hamilton, facing him. He had never dreamed that they would meet again; but, now they had, he saw that the game was up. There was no hope of escape. He was being taken to meet Sir Henry Heyburn, the very last man in all the world he wished to face. His sallow countenance was drawn, his lips were thin and bloodless, and upon his cheeks were two red spots which showed that he was now in deadly terror.

Gabrielle, who had been weeping at the knees of her father, heard the whir of the car coming up the drive, and, springing to the window, witnessed the arrival of the party.

A moment later Krail, between the two con-

stables and with the local inspector standing respectfully in the rear, stood in the big, long library, into which the blind man was led by his daughter.

When all had assembled, Sir Henry, in a clear, distinct voice, said, 'I have had you arrested and brought here in order to charge you with stealing certain documents from my safe yonder, which you opened by means of a duplicate key. Your accomplice, Flockart, has given evidence against you; therefore, to deny it is quite needless.'

'Whatever he has said to you is false,' the foreigner replied, his accent being the more pronounced in his excitement. 'I know nothing about it.'

'If you deny that,' exclaimed Hamilton quickly, 'you will perhaps also deny that it was you who secretly poisoned Miss Bryant in the Pontarmé Forest, even though I myself saw you at the spot; and, further, that a witness has been found who actually saw you substitute the wine-bottles. You intended to kill me!'

'What ridiculous nonsense you're talking!' cried the accused. 'The girl yonder, mademoiselle, killed Miss Bryant.'

'Then why did you make that deliberate attempt upon my life at Fotheringhay?' demanded Gabrielle boldly. 'Had it not been for Mr Hamilton, who must have seen us together and guessed that you intended foul play, I should certainly have been drowned.'

'He believed that you knew his secret, and he intended, both on his own behalf and on Flockart's also, to close your lips,' Murie said. 'With you out of the way, their attitude towards your father would have been easier; but with you still a living witness there was always danger to them. He thought your death would be believed to be suicide, for he knew your despondent state of mind.'

Sir Henry stood near the window, his face sphinx-like, as though turned to stone.

'She fell in,' was Krail's lame excuse.

'No; you threw me in!' declared the girl. 'But I have feared you until now, and I therefore dared not give information against you. Ah, God alone knows how I have suffered!'

'You dare now, eh?' he snarled, turning quickly upon her.

'It really does not matter what you deny or what you admit,' Hamilton remarked. 'The French authorities have applied for your extradition to France, and this evening you will be on your way to the extradition court at Bow Street, charged with a graver offence than the burglary at this house. The Sûreté of Paris make several interesting allegations against you—or against Felix Gerlach, which is your real name.'

'Gerlach!' cried the blind man in a loud voice, groping forward. 'Ah,' he shrieked, 'then I was not mistaken when—when I thought I recognised the voice! That man's voice! *Yes, it is his—his!*'

In an instant Krail had sprung forward towards the blind and defenceless man, but his captors were fortunately too quick and held him back. Then, at the inspector's orders, a pair of steel bracelets were quickly placed upon his wrists.

'Gerlach! Felix Gerlach!' repeated the blind Baronet as though to himself, as he heard the snap of the lock upon the prisoner's wrists.

The fellow burst out into a peal of harsh, discordant laughter. He was endeavouring to retain a defiant attitude even then.

'You apparently know this man, dad?' Gabrielle exclaimed in surprise.

'Know him!' echoed her father hoarsely. 'Know Felix Gerlach! Yes, I have bitter cause to remember the man who stands there before you accused of the crime of murder.'

Then he paused, and drew a long breath.

'I unmasked him once as a thief and a swindler, and he swore to be avenged,' said the Baronet in a bitter voice. 'It was long ago. He came to me in London and offered me a concession which he said he had obtained from the Ottoman Government for the construction of a railroad from Smyrna to the Bosphorus. The documents appeared to be all right and in order, and after some negotiations he sold the concession to me, and received ten thousand pounds in cash of the purchase-money in advance. A week afterwards I discovered that, though the concession had been granted by the Minister of Public Works at the Sublime Porte, it had been sold to the Eckmann Group in Vienna, and that the papers I held were merely copies with forged signatures and stamps. I applied to the police; this man was arrested in Hamburg, and brought back to London, where he was tried, and, a previous conviction having been proved against him, sent to penal servitude for seven years. In the dock at the Old Bailey he swore to be avenged upon me and upon my family.'

'And he seems to have kept his word,' Walter remarked.

'When he came out of prison he found me in the zenith of my political career,' Sir Henry went on. 'On that well-remembered night of my speech at the Albert Hall I can only surmise that he went there, heard me, and probably became fiercely resentful that he had found a man cleverer than himself. The fact remains that he must have gone in a cab in front of my carriage to Park Street, alighted before me, and secreted himself within the portico. It was midnight, and the street was deserted. My carriage stopped, I got out, and it then drove on to the mews. I was in the act of opening the door with my latch-key when, by an unknown hand, there was flung full into my eyes some corrosive fluid which burned terribly, and caused me excruciating pain. I heard a man's exultant voice cry, "There! I promised you that, and you have it!" The voice I recognised as that of the blackguard standing before you. Since that moment,' he added in a blank, hoarse voice, 'I have been totally blind!'

'You got me seven years,' cried the foreigner

with a harsh laugh, 'so think yourself very lucky that I didn't kill you.'

'You placed upon me an affliction, a perpetual darkness, that to a man like myself is almost akin to death,' replied his accuser very gravely. 'Secure from recognition, you wormed yourself into the confidence of my wife, for you were bent upon ruining her also; and you took as partner in your schemes that needy adventurer Flockart. I now see it all quite plainly. Hamilton had recognised you as Gerlach, and you therefore formed a plot to get rid of him and throw the crime upon my poor unfortunate daughter, even though she was scarcely more than a child. In all probability Lady Heyburn, in telling the girl the story regarding Murie and Miss Bryant, believed it; and if so, she would also suspect my daughter to be the actual criminal.'

'This is all utterly astounding, dad!' cried Gabrielle. 'If you knew who it was who deliberately blinded you, why didn't you prosecute him?'

'Because there was no witness of his dastardly act, my child. And I myself never saw him. Therefore I was compelled to remain in silence, and allow the world to believe my affliction due to natural causes,' was his blank response.

The sallow-faced foreigner laughed again, laughed in the face of the man whose eyesight he had so deliberately taken. He could not speak. What had he to say?

'Well,' remarked Hamilton, 'we have at least the satisfaction of knowing that both this man and his accomplice will stand their trial for their heartless crime in France, and that they will meet their just punishment according to the laws of God and of man.'

'And I,' added Walter in a voice broken by emotion, as he again took Gabrielle's hand tenderly, 'have the supreme satisfaction of knowing that my darling is cleared of a foul, dastardly, and terrible charge.'

CHAPTER XXXIX.—CONTAINS THE CONCLUSION.

AFTER long consultation—Krail having been removed in custody to the village—it was agreed that the only charges that could be substantiated against Flockart were those of complicity in the ingenious attempt upon Hamilton's life by which poor Miss Bryant had been sacrificed, and also in the theft of Sir Henry's papers.

But was it worth while?

At the Baronet's suggestion, he was allowed freedom to leave the upstairs room where he had been detained by the three stalwart servants; and, without waiting to speak to any one, he had made his way down the drive. He had, as was afterwards found, left Auchterarder Station for London an hour later.

The painful impression produced upon everybody by Sir Henry's statement of what had actually occurred on the night of the great meeting at the Albert Hall having somewhat subsided, Murie mentioned to the blind man the legend of the Whispers, and also the curious discovery which Gabrielle and he had made earlier in the morning.

'Ah,' laughed the old gentleman a trifle uneasily, 'and so you've discovered the truth at last, eh?'

'The truth—no!' Murie said. 'That is just what we are so very anxious to hear from you, Sir Henry.'

'Well,' he said, 'you may rest perfectly content that there's nothing supernatural about them. It was to my own advantage to cause weird reports and uncanny legends to be spread in order to preserve my secret, the Secret of the Whispers.'

'But what is the secret, Sir Henry?' asked Hamilton eagerly. 'We, curiously enough, have similar Whispers at Hetzendorf. I've heard them myself at the old château.'

'And of course you have believed in the story which my good friend the Baron has caused to be spread, like myself: the legend that those who hear them die quickly and suddenly,' said the old man, with a smile upon his gray face. 'Like myself, he wished to keep away all inquisitive persons from the spot.'

'But why?' asked Murie.

'Well, truth to tell, the reason is very simple,' he answered. 'As we are speaking here in the strictest privacy, I will tell you something which I beg that neither of you will repeat. If you do it might result in my ruin.'

Murie, Hamilton, and Gabrielle all gave their promise.

'Then it is this,' he said. 'I am head of a group of the leading financial houses in Europe, who, remaining secret, are carrying on business in the guise of an unimportant house in Paris. The members of the syndicate are each of them men of enormous financial strength, including Baron de Hetzendorf, to whom our friend Hamilton here acts as confidential secretary. The strictest secrecy is necessary for the success of our great undertakings, which, I may add, are perfectly honest and legitimate. Yet never, unless it is absolutely imperative, do we entrust documents or letters to the post. Like the house of Rothschild, we have our confidential messengers, and hold frequent meetings, no "deal" being undertaken unless we are all of us in full accord. Monsieur Goslin acts as confidential messenger, and brings me the views of my partners in Paris, Petersburg, and Vienna. To this careful concealment of our plans, or of the fact that we are ever in touch with one another, is due the huge successes we have made from time to time—successes which have staggered the Bourses of the Continent and caused amazement in Wall Street. But being unfortunately afflicted as I am, I naturally cannot travel to meet the others; and, besides,

we are compelled always to take fresh and most elaborate precautions in order to conceal the fact that we are in connection with each other. If that one fact ever leaked out it would at once stultify our endeavours and weaken our position. Hence, at intervals, two or even three of my partners travel here, and I meet them at night in the little chamber which you, Walter, discovered to-day, and which until the present has never been found, owing to the weird fables I have invented regarding the Whispers. To Hetzendorf, too, once or twice a year perhaps, the members pay a secret visit in order to consult the Baron, who, as you perhaps may know, unfortunately enjoys very precarious health.'

'Then meetings of Frohnmeyer, Volkonski, and the rest were held here in secret sometimes?' echoed Hamilton in surprise.

'On certain occasions, when it is absolutely necessary that I should meet them,' answered Sir Henry. 'They stay at the Station Hotel in Perth, coming over to Auchterarder by the last train at night, and leaving by the first train in the morning from Crieff Junction. They never approach the house, for fear that servants or one or other of the guests may recognise them, but go separately along the glen and up the path to the ruins. When we thus meet, our voices can be heard through the crack in the roof of the chamber in the courtyard above. On such occasions I take good care that Stewart and his men are sent on a false alarm of poachers to another part of the estate, while I can find my way there myself with my stick,' he laughed. 'The Baron, I believe, acts on the same principle at his château in Hungary.'

'Well,' declared Hamilton, 'so well has the Baron kept the secret that I have never had any suspicion until this moment. By Jove! the invention of the Whispers was certainly a clever mode of preserving the secret, for nobody cares deliberately to court disaster and death, especially among a superstitious populace like the villagers here and the Hungarian peasantry.'

Both Gabrielle and her lover expressed their astonishment, the latter remarking how cleverly the weird legend of the Whispers invented by Sir Henry had been made to fit historical fact.

. . . . . .

When the eight o'clock train from Stirling stopped at Auchterarder Station that evening, a tall, well-dressed man alighted, and inquired his way to the police-station. The porter knew by his accent that he was a Londoner, but did not dream that he was 'a gentleman from Scotland Yard.'

Half-an-hour later, after a chat with the rural inspector, the pair went along to the cell behind the small village police-station in order that the stranger should read over to the prisoner the warrant he had brought with him from London—the application of the French police for the arrest and extradition of Felix Gerlach, *alias* Krail, *alias* Benoist, for the wilful murder of Edna Mary Bryant in the Forest of Pontarmé, near Chantilly.

The inspector had related to the London detective the dramatic scene up at Glencardine that day, and the officer of the Criminal Investigation Department walked along to the cell much interested to see what manner of man was this who was even more bold and ingenious in his criminal methods than many with whom his profession brought him daily into contact. He had hoped that he himself would have the credit of making the arrest, but found that the man wanted had already been apprehended on the charge of burglary at Glencardine.

The inspector unlocked the door and threw it open, but next instant the startling truth became plain.

Felix Krail lay dead upon the flagstones. He had taken his life by poison—probably the same poison that he had placed in the wine at the fatal picnic—rather than face his accuser and bear his just punishment.

. . . . . .

Many months have now passed. A good deal has occurred since that never-to-be-forgotten day, but it is all quickly related.

James Flockart, unmasked as he had been, never dared to return. The last heard of him was six months ago, in Honduras, where for the first time in his life he had been compelled to work for his living, and had, three weeks after landing, succumbed to fever.

At Sir Henry's urgent request, his wife came back to Glencardine a week after the tragic end of Gerlach, and made full confession how, under the man's sinister influence, both she and Flockart had been forced to act. To her husband she proved beyond all doubt that she had been in complete ignorance of the truth concerning the affair in the Pontarmé Forest until long afterwards. She had at first believed Gabrielle guilty of the deed, but when she learned the truth and saw how deeply she had been implicated it was impossible for her then to withdraw.

With a whole-hearted generosity, Sir Henry, after long reflection and a desperate struggle with himself, forgave her, and now has the satisfaction of knowing that she prefers quiet, healthful Glencardine to the social gaieties of Park Street, Paris, or San Remo; while she and Gabrielle have lately become devoted to each other.

The secret syndicate, with Sir Henry Heybarn at its head, still operates, for no word of its existence has leaked out either to financial circles or to the public; while the Whispers of Glencardine are still believed in and dreaded by the whole country-side across the Ochils.

Edgar Hamilton, though compelled to return to the Baron, whose right hand he is, often travels to Glencardine with confidential messages and documents for signature, and is, of course, an ever-welcome guest.

The unpretentious house of Lénard et Morellet

of Paris now and then effect deals so enormous that financial circles are staggered and the world stands amazed. The true facts as to who is actually behind that apparently unimportant firm are, however, still rigorously and ingeniously concealed.

Who would ever dream that in that quiet, gray-faced man with the sightless eyes, living far away up in Scotland, passing his hours of darkness with his old bronze seals or his knitting, was the brain which directed their marvellously successful operations?

The Laird of Connachan died quite suddenly about seven months ago, and Walter Murie succeeded to the estate. Gabrielle—sweet, almost child-like in her simple tastes and delightful charm, and more devoted to Walter than ever—is now Lady Murie, having been married in Edinburgh a month ago.

At the moment that I pen these final lines the pair are spending a blissful honeymoon at the great old château of Hetzendorf, high up above the broad-flowing Danube, the Baron having kindly vacated the place and put it at their disposal for the summer. Happy in each other's love and mutual trust, they spend the long, blissful days in company, wandering often hand in hand, for when Walter looks into those wonderful eyes of hers he sees mirrored there a perfect and abiding affection such as is, indeed, given few men to possess.

Together they have in secret explored the ruins of the ancient stronghold, and, by directions given them by the Baron, have found there a stone chamber by no means dissimilar to that at Glencardine.

Meanwhile Sir Henry Heyburn, impatient for his beloved daughter to be again near him and to assist him, passes his weary hours with his favourite hobby; his wife, full of sympathy, bearing him company. From her, however, he still withholds one secret, and one only—the Secret of the House of Whispers.

THE END.

BEHIND THE SCENES IN WALL STREET.

IF Americans and even the members themselves of the New York Stock Exchange do not fully understand its methods, outsiders in this country may be excused if Wall Street is only a name for the centre of United States financial affairs. If anything could help the 'many-headed beast' to understand its operations, the volume written by Henry Clews, LL.D., *Fifty Years in Wall Street* (Irving Publishing Company, New York), which runs to over a thousand pages, should help him to do so. The purpose of the writer has been to give the general public a clear insight of the reputed mystery and true inwardness of Wall Street affairs. The founder of the great house of Rothschild, when asked how he got so rich, replied, 'I buys *sheep*, and sells *deer*.' As the men who have made great fortunes in Wall Street, and whose names are household words, are of world-wide interest, we draw attention to Mr Clews's valuable and interesting contribution to the history of the subject, giving samples of his material.

The New York Stock Exchange is not a building, but an association of brokers united for the purpose of buying and selling representations of values called stocks and bonds. It brings together the capitalist and the captain of industry, just as the railway brings producer and consumer together. Wall Street in New York City runs from Broadway to the East River, following the line of the early city wall across Manhattan Island. It contains the United States Sub-Treasury and numerous banking institutions, and hence is the centre for financial operations in the United States. The business of New York Stock Exchange was conducted here in hired rooms until 1865, next in premises erected in Broad and Wall Streets, and since 1903 in a new building erected on the same site. Wall Street moves the money that controls the affairs of the world. There are about eleven hundred members of the Stock Exchange, and it is seldom that a black sheep is found amongst them. Mr Clews tells us that there is not a more intelligent body of men in the world, with such statesman-like grasp of mind. The strain on a Wall Street broker is very great, but he unbends at Christmas and other seasons, when he finds a safety-valve in practical joking and boyish pranks. The members then become extremely human or boyish: the sound of hand-organs is heard in the board-room; there is smashing of hats, pushing and jostling, blowing of horns, waltzing, wrestling, and sparring. This is a natural reaction after days of strain and stress. Travers, a humourist of Wall Street, said once of a celebrated lawyer, 'Look across the way, boys; there's Barlow with his hands in his own pockets at last.' When Travers was dying in Bermuda, whither he had gone by the doctor's orders, some one remarked to him that it was a nice place for rest and change. 'Yes,' was the quick reply, 'the waiters get the *change*, and the hotelkeepers the *rest*!'

Henry Clews, who was born in Staffordshire in England, and intended for the Church, tells us that he cannot now help being an American, and that he does not want to. When brought to the States for only a short visit by his father, he became aware of the possibilities that presented themselves to a young man who had the courage to push and compete for a place in the race for wealth and position. He liked the hustle, and on leaving school at fifteen entered mercantile life in New

York. Afterwards, in 1858, he became a member of the firm of Stout, Clews, & Mason, and later of Livermore, Clews, & Company. At the outbreak of the Civil War Clews was invited by the Secretary of the Treasury to become agent to sell Government bonds. The firm of Henry Clews & Company was organised in 1877, its members pledging themselves never to take any speculative risks. Needless to say, the firm has had a highly successful and honourable career. Mr Clews married Lucy Madison, grandniece of President Madison. He has been a frequent contributor to newspapers and magazines, and these contributions, with addresses on financial subjects, have helped to swell the present volume. Much of his success in life he ascribes to the influence of the men of character and ability with whom he came in touch at first. Millionaires were then few, and truthfulness and honesty, combined with willingness to work, were the passports to success. He has kept his youthful appearance, but is entirely bald, and tells this joke against himself. A Wall Street humourist said one day, 'Hallo, boys! here comes Clews, the self-made man.—I say, Clews, as you are a self-made man, why the deuce didn't you put more hair on the top of your head?'

Mr Clews points out that few men, with the exception of the Rothschilds, Astors, and a few others, have had any children capable of increasing their wealth. Cornelius Vanderbilt and his son, Mr William H. Vanderbilt, in little more than half a century accumulated the largest private fortune in the world, excepting the aggregate wealth of all the Rothschilds combined, 'which has been the result of the most expert financiering in all the capitals of Europe through several generations, with all the resources of the greatest monarchs on earth to back their various enterprises.' In seventy years Cornelius Vanderbilt rose from nothing financially to be possessor of about ninety million dollars, or sixteen millions sterling. William H. Vanderbilt was left fifteen million dollars, and nearly trebled it in a tenth-part of the time. He made three times as much in seven years as his father made in seventy. Regarded at first as a man of moderate capacity, he became a first-rate financier and the largest holder of American securities in the world. Once, in conversation with Mr Chauncey Depew, Mr Gladstone said, 'I understand you have a man in your country who is worth twenty million pounds, and it is all in property he can convert at will into cash. The Government ought to seize his property and take it away from him, as it is too dangerous a power for any one man to have. Supposing he should convert his property into money and lock it up, it would make a panic in America which would extend to this country and every other part of the world, and be a great injury to a large number of innocent people.' Mr Depew admitted that Mr Vanderbilt, who was the person referred to, had that amount of money, and replied, 'But you have, Mr Gladstone, a man in England who has equally as large a fortune.' Mr Gladstone said, 'I suppose you mean the Duke of Westminster. The Duke of Westminster's property is not so large as that. I know all about his property, and have kept pace with it for many years past. The Duke's property is worth about ten million pounds, but it is not in securities which can be turned into ready cash and thereby absorb the current money of the country, so that he can make any dangerous use of it, for it is merely an hereditary right—the enjoyment of it—that he possesses. It is inalienable, and it is so with all great fortunes in this country; and thus, I think, we are better protected here in England than you are in America.' Mr Depew's reply was, 'Ah, but, unlike you in England, we in America do not consider a fortune dangerous.'

In his day Cornelius Vanderbilt was a genius without equal in the financial world. No more than his eccentric and able contemporary, Daniel Drew, did he owe anything to education received. Neither believed in book-keeping; indeed, Drew called it 'a confounded fraud,' and carried his business matters in his head. Vanderbilt started with a row-boat plying between Staten Island, Governor's Island, and New York, in which he himself did the rowing. Later he became a hotel-proprietor, the head of a Pacific line of steamers, and then went whole-heartedly into railroad business. One of his sayings was, 'Never tell anybody what you're goin' to do till you do it.' His son, William H. Vanderbilt, when installed in the vice-presidency of a consolidated system of railways, proved an indefatigable worker, taxing his powers to the utmost. No wonder he died suddenly at an early age. He insisted upon making himself familiar with the minutest details of every department; scrutinised bills, cheques, and vouchers; and even inspected every engine upon the numerous systems of railways he dominated. He examined correspondence which others would have delegated, and answered a large number of letters with his own hand. His father lived to be eighty-two; he died at fifty-six, leaving a will distributing his vast wealth to his own family and his brothers and sisters.

Millions, says Mr Clews, were distributed as other millionaires had dealt with thousands. Of the distribution of a fortune of about forty million pounds sterling Clews says: 'The ordinary human mind fails to grasp the idea of such a vast amount of wealth. If converted into gold it would have weighed five hundred tons, and it would have taken five hundred strong horses to draw it from the Grand Central Depôt to the Sub-Treasury in Wall Street. If it had been all in gold or silver dollars, or even in greenbacks, it would have taken Vanderbilt himself, working eight hours a day, over thirty years to count it.' Mr Clews, who does not believe in monopolies, yet points out that the Vanderbilt system of railroads employs two hundred thousand people at better wages than they could obtain elsewhere. It pays thirty pounds an hour in taxes.

'Until the Georgeites, the M'Glynnites, and the Socialists demonstrate that their untried systems will confer greater happiness on humanity than honest enterprise—in the best circumstances, under our present social system, with all its defects—has developed, I shall be tardy in subscribing my adhesion to the new order of things.'

Was it Vanderbilt the first who said that 'a fool can make money, but it takes a wise man to keep it'? Daniel Drew, when worth two millions sterling, is described by Clews as negligent in his attire, dressed like the cattle-drover he once was, with the handle of an old, worn-out umbrella for a walking-stick. He was economical in home life, though he entertained liberally, and his house used to be open to Methodist ministers. He was cunning and avaricious, but his great fortune went as it had come. From selling cattle he became proprietor of a tavern, a strong opponent of Vanderbilt in the steamboat business, and a great railroad speculator; and it was a disaster in the 'Erie corner' through the 'machinations of Gould and Fisk' that broke the man. He had entered Wall Street in 1844, and became one of the most successful and daring operators. 'Watering stock' is a term said to have had its origin from a practice of Drew's, when a cattle-dealer, of giving his cattle salt in order to create a thirst in them that would cause them to imbibe much water, and so appear bigger and fatter when brought to market. Brindley the engineer used to go to bed when he had a difficult problem to solve; our Wall Street operator went to bed after any stroke of bad luck. Drew said, 'I had been wonderfully blest in money-making. I got to be a millionaire almost before I knowed it hardly. I was always pretty lucky until lately. I didn't think I could ever lose money extensively. I was ambitious of making a great fortune like Vanderbilt, and I tried every way I knew, but got caught at last. Besides that, I liked the excitement of making money, and giving it away, and am glad of it. So much has been saved, anyhow. Wall Street was a great place for making money, and I could not give up the business when I ought to have done so.' Clews describes Drew as tall, strong, sinewy, and in later days his face was seamed with deep lines indicating intense thought and worry; he had restless, twinkling eyes, with a steady, cat-like tread in his gait, while his demeanour was bland, good-natured, and insinuating.

Mr Clews's account of Rockefeller seems more generous than most narratives which relate the doings of the founder of the Standard Oil Trust. We give it almost in the author's words. It may be compared with Miss Tarbell's account or Rockefeller's autobiographic narrative: 'John D. Rockefeller must be regarded as one of the most interesting types of the great commercial powers of the day. He was a pioneer, a commercial Daniel Boone, striking out into a new and untrodden field of enterprise, taking great risks, undergoing grave financial perils of a novel kind, and at length winning a complete and lasting success, a success which has filled business history with his achievements and the world with his fame. It was a great stride from the little farmhouse in Tioga County, New York, to the place he fills to-day. He was born in 1838, reared by strict church-going people, and is a striking example of what thrift, enterprise, and persistency will do for a young man who starts out in life with apparently little or no chance of success. His old schoolmaster, it seems, was the first to get the young man to look into the refining of petroleum. Not so many years ago sperm-oil was in general use, and it cost one dollar and a half a gallon. How to refine the thick, ill-smelling oil found in the watercourses of Pennsylvania was a problem. It was black slime, and John D. Rockefeller, by hitting upon a method of refining and introducing it into every home throughout the world, has made a fortune that recalls the fable of Midas. Before he was twenty-one he formed a partnership with a man named Hewitt, and at first engaged in the warehouse and produce business. Then came the great oil-craze in Pennsylvania. Poor farmers suddenly became rich; thousands flocked to the oilfields. Young Rockefeller kept his head. Asked to make investments in oil-wells for Cleveland friends, he dissuaded them from the project on the ground that the thing was being overdone; and with Samuel Andrews, who was familiar with the general processes of distilling, engaged in the refining branch of the petroleum trade. The firm subsequently became Rockefeller, Flagler, & Andrews, which rapidly expanded its field of operations, and in 1870 organised the Standard Oil Trust with a capital of a million dollars. It started pipe-lines to ship the oil to the seaports; it made millions in by-products once considered worthless; it established markets all over the known world, cheapening its methods of production and outstripping all competitors. Little wonder, then, that its extra dividend in the year 1899 amounted to twenty-three million dollars over and above the regular dividends on the whole capital stock.'

Mr Rockefeller attributes his success to early training and perseverance. That is, like other men who have stamped their individuality upon the affairs of mankind, he is what is termed a causationist; in other words, he believes that nothing is got for nothing; that effects proceed from causes, and the cause of success he believes to be largely perseverance. He believes that perseverance overcomes almost everything, even nature itself. John D. Rockefeller is credited to be the richest man ever known in human history, and in his donations to schools, colleges, and universities, like Andrew Carnegie, has illustrated his belief that the greatest charity lies in helping others to help themselves. The connection of this narrative with Wall Street is apparent when we remember that the Standard Oil Trust is all-powerful there.

After this fashion does Mr Clews deal with other

famous financiers and millionaires such as Jay Gould, Huntingdon, Leland Stanford, J. W. Mackay, Cyrus W. Field, J. A. Stewart, Russell Sage, Pierpont Morgan, and Harriman, and give us peeps behind the scenes of the history of important financial transactions. As at Monte Carlo, some plungers sink in the stream never to be heard of more, and cases of suicide are chronicled.

This is but a sample of the fifty years' experiences of Henry Clews, mixed with wise and shrewd remarks. It may interest suffragettes to know that women do not thrive in the atmosphere of Wall Street, and that as speculators hitherto they have been utter failures. Information may be a good or a bad thing. Many speculators lose because of insufficient information, more because of false, others because, while information is correct, they do not know how to turn it to account. There are manufactured 'points' which mislead. Those who follow a natural disposition rather than the course of the market are sure to become bankrupt sooner or later. Some are too ignorant or too wise, too timid or too bold, too pessimistic or too sanguine, too slow or too hasty, too diffident or too conceited, too confiding or too incredulous. There is no discipline more severe and exacting than that of speculation. Mr Clews lays it down as a first rule for success that the judgment be not warped by any natural idiosyncrasies. The operator must be as calm and impartial as a judge. Mr Clews says, and with this we conclude: 'For a man to be a thoroughly equipped speculator it is necessary that he be possessed of extraordinary parts and attainments. He must be an unceasing and intelligent observer of events at large, and a sagacious interpreter of symptoms on the Exchange; his judgment must be sound not only as to existing conditions but as to coming tendencies, and he must possess the calmness and nerve to face unflinchingly whatever emergencies may arise. Whoever enjoys these qualities in the highest degree must be the king of speculators.'

RIVETT'S WHEAT.

CHAPTER II.

IT was the meet of the Thurnton hounds. Cassius Crewe, moody and taciturn, held himself apart on his restive hunter, apparently intently watching for his mother's motor-car. Mrs Crewe, who revelled in the picturesque, intended to be present; and her chauffeur, a reckless young foreigner, had a reputation for carelessness. But it was also rumoured that Lady Bentley, who hated fox-hunting, was coming; and this perhaps accounted for the young man's persistent gaze on the winding road below. Suddenly he saw, turning a curve, the familiar low pony-carriage with its two female occupants, and capering, leaping near it was a fluffy ball which he recognised as Eleonore's Skye terrier, the darling of her heart. He gave another, an anxious glance. Great heavens! yes, there at the cross-roads——

'Tarnation!' shouted Cassius. The field became aware of the young American, who had not been with Roosevelt's Rough Riders for nothing, taking a headlong short-cut over bramble-hedge and barbed-wire fence to the highway.

What he anticipated occurred. Eleonore, suddenly cognisant of her pet's danger, sprang from the carriage, heedless of consequences. The chauffeur, speeding round the corner, lost his head, but pulled up with a sharp shock when his young master came riding full tilt at the machine. Ere spectators realised what had taken place, there was a girl lying prone on the road, a small dog whining over her, while a riderless horse galloped away and its owner spoke wild words to the scared chauffeur and the trembling woman in the car. Five minutes later, when Eleonore revived, two white-faced men gripped hands in a spasm of emotion. Sir Bertrand Penmaur and Cyrus Crewe sank their differences in paternal thankfulness.

'Blamed if she ain't a fine girl!' sputtered Cyrus. 'See her risk her life like that for a dog! Why, sir, she deserves to be a Murrikan!'

'Your son is a manly fellow,' returned Sir Bertrand, ignoring the jar on his ears in a rush of feeling. 'He has saved my granddaughter's life. I am not likely to forget it.'

As for Lady Bentley and Mrs Crewe, their first frantic terror over, they were jubilant. Such a dramatic episode could have but one ending. And the fact that both Eleonore and Cassius suffered from nervous shock and required care only made matters more hopeful.

Yet, withal, the course of true love did not run satisfactorily; there was an armistice, but no signed peace. Sir Bertrand, grateful though he was, impressed on his granddaughter that a man might be brave, impulsive, self-sacrificing, yet no fit mate for a Penmaur. Gratitude could not obliterate the distinctions drawn by nature and heritage. Cyrus Crewe unstiffened somewhat more. The instinctive chivalry that most Americans have for women was impressed by this English girl's impulsive courage. He inquired for her daily; he sent her hothouse fruit and flowers in profusion; he even 'allowed' to his wife that she might not prove unsatisfactory as a daughter-in-law. But he was not going to permit any such project to be entertained unless Sir Bertrand's pride unbent. There was to be no suggestion that she stooped in marrying the son of Cyrus Crewe, millionaire. No, sir!

Eleonore, as she lay languidly on her sofa, slowly

realised her own feelings. The courageous young American who had risked life and limb to save her held the key of her heart. Tradition and family prejudice had gone to the winds; she was his in soul; but she would never be his in reality against her grandfather's will. No woman of her house had ever come under the family ban.

'Yes, I love you, dear,' she said, flushing like a crimson rose when they were well enough to meet, and he pleaded his suit with hot Virginian ardour. 'How could I do otherwise? Did you not risk everything for me? But—no, no, dear,' shrinking as he bent forward eagerly—'no, I cannot accept you, I cannot be engaged, unless grandpapa approves. I—I—think I shall—love you—all my life; but I must not say more than that. We do not ignore parental rights over here.'

Mrs Crewe had a very bad time of it while Cassius inquired how long young folk were to be sacrificed to old fools.

One day Lady Bentley took matters into her own hands. 'It is my birthday on Saturday,' she said to Sir Bertrand, 'and I mean to have a tiny party—just ourselves, you know. The young people deserve an afternoon-tea after all they have gone through, and you will have to come as a matter of course. You really cannot do less under the circumstances. And mind you behave yourself!'

Sir Bertrand growled something under his moustache, but it was inaudible.

'I want to have our young people to tea on my birthday,' she observed to Cyrus Crewe; 'we have to do something to celebrate their convalescence, and of course you two tiresome men must appear and be civil to each other. I am positively tired of all your nonsense. Now, try to be charming!'

'A darned fine woman,' said Cyrus, watching her. 'I begin to think a heap of Englishwomen. 'Tis the men that rile me.'

The Grange was an ideal rustic home, gabled, rose-covered, tree-embowered, the abode of real romance. Lady Bentley, white-haired and sweet, in her flower-adorned drawing-room, was in keeping with the home. Mrs Crewe, resting gracefully in a low chair, with stately Sir Mark beside her, looked like a rare exotic transplanted to English soil. The lovers were to be seen wandering in the large conservatory, followed by two pairs of masculine eyes, the one wrathful, the other perplexed.

'Leave those children alone and come and sit with me,' said Lady Bentley, taking Sir Bertrand and Cyrus Crewe by the hand and leading them to the sofa. '*I have a song to sing you.*'

Each opened his eyes. The white-haired lady, seated between them, placidly took up her knitting and began her story.

'Once upon a time a boy and girl loved each other, as boys and girls will. Their parents opposed the love, as parents will, and the love grew. Then the storm burst. They were ordered apart. He was ready to defy parental authority for her sake. She had been well trained in obedience, and gave in. So they parted. He rode away to life and the wars with wrath in his heart, for he deemed her cold. She stayed on in the old home and nearly broke her young heart.'

Sir Bertrand moved restlessly.

'Years passed. The girl was left, orphaned and desolate, but her home remained to her. She had money to supply her wants. She had the villagers, who learned to look upon her as a providence. Her life was not empty, but her heart was. She saw her contemporaries surrounded by children while her own hearth was deserted. She saw old friends sheltered and cared for while she had to tread her lonely way. She knew of her old lover's marriage, and suffered in silence, thinking that another had consoled him. Her soul was sore within her. But it was not embittered, for Love remained with her—the Love that keeps the heart young.

'So she passed, calmly but very wearily, to autumn days, then to silver hairs. And when life was almost a closed chapter she met her love once more. He too was silver-haired. He too had passed through lonely weariness. His marriage had been one of pique which left his heart unwarmed, and there he cherished her image. So true love came to its own at last, and those twain, despite parent and circumstance, ended their days as one.'

She looked up from her knitting. Her soft eyes, tear-brimming, rested on Sir Mark, by Mrs Crewe's chair.

'But—that is your own life, Margaret,' protested Sir Bertrand.

'Yes.'

'And it was—it always seemed—a happy life.'

'Perhaps.' She laid her hand on his. 'Yet think of all those wasted years when we missed true happiness. Think!' She turned her head towards the conservatory. 'Do you wish sorrowing loneliness and poverty for her? Do you want her to reproach you in her heart after you are gone? And, remember, it is but putting off. Love comes to his own at last, but sometimes he comes into it too late for this world.'

Cyrus was mopping his eyes with his handkerchief.

'Ma'am,' he said, 'I admire your sentiments. I appreciate them. That's so. She's a grand girl, and you're another, ma'am! If Sir Bertrand's game for the wedding, I'll foot the bill.'

Sir Bertrand drew himself up resentfully.

But Lady Bentley whispered eagerly in his ear, 'Look at the mother!'

He did. The Virginian sat erect, lithe, sinuous, red lips parted, feverish anxiety in her dark eyes. Her son's future was at stake, and the mother-hunger for his happiness possessed her.

Sir Bertrand bent his head.

'Now, Cassius, you have no business here at all,' protested Lady Bentley briskly some weeks later. He had intruded on a female trio discussing trous-

seau mysteries. 'You know this is not your province!'

'That so? Now, I calculate there's suthin' I most particularly require to busy with. Eleonore, honey, yo' must wear Rivett's Wheat in yo' weddin' wreath.'

'Rivett's Wheat!' The matrons echoed his words and stared.

The bride-elect understood. 'Yes,' she said, laughing and blushing, 'I think I must wear Rivett's Wheat in my hair!'

THE END.

THE MONTH: SCIENCE AND ARTS.

KINEMATOGRAPHS FOR THE TABLE.

EW diversions have met with such universal popularity as animated photographs. Hitherto the enjoyment of this form of entertainment has been restricted to a roomy hall; but, as the result of demand, it has now been adapted to the dining-room table of the ordinary home in just the same manner as the phonograph. A small apparatus, measuring about three feet in length by about a foot wide and deep, has recently been patented, together with the necessary projecting equipment, and it is so simple in operation that a child can use it. The image is thrown upon a ground-glass screen, giving a picture about fourteen inches by ten, at one end of the machine. If necessary, however, this screen can be removed and the image projected upon a large white sheet, a piece of white cardboard, or some other opaque medium to greater dimensions. The projecting apparatus is of the simplest design, and, being strongly built, is not easily damaged or thrown out of gear. The apparatus is perfectly safe to use, there being no danger of igniting the film such as arises when a powerful luminant is employed, as in the ordinary exhibition installation. In fact, all that is necessary is a conventional acetylene bicycle lamp or some other convenient form of lamp. The film being placed some distance from the lighting medium, there is no possibility of sufficient heat being generated in focussing the light to bring about combustion of the film. The films are supplied on spools, and operate in the usual manner, being wound again on another spool after passing before the lens. The picture thrown upon the ground-glass or other screen is perfectly distinct and clear, possessing all that vividness of life-movement incidental to the large exhibition projector. The apparatus is designed in a variety of styles, ranging from a few shillings to as many pounds; and the spools of films, lasting from two to three minutes, are available at a price comparable with the ordinary phonograph record. This latest invention ranks as one of the greatest developments in kinematography, since it ensures moving pictures with all their peculiar fascination being brought within the range of every home, and should rival the phonograph as an educational and diverting form of beguiling the tedium of an hour or so.

A NEW FIBRE-DECORTICATOR.

The increasing demand for cheap fibres for various kinds of industry has, during the past few years, resulted in great attention being devoted to the possibility of utilising for such purposes various grasses growing so plentifully as almost to become classed as weeds. In India and the East generally this is a problem of vital significance, but the problem is one beset with innumerable difficulties. Many of these plants are tough, and their constitution such as to defy manufacture into the requisite raw material by existing facilities. The result is that inventive effort is being directed towards the evolution of special machinery. In this connection a notable achievement has been accomplished by an English inventor, the outcome of which will be that the pernicious weed tara grass, which is the *bête noire* of the tea-planter, will now be rendered of distinct commercial value, especially for the production of cordage. This grass thrives very luxuriantly, is of very rapid growth, and exists in illimitable quantities throughout a large portion of our Indian dependency. The new machine specially devised for preparing this material comprises two drums revolving in opposite directions. The grass is fed into a receiver and passes between these rollers, around the peripheries of which are disposed a series of bars studded with pins and varying from coarse to fine. As the grass passes over these teeth it is combed out, it being possible to secure fibres of any desired degree of fineness. One notable feature of the apparatus is that the decorticating teeth are self-cleaning, this being accomplished once in every revolution of the drum by bringing them into contact with a stiff brush which rotates at a rapid speed in a direction opposite to that of the drum. The result of this treatment is that all the vegetable matter contained in the material is eliminated, leaving the fibrous constituents in long, straight lengths, which emerge from the apparatus in a perfectly clean condition. The only preliminary operation necessary with the grass is a slight crushing in order to remove the superfluous moisture from the stems and leaves. In this manner the acid constituents of the grass—which are so deleterious to the fibre if left associated therewith, either setting up a violent rotting action or seriously discolouring the finished fabric—are removed by means of a water-spray which is brought to bear upon the mass while decortication is in progress.

The fabric produced upon these lines has subsequently been manufactured into cordage, and has proved completely successful, equalling in texture that made from the orthodox materials. The market for the product is already assured both in this country and America; and as the cost of preparation, as well as that of the grass, is small, a new and flourishing industry should be possible of foundation. Seeing that the grass is an annual growth, easily maturing within twelve months of being cut, an inexhaustible supply is assured. Another feature of the machine is that it is applicable to a variety of other fibrous plants which hitherto have resisted preparation at a profit either by mechanical or chemical decorticating methods. The plantain-tree, for instance, can even be utilised in this manner. This is of supreme importance, since there are over a hundred thousand acres of this fruit under cultivation in Burma alone, the fibre of which has hitherto been discarded as waste. This is irrespective of the huge expanses of the wild variety of the same tree which thrives in the jungle, the fibre of which is stated to possess greater strength than the cultivated class. The process is economical in every sense of the word, as the short stuff left after the combing out of the long lengths is available for the manufacture of paper.

A POWERFUL DISINFECTANT.

If there is one subject more than another about which misconception popularly prevails, it is that of disinfectants. Yet, at the same time, there is nothing more vital to the welfare of the community than the efficiency and perfection of a germicide. The general idea is that the greater the odour emitted by an antiseptic the greater its power; but this is entirely fallacious. Moreover, the vast majority of such products are combined with injurious, deleterious substances to assist the specified work. Many disinfectants in common use are quite deficient in germicidal qualities, but at the same time are highly charged with caustic, which effects such corrosive action upon bedding and other fabrics. Consequently in the case of an infectious malady it is advantageous that a pure germicide should be employed. Recently such a disinfectant has been introduced under the name of kalzen, which marks a great improvement upon existing articles of this nature. It possesses very high germicidal value, and is most insistent and instantaneous in its attack upon germs, being from ten to fifty times as powerful and effective as carbolic acid, which is usually the unit in bacteriological tests. It has the conspicuous advantage over this standard element, however, in that it is almost odourless, and does not burn, stain, or discolour the most delicate textiles, and can consequently be used with impunity in disinfecting operations. It is prepared in a variety of forms, such as soluble and insoluble powder, soap, and fluid. When diluted with water—for the fluid is prepared in a highly concentrated form—it is non-poisonous; and, though not advocated for internal application, it can otherwise be used with safety. For sterilising surgical instruments it is distinctly efficacious. In the severe bacteriological tests that have been carried out it has been found to possess a carbolic coefficiency on the typhoid bacillus of 17, and on the diphtheritic organism a coefficiency of 25, as determined by the Rideal-Walker means of standardising disinfectants. In view of the demand that has been prevalent for some time for a more powerful antiseptic than those at present in vogue, and one that can be more safely used than either carbolic acid or corrosive sublimate, this new germicide should meet with a widespread measure of popularity.

NEW TROPICAL TABLE-FRUITS.

Table-dessert in these northern climes is necessarily somewhat restricted in point of variety, and for this reason the palate requires some cajolery to enjoy a new addition in this direction. There are numerous appetising and health-bestowing fruits of exotic origin available, which only await the public fancy. It was not many years ago that the grapefruit growing wild in Florida was regarded with disdain, but to-day it is considered somewhat of a dainty. Efforts are now being made to introduce some of the indigenous luscious products of Mexico, which at home are appreciated because of their delicious and novel flavour. Among these is the well-known custard-apple, which when fully grown measures from four to five inches in diameter, and has a soft, custard-like, refreshing taste, the flavour not being dissimilar from that of vanilla. Another is the guava, a curiosity of the plant-world, inasmuch as blossoms and fruit in every stage of development are found on the tree at one and the same time, so that a supply is constantly available. The zapote is a third delicacy to Mexican tastes, which in its various forms should secure the appreciation of the English fruitarian, owing to its exquisite taste. These fruits are quite foreign to our experience, and naturally the palate will have to undergo a certain education to enjoy their qualities, but it should not be a difficult task.

RAT-SKIN LEATHER.

Though the rodent is at present the object of bitter attack, owing to its disease-propagating influences and destructiveness, yet the warfare against its existence has been productive of a new and promising industry. It has been found that the skin of this animal is splendidly adapted to a variety of purposes, such as the binding of books, purses, gloves, and other articles of feminine use and adornment. It is stated that already the traffic in this commodity amounts to about fifty thousand pounds per year, and advertisements have appeared for supplies of skins of the brown rat in lots of one hundred to ten thousand. Despite the extent to which these islands are overrun by this pest, they cannot even begin to meet the demand. It would appear,

however, that in order to secure the most perfect and marketable skins the animals should be trapped or despatched by means other than virus, as the peculiar eruptive effects of the last-named method would depreciate the value of the skin.

THE WORLD'S TIMBER RESOURCES.

Few questions are occupying such a prominent position in the minds of commercial economists and provoking such feelings of alarm to-day as the timber resources of the world. During the past quarter of a century the use of wood-pulp, principally for the manufacture of paper (the production of this indispensable commodity is now over six million tons per annum), has been so enormous as to lead to the rapid depletion of the great timber-belts of the temperate zones, and its extent has only been realised when almost too late. Though the whole of the northern continents have contributed to this state of affairs, the authorities of some of the countries concerned have been somewhat more far-sighted, and years ago resolved to husband their natural resources. In the United States the inroads upon the timber forests have been such that they are to-day in serious jeopardy of becoming wiped out altogether. In that country wastage and unscientific methods of timber-felling, combined with speculation in the forests, have contributed to the disaster. Already the price of wood-pulp has risen to an abnormal figure, and many of the newspapers are hard put to it to sell their sheets at the usual price; in fact, in some instances the price has been raised to meet the enhanced cost of the raw material. The paper industry of the States has attempted to go across its borders and deprive Canada of its timber, but the Dominion Government has gripped the question with a tight hand. To-day it holds supreme position in the possession of forest land. There are over one million and a quarter square miles of timber now under protection, irrespective of the vast tracts in the frozen north, which as yet are safe from depredation owing to their inaccessibility. Evidence points to the fact that in the course of a few years the Dominion will stand as the timber-producing country of the world—a position that cannot be disputed, since the other nations will be attempting to retrieve their lost resources by means of huge afforestation schemes. Such restorative work is now in active progress, but it will be another quarter of a century before maturity is attained. Had the forests, as fast as they were depleted, been planted with young trees, no such position as the present would have resulted, since thereby rotation of timber yield would have been maintained. Meanwhile the demand for wood for a variety of purposes continues to increase by leaps and bounds, from the humble match to the telegraph pole, the lead-pencil to household furniture. The chemists are hard at work seeking for some synthetic process of converting various residues into wood-pulp, but the quest is a stern one. Certainly, the results so far achieved have not pointed to any practical alleviation or avoidance of what is popularly predicted—a world-wide timber-famine.

ARMY KITCHENS FOR FIELD USE.

While the provisioning of an army in the field is one of the most difficult and essential problems in military operations, it is almost equalled in its significance by the urgency of some means of preparing the food for the men. The question is more acute when the army is continually on the move, since then the stationary kitchen is quite useless. Improvements in mechanical propulsion have led to the devising of portable kitchens which can keep up with the army; but here again there are great possibilities for inventive effort. The most noticeable strides in this direction have probably been achieved in connection with the Austrian army, which is now procuring a complete equipment of travelling kitchens at an outlay of about half a million sterling. The War Office authorities have for some time been experimenting with various types of culinary appliances adapted to the rigours of campaigning, and some very interesting devices have been demonstrated. One consists of a motor-driven installation, in which are carried three large boilers enabling soups, vegetables, and other kinds of food to be prepared while the army is on the march, adequate provision being also available for the preparation simultaneously of the food for the officers, together with suitable receptacles for the conveyance of the various necessities incidental to culinary operations, such as fuel, stores, &c. This device has proved very satisfactory, the boilers being provided with tight-fitting covers not easily displaced, which prevent the contents from being spilt on a journey over rough country. The value of such an acquisition to an army in the field is obvious, since it ensures that the men shall receive nourishing, hot, and tasty meals in plenty, and physical fatigue through insufficiency of suitable food is overcome. The one disadvantage of the system is the high price of the installation; but this, it is stated, is more than compensated for by the maintenance of the men in the pink of condition.

PRESERVING FRUIT AT HOME.

Though fruit-preservation is invariably an occupation in which the housewife displays the greatest enthusiasm, the pleasure of the work is invariably marred by the difficulties incidental thereto. When cooking is carried out in the ordinary domestic apparatus the contents must not be left for a moment, otherwise there is grave risk of the whole being spoiled by burning. In order to achieve the object with the greatest measure of success recourse should be made to the Welbank boilerette, which is eminently adapted to the purpose. Therewith one need have no fear of the fruit being burned, and the task is appreciably facilitated. All that is necessary is to place the bottles in which the fruit is contained in the inner vessel, which is then im-

mersed in the outer water-charged receptacle. When brought to the boiling-point the water is allowed to boil for half-an-hour, which effectively sterilises the fruit. The bottles of fruit are then removed and easily sealed by means of the glass cap, air-tight rubber ring, and screw band. This is practically a hermetically sealing process, and when the bottle and contents have cooled the seal is kept intact by the greater external atmospheric pressure. Fruit sterilised in this manner will keep for an indefinite period without undergoing any deterioration, and when the bottle is opened will be found as fresh as if newly gathered. The simplicity as well as the efficiency of the process cannot fail to impress the industrious lady of the house, especially the simple and complete means of sealing the bottle, which is only second in its attractiveness to the scientific cooking system advocated.

A 'SAFE' SASH-WINDOW.

Though paternal legislation has endeavoured to minimise, if not totally prevent, the window cleaning or painting accident, the most satisfactory solution of the problem lies in the evolution of a window in which all such operations can be safely effected from within the room. Many attempts to this end have been made, but they only partially achieve the desired object, the majority failing because they entail structural alterations in the ordinary sash-window. In one type which has recently been perfected none of these drawbacks are existent. No special frame, beading, or fittings of any description are required, and any sash-window can be easily adapted to the new type. In ordinary appearance it resembles the conventional double-panel window, the sashes sliding up and down in the orthodox manner. When, however, it is desired to clean the outside surface of the glass or to paint the woodwork, the window opens inwardly like a casement, so that the whole external area is brought within the room. For painting this is a distinct advantage, as it dispenses with the use of ladders and scaffolding, so that the work is completed more quickly, cheaply, and in absolute safety. Moreover, the sashes are absolutely wind and water tight. The device, owing to its simplicity of fitting, inexpensiveness, and immunity from danger, should meet with widespread approval, for it indicates one of the greatest strides towards the ideal that has yet been devised.

SCIENTIFIC PACKING OF STORES.

On the occasion of his dash to the South Pole, Lieutenant Shackleton resolved to keep a record of all stores which when opened proved defective as a result of injudicious packing. In this direction, however, as he relates, he 'drew a blank.' Considering the great distance over which the stores had to be transported from this country this is no mean achievement, and is directly attributable to the use of venesta cases. For the preparation of these the wood is specially prepared, being composed of thin layers, with the grain of each laid transversely to its fellow. This not only obviates splitting and warping, and adds a greater measure of strength to the material, which it retains under all and varying conditions, but enables the case itself to be made much lighter and to carry a far greater weight than the ordinary wooden case. Special means are also adopted for uniting the various sections together, so that no danger need be apprehended of a breakdown at these vulnerable points. The fact that these cases are extensively employed for the transportation of tea, one of the most difficult articles to handle owing to its extreme susceptibility to outside influences, testifies to their utility. A further development in this direction which should possess a great future is the construction of portable collapsible houses, where the minimum of weight with the maximum of strength is the great desideratum. In the Manchurian campaign the Russian Red Cross Service employed one of the structures. It was fifty feet in length by about twelve in width and seven and a half in height. It was built up of three-sixteenth inch venesta boards, which weighed twelve ounces per square foot, so that the whole building only turned the scale at five and a half tons. The structure was found completely wind and water proof, and even withstood the rigorous Siberian winter without suffering the slightest ill effects. Success in such a severe test points to the excellence of the material, and for portable buildings it should be capable of many possibilities.

LIFE IN ST LUCIA, BRITISH WEST INDIES.

A correspondent writes: 'I came out here a year ago from Glasgow, and bought a small cacao estate. The fogs, &c., at home being too much for my hearing, I flitted before the damage was considerable. I dare say the articles which have appeared in *Chambers's Journal* for years at odd times had something to do with my coming; and what astonishes me is that more of the men like myself so plentiful in Glasgow, and Scotsmen generally, with a little money, don't come out to a decent, reliable climate like this, instead of being taken into their fathers' businesses and having to endure weather of the worst. Englishmen, young and middle-aged, are continually dropping in among the islands as settlers. I am told the barracoota "goes for" any man in the manner your article last month implies. As to the tarpon three-cornered duel, I've been at the catching of a fairly big one. We were in a cranky dug-out pirogue at sunset, so, though we hadn't a shark to consider, we had a possible upset, and darkness latterly, to deal with. Altogether it is as good a life out here as can be had anywhere. The black folk tell me I work too hard; but the saying to "work like a nigger" was not inspired by any coloured gent I have happened on yet in St Lucia, so their opinion is of little value. The only time they do put their backs into it is on wet days—to keep warm, I think. It may

interest you to know that the mongoose has driven the rats into the trees. There they build big nests, and there they live on the sweet stuff in the pods of the cacao-trees. Some planters say the mongoose has taken to tree-climbing also; but I haven't heard of one which was actually seen climbing.'

FORECASTING THE WEATHER.

Mr D. W. Horner has written a booklet on *Observing and Forecasting the Weather* (Witherby and Company) which may be of service to those who wish to do so without going to the expense of instruments; and the carrying out of the hints will sharpen the faculties of observation and prove of practical value. The rules laid down are of a very simple kind, in which cloud-changes, direction of the wind, halos, thunderstorms, the moon are discussed. Of proverbial weather-sayings, Mr Horner holds that a large number of them will not stand the test. But the following are reasonably true:

Rain before seven,
Fine before eleven.
Thunder in spring
Cold will bring.

A wet June makes a dry September.

Mr Horner quotes John Ruskin on the beneficial influence of such studies: 'It is the science of the pure air and the bright heavens; its thoughts are amidst the loveliness of creation; it leads the mind as well as the eye to the morning mist, the noonday glory, and the twilight cloud, to the purple peace of the mountain heaven, to the cloudy repose of the green valley; now expatiating on the silence of stormless ether, now on the rushing of the wings of the wind. It is indeed a knowledge which must be felt to be in its very essence full of the soul of the beautiful.'

CONVEYING BUTTER BY RAIL.

It frequently happens that one may be living in a rich agricultural county in Great Britain, and Danish or some foreign butter persistently turns up on the table. The home product is conspicuous by its absence. The care with which foreign butter is manufactured and the co-operative dairy system partly explain this. At the port of Hangö, Finland, which is kept open all the year round by means of ice-breakers, the Finnish Government has built a massive cold store, with refrigerating plant. Here shippers may store butter for export at a rent of four marks per square metre. The butter-wagons of the Finnish State railway are painted white, and inside are fitted with long corrugated tubes filled with ice and sawdust. There is a thermometer on each side of the wagons; the temperature must never be lower than eight degrees centigrade, or higher than fourteen degrees, and it is the duty of officials at wayside stations to watch that this is so. A steam coil in the wagons, connected with the locomotive, keeps up the temperature in winter. Two analysts, also, see that the butter that leaves Hangö is all that it should be. In Canada there is also a special ice-car service for the carriage of butter to Montreal. The service begins on May 17 and continues until the middle of October, about sixty cars being operated each week. Inspectors are employed to test the temperature of the butter at the railway shipping stations before it is loaded into these cars, and also when it is unloaded at Montreal. These inspectors also see that the cars are kept clean and well iced. Shippers making use of the cars have to pay the regular freight rate only, there being no extra charge for the special service or for icing. Inspectors watch the handling of perishable freight as it is unloaded from the cars and loaded into the steamships, test the temperature of butter before it is placed in the cold-storage chambers in the ships, and place thermographs (recording thermometers) in the different chambers and holds.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

LOVE IN A GARDEN.

Song of bird and scent of roses,
Rapture of mid-June!
In my lady's garden closes
Life is one glad tune.
Daisies peep thro' tangled lashes
From the emerald grass,
Softlier the fountain plashes
As we, whispering, pass.

Pansy faces, dim and tender,
Turn with solemn air;
Lady-lilies, tall and slender,
Breathe o'er us a prayer;—
Dainty sweet-peas, light and airy,
Strive to set them free,
Just to join a sister-fairy
As she walks with me.

Surely Love among the roses
Sweetest is of all?
And my lady's garden closes
Hold my heart in thrall.
In a garden Love's dear story
First was told, they say;
And methinks its ancient glory
Lives in this to-day.

M. Hedderwick Browne.

*** TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Printed and Published by W. & R. Chambers, Limited, London and Edinburgh.

VANESSA.

A MOTOR IDYLL.

By Sir J. H. A. MACDONALD, K.C.B., LL.D.

CHAPTER I.

There is such instinctive insight in the human heart that we often form our opinion almost instantaneously; and such impressions seldom change—I might even say they are seldom wrong. Love at first sight sounds like an imprudence, but it is almost a revelation.—LORD AVEBURY.

But to see her were to love her,
Love but her and love for ever.—BURNS.

THERE was nobody like Vanessa. Others might have features more classically cut, but hers had an abundance of that ineffable charm which the purely classical cannot claim to possess.

The day will never be forgotten when I, a delicate little thing of fifteen, was handed over to Frau Deckerschenk in the Wolfstrasse of Frankfort to be 'finished.' How I shrank from that knot of girls, so boisterous in their rude health, and how suddenly I seemed to pass from shadow into sunshine when my eyes fell on Vanessa's glorious outline, as she stood for a moment in the doorway, like a Romney come to life! With one glance she grasped the situation; and, walking past the group of girls who had been making me hot with their sharp questioning, she held out her hand, into which mine fell and lay there, while I brightened at the sight of the two sweet dimples that flitted into her cheeks as she gave me a nod of encouragement and slipped her arm into mine. She was indeed the angel of my schooldays, an angel who filled my heart with joy in her love, but could be a stern angel to guard me from my foes. For no one could defy Vanessa, and every girl at Deckerschenk's knew that however weak she might be, if Vanessa was her strength she was strong indeed.

Oh, how I wept when she was declared 'finished,' and was taken home to live with a chaperon at a great mansion in England! For Vanessa was a great heiress, and an orphan. My only consolation was that her new home was in our part of the country, where I might hope to see her often when my exile was over—an exile which was made harder by the blank she left.

What a joy when within a day or two of my return to my home a sweet letter came to me from my darling, enclosing a note to mother, asking if she might come and take me to her house to stay with her for a while. Mother had often heard Vanessa's praises sung, and gladly wrote consenting. Then came a telegram: 'Expect me to-morrow morning.'

She lived about forty miles off, and the carriage was ordered for me that I might meet her at the early train. But that was not Vanessa's mode of travelling. I was up betimes, and took as much care with my toilet as if it was a lover I was expecting. When in the act of fastening a bunch of violets—her favourite flower—in my belt, I was startled by the *toot-toot* of a horn, and, flying to the door, was just in time to see the car rounding the great cedar at the corner of the lawn, and sweeping up to the door, Vanessa silhouetted on the dark background, radiant with her bright colour made yet brighter by the crisp morning air, a delightful piquancy added by the charming disorder of a stray lock, half-gold, half-brown, curling over her forehead in the breeze under her dainty motor-cap.

With a bound she was on the doorstep.

'Oh Vanessa!' was all I could say, as I fell into her arms.

She held me close to her, murmuring in the rich, deep tone I knew so well, 'Dear little Mite!' her name for me at school. Then holding me out at arm's-length, she laughed aloud. 'Mite indeed! Why, you wretch, you are taller than I am;' and she shook me merrily.

It was true. Whatever the failings of the Deckerschenk Schule were, the body was well taken care of both in food and skilfully ordered

 [*All Rights Reserved.*]

exercises; and so the thread-paper chit of fifteen that Vanessa had known met her in health as happy as her own, and with a trifle to give in the matter of inches, although she was what is accounted tall for our sex.

Mother beamed on us from the porch, and when Vanessa released me came forward, holding out her hands, and drew her inside the door. She eagerly scanned her face, saying gently, 'So you are Vanessa! I am so glad to meet Mary's friend.' The friend looked into her eyes with her own full-hearted gaze, and when Vanessa looked so she was irresistible. Mother leaned to her, and their kiss was as if love had already 'on their hearts a soft hand laid.'

As they walked in side by side, mother cast a glance over her shoulder, which said unmistakably, 'Yes, indeed yes,' to all that I had so often poured out to her about my darling.

Before going in I turned round, and addressing the back of a leather coat and cap, the individual in which was stooping over the car's anatomy, said, 'If you will go round to the back they will give you some breakfast.'

The youth stood erect, and, touching his cap, said, 'Thank you, miss.' I seemed to see something about his appearance that puzzled me, while the look of his eye suggested amusement; but as I turned quickly to hasten after Vanessa I thought no more of it.

We had a merry breakfast. She was at home at once with dear mother, and made the latter laugh till she almost cried with her account of our adventures at Deckerschenk's 'polishing-yard,' as she called it, mimicking me in my early shrinking depression, and so making such a contrast to her own sunshiny way that I could but laugh myself.

'Indeed, my dear,' said mother, 'if she is different now, I feel that the thanks are more due to you than to Frau Deckerschenk.'

'Oh no,' said Vanessa, but she reddened with pleasure.

Suddenly, when we had almost finished breakfasting, she threw up her hands, exclaiming, 'Goodness! I have forgotten Tommy out in the cold.'

'Tommy!' I cried in turn. 'Do you mean your motor-boy?'

'Well, he is doing motor-boy to-day, but he is my cousin.'

'Your cousin!' with a shriek. 'Why, I sent him round to the servants' hall to breakfast, and he never said a word!'

What a laugh Vanessa gave as I rushed to the door! 'Oh, leave him there; he will be all right;' but I was off and running downstairs and along the passage as fast as I could.

While still hid in the darkness of the passage I suddenly stopped at the sight I saw at the end of the hall-table, which was between the open door and a window. There sat Tommy, with a half-eaten rasher before him, his knife and fork with their handles on the table and their points in the air, talking big to the servant-girls.

'And do you drive that grite big machine yerself?' one of them was asking.

'Don't I though? I can make her hum, I can tell you. At least, I used to; but they've got a rotten Act of Parliament now that nobody's to drive till he's seventeen, and so Va—missis, I mean—won't let me. I call it a beastly shame. Wouldn't it be jolly if I could give you girls a run?'

'Wouldn't it just!' said Lily the under-housemaid; while cook pressed him to have something more.

Tommy was just in the act of attacking a pot of marmalade when I said out of the darkness, 'Your missis wants you'—stress on the 'missis.'

Tommy jumped up, patronisingly swept his eyes round the caps and aprons with a 'Thank ye kindly,' and chucked the pretty Lily under the chin, saying, 'Good-bye; don't cry. You wait till next birthday: missis is sure to come here again, and I'll manage to get you a run.'

As he joined me in the passage I said, 'How could you let me send you downstairs? I am so sorry!'

'Oh, it's all right. I had a stunnin' time, better than hearing you and Van talking women's rot about hats and all that.'

As we entered the breakfast-room Tommy marched up to Vanessa, his back assuming the rigidity and his face the wooden-god expression of the English male domestic, and said in semi-sepulchral tones, 'Any horders, miss?'

Vanessa seized him by the arm with a mock frown which her laughing eyes belied, 'Yes; go to Mrs Bellair, and ask her if she will shake hands with you after this escapade; although,' relaxing into a smile, 'I was the one in fault.'

'Oh, that's all right. When you girls get together cousins haven't much chance, and I had an awful good time in the hall.'

Tommy and my mother fell into sympathy at once—that never took long between her and the young; and he, like a true schoolboy, was attacking a second breakfast vigorously when the parlour-maid came in. She stood for a moment aghast, when a wink from Tommy's eye completely upset her, and she fled, leaving behind her the sound of an ill-suppressed giggle. The servants' hall chatter that day would have been amusing. When we were about to start there was a show of caps at the windows above.

'Put on plenty of wraps,' said Vanessa; 'remember that we make our own breeze.'

'I hope you don't go very fast,' said mother.

'Oh no. I took an hour and forty minutes to do the forty-one and a half miles this morning, and you cannot call that fast.'

'It's downhill going home,' broke in Tommy.

'Trust Van to make her touch the legal limit.'

'Tommy, start the engine,' said Vanessa with a frown.

Mother and I looked at one another. Her look said, 'Oh dear!' mine said, 'Trust Vanessa.'

Presently we were off and outside the avenue gates, when Vanessa leaned down and pulled at something, and the car hummed off into a speed that made the telegraph-posts pass us as if we were in a railway train. I did hold on to the side of the car, and it was only by casting my eyes up to the bright, serene profile which spoke of perfect self-control and nerve that I became reassured. A mile or two were covered, when I found my hand unconsciously had relaxed its rigid grip on the arm-rest, just as Vanessa smiled down on me, saying, 'If it is too fast, Mitey, tell me, and I will slow down at once.' Was it likely, whatever I felt within, that I would say to Vanessa that I had not confidence in her? Never!

On we fled, and when another long stretch had been covered I began to breathe freely and settled down, the steady hum of the car lulling my nerves into confidence.

Careering down a long, gentle descent at a speed that seemed to me like flying, we saw a speck in the distance which quickly developed into a hunter with a man in faultless pink on his back. As we approached he held up his hand; and Vanessa, with a little *moue* of impatience, slowed down; but, seeing that the horse was in no way nervous, was passing on, when the hand went up again, accompanied by a peremptory 'Stop, please!' Vanessa, as she pulled up nearly opposite to him, said below her breath, 'Too bad! I'll give the fellow a bit of my mind;' and the Bellona look came over her face, a look I knew so well in the days when she fought my school battles for me, and before which even the Deckerschenk herself used to shrink.

'What is the meaning of this?' she said icily. 'Your horse is not restive, and your stopping me is —is—I have no words to describe it.'

'Beastly cheek, I call it!' came in a stage-whisper from Tommy.

'I wished to speak to you.'

'Sir, I shall tolerate no such thing.'

'Pardon me, there is something you ought to know.'

'Oh indeed!' with a contemptuous shrug of the shoulders.

'Yes, at the risk of further offending you, I must speak.'

Vanessa turned the back of her head to him, and set her gear for starting.

'I ask your pardon if I have taken a liberty; but there is a police-trap a quarter of a mile farther on, and I thought you ought to be told of it.'

What a blush of shame covered the lovely face! In a moment the gear was out and she was on the ground beside the horse's neck, saying, 'Sir, it is I who must beg pardon. I have been most hasty and most rude.'

He too was on the ground in a moment, exclaiming, 'I beg you will not say that. It was only a mistake, and a natural one.'

'No, no,' said Vanessa humbly, looking hard into the horse's neck, and nervously smoothing its glossy skin with her glove. 'I have done wrong, and I must hear you say that the wrong is pardoned.'

How handsome and how uncomfortable he looked, picking at the thong of his crop, and glancing up and then down again!

For a few seconds there was silence, and then she in her low, earnest voice said, 'Do not add to my humiliation by forcing me to ask twice.'

'Oh, well, of course you know, if you say I must say it, well of course I must.' He took off his hat, and looking into the distance, said, 'A lady bids me pardon what she thinks calls for pardon: I must obey; it is pardoned;' and he bowed.

'I thank you,' said Vanessa, 'for restoring to me my self-respect.' She turned and held out her hand to him, raising her eyes to his, and he closed his fingers on it gently and respectfully for a moment. Then, with a graceful inclination of the head, she returned to the car, which had been gently humming its impatience the while.

When we moved off she did not look in his direction; but as we passed him her head bent forward until it nearly touched the steering-wheel, and so we left him.

I looked back when we had gone a short distance, and there he stood, still bareheaded, gazing after us. I smiled inwardly, and let my imagination run free. After a time I glanced at Vanessa, and seeing a look indescribably sweet on her lips, and a crystal drop shining on her eyelid, 'Is this all?' I said to myself. 'We shall see.'

We moved on slowly in silence.

Tommy, whose face had shown marked disapproval of humble-pie, had leaned over from the tonneau to express his views on the situation; but I succeeded in checking him with a friendly frown and headshake.

We were quickly brought down to the mundane and ordinary. The warning we had received led to caution, and we all were on the *qui vive* for signs of the ambush. Vanessa, recovering herself, was eager for the encounter. Tommy, whose eyes were as sharp as a Boer's, suddenly hissed into our ears, 'There he is behind that gatepost! I saw him peeping. You leave him to me.' He sank down in the car, where I heard him shaking something out of a tin; and looking round, I saw him peering over the side. As we came up to the gate a constable came into view holding a watch in his hand. He looked up as we came opposite to him, and I heard a strange noise from the tonneau. The man's face puckered up as if he had been stung, and the watch fell and rolled on the ground. Turning round, I saw him rubbing his eye and shaking his fist after us, and I had to seize Tommy's hand as he was putting it to his nose to make what I am told is the Freemasons' sign. In the other hand I saw a pea-shooter! I hoped that Vanessa had not noticed it. If she did she made no sign.

We looked hard to see where the trap ended, but saw no one. Whoever was at the other end had more sense than the constable, and kept well

in hiding. As we passed through the next village Vanessa stopped at the local doctor's surgery, and went in for a few minutes. Starting again, we had a delightful run, and reached Vanessa's house, where I spent a too short week of happiness, and returned home without any further adventure.

CHAPTER II.

I HAD a great curiosity to learn who our hero of the scene on the road might be, for the incident had made a strong impression upon me, and I often found myself studying the picture snapped by my brain-camera: Vanessa nobly humbling herself for a conscious wrong, and the manly sportsman embarrassed and uneasy, as your Englishman always is when his pardon is asked for, and most so when the suppliant is a lady. I saw again the hand-clasp, the meeting of the eyes, the head bowed over the wheel. It was a living picture, full of interest for one who believes that things do not happen by accident, and I freely confess that it moved me strangely, and showed itself time after time on the tablets of my memory. I wondered who he might be. Once or twice mother caught me smiling, and banteringly offered me a penny for my happy thought. I replied that gold would not buy it, but perhaps she would know some day.

A few days after I had reached home a letter arrived from Vanessa giving me startling news. It said, 'What do you think? A constable arrived here this morning, bearing a blue paper summoning your Vanessa to the Petty Sessions at Stickleton on the 28th, to answer for autocar No. GP. 99 having been driven by her at a speed dangerous to the lieges, &c. Don't be alarmed. I think it will be great fun.'

I did not feel able to take quite so complacent a view of the matter as she apparently did, for I could not but recall the remarks of some of the Justices at council meeting, which I had seen in the *Pinsterly Courier*, at which an old Indian colonel talked growlingly of 'murdering Juggernauts,' and a vicar whom I knew to be of mild countenance interlarded his observations with allusions to his Satanic Majesty in speaking of the originator of the road-motor. But I knew very well that to Vanessa the whole thing would present itself as an amusing adventure, in which, if she could not win, she would at least manage to score somehow.

As I turned it over in my mind, a thought suddenly flashed upon me: what about our hunting friend? Could he not help us if we could find him? I asked myself what it was that made a smile flit on to my lips as I thought of him. I know now, and I half-think I knew then. But how to find him? On the spur of the moment I sat down and wrote:

'MOTOR-TRAP.—Will the gentleman who stopped an autocar near Chipley on the 14th kindly communicate with M. B. at Westwood Lodge, Leytonsborough?'

And without waiting to consider, I despatched copies, with stamps enclosed, to the *Times* and to the local *Courier*. When I had dropped the letters into the pillar-box at the gate I suddenly began to wonder whether M. B. was not a very bold young person, and in a half-repentant mood I went and "fessed,' like Topsy, to mother, who was at first shocked, and then laughed, saying, 'I suppose I must forgive you, as it was for your beloved Vanessa; fortunately our initials are the same, and if you get a reply I will take the matter up for you.' Dear mummy, she is always sympathetic, even when she disapproves, and so I never have any secrets from her.

When at Deckerschenk's I had one talent developed in a very marked degree by a brilliant teacher—that of drawing and modelling, especially from the figure. So successful had he been in bringing out what he saw I had in me that I had taken the gold medal of the Art Society of Frankfort, an honour which had never been carried off by a female, still less by a schoolgirl in her teens. No wonder, indeed, when I had a model that Phidias himself would have coveted. The last year I was at Frankfort with Vanessa the girls were allowed to have a fancy-dress evening, and I persuaded her to let me dress her as Britannia, in which character she took her place in an international tableau with which we opened the ball. I took great pains with the dress, and my art-teacher posed the figures most successfully, Vanessa being set by him in the attitude shown upon our coinage, seated with the trident in her left hand, and her right arm drooping over her shield. That arm, from the clasp of the classic drapery above the shoulder down to very finger-tips, was indeed a thing of beauty, such as must have been that of the Venus of Milo when it left the sculptor's hand. Poor Vanessa suffered for its charms, irresistible to an artistic eye, for I coaxed her to pose to me as Britannia while I drew study after study, until she was driven to cry, 'Mitey, if you don't release me, that arm you are fussing about will go mad, and its fingers will do something horrid.' Still, at the close of the sitting it passed round my neck, and then she took a look at my work—a long look—and, stooping down, she kissed me, and, keeping her eyes from mine, she left me. The grace of her walk in her flowing robe was a delight to behold.

When with her at Larkhall I persuaded her once more to put on the Britannia dress, and my artist's eye quickly discovered a change in comparing my school studies with the now matured model. The school-figure of former days showed traces of what was girlish, charming indeed, but scarcely giving a satisfying presentment of the grace and grandeur of Britannia which the matured Vanessa now exhibited.

On my return home I went vigorously to work at my easel, and also at a clay statuette, a standing

figure that I had begun to model, stimulated by the sketches I had brought back with me from Larkhall, and hoping for a day when I might finish my work with the delightful aid of my living model.

The day after my advertisement had appeared in the *Times* I was in the conservatory outside the drawing-room working at my statuette, in my long artist's blouse and with my picture on the easel beside me, when I heard the door-bell ring, and the words, 'Oh, bother, visitors!' came to my lips. Mother was out, having driven to Leytonsborough to visit her old women at the County Hospital; and Lily, who specially attended upon me, came to the conservatory, saying, 'Please, miss, there's a gen'leman 'ere 'o says something about a newspaper that I can't make aout, and 'e wants Emby, 'e says.'

Here was a *contretemps!* Should I plunge deeper? A moment's hesitation, and the face of Vanessa rose before me as she lifted her head from bending over the steering-wheel. My indecision was gone. I told Lily to show him up, and fled through another window to slip off my clay-bedabbled smock and cleanse my fingers.

Returning a few minutes later through the room, I saw my hero gazing at my work so intently that he did not hear me coming, and I purposely made the leaves of a palm rustle as I stepped into the conservatory, causing him to look round. Oh, what a shade of unmistakable disappointment passed over the handsome face as he saw me coming towards him! That look had its own eloquence.

'It was good of you to come yourself!' I said, holding out my hand. 'I am sorry my mother is out.' I was not in the least sorry, but it was the nice thing to say, wasn't it?

I told him the tale of woe—that my friend had been summoned, and that we—meaning mother and myself—thought that perhaps if we could find him he would help us.

Oh, he got quite exuberant! He would be so glad! His great blue eyes beamed with delight. Then he asked if Vanessa—'your lady friend' he called her—was staying with us, hinting eagerly that it would be well if he saw her before the trial.

A woman's malice came over me. 'Oh no,' I told him, it would never do; and down went the sun again, and the bright blue faded into gloom. I did enjoy myself telling him that I had thought it all over (I had not, for the thought only flashed on me then), that it would never do for him to meet her before the trial, that she knew nothing about our advertisement (stress upon the 'our'), and that he ought to appear as a witness without her knowing anything about it. Of course I knew in my own secret heart that nothing would have induced Vanessa to take his help as if she had asked for it, and that she would have done anything, paid any fine, or even gone to prison, rather than that he should describe the scene on the road in the Petty Sessions courtroom.

'Well,' he said at last, 'I suppose you are right. I shall be there to-morrow, and will take care not to show myself till the right moment.'

'The hour is eleven,' I said.

He was gone. He never asked what my name was. I was not surprised. If he had asked for names I felt sure it would not be mine he would care to know, and it was only after he was gone that I suddenly remembered that Lily had laid down his card on the ledge of my modelling-stand. Somehow, the remembrance excited me, and I flew from the door where I had parted from him, and, seizing the card, read with a gasp, 'The Marquis of Oldsborough;' and then all in a moment I found myself clapping my hands together, saying, 'Oh Vanessa, I am so glad!' which you, dear reader, will be inclined to think was, in the words of an awful but most useful vulgarism, 'a little previous.' To me it was not. I knew—I felt I knew; and that night in my dreams I saw my Vanessa in all the splendour of her velvet robes and coronet, her corsage glittering with the renowned Oldsborough diamonds, standing in the Stickleton courthouse, the irate colonel with his red face and protruding white moustache, and looking like a boiled walrus, being defied to mortal combat by a champion of dames in a hunting-coat.

(To be continued.)

A SUBURBAN SEA.

By W. E. Cule.

MANY cities grow their suburbs as the oak-tree grows its rings, each new belt being the fruit of imperceptible days slowly measured into decades. It is not so with London, for here new suburbs rise with breathless haste. What was yesterday a market-garden is to-day a brickfield, and will to-morrow have its District Council; but when we look again it is already declining, and its newspapers make sad plaints of people going 'farther out.' There is also something of glamour in the story of the London suburb, some hint of the magic powers bestowed by wealth. The rich man bemoans the crowded state of Highgate or Muswell Hill, and at once new express trains open out to him the sylvan beauties of Bucks and Herts and Surrey. There is a talk of Garden Cities, and immediately we find that one has been laid out and even partially built within sight of the dome of St Paul's. Once, in his dreams, a City man heard the murmur of the sea, and saw a vision of a wide horizon with white sails upon it; yet the dream was not a dream merely, for when he opened his morning paper he found that the thing

was done. His fantastic but all-compelling Providence laid its latest effort before him with a smile of mingled triumph and satisfaction: 'Here is your sea!'

The first steps of the journey offer no suggestion of what is in store. Fenchurch Street Station is the gloomiest of all railway termini, hidden in an obscure corner of the City. The approaches are by narrow lanes and grimy stairs, and the waiting train bears no token of its splendid destination. The new-comer watches the scene with a perplexity which needs to be comforted again and again. Here is a bustling crowd of very ordinary City men, with no seaside air about them and no apparent consciousness of the happiness of their lot. But his lingering doubts are gradually dissipated as the engine gathers speed, for this train does not halt at every station. It shoots by with scorn that scarcely deigns a look, and with a shrill blast that tells of a broken bondage and a great deliverance.

The run of fifty minutes has three stages of increasing interest. We speed first through the murk of East London, travelling just above the house-tops of Stepney and Bow. The wandering gaze falls upon an army of chimney-pots in massed battalions, rank on rank, regiment on regiment, officered here and there by some grotesquely outstanding cowl, and broken by uprising spires and faded signboards. It is a grim and sombre army, keeping guard over the secrets of sunless streets and flowerless windows, and stretching away into the smoky mist that always broods over the great city. But our train rushes on to the junction at Barking, the last outpost of the ever-extending District Railway. Here it pauses at last, to take up a few waiting passengers whose air of haste and relief suggests that they are belated fugitives from a city of dreadful night. They climb in hurriedly, and the doors are slammed upon them with an echo of finality and completion.

The second stage is the stage of London's kitchen-garden, a section of that broad belt of cultivated fields that forms so large a portion of the Plain of Essex. Here they stretch almost unbrokenly from Barking to Upminster, in the spring a quiet study in greens and earth-browns, in summer and autumn a marvellous panorama of colour, where greens of every shade in nature are splendidly varied by prodigal efforts in golds and reds. But once beyond Upminster—the latest new garden suburb, by the way—the last touch of London has been thrown off, and it is a wide country-side of meadow and hedge-row that rests the tired eyes which have pored all day over ledgers and cash-books, a country-side where cosy farmsteads are set in woodland fringes of deep purple. In the morning the landscape lies bathed in sunshine and moist with dew; in the evening it is again fragrant, but with the fragrance of departing day. Then its hush seems to fall even upon the train which has rolled so noisily into the scene.

It is at Benfleet that we first realise our destination. Here we touch the long arm which the Thames has thrust between our mainland and Canvey Island—a long, thin arm, with a quaint selection of tiny yachts and brown-sailed fishing-boats. Then comes Leigh, with an ancient and grimy fisher-village, and with a great hill of modern villas overshadowing the railway. But now our iron road runs along a narrow foreshore, and the sea is within an arm's-length. These are real waves that we hear and see; this is a true salt breeze that blows into our close compartment. The tide is high, and the sun of evening gleams upon the moving breast of the Thames estuary. A hundred little yachts dance and rock upon the water, and a distant trail of smoke marks where a great liner steams steadily up the main channel of the chief waterway of England.

It seems but yesterday that London was smiling at the idea of a suburban sea, but the incredible has long since become the actual. That fantastic Providence overcame every obstacle, and swiftly planted long lines of tasteful residences, hotels, and boarding-houses on the slope that rises from the beach westwards from Southend. In a little while that bare hill-slope had become one of the fairest sea-fronts on the east coast; for since it was bare there was nothing to hinder the architect's fancy, nothing old to break the sweep of the uniformly new. Another nod, and the providing genius changed an old country-house and grounds into a public park and playing-fields, and yet another produced a swift and comfortable train-service to and from the City at the modest charge of less than a shilling a day. And now there are several thousands who shake the dust of London from their feet each night to turn their brows to the breeze from the Channel and to scan an horizon where blue cloud and blue water meet.

There is little lacking in this suburb; indeed it has a fullness unknown to many seaside places of greater name. The daily trains and the touch of the City take nothing from its charm, while they save it from any fear of monotony. Moreover, it extends its hospitality to all alike, with a catholic freedom quite foreign to Highgate or Dulwich. The managing director may have his residence on the front, with his yacht afloat within range of his dining-room windows. But the clerk with two hundred a year may also find a home on the hill behind, coming down every evening with his wife and daughter to enjoy a quiet hour on the promenade; or, leaving his train at Leigh, he will walk homewards along the narrow beach-path, with the water breaking upon the stones at his feet. The hush of the evening by the sea falls strangely upon his spirit after the clamour of the City and the roar of the train. At Westcliff he finds children still playing upon the belt of sand and shingle, while their mothers sit and read; and when he sees them he feels that his rusty City garb, his bag and

umbrella, are curiously out of place in such a setting. Then the fantastic improbability of the thing occurs to him, and he doubts whether the reality may not prove to be a dream. Was he in London an hour ago, or is the City but a vivid memory of last year? But then his wife approaches to join him, so that they may walk home together. It was for her sake that he first dreamed this dream, and with stern self-denial made it come true; and he smiles to notice again how the breath of our suburban sea has brought back to her eyes the sunshine of health.

No, there is no dullness here. Quite apart from the trains, we are in touch with England's very heart, the centre of her life. From the beach we may see a long sweep of the Kentish coast and the mouth of the Medway, with Chatham and Rochester behind, and with England's iron fleet upon the waters—*Dreadnoughts* and *Invincibles* in all their pride, it may be, with a cloud of satellites of less tremendous calibre. Sometimes a deep boom rolls slowly and sullenly over land and sea, and we know that at Shoeburyness the great guns are at work; or in the dusk of evening we may follow the course of the searchlight at Sheerness as it moves its vigilant beam from point to point. All day long we may see silent ships go out, a slow procession of gray sails and mighty funnels; and all day long the ships pass in on their way to Tilbury and London. Often at night a mist lies heavy upon the water, and then hour after hour the distant fog-horns croak, reminding us that our quiet chambers stand upon the verge of our greatest and busiest river.

Yet it is a place where people come and go frequently, as in all the London suburbs. The novelty has faded and the pleasure staled, or perhaps a measure of the lost health has been won back; so the tent is struck once more, to be pitched somewhere on the inner side of the great kitchen-garden. Next year it may be so with us, for our admirable and fatal capacity of adapting ourselves to our surroundings, which can find compensations even in a Purgatory, may also reduce a Paradise to the plane of the matter-of-course. Then we too will return to the radius of the electric train and the suburban directory, a little surprised, perhaps, that we ever went so far away.

But in the meantime all is fresh and new, and there are treasures of worth in the salt breeze and the blue horizon. So it is with a sigh of mingled relief and gratitude that we seek our train among the shadows of Fenchurch Street, and await the moment when the last door is slammed and the shrill whistle sounds. A London porter shouts for the last time his version of our destination in uncouth syllables which no stranger may hope to understand. But we give it the free translation of a happy fancy:

'This is the train for the Suburban Sea!'

WAX-GATHERING IN MALAYA.

By D. W. O. Fagan.

IT was 'way back' in the middle seventies that, disguised as a native silk-merchant, I was in hiding at the Court of the Rajah of Langkat. The Acheenese were in full rebellion against the Dutch authorities. My offence was political, having to do with contraband of war. Suffice it to say that, for various reasons, I was anxious to keep out of the clutches of Mynheer Van Dunk. They put a price on my head that would have made any Malay of the common people as rich as a sultan; but the natives, true to their salt, would as soon have forgone the joys of Paradise as have betrayed the 'Tuan Ferinchi' to the common enemy.

My enforced seclusion lasted twelve months; but, from the Rajah downwards, every one was anxious to make my sojourn as enjoyable as possible. Hamil the 'Pangerang' (or Rajah's heir) and myself were great chums. Many exciting expeditions we had together after big game in the wild interior.

It was one night in late autumn that he and I, in search of fresh experience, accompanied the hunters on a wax-gathering expedition to the forest. And so to my subject.

The wild bees of Malaya are, I take it, a genus apart, larger, fiercer, than those of the domesticated species known to Europe, and differently marked. They hive in the thick jungle of the interior in immense numbers; and with this peculiarity, that in all the wide option of the forest they invariably make their home in one species of tree alone.

The 'rajah-tree' of Sumatra, common to all the islands of Malaya, with a trunk-diameter of six or eight feet, towers amid tropic undergrowth to a height of a hundred and fifty feet or more. In appearance it resembles nothing so much as a huge umbrella wide open, poised upright on its handle. No knot or protuberance breaks the smooth, vertical column of the massive trunk till, seventy or eighty feet up from the ground, the crown of branches radiates horizontally from the bole as spokes from the hub of a wheel, or, to carry out my first simile, the ribs of an open umbrella. On and above the branches is superimposed a dome-like mass of dense foliage, flattened and compressed, the outside rim of the mushroom-like top, regular and orderly as though trimmed with giant shears, forming a circle of perhaps two hundred feet diameter.

In the shade of this vast umbrella the bees live in colonies, shielded alike from the fierce rays of

the sun and the flail of the tropic rains that now and again sweep over the forests. Their hives, fashioned of wax, hang in thick clusters from the under-surface of the great limbs. Semicircular in shape, with a circumference of three feet, these hives, of which there may be quite two hundred in one tree, give one the idea of so many gigantic, yellow pudding-basins sticking by their rims beneath the branches.

From time immemorial a sort of semi-religious sanctity has been thrown around all 'rajah-trees.' They are held sacred to the rulers and potentates of those provinces where they grow, who also claim full right of value of all wax produced by the bees. To cut or injure a 'rajah' is regarded as an offence meriting the shortest possible shrift; and if, indeed, any unfortunate Malay of the common people were to cut one down or set it afire accidentally (he would never do it on purpose), I have never been able to find out what sort of frightful thing would happen to him.

Yearly, as the season approaches, armies of bee-trackers are sent out, whose duty it is to mark the young swarms and follow them to their homes, and as soon as it is observed that bees have commenced to frequent a 'rajah-tree' both it and the spot on which it stands are 'tabooed' to prevent any molestation of the insects by a too near approach. As no tree is considered worth robbing unless it contains at least a hundred and fifty hives, the 'taboo' may hang around the tree and its environs for quite a long time.

Where the bee-tree grows far back in the wilds, many miles beyond the settlement-line, the hive-robbing becomes a work of some magnitude, and the expedition may last three weeks. Fortunately in our case the scene of operations was only about four miles, within the fringe of the forest, beyond the village outskirts.

Like burglars setting out to crack a crib, we waited till the shades of night had well fallen ere starting. Like many another nefarious undertaking, hive-robbing is best done in the dark. Precipitation is to be avoided; and, anyhow, as my friend Hamil sensibly put it, 'There 's no use starting in to rob bees till they 're sound asleep.'

On arrival at the village we found the hunters, ten active and athletic Malays, headed by the 'Pungloo' (headman of the village), waiting our presence and the coming of the 'Mullah.' For, though the presence of the Pungloo at a bee-hunt is not indispensable, no company of pious Mohammedans could be got together for a night expedition unless under the leadership of the 'Crang-Kramat' (literally, 'Mystic Man'), as the village priest is called.

Presently, headed by the Mullah, a fine-looking Arab, with grave, ascetic face, we crossed the cleared land, where the moonlight fell in a silver flood, and plunged into the gloom of the forest. Our Pungloo, being fat and heavy, left us at the fringe; and the Mullah, lighting a torch, as with the guide he marched at our head, struck in through the undergrowth. The Pangerang and I followed close in single file, and after us the hunters, bearing various impedimenta on their heads—coils of light, strong rope, baskets, bundles of torches, and bales of split bamboo pegs pointed and fire-hardened to an iron-like rigidity.

Elephant-tracks and rhinoceros-runs pierced the jungle here and there; and where possible, and they led in a right direction, these were followed as offering easy going. Elsewhere, so dense was the maze of scrub and lianas that often the hunters' *krisses* were requisitioned to cut a way for us.

It was a weird and eerie march. No moon-ray pierced the impenetrable roof of foliage. The single torch carried by the Mullah cast a feeble glimmer around the head of the column. The light, striking on tangled ropes of lianas and twisted limbs of trees, threw strange shadows across the path. The dew dropping from the leaves fell on us chill as ice. Great tree-boles came at us out of the darkness, paused in the circle of light as we passed, and were gone, stepping in and out of the shadow like ghosts. The forest was full of the thousand night-noises of the tropics. From out the gloom came the crashing rush of a startled rhinoceros as he made off through the undergrowth, the low growl of prowling tiger, or sibilant hiss of a python overhead.

Hamil and I went finger on trigger, though in the thick gloom a bullet might well prove equally dangerous to friend as foe. With nerves strung to highest tension we marched, the long line of bearers in single file tailing out behind.

'The tree is near,' whispered the guide. 'Through this thicket, and yet a little way.'

Into thicker shadow and denser undergrowth than any we had passed. Suddenly a hurtling rush of some great body through the air, felt rather than seen, a stifled scream, and the frightened bearers bunched around us in a huddled group. A moan or two from aloft, a rustling of leaves overhead, and that was all. Hamil, guided only by the noise of swaying foliage, fired into the gloom above. We heard the *zip, zip* of the ball among the twigs, but whether the shot told on snake or victim who shall say?

'Who is it?' was called.

'It is Ali,' came the answer. 'To-morrow his wife will weep for the father of her child.'

All thought of rescue was hopeless. The man, crushed to a pulp in those fearful folds, had vanished into the night, and there an end.

'Allah Akbar!' called the Mullah. 'God is good. It is the will of God. Take up your burdens, my children, and proceed.'

If the men felt sorry for their comrade's fate, they did not show it in their bearing. The march was resumed; and though, for my part, I felt that much of future enthusiasm was damped by the shock of Ali's terrible death, the hunters were soon whispering away again as gaily as ever.

Human life in Malaya is cheap, and in these

nocturnal expeditions tragedies are frequent. Who shall blame the poor fellows for want of feeling? It may be the turn of any one of them to-morrow. What then? It is *kismet*. The Mullah has blessed each man singly ere setting out. The victim's fate was written on his forehead, and he has gone straight to the joys of Paradise.

The rest of our march was unattended by disaster, and we arrived safely in the vicinity of the tree. Here the tangle of undergrowth fell back, leaving a sort of natural clearing. Silver rays of moonlight flecked the shadows with a sort of half-light. In the centre of the open space the great trunk, massive and column-like, held aloft its huge mushroom top of leaves and branches. One could just make out in the gloom overhead clustering bunches of hives depending in groups from the under-surface of the giant limbs.

At the tree-foot a halt was called, and the Mullah, lifting hands to heaven, invoked the protection of God for his men and a blessing on the undertaking. The group of hunters and ourselves stood silent, with bowed heads, as the priest, chanting the universal prayer of Mohammedans, marched seven times round the tree-trunk. One could almost fancy one's self present at a midnight service in some vast mosque of Nature's fashioning, so weirdly impressive was the scene. The red light of the single torch borne aloft by the Mullah as he moved cast momentary flashes of crimson colour now on tree-bole, now on dusky forms of waiting hunters. Elsewhere deep twilight gloom. The intoned notes of the 'Bismillah-Heigh-Rath-Ma' echoed and re-echoed down the dim aisles of the forest, ringing out solemn and resonant on the heavy air of the thick tropic night. As the last notes died away, the prayer was answered from afar by the shattering roar of a tiger and the nearer trumpeting of an elephant.

With the cessation of prayer, work was commenced in earnest. The reason of the hundreds of pegs became apparent. Two feet from the base of the trunk a pair of pegs, standing abreast and about a foot apart, driven well into the soft bark, formed the first rung of a ladder. Two more were quickly added at a height of eighteen inches above. The man, using a wooden mallet, mounted his ladder as it grew, standing on the pegs, and clinging by one hand, as he drove a second pair above his head. The men relieved each other in turns, and the peg-driving went on quickly, till from base to crown the smooth trunk was marked perpendicularly by an easily negotiable ladder of pegs.

From a waiting group of men who had hitherto only watched the proceedings, the first of the hive-gatherers sprang forward, mounted the ladder, and, shinning out far on a great lateral branch, hauled up with a rope he had carried with him a large semicircular basket, which he slung to the limb beneath the first hive selected.

The next step was to light a torch which in burning gave off a thick cloud of white smoke. The bees had not yet waked from their slumbers; but when the man, holding his torch close to the orifice of the hive, rapped smartly on the waxen wall with a scimitar-shaped wooden knife, we could hear the angry *buzz-z-z* of the insects from where we stood a hundred feet below, as they emerged in an outrushing swarm. A rain of dead bees, meeting the fiery death of the torch, fell on our upturned faces. The great majority of those that escaped, stupefied by the narcotic fumes of the *damma*-soaked torch, were practically harmless. The man's body, too, had been carefully rubbed with a pungent essence, distilled from the leaves of the wild pepper-tree, peculiarly repellent to all the bee-tribe, and only about a dozen bees succeeded in getting 'home' on him.

Working the point of his knife between the rim of the hive and the wood, the hunter dropped the hive into the suspended basket, and it was quickly lowered to the waiting group below. Far overhead was a noise of a myriad enraged insects, shrill and fierce.

Luckily, the bees, dazed by the rapid fall of their home, made no attempt to follow the hive to the ground, contenting themselves with frantic buzzing in the tree-top—a fact for which I, at least, was truly thankful.

The hives are taken singly, one man only being allowed in the tree at a time; and though the bees in neighbouring hives cannot fail to be aroused by the noise of their neighbours' spoliation, there seems fortunately a sort of selfish individualism and want of solidarity on the part of the various bee-communities that precludes the taking of united action to repel the invader. Hence it is only from the bees of the hive actually in process of demolition that the hive-gatherer has anything to fear.

Fifty hives were taken on the first night, the men working in relays; and as with dawn the million bees from every hive, fully awakened, would be ready and eager for business, and as already signs of the coming day were apparent, it was decided to leave the remainder to be brought in on a future occasion.

The men below had not been idle. As each hive reached the ground the honey was quickly pressed from the wax, which was at once packed in bales for transport on the bearers' heads. No attempt was made to save the honey, nor did I see any eaten; though, even while hard at work, the men—scooping them into their mouths in handfuls—gorged great quantities of young bees, of which they are inordinately fond.

Malays are splendid climbers, and, considering the hazardous nature of the work, accidents in the actual hive-gathering are remarkably few; though from a careless use of the torch or an insufficient anointment of oil, cases sometimes occur of a man, paralysed by many stings, meeting his death by a fall from the tree.

One danger, happily rare, is more dreaded than aught else. The big brown bear of Malaya is

himself a bee-fancier, with a fine taste for new honey. It sometimes happens that, all unknown to each other, bear and hunters have fixed their attention on an identical tree, and the unconscious hive-taker, mounting his ladder of pegs seventy or eighty feet above mother-earth, finds himself confronted by an enraged Bruin, who, having his enemy at a disadvantage, uses his long, scythe-shaped claws so effectually that the unfortunate man's interest in bee-hunting is closed for ever.

The weight of wax in an average hive is eight or ten pounds, and from a good tree as much as a thousand pounds of wax is frequently obtained.

In our case, the fifty hives secured on the first night yielded considerably over four hundred pounds, which, on our return to the village in the early morning, was taken to the palace, weighed, and valued; the Rajah finally distributing among his faithful subjects a sum equal to about one quarter the value of the whole.

The bee-hunting industry of Malaya gives annual employment to some thousands; and though little heard of outside those countries where it flourishes, and its market quotations find no place in the money-columns of the newspapers, it is, notwithstanding, a business of no mean importance in the Far East, and it is to the profits arising from the industry that the native Rajahs and other potentates look for large part of their revenues. The wax, being of superfine quality, commands a ready sale in the China markets at a price equal to a shilling or eighteenpence per pound.

From earliest historic times wax has formed a staple of Malay trade, and with true Oriental conservatism and contempt of mere expediency, the manner of work and tools used have not altered with the ages, being still probably identical with those employed in the days of Abraham. Many age-old superstitions have, with the centuries, grown around the industry, persisting even to the present day. One in particular, if only from its apparently utter unreasonableness, deserves mention—the strict prohibition against the employment of metal in any shape. Though—especially in the case of the knife used to cut the hives from the branches—the use of steel would be a distinct advantage, the knives, mallets, and other tools, even to the scales and weights used for weighing the wax, are fashioned solely of wood. The origin of the prohibition is shrouded in the mystery of immemorial eld, and no one when questioned, not even the Mullah, could give a reason for it.

A CASE OF CAPTURE.

By Arthur H. Henderson.

PART I.

'YOU have heard the evidence of the captain?'

'Yes, sir.'

'And of the chief engineer?'

'Yes.'

'No doubt you have talked over all the details of the loss among yourselves a good deal lately?'

'Well, we have a bit,' the witness agreed rather reluctantly.

'Especially when you heard there was to be an inquiry, I suppose,' the young barrister commented with significance. 'And you are all of the same opinion?'

'Yes, sir.' The answer was emphatic.

'You adhere to the statement, then, that there had been constant trouble with the steam steering-gear all the voyage?'

The witness nodded.

'Speak, man! Nodding won't do,' said Neville Orr sharply.

The burly bo's'un glowered. 'It was about the unhandiest thing in the ship,' he grunted sulkily. 'Times it broke down; times it jammed.'

'Yet, knowing this, you went into Las Palmas without preparing the hand-gear for use in case of emergency?'

''Twas for the cap'en to order it,' said the witness with surliness.

'And he gave you no instructions about this?'

'Never a one.'

'Ah!' Again a peculiar significance rang in the suave tones. 'One more thing, please: had you any insurances on the *Redan* yourself?'

'Not me.' The bo's'un seemed relieved at being able to give the answer. ''Ain't no notion 'ow to do sich things.'

'Perhaps you wish you had now,' came the swift rejoinder.

'No, I don't,' said the witness angrily, as his examination ended and he left the box.

The dull December afternoon was ending. The fog, which had scarcely lifted all day, was settling down with the oncoming night in a thick pall of darkness. There was clinging fog in the well of the court where the shorthand-writers bent over their notes; there was vaporous fog drifting from the passages in through the swinging doors; there was sombre fog hazing the lights into misty dimness above the seats of the magistrate and his two nautical advisers. Witnesses coughed in the suffocating atmosphere, and the public seats were long since deserted. Blacker and blacker the evil gloom deepened, so that elderly gentlemen fidgeted restlessly and wondered how they were going to get home.

'We will adjourn till to-morrow morning at

eleven,' the magistrate decreed. 'You can continue any needful cross-examination then, Mr Orr.'

The barrister bowed, and an audible sigh of relief arose at the announcement.

The occasion was the official investigation into the circumstances of the wreck of the British steamer *Redan* of the Battle Line, which struck the rocks at the entrance to Las Palmas on a voyage from Sydney to London with a valuable cargo of wool.

As Neville Orr, who appeared for the Board of Trade, collected his papers he reflected that his case so far had been very satisfactory. From the mass of prevarication he was gradually extracting details. Unwilling witnesses wriggled under his fire of questions. Particulars of overloading, undermanning, and probably, too, of large over-insurances were coming to light. To which was to be added the simple fact, not yet satisfactorily explained, how the *Redan* came to be lost in broad daylight and fine weather when making a well-known harbour. The barrister smiled grimly as he thought how he would sift out the evidence, and marshal in emphatic accumulation all his points to prove the wilful destruction of the steamer.

But the owner and the captain were clever, and they had come into court with a brazen confidence that had roused every fighting instinct in the opposing counsel. From the solicitors to the Board of Trade he knew how vessel after vessel of the Battle Line had been lost in recent years, and how public suspicion of the management had grown. At Lloyd's, too, the most scathing statements were being freely made.

As Orr's examination of the witnesses had proceeded, the managing director and real owner of the line had begun to show signs of uneasiness. Old Harold Graham regarded the young barrister as an enemy intent on convicting him of crime. Never had any one dared to utter such innuendos or draw such inferences in the astute old autocrat's presence before. He was furious with rage, and longed to crush the impudent young upstart who had crossed his path.

Already the investigation had lasted two days. The morrow would see the arguments of counsel and the decision of the Court. Large sums of money as well as men's reputations were involved, and Orr meant to make a speech which would decide the case, if possible, for his side. There should be no evasion of the issues; the ship-owners should be shown up; a summary check should be dealt to this casting-away of steamers. He was assured, too, that much depended on his own efforts; the powerful solicitors to the Board of Trade had openly told him so with friendliest confidence. They were relying on him to combat successfully the specious arguments of the great K.C. retained on Mr Graham's behalf.

Phew, how dense the fog was! The choking, pasty darkness drove down the mud-encrusted streets, and the loom of the flaring gas-lights in the shop windows flickered in faint, yellow smudges over the greasy pavement. The rays of the electric street-lamps were lost in the gloom, and their iron columns simply pointed to long cones of shadow in the darkness overhead. Foot-passengers and vehicles were mere black shapes that passed in the blur.

Orr was unmarried, and a sudden whimsical wish possessed him that a pretty wife and snug home of his own were awaiting him on this dismal day. He rarely admitted to himself that his bachelor chambers were lonely, yet he sometimes wondered how it would feel to have a bright-hearted girl eager for his return. In the thirty-three years of his life Orr had been amused by many women, had liked a few, and had loved none. His work had been very exacting, but at last he had started on a clear career of success at the lucrative Admiralty Bar.

A voice spoke at his elbow out of the smother of the emptying street. 'Ay, that's 'im right enuff, Bill.'

Before Orr could attach any import to the words a man stopped him, touching his cap respectfully. 'Want a taxicab, sir? 'Ere's one as is willin' to go through the fog.'

Orr hesitated; he was tired. The outline of a motor slid alongside the kerb. It was a large car for a mere taxicab. Then, before he realised what was happening, Orr was seized from behind and his elbows pinned to his sides by a mighty grip. For a second he was aware of being propelled forcibly into the waiting motor-car. Then the door snapped behind him, and he remembered nothing more.

When he recovered consciousness he was still in the motor-car, and his head ached with persistence. A grimy man who smelt alcoholic watched him warningly.

'Salvage from the *Redan*,' his warder informed Orr genially, indicating the handcuffs with which the latter's wrists were secured. 'But I'll take 'em off yer soon as we're aboard. 'Tis jest necessary precaution-like, yer know.'

Orr differed, and said so. His tongue was free, and he used it with lurid eloquence.

'Easy there,' his companion chuckled composedly. 'Stow that jawin' or I'll gag yer. I guess it won't 'urt yer ter cool yer claws in country retirement, so ter speak, till that there trial is over, an' yer can't do no more mischief. Too glib, that's wot's wrong wi' yer.'

Orr chafed in maddening impotence. He had never felt so helpless in his life.

'I suppose you are aware what a serious offence you are committing?' he demanded belligerently.

'I'm paid ter risk that,' the man told him coolly. 'S' long as I don't let yer go till I'm ordered I'm easy on that 'ead. An' I don't mean yer ter escape, mister, no'ow. So yer 'ad best take it quiet an 'appy-like, an' yer won't come ter no 'arm, I reckons. See?'

Orr sat silent, cudgelling his brains. For the moment resistance was absolutely futile. It was evident that he had been kidnapped temporarily in order to prevent his appearance in court to-morrow.

The other side feared his attack on them immensely, and had taken this extraordinary step to avert it. This was complimentary to his abilities, but he writhed with silent fury at the assault.

'Pompous old crow that there beak!' broke in his companion in reflective disgust. ''E's in a 'urry ter finish the case, too. Won't wait 'cos yer don't turn up —not 'e.'

So Mr Harold Graham & Company were sure of the investigation being completed in his absence. The barrister understood.

'Where are you taking me?' asked Orr shortly, masking his wrath as best he could under an assumption of indifference.

But his guardian dissuaded inquiries. 'Yer'll see in good time,' he consoled. 'Nasty thick night it is 'ere, too! Lor'! but I was fair scared in this craft a-comin' through them narrer streets Mile End way. A smash would 'ave let yer out.'

So there are occasions when even a motor accident might be desirable, Orr reflected grimly. And they were going east, were they? He wondered how long he had been unconscious.

The absence of all hills showed that the motor was travelling a level country—probably Essex flats. He stared out into the night. Were they near the sea? A thick cloak of mist white as wool shrouded the land, and the car was moving warily. Everything was blotted out in waves of cold fog. Orr fancied he could smell water.

Presently the motor came to an unexpected stop. Orr's companion let down the window, and a whiff of cold air blew inwards, laden with moisture. Orr could just discern a grassy bank, a stretch of mud-coloured estuary, and the dim shape of a vessel in the curling mist.

The chauffeur flourished a lantern and uplifted a stentorian voice summoning one Albert. A frowsy figure appeared at the vessel's side in response. Albert was bidden with shouts to bestir himself, and he thereupon indicated a gangway. No one seemed to fear that they would alarm the neighbourhood by noise. The solitude was profound.

There were no deck-lamps on the ship, but from a skylight aft a sickly radiance penetrated the vague obscurity of the fog. Orr's guardian bade him brusquely proceed on board.

'Yer 'ad best go peaceful-like,' his captor's voice rang with sinister meaning; and the chauffeur closed in menacingly beside him. Escape was clearly impossible, and Orr obeyed. He was fairly trapped.

He was guided to a tiny chartroom under a diminutive bridge, and an electric light was switched on. It was a trim little place, and Orr surmised that he was on some yacht which was laid up in an Essex backwater for the winter. He sat down wearily on a locker, and his guardian removed the handcuffs.

'Yer ain't bin no spes'ul trouble so far.' His informant wagged his head approvingly. 'She 'll bring yer some grub 'erself, she sez, an' then yer can doss down 'ere for the night; an' don't forgit yer prayers in yer disappointment. Yer can't git out, 'cos me an' my mates an' the dawg—wot bites 'orrible—will see ter that. Dont yer cross th' animal; 'e's a fair terror in a scrap, 'e is.'

With which parting advice the door was slammed and locked. As a further hint a dog was stirred into a harrowing howl outside, and Orr was left alone.

He jumped to his feet and opened the porthole. All outside was dark. The swish of the water licking sloppily against the yacht's side had a very lonesome sound. He shivered at the raw night air and closed the porthole hastily.

And who was 'she'?

Gradually he began to notice arrangements apparently made for his reception, showing how his capture had been elaborately planned. A small oil-stove burned comfortingly in a corner, and a pile of blankets had been ostentatiously placed on the locker. A box of cigarettes and some matches were laid out on the chartroom table, and—by Jove!—a cut-glass jar of whisky and a siphon of soda shone with invitation. Orr helped himself thirstily—he needed it. Then he even laughed when he found a magazine put out for him—it was a ladies' journal.

He suddenly decided that he was very hungry.

A voice called to him from the other side of the locked chartroom door. 'If I bring you in some supper will you promise not to rush past me?' it asked cautiously.

'Certainly, till supper is over,' Orr shouted back, only too pleased. He was by no means desirous of escaping from something to eat.

The key turned promptly, and a bolt was shot back. Next moment the voice's owner appeared with a large tray most temptingly filled. It was a girl.

'I seem to have taken you by surprise,' said the bringer of the tray demurely.

She had—distinctly. Orr had received yet another shock on that eventful evening.

'I've come to wait on you, sir,' she told him.

She whisked some cigarette-ash off the chartroom table and proceeded to lay the cloth with a servant's trained dexterity. Orr watched her, amazed. Where on earth had he seen her face before?

She was bewilderingly pretty, large-eyed, with a wonderfully clear, white skin. She was wrapped in a long, rather shabby cloak, which, however, could not conceal the alluring outlines of her dainty figure. Orr noticed, above all else in a woman's dress, the shoes she wore; this girl's were very small and smart. She pushed back the hood from her head in the heat of the chartroom, and this revealed a bewitching mass of the fairest wavy hair, two provoking pink ears, and a dimpled chin. Her resemblance to some one he had once met was baffling. But Orr searched his memory in vain.

'It is all ready, sir,' she announced. 'My—my mistress hopes you will find your supper nice.'

'Who is she?' asked Orr, turning with abruptness.

The girl meditated a moment. Then she raised

her eyes to his with a little glint of defiance in them. 'Her name is Graham—Helen Graham,' she said.

'Oh, a daughter of the ship-owner,' commented Orr coldly. 'Now I understand.'

'Not a daughter, an only niece,' he was told in quick correction.

'Well, I won't mention my opinion of her conduct,' Orr declared darkly. 'Later on she is likely to hear what people think—in another place.'

The girl wrinkled her brows and looked rather perturbed. Orr sincerely hoped she was.

'If you 'll let me explain'—— she proposed.

'Explanation is impossible,' Orr pronounced with asperity.

A pair of aggravating blue eyes sought his unflinchingly.

'Perhaps your temper will be better when you have had something to eat,' she hoped indulgently.

Orr grunted, with his mouth full.

'My mistress is much happier now that she has got you safe like this. It was partly her own idea,' she confided.

This too was unmollifying. An unsuitable rejoinder concerning lunatics rose to Orr's lips. He checked the impulse.

She watched him keenly, her small head aslant. Then, 'Have we met before?' she asked abruptly.

'We shall probably meet again—in a police court,' Orr parried. So she was puzzled too at the encounter, he noted.

'I expect everything will come all right,' she considered with somewhat affected cheerfulness.

Orr devoted himself to his meal. At the same time he found himself wondering if the mistress was half as pretty as the maid. An unaccountable train of thought led him to glance unexpectedly at his waitress's left hand. It was very fine and white; also, it was destitute of a ring on a certain finger.

The said hand caught itself away into a pocket of its owner's cloak. Her chin rose high.

'Anyhow, this—this detention—is all your own fault. The things you said in court about Mr Graham were simply disgraceful,' she averred with spirit.

'You shouldn't be misled by the papers,' said Orr bluntly. 'You only get a lot of silly ideas into your head. You are not in a position to judge.' He spoke in his most superior, legal fashion.

'Oh, I suppose you think that I have no brains!' cried the girl disdainfully, indignation mantling red on her oval cheeks.

Orr, pointedly, didn't say.

'Just like a man,' she proclaimed, and her hearer was astonished at the bitterness in her voice. 'You are very clever—oh, I know your reputation!—and you use your cleverness to injure Mr Graham. Why, in your heart you know that the *Redan* was lost by the jamming of her steering-gear!' she cried.

Orr informed her curtly that he was aware of nothing of the sort.

'And it is abominable of you to contradict so flatly,' she opined.

Orr increased his iniquities by murmuring that he didn't care.

'That 's simply impertinent,' she pursued irately. 'I have a great mind to go straight away at once.'

Quaintly enough Orr felt that he *did* care at this sudden prospect of solitude. However, the girl, on her part, seemed in no hurry to carry out her threat.

It was a curious scene in a little chartroom. The girl, erect and flushed with annoyance, made a perfect picture of dainty scorn. Her breast heaved stormily; one little foot beat an impatient tattoo on the floor. There was no hint of the nervousness of an inferior in her manner. She scanned the man's clean-cut, handsome face with deep resentment. A strange suspicion crept over the barrister's mind.

(To be continued.)

THE EXECUTIONER OF KING CHARLES THE FIRST.

By J. B. Williams.

HEN King Charles stepped upon the scaffold at Whitehall Gate—the very entrance of his own palace—at a little before two o'clock in the afternoon of Tuesday, January 30, 1649, two executioners were awaiting His Majesty, for it had been thought that the King would resist or refuse to bow his head. And so, not only had cords, staples, and pulleys been provided with which to force him down to the block if necessary, but also the headsman had been given an assistant for the purpose.

According to the grisly custom of the times, each of these men wore a mask (visors they were called), was attired in the executioner's 'frock' (or close-fitting woollen tunic), and had on 'frieze trunk-breeches.' One of the two—and this was the man who held up the King's head and called out, 'This is the head of a traitor'—wore a black wig and false beard, and had a black hat 'cocked up' on his head. The other—the man who struck the fatal blow—had on a gray beard and a gray periwig. It was necessary that they should be effectually disguised in order to shield them from popular vengeance; and, though the day was frosty, a bright sun was shining.

One horror-struck witness of what followed was Philip Henry, the father of a worthy Nonconformist divine, the biblical commentator Matthew Henry; for his own father was an old page of the King, and had apartments in Whitehall. He says that he saw it all 'with a sad heart,' and that at the instant

when the axe fell 'there was such a dismal universal groan among the thousands of people that were within sight of it' as he never heard before and prayed he might never hear again; and he adds that immediately this was done one troop of horse commenced to march up King's Street (now called Whitehall) towards Charing Cross, and another from Charing Cross to Whitehall, 'purposely to disperse and scatter the people, and to divert the dismal thoughts they could not but be filled with by driving every one to shift for his own safety.'

Earlier in the day a troop of horse had been sent to fetch Richard Brandon, the hangman, from his house in Whitechapel; and he had been brought to Whitehall alone and without his assistant. But at the trial of the regicides on October 15, 1660, a waterman called Abraham Smith gave evidence, and said that directly afterwards, 'as soon as that fatal blow was given,' as he was walking about Whitehall, 'down came a file of musketeers.

'The first word they said was this, "Where be the bargemen?"

'Answer was made, "Here are none."

'Away they directed the hangman into my boat. Going into the boat, he gave one of the soldiers a half-crown.

'Saith the soldiers, "Away with him! Begone quickly."

'But I, fearing this hangman had cut off the King's head, trembled that he should come into my boat, but dared not to examine him on shore for fear of the soldiers. So out I launched, and having got a little way in the water, said I, "Who the devil have I got in my boat?"

'Says the fellow, says he, "Why?"

'I directed my speech to him, saying, "Are you the hangman that cut off the King's head?"

'"No, as I am a sinner to God," saith he, "not I." He shook every joint of him.

'I knew not what to do. I rowed away a little farther and fell to a keen examination of him. When I had got him a little farther, "Tell me true," said I, "are you the hangman that hath cut off the King's head? I cannot carry you," said I.

'"No," saith he. "I was fetched with a troop of horse, and I was kept a close prisoner at Whitehall, and truly I did not do it. I was kept a close prisoner all the while; but they had my instruments."

'I said I would sink the boat if he would not tell me true; but he denied it with several protestations.'

It is clearly in consequence of protestations like this that Richard Brandon lived unmolested at his house in Rosemary Lane, Whitechapel, until his death on June 20, 1649. It does not matter that he afterwards is said to have confessed that he was the man, for plenty of others made the same boast, and we can set aside the accounts (all of them Royalist) of his delirious deathbed ravings. It would have been strange, indeed, if a public executioner had died peaceably in those days. The points to note are, firstly, that many other people were then (as well as at the Restoration) accused of having acted in his place; and, secondly, that he was alone and without his assistant.

Of the ten licensed 'newsbooks' which appeared during the week after the hangman's death, two only, the *Kingdomes Weekly Intelligencer* and the *Moderate Intelligencer*, contained accounts of a death-bed confession that he had actually beheaded the King; and both these periodicals were strongly Presbyterian and secretly Royalist. Probably the licenser purposely allowed the story to be inserted in them in order further to conceal the real person.

It is to the principal Independent newsbook, *Perfect Occurrences of Every Daies Journall*, and its writer, Henry Walker, that attention should be given. Walker says in his newsbook for 30th March-6th April 1649: 'Some have lately laid an imputation on Captain Edward Fradsham that he was the King's headsman. But the contrary is attested by those in whose company he was. And indeed the report is ridiculous.' Henry Walker lived in King's Street, was hand in glove with Hugh Peters, Cromwell's chaplain, and *knew* that Brandon was not the man.

It is a matter for great surprise that so important a person as Henry Walker should have been forgotten. No one—not even Cromwell himself—was better known and more hated than this red-haired newsmonger, the man who threw the pamphlet, '*To your tents, O Israel!*' into the King's coach in 1642. He had an amazing career. First an ironmonger, then at Queen's College, Cambridge, for a few months, then ordained deacon by the puritanically minded Bishop Williams of Lincoln, then expelled by his bishop from the ranks of the clergy, then a bookseller and vendor of seditious and puritanical pamphlets, and, lastly, placed in the pillory in Cheapside in 1642 for the insult to his sovereign, and only saved from the hangman by his King's special intercession with the Parliament. Walker retired from the public view in 1643, and joined the army, only reappearing in 1647, when the Independents came to the front, as the writer of *Perfect Occurrences*. Yet very nearly a thousand books and pamphlets written by him are in existence in the Thomason Collection (most, of course, being newsbooks), some of which are unsigned and some signed with the anagrams or pseudonyms of 'Luke Harruney,' 'Valkrue,' 'Neh. Lawkerry,' 'Voluntas Ambulatoria,' &c., for he was one of the most prolific writers of his day. What is quite certain is that Walker, after expressing the most unbounded gratitude and devotion to King Charles for saving his life in his *Modest Vindication of Henry Walker*, was in the forefront with the men who deliberately designed the King's death.

Those who know Martin Parker the ballad-writer's famous old song, 'When the King enjoys

his own again,' must have noticed the verse in it:

> Does Walker no predictions lack,
> In Hammond's *Bloody Almanack*
> Foretelling things that would ensue,
> That all proves right if lies be true?
> But why should not he the pillory foresee,
> Wherein poor Toby once was ta'en;
> And also foreknow to the gallows he must go
> When the King enjoys his own again?

This was written at the time of Walker's first literary forgery, at the end of the year 1647, when Colonel Hammond was the King's custodian in the Isle of Wight, and when Parker was writing a periodical called *Mercurius Melancholicus*. In the number of this 'Mercury' which was published for December 18–25, 1647, Parker exclaims of Walker: 'He hath counterfeited Mr Booker's name [John Booker, the astrologer] under the false title of a *Bloody Almanack*. . . . He dare not denie but it is feloniously stolne out of the treasures of old Brightman and other reverend authors. . . . Well, Harry, when all is done I see thou wilt be a knave, doe what I can.' The Rev. Thomas Brightman, who died in the year 1607, was one of the first exponents of the prophecies of the prophet Daniel and of the Apocalypse in what I may be permitted to call a rabid Protestant sense, and the contents of Walker's forged almanac are very plainly stolen from his works, as Parker said. The *Bloody Almanack* for the year 1648 will be found duly catalogued to John Booker, who had nothing to do with it, and the feature in it which so excited Martin Parker's wrath was the illustration on its title-page depicting a prisoner on his knees at the bar of the House of Commons, with the three inscriptions, 'His Majestie's Return to the Parliament,' 'The Execution of Justice,' and 'The Joy and Peace of the People.' The King had escaped from Hampton Court in order to avoid assassination at the time when this appeared; and thus, even at that early date, Henry Walker knew what was going to happen a year later on.

On February 3, 1648, Walker published his piracy of the Jesuit Father Robert Parsons' book; a full account of which, and of his real share in publishing it, will be found in Anthony à Wood's Life of Parsons in the *Athenæ Oxonienses*. This book was the basis of all Bradshaw's arguments at the attempted 'trial' of the King. Father Parsons' book was entitled *A Conference about the Next Succession of the Crown of England*, and was written to advocate the exclusion of James the First from the throne of England. The object of Walker's forged version of this may be gathered from the title which he gave it: *Several Speeches Made at a Conference concerning the Power of Parliaments to Proceed against their King for Misgovernment.*

This was not all, for on February 25 Walker remarked in his newsbook (*à propos* of the Bill of Attainder against Strafford and a speech by Pym): 'But there is a book translated into English called *Vindiciæ contra Tyrannos* which fully clears all such disputes.' *Vindiciæ contra Tyrannos* appeared on March 1, 1648, and (though it may be doubted whether he could construe a Latin sentence properly) Walker was at any rate responsible for the book, and it was issued by his publisher, Ibbitson.

Vindiciæ contra Tyrannos was the work of the French Protestant Hubert Languet, and was first published in 1579. It is largely based on Machiavelli, and is said by Lenglet-Dufresnoy to be one of the most dangerous books of the kind ever written. I have elsewhere described the rest of Walker's extraordinary career, his sermon before Cromwell on the eve of the latter's starting for his campaign in Scotland, the burning of that sermon by the hangman owing to its scandalous dedication, the book which he dedicated to Cromwell, and the benefices which he successively obtained under his rule, all which is exceedingly discreditable to Cromwell; and now pass on to the evidence offered at the trial of the regicides on October 15, 1660.

At the Restoration no one for a moment suggested that Brandon was the executioner of the King. The House of Commons at once took the matter up. One Matthew, who had boasted that he had beheaded the King, was ordered to be arrested on 14th May 1660. He was found to be innocent and discharged.

Then William Lilly the astrologer was examined by a committee appointed on 2nd June, and tells us in his autobiography that 'Robert Spavin, secretary unto Lt.-Gen. Cromwell,' came with the others 'to dine with me a fortnight after the King's death;' and adds: 'Their principal discourse all dinner-time was only who it was that beheaded the King. One said it was the common hangman, another Hugh Peters, others were nominated, but none concluded. Robert Spavin, as soon as dinner was done, took me to the south window. Saith he, "These are all mistaken, they have not named the man that did the fact; it was Lt.-Col. Joyce [the tailor who abducted the King from Holdenby]. I was in the room when he fitted himself for the work, stood behind him when he did it, when done, went in again unto him. There's no man knows this but my master Commissary Ireton and myself."'

But there was a serious objection to this, and it was that Robert Spavin was not a credible witness. In June 1649 Cromwell dismissed him from his service for forging his hand and seal, and he was sentenced to ride on horseback 'from Whitehall to Westminster, and thence through the City, with an inscription on his back and breast written in capital letters to signifie his crime.' So it is not surprising to find that nothing more was heard about Joyce. Phineas Payne and Christopher Alured, mentioned in the State Papers for 1660 (June 26 and July 9), can also be dismissed. In the preparation of the case against the regicides for their trial in October the real facts came out, and William Hulett was found to have been one of the two men. Hulett was, therefore, tried with the other regicides, and

at these trials a very important witness was called, one Lieutenant-Colonel John Nelson, who had been sent for from Ireland.

Lieutenant-Colonel John Nelson was the 'Captain John Nelson' on whose behalf Cromwell wrote a letter demanding arrears of pay on 10th March 1643, and who had subsequently served under Lord Inchiquin in Ireland. He had thus come into personal contact with Colonels Axtell and Hewson, whose regiments also served in Ireland after the King's death, and was an unimpeachable witness. Axtell had the ordering of the King's 'execution,' and at his trial Nelson testified that 'upon a discourse with the prisoner in Dublin, five or six years since, and asking him who it was that executed the King, saith he, "It was Hulett and Walker." I desired to know their reward. "Truly," said he, "I do not know whether thirty pounds apiece or between them." I said it was a small reward for a work of that nature. "Truly," said he, "that was all."'

Again, at Hulett's trial, Lieutenant-Colonel Nelson testified that Axtell said, '"We pitched upon two stout fellows." "Who were those?" said I. "It was Walker and Hulett; they were both sergeants in Kent when you were there" [that is, just after Walker had been put in the pillory and had joined the army]. "Who gave the blow?" said I. Saith he, "Poor Walker, and Hulett took up the head."'

There were other witnesses, but I think enough has been said. There was only one Walker in the eyes of England at that time, and the fact that his Christian name, Henry, is omitted is additional evidence that Henry Walker, the red-haired newsmonger—'Judas,' as the Royalists had dubbed him long before the King's death—was the actual perpetrator of that black and awful deed.

It remains to be added that on August 3, 1660 (before Lieutenant-Colonel Nelson had arrived from Ireland), Walker published his last book. Its title, *Serious Observations lately made Touching his Majesty King Charles the Second;* the Hebrew anagram on the title-page, with a translation to the effect that 'The King hath prepared a refreshing, he hath crushed it out of the rock by degrees;' 'Published to inform the People per H. Walker, S.S.T.S.;' and its contents, literally fawning on and beslavering the King, and speaking of his Royal father, 'whom treacherous servants slew'—all mark him out as a rogue beyond compare when one considers his share in urging on the King's fate by his writings, and his scurrilous and vile *True Manner of the Crowning of Charles II. King* (by the Scots), 27th February 1650. And if to all this is added, as I think it will now be added, that his was the hand that struck the fatal blow, then Henry Walker becomes one of the vilest wretches known to history, one before whom even Titus Oates must take second place; for the King whom he murdered had actually saved his life.

There are two other suspected persons who should be mentioned. One is Henry Porter, alluded to in a letter from the Marquis of Ormonde to Secretary Bennett as having been in prison for two years in Ireland under suspicion of being 'the actual executioner of Charles the First.' The letter is dated 29th April 1663, and is to be found among the Irish State Papers. Clearly this man was arrested on account of his Christian name, Henry, and the similarity of his surname, Porter, to Walker, owing to the reports which came to Ireland from England.

The other person is William Walker of Darnal, Sheffield, whom local tradition identifies as not only the translator of *Vindiciæ contra Tyrannos* but also the executioner of the King. William Walker was the secretary of General Lambert, and died peacefully at Darnal in 1700. All reports of warrants having been sent down for his arrest must be nonsense, for he was made a freeman of the Sheffield Cutlers' Company in 1681. The books of Queen's College, Cambridge, show that Henry Walker came from Derby, which is not very distant from Sheffield; and, therefore, it may be inferred that the two were related, and that the warrants which came down were for the arrest of Henry and not William Walker. An account of the latter is to be found in Hunter and Gatty's *Hallamshire*, in which the authors, who had not otherwise any knowledge of Henry Walker's career, actually say: 'There can be little doubt that the Walker here spoken of was Henry Walker, of whom John Taylor wrote *The Whole Life and Progress of Henry Walker the Ironmonger*' (published after Walker's appearance in the pillory). But the parish registers of Darnal contradict the supposition that William and Henry were the same man, for not only do they record William Walker's burial in 1700 (there is, or was, a brass to his memory in the parish church), but they also contain an entry of his baptism on 2nd September 1621, as 'Willm. Walker fil. Robti. Walker.' The tradition, therefore, so far as it goes, must be taken as confirming the fact that Henry Walker beheaded his King.

Hulett was reprieved, and was not executed. History has drawn a veil over the last scenes of Henry Walker's life. Where he went and what became of him no one knows.

THE SECRET VOICE.

'The road is hard,' you said; 'the way is long,
Stony, and steep—a path to test the strong,
And you must go alone. Be brave, dear heart!
One kiss—farewell—for here our pathways part.'

Then you were lost to view. With gazing blind,
I turned at last my stony path to find;
Harder and steeper than my soul had dreamed,
And lonelier far than death to me it seemed.

Now, weary, spent, I struggle up the slope,
Yet, through despair, remembrance whispers hope;
'Be brave!' you said, who never spoke in vain,
And courage rises in my heart again.

THE PILLARS OF HERCULES.

By Rev. E. J. HARDY, M.A., Author of *How to be Happy though Married*, *John Chinaman at Home*, &c.

EVERY one knows something about 'Gib,' or 'The Rock,' as military people call Gibraltar; but only those who have studied it are aware how interesting is this Key of the Mediterranean. Gibraltar, the Mons Calpe of the ancients and one of the Pillars of Hercules, was first known to the Phœnicians. Calpe was the European and Abyla the African Pillar of Hercules, the *ne plus ultra* land. Gibraltar was not inhabited until the Moors invaded Spain. It was called Gebal-Tarik, or the Mountain of Tarik, from Tarik, the Moorish leader. Its present name is a corruption of these two words. Another derivation given is Gebal-el-Tar, or the Steep Hill.

The rock was taken and retaken by the Moors and Spanish several times. After a siege of only three days, it surrendered to a British squadron on 24th July 1704. Altogether there have been fourteen sieges of Gibraltar. The last, which was by France and Spain, began in 1779, and continued for four years. The floating batteries that could, it was said, neither be burnt, sunk, nor taken, were either burnt, sunk, or taken.

Many traditions and traces of this last and greatest siege remain. After it was ended the Spanish commander-in-chief visited the fortress, and said to some British artillery officers who were presented to him, 'Gentlemen, I would rather see you here as friends than on your batteries as enemies, where you never spared me.' When he was conducted through one of the galleries he exclaimed, 'These works are worthy of the Romans.' One battery so annoyed the Spanish that they called it Lengua del Diablo, and this name of Devil's Tongue is still given to a place at the end of the Old Mole. The guns on even the highest point of the Rock were frequently dismounted by the enemy's fire during the siege.

In Spain King Charles asked every morning, 'Is it taken?' and to the negative he never failed to reply, 'It will soon be ours.' We all know the legend of the Queen of Spain saying that she would not leave the mountain overlooking Gibraltar until the fortress were taken, and of the Governor allowing the Spanish flag to be hoisted for a few minutes so that she could leave her uncomfortable watch-tower with honour.

During the siege there were some wonderful escapes. A shell blew an old woman out of a window, but she sustained no hurt beyond a few bruises. Another shell, bursting, fractured a soldier's head, broke an arm in two places, one of his legs, and a finger; but he had so good a constitution that in eleven weeks he recovered. Scurvy caused many more deaths than the enemy's fire. Fortunately a ship was taken laden with lemons and oranges. These were given to the sick, and most of them regained health. General Elliott, who was Governor during the siege, when going round one day said to a sentry, 'Do you know me; and if so, why do you not present arms?' 'Because,' was the reply, 'within the last few minutes two of the fingers of my right hand have been shot off, and I am unable to hold my musket.' The Governor said, 'Now, my friend, give me your musket, and I will relieve you; go and have your wounds dressed.'

During the destruction of the Spanish batteries the same general found a captain of the Spanish artillery dreadfully wounded. He ordered him to be removed to a place of safety; but the Spaniard exclaimed, 'No, sir—no; leave me, and let me perish amid the ruins of my post!' In a few minutes he died. It was afterwards found that he had commanded the guard of one of the batteries, and that when his men fled he rushed forward into the attacking column, exclaiming, 'At least one Spaniard shall die honourably.'

The galleries are the great sight of Gibraltar. They are pierced with embrasures blasted out of the rock. They are divided into two ranges, the lower and the higher, the latter containing two magnificent halls, St George's and Cornwallis's. They are of no use for modern guns, but a visit to them is worth paying on account of their history.

 [*All Rights Reserved.*]

On one occasion General Elliott exclaimed, 'I would give a thousand dollars to any one who would tell me how to bring a flanking fire on these works,' pointing to some very troublesome batteries of the enemy. A sergeant by the name of Ince stepped forward and made a suggestion that resulted in the excavation of the famous galleries. Ince became a commissioned officer, and the Duke of Kent gave him a good horse, having observed that he was in the habit of riding a miserable screw. Meeting him one day not on the new horse, the Duke asked why he did not use him. 'I like to ride easily, your Royal Highness,' said Ince. 'Then put the horse in your pocket,' answered the Duke, meaning that he had his permission to sell him. Through the galleries, or, better, by a path fringed with palmettos and asphodel, one can go to El Hacho, or the Signal Station, whence the view of the sea and of the two continents is magnificent.

Great damage was done during the siege to the Moorish castle, which was built in the eighth century, and is the most interesting relic of antiquity in Gibraltar. There are two Moorish inscriptions on it, and this short English one: 'To the God that lasts for ever.'

Many devices were used to obtain food. One was to incubate eggs into chickens by keeping them in heated wool.

Gibraltar is said to resemble a lion, the late Mr Gladstone, and the corpse of a giant. It is a peninsula three miles long and three-quarters of a mile broad at the broadest part. It is connected with the mainland by a low, sandy isthmus. The western side is inhabited; the eastern, which faces the Mediterranean, is, with the exception of a small village, a series of rugged precipices bare of vegetation. The highest elevation of Gibraltar is one thousand four hundred and thirty feet. The rock was probably uplifted by volcanic action, and this at a comparatively recent period, as a marine beach exists more than four hundred and fifty feet above the sea-level. The bones of elephants, cave-bears, deer, and of many other existing and extinct animals have been found. Though Gibraltar is often called a barren rock, it has four hundred and fifty-six species of indigenous flowering plants. Castor-oil plants, daturas, and daphnes here attain the dignity of trees, and geraniums and heliotropes the proportions of hedges. It is characteristic of the place that these floral delights often conceal cannons and other things belonging to grim-visaged war. The few snakes that are found are small and harmless, and lizards are seen as long as one or even two feet.

Europeans and Africans jostle each other in the crowded streets of the town of Gibraltar, which is not allowed to extend either by nature or by Government. The steep slopes at the back are thickly covered with houses built tier above tier to the height of two hundred and fifty feet above the sea. The South Town, which consists for the most part of naval and military buildings, is separated from the commercial portion by the beautiful Alameda, or public gardens. It may here be mentioned that there is an Alameda in almost every Spanish town, and that the name is derived from *alamo*, a poplar-tree.

From November to May the climate of Gibraltar is good, but the remaining five months are uncomfortably hot, and the unhealthy Levanter or east wind then prevails. The Rock used to be pestilential, nearly half of the population dying in the year 1804 of a single epidemic; but so much care and money has been expended on sanitation and water-supply that now Gibraltar compares favourably in reference to health with most other towns. Perhaps the new tanks and filtering arrangements are more worthy of inspection than anything else in Gibraltar. The population at the end of 1905 was twenty-five thousand six hundred and sixty-five, including six thousand three hundred and seventy-nine military. No right to reside on the Rock is recognised, and it is only by permission that any one can do so. The increase of 'Rock scorpions,' as the natives are called, is discouraged by the authorities on account of the difficulty that during a siege would be experienced in feeding them in the now-disused galleries where they would probably be stowed away.

Perhaps we should include in the population of Gibraltar the few monkeys that still remain. They are the only monkeys in Europe, and seem to point to a time when Gibraltar was joined on to Africa. They may be a remnant of the 'apes of Tarshish' mentioned in the Bible. This is possible, for the town which the Greeks called Tartessus was near Gibraltar, and is said to have been the identical port of Tarsis to which the fleets of Solomon resorted. It was to this Tarsis, too, that Jonah was sailing from Joppa when he was thrown overboard and picked up by a whale. Some ruins of the harbour of the place may still be seen under the sea at low-water. Many tricks of the Gibraltar monkeys are related. When a smooth, sloping surface was made at a place on the east side of the Rock to catch water, the monkeys, not liking to slip, threw earth and stones upon it. During the great siege a monkey got its head into a jar when pilfering. A sentry chased it, and it ran off with the jar on its head. The sentry, thinking that the jar was the head-gear of an enemy, aroused the whole garrison. They did not find any Frenchmen or Spaniards, only a monkey wearing a glass hat!

There are two market-places near to each other in Gibraltar, one British and the other Moorish. These are visited by passengers from the steamers in order to see the fruit of the place and the costumes of the people.

The gates of Gibraltar are interesting. On the Southport Gate are the arms of Charles the Fifth of Spain, to which were added by command of that monarch the pillars of Hercules. The motto 'Ne *plus ultra*' was changed into '*Plus ultra*,' because America had then been discovered. Near this gate

is a cemetery where many of those who fell at the battle of Trafalgar, about twenty-five miles distant, are buried.

The Garrison library is the finest British library out of Great Britain. It was begun in 1793, and Mr Pitt, at the suggestion of the then Commander-in-Chief, granted a sum of money to build a suitable building 'upon consideration of the use and importance of such an institution.'

King's Chapel, where British soldiers now attend church, is the chancel of the chapel of the old convent of Franciscan friars, now Government House. The south transept and the choir of the chapel were stolen to make the staircase and the ballroom of Government House. The banqueting-hall of Government House, built in 1864, is enriched with the shields, flags, and mottoes of the Governors of Gibraltar from 1704, and of other illustrious persons connected with the fortress. In the court may be seen a grate for heating shot, used during the siege, and some curious specimens of ordnance. The garden has many rare and beautiful trees, one being a dragon-tree said to be over a thousand years old.

Gibraltar has made more history than larger places. It is a fortress, and in time of war is under martial law. Quaint orders have been issued from time to time showing customs very unlike those prevailing now. Here are specimens of the orders during about a hundred years from 1730: 'All masons are to be employed on the King's works, and on no other; if any are found to be employed on private works Lord Tyrawley will have every foot of the work done pulled down.' 'Fishermen are only to sell their fish after the servant of the Governor has bought what he requires.' Some officers had gone, contrary to orders, into the Spanish lines, and this appeared in orders: 'The Spanish General is glad the sentry did not shoot these officers; the English General would have been glad if he had, as a warning to others. He hopes to hear no more of such school-boyish behaviour, which would shame the service of the most unmilitary nation upon earth.' One order was issued against swearing, and a notice given that one shilling fine for each oath would be charged. If any one commits the 'wicked and cowardly' crime of suicide, his 'body is to be hung up by the heels for a certain time, and afterwards thrown over the line wall like a dog or cat.' 'The men under sentence of the general court-martial having signified to the General that if he would forgive the remainder of their punishment they would fight like devils in case the place is attacked, he takes them at their word and liberates them.' 'No officer or soldier on duty is to carry an umbrella.' 'When passing an officer, a soldier is to put his hand gracefully to his head, looking the officer respectfully in the face.' 'It having been brought to notice that the provost-sergeant does not inflict upon prisoners the whole of the punishment awarded, it is ordered that in future, when any part of the punishment is not inflicted by him, he shall receive the remainder himself.' 'No person whatever is to be suffered to go on the line wall or ramparts in a night-gown or night-cap.' 'The drum-major to take the cat out to exercise.' One would think that the drummers who flogged men had enough exercise in the use of the cat-o'-nine-tails, for the punishments then ordered were terrible. A bombardier received three hundred lashes for 'playing the quack and giving opium pills to a soldier.' A soldier got two hundred lashes under a gallows while two privates were hanging there. A private was given one thousand lashes, the last fifty being administered by the common hangman. Sentries not calling out 'All's well' every half-minute were punished with two hundred lashes.

The road to the Signal Station was commenced in 1749 by men sentenced to corporal punishment. A man got off from fifty to a hundred lashes for every day's work he did.

The following lines were cut by a soldier in a stone sentry-box at Gibraltar:

> God and the soldier all men adore
> In time of trouble, and no more;
> For when war is over,
> And all things righted,
> God is neglected
> And the old soldier slighted.

Certainly the soldier seems to have been slighted at Gibraltar, if we may judge from an order like the following, which was issued in 1726: 'For the convenience of quarters, the regiments that are in barracks to put three men in a bed, and as many beds in a room as possible.'

VANESSA.

CHAPTER III.

MOTHER and I drove over to Stickleton betimes, and took our seats in the ridiculous cattle-penned room that was dignified by the name of a courthouse.

Presently the walrus took his seat, with the externally meek-looking vicar on one side, and an old squire on the other, Major Vandeleur Sargood, whom I knew intimately. The sight of him on the Bench comforted me a little, for he was a very old family friend, and a kinder or more reasonable soul never lived; and although, like many a horse-lover, he had not got over his prejudice against motor-cars, I felt sure that he would be all the more careful that what he did should be right. Only a week before he had said to me, 'My

dear, I am too old to change my own ways; but I am no spoil-sport, and if they do not drive to the danger of the public I see no reason for persecuting them, and very soon our horses will get accustomed to them.' He was a dear old thing, and all the young people in the county when they spoke of him called him 'Uncle Goodman;' indeed, some of us girls used the name in affectionate tones to himself, and he loved to have it so.

After a weary hour of petty cases—in which two shillings and sixpence was held a sufficient penalty for a carter being drunk and allowing his wheel to rasp off a corner of the parish pump, and a wagoner who had left a team of four horses unattended in the public road while he boozed in the 'Green Dragon' was thought to be sufficiently dealt with by a growl of reprimand from the walrus and a threat for the future—the cry was, 'Wanisar King, come into the court,' with a very marked accent on the first syllable. She stepped in, and took her place in the dock, motioning her chaperon, who was following, to a seat in the court. At the sight of her, mother and I looked at one another and laughed. What was seen of her dress above the dock consisted of a shabby little, ill-fitting brown coburg cloak without sleeves, falling below her waist. Her veil was drawn down over her cheeks and fastened under her chin, so that nothing could be guessed as to her face. Our amazement was doubled when she made a little bob of a curtsey towards the walrus such as a charity-schoolgirl might drop to the lady of the manor when passing on the road.

A constable shouted 'Silence!' in Big Ben tones, and the charge was read out—something to this effect:

'For that she, on the 16th day of March one thousand nine hundred and three, in the county of Warkshire and parish of Chipley, then being the driver or person in charge of a light locomotive bearing the register number GP 99, on a certain highway between Ashwood Hill and Chipley aforesaid, unlawfully did drive the said light locomotive at a speed dangerous to the lieges, contrary to the form of the statute in such case made and provided,' &c.

Being only a woman, I must be forgiven if my note of the charge is not strictly accurate; but that was the gist of it.

'I did not catch the lady's name,' said the squire.

The constable repeated it, with more stress on his '*Wan*' than ever. Uncle Goodman, who was a little deaf, said, taking a note, 'Fanny Sarkey. Thank you.' Vanessa's shoulders gave a little shrug.

The walrus assumed a solemn air, and inquired whether Vanessa pleaded guilty or not guilty.

Vanessa replied in a deferential and low voice that there was no one on the road, so that she could not have driven to the danger of these lieges, whoever they might be.

'But do you drive fast?'

'I beg pardon, that is not what I am charged with doing.'

The walrus's red became redder, and he looked bewildered, and appealed to the clerk, who suggested to note that she pled not guilty.

'But she has not said that,' broke in the vicar. 'What do you say?'

'I say I did not drive to anybody's danger.'

'That, your honours,' said the clerk, 'is a plea of not guilty.'

'Then I wish she would say so,' said the walrus testily.—'Do you say so?'

The clerk, who seemed friendly, gave a little nod of encouragement to Vanessa, who at once replied, 'Certainly, if you wish it.'

The first witness called was Constable Miles Sturgis, who said, 'Aa waas a-waatchin' at the gate o' Farmer Chowler's meadow, w'en aa see'd the lady a-comin' down h'Ashwood 'ill uncommon fast, but aa think she moost 'a stopped in the 'ollow afore she coom oop, as she were a long time afore she coom raound the copse near the boundary-stone. Aa stud be'ind the gate-post wi' me watch in me 'and, w'en jewst as the lady was coomin' past the wheels sent a lot o' stuff in me face.'

'Because the car was going so fast, I presume?' broke in the vicar.

'Ees, sur, mortial fast, for it 'it me in the heye and a kind o' dazed me loike.'

'How far off was it from you?'

'Most o' three yards, yer 'oner.'

'Ah, then the car must have been racing.'

At this I looked at mother, and we both laughed till checked by a little turn and shake of the head from Vanessa.

The squire, without looking up, said quietly, 'I think we had better hear the case before giving opinions.' This diverted the vicar's frown from us, and made him gaze up at the cupola with the air of a martyred saint.

Asked what he thought the speed might be, Miles Sturgis declared that by his and the inspector's watches it was thirty-one miles an hour.

'Ah,' said the vicar, looking at the walrus, who looked in turn at the squire, saying, 'Bad case, bad case!' at which the squire said something to him behind his hand, which made the walrus turn abruptly away.

Vanessa was asked whether she wished to put any questions, and she at once said in a sympathetic voice, 'Were you hurt?'

'Ees, miss; sommut stuck in me heye, and the doctor 'e come and took it out.'

'I am so sorry! Are you sure that something flew off the road? Were you not looking hard at the watch?'

'Ees, miss, but I be sartin sure. It were stones off the road.'

'And when you were struck you let your watch fall?'

'Well, I did, I was that taken aback loike.'

'I suppose you did not pick it up till you had rubbed your eye?'

'Well, no, miss.'

'And had shaken your fist at us?'

'Well, I can't deny that I did.'

'And then you picked it up and pressed the stop?'

'That is right, miss.'

'That was some time after I passed.'

'Like enough 'twould be, miss.'

'That is all,' said Vanessa.

Then the vicar took up the running. 'You are quite sure that the car was going more than twenty miles an hour coming down Ashwood Hill?'

'Ees, sur; and twice as fast as w'en it passed.'

'Ah! over sixty miles an hour. That is sufficient.'

At this some one in court broke into a loud laugh, which caused the walrus to raise head and hand, and to threaten to clear the court.

Inspector Nokes then came into the box and gave evidence that he was hiding a measured quarter of a mile off from where he had placed the constable, but said he thought that he must have been seen, as the car when it passed him was going 'not very fast,' but on comparing watches he found that it had run the quarter of a mile in sixteen seconds.

'So,' said Vanessa, 'you say that the pace was equal to a mile in sixty-four seconds?'

'I do.'

'Well, my car cannot do anything like that; but tell me, was I not going at an ordinary pace as I came up to you?'

'Yes; but I go by the watch.'

'And did the constable tell you that he let the watch fall before he passed the shop?'

'No, he did not.'

'Then of course the timing could not be right?'

No answer.

The vicar again came to the rescue. 'Did the constable report to you the speed at which the car came down Ashwood Hill?'

'Yes, sir.'

'As very fast?'

'Yes, sir.'

This closed the case for the prosecution, and the walrus asked whether there were any witnesses for the defence, whereupon Vanessa announced that she desired to give evidence, and she moved towards the witness-box. As she did so she dropped the hideous cape from her shoulders, uncovering a lovely cloth coat with double driving-capes, and, unfastening the veil from her chin, threw it up on to the top of her hat, where it spread out like a cloud, giving a charming setting to the lovely face with its rich tints. Then occurred what the newspaper reports call 'sensation.' A voice behind me ejaculated, 'My! ain't she a stunner?' To which the reply came, 'Strite out o' the Book o' Beauty, me lad.' A murmur ran through the court as she raised her eyes solemnly while the words of the oath were being dictated to her, the Bench yielding for the moment to the fascinating vision, and gazing with unmistakable admiration. But the most extraordinary thing was the effect of this vision suddenly bursting upon the dear old squire. A change came over his face as Vanessa threw up her veil. It was a look of intense surprise, and seemed to be followed by a wave of feeling, for he bowed his head and put his hands to his brow, and I saw his breast heave as from some strong emotion. When he raised his head again his face had a far-away look, as if the court and all its petty proceedings were out of his sight, and only this new vision and some association with it were present to his soul.

Vanessa told her story frankly and shortly, declaring that for half a mile before she passed the constable the car was going closely throttled at a speed which could not exceed sixteen miles an hour; and when the inspector rose to cross-examine her, she turned to him with a smile that might have warned him of coming defeat.

'You heard Constable Nokes say that the car threw stones in his eyes?'

'Yes; but no such thing happened.'

'Oh, indeed! How do you know that?'

'Because I know what it was that hit him.'

'And, pray, what was that?'

'Peas!' (Loud laughter in court.)

The walrus blew out his cheeks, and a constable shouted, 'Silence!'

'This jesting is rather unseemly,' said the vicar severely.

'I am not jesting,' said Vanessa, with a touch of the Bellona look, under which the vicar cowered, and, bending down, pretended to make a note.

I was getting excited, and wanted to stand up and corroborate about the peas, but mother restrained me, and told me to wait.

The Bellona look seemed to excite the walrus too. He glared through his glasses, and said, 'What do you mean by talking about peas? There were no peas on the road, were there?'

'No.'

'Then what is this silly nonsense about peas? Do not trifle with the Court. Be serious, young woman, if you please, or it will be the worse for you.'

'I am perfectly serious; and, although I am under accusation, you will please treat me with ordinary courtesy. I had supposed I ought to tell all the facts.'

''Ear, 'ear,' said a voice behind.

The walrus looked like bursting, and the vicar threw up his eyes, and the constable again yelled, 'Silence!' The clerk smiled, and said *sotto voce* to the inspector, 'Go on.'

'Do you solemnly say it was peas?'

'I don't see any cause for solemnity. I say it.'

'And, pray, where do you say these magical peas came from?'

'Put your question without talking about magic, and I will answer.'

'Answer the question, please, and don't dictate to me how I am to put my questions.'

'Must I answer the question?' said Vanessa, looking round to the Bench.

'Yes, you must,' growled the walrus.

'Then I will obey the maxim to answer a fool according to his folly. My answer is that there were no magical peas. They were split-peas.' (Loud laughter and the consequent shout of 'Silence!')

'Then you decline to answer where these peas came from?'

'No, if you ask where the split-peas came from. They came from a pea-shooter.' (Renewed laughter.)

'From a what?' said the squire, with his hand up to his ear and a twinkle in his eye.

'From a pea-shooter,' said Vanessa, smiling back to him. 'Here it is,' opening a parcel she held.

The squire seemed to enjoy this phase of the case greatly, and lay back in his chair and laughed, to the evident scandalising of his colleagues, who looked toward him in marked disapproval.

Vanessa added, 'I admit it was a very wrong thing to do.'

The inspector thought he saw a good point here. 'Then why did you do it?'

'I did not say I did it. I was very angry when I knew it.'

'Oh, indeed! And who did it, then?'

'A schoolboy.'

'How do you know that?'

'Because he confessed it to me, and I took the shooter from him.'

'And pray who was this boy?'

'My cousin.'

'Is he here to-day?'

'No; he is at school in Paris.'

'Ah,' said the walrus, 'then this is a waste of time; there is no corroboration.'

I rose, saying, 'Yes, there is;' but mother pulled me down, saying, 'Wait, dear; wait.'

The inspector then inquired at what speed Vanessa had come down Ashwood Hill, when she at once frankly said, 'About twenty-eight to thirty miles an hour.'

'And yet you say you were only going sixteen miles an hour when you passed the constable!'

'So I was.'

'And why, pray?'

'Because a gentleman kindly warned me that the police had a trap set.'

'Oh, who was he?'

'I don't know.'

'Haw!' said the walrus, and he and the vicar looked at one another and exchanged a solemn nod, while the inspector looked at the Bench and sat down with a flourish.

Vanessa returned to the dock, donning the brown cloak and lowering her veil, and becoming once more the humble prisoner, repeated the bob-curtsey. The clerk asked her whether she had any other witnesses.

'No,' answered Vanessa.

'Yes,' I cried, and I came forward. Vanessa looked annoyed, and leaning over the dock, said, 'Mitey dear, I don't want you to be mixed up in this.'

'Oh, but I must! I must!' I replied.

While she was still remonstrating with me the walrus said, 'I should like very much to know who this person was that tried to balk the police.'

'It was I,' said a voice which I knew, from the back of the court. Vanessa knew it too, and I saw the blush that spread over her neck as she drew her veil more closely round her face.

The walrus glared and said, 'Who are you?'

'My name is Oldsborough.'

'Do you wish to give evidence?'

'Yes, if the lady who is prosecuted will allow me.'

Vanessa hesitated a moment, and then bowed her head, whereupon he stepped into the box. Being asked what his Christian name was by the clerk, he gave it as Cecil.

He took the oath and then said, 'Hearing of this summons, I thought it my duty to attend, as I know the circumstances. I did warn this lady of a trap which I observed when I was on the way to the meet at Beechwood Manor, and when I held up my hand the car was stopped in a few yards, and after that it went quite slow.'

'But before she stopped,' put in the vicar, 'the legal limit was being exceeded.'

'It may be so, but this Court has nothing to do with that.'

'Eh, what!' said the walrus, bristling up. 'What do you mean, sir? This Court is the judge of its own jurisdiction.'

'Yes, certainly, sir, within its own jurisdiction; but I beg to call your attention to the fact that Ashwood Hill is in the county of Craneward, and there you have no jurisdiction.'

The walrus, who had almost risen on end, glaring with official rage, suddenly collapsed, amid loud laughter and clapping of hands in court, which was instantly suppressed by a second threat to clear the court; but the spectators leaned forward with their heads on their hands, looking aside at one another and shaking with laughter.

The inspector broke in to cover his chief's discomfiture. 'Do you live here?'

'No; I live in Yorkshire.'

'And pray, sir, how then do you make yourself a judge of boundaries?'

'I do not; I only state facts. I spent my boyhood in this neighbourhood, and I know the boundary-stone at the bottom of Ashwood Hill well. You know it as well as I do.'

The inspector looked rather foolish, and there was another titter. The clerk rose and laid a map before the walrus, the vicar and the squire craning over to look at it, and then they all sat back in their chairs, the walrus and the vicar trying to look as if they were not annoyed, in which they failed miserably, while the squire gave vent to an audible chuckle.

The inspector resumed. 'Why do you call it a trap?'

'Because it was one, set in a lonely place where there was no traffic and a falling gradient, and therefore it was set solely for trapping purposes. That is why I call it a trap.'

'And do you consider it right to aid people to escape the grasp of the law?'

'I can see nothing wrong in warning people not to go beyond the law.'

'But you would only do that if the police were about?'

'Certainly not; I would warn any one who, I thought, was causing danger to the public.'

'Now, at what speed was the car coming down Ashwood Hill?'

'A good fast pace.'

'More than twenty miles an hour?'

'Yes, I should say so; but there was not a soul in sight.'

'How do you know what speed the car went at after it passed you?'

'Because I watched with a glass until it disappeared into the village, and it took ten minutes to do two and a quarter miles.'

'Oh, indeed! Then how do you account for its having thrown stones in the constable's eyes?'

'It did not do that; you have heard the lady say so.'

'And you heard the constable say that it did. How can you decide between them?'

'I don't decide; but I know, for I have seen the doctor, and he said to me'——

'Stop, stop,' broke in the walrus; 'you must not tell us what the soldier—er, er—I mean the doctor said; it is not evidence,' evidently having the law laid down by Justice Starleigh in his mind.

'Very well, sir; the doctor is here. He will tell you.'

The inspector tried a last shot. 'When did you see the prisoner last?'

'If you mean the lady you have summoned, and of whom you speak thus impertinently, I saw her last on the day in question when I warned her of your being in the ditch.' (Laughter.)

'How long have you known her?'

'I do not know her. I never met her before or since.'

'Then what interest have you to volunteer your evidence in the case?'

'Only the interest of every citizen to prevent injustice.'

Here the vicar got excited, and said, 'Do you suggest that this Court would do injustice?'

'Certainly not; but I do suggest that in order to do justice it should have all the facts.'

The vicar had enough of it, and again made an imaginary note, and my hero stepped down. I observed that he never looked at Vanessa, and, like a woman, was half-angry with him, while I could not but applaud his good taste in closely adhering to his rôle of disinterested spectator and witness.

The doctor next stepped up, producing from his pocket with a professional air a small pill-box, and placing it in front of him. He described how the lady had asked him to see the constable professionally, and how he had extracted two pieces of solid matter from the eye, which on being examined with a glass proved to be 'the ordinary split-pea of commerce, which I now produce. No trace of stones or anything from a road surface.'

The inspector tried a shot. 'When you were asked by the prisoner—er, I mean the lady—to see the constable, did she say anything else?'

'Well, yes,' with a smile.

'You must tell us what she said.'

'Oh, certainly. She said she was sorry for the constable being put to do such dirty work.' (Loud laughter.)

'What dirty work, sir?'

'Well, it was her expression.'

The inspector might have been warned by the twinkle in the doctor's face, but he persisted.

'Come, what did you understand her to mean?'

'I suppose she meant sneaking in ditches instead of attending to his duties.'

'Do you suggest that the police ought not to do what they are ordered to do?'

'No, I suggest nothing. I answered your question. I may add that the constable himself was ashamed of it, and said so. He told me he would give a week's pay to be free of it, but that he must obey orders, as the colonel was an awful man.'

The walrus's face suggested apoplexy, and he gasped but could not articulate; and the squire put his hands into his pockets and leaned back with a look of amused delight on his wizened face.

I then came forward in a determined way to the box, knowing that Vanessa disapproved, and being inwardly a little nervous; but for her I would have faced beasts at Ephesus, to which a walrus was as nothing. While I was coming forward the squire leaned across and spoke to his colleagues, who seemed to receive what he said somewhat testily. Being in the box, I was near enough to hear the words, 'Plainly guilty at Ashwood Hill,' and his reply, 'Yes; but that is outside.' The walrus ended by throwing down a pen with a scowl, and the vicar gave an unctuous wave of his hand and shook his head, saying, 'I am of a totally different opinion.' There was dead silence in court as every one watched this little scene, which ended in the squire sitting back and saying—seemingly unconscious how loud he was speaking, as is the way of the slightly deaf—'Well, do as you like; but you will be snubbed in the Appeal Court.'

I was then sworn, and had given evidence that after the time when we met Mr Oldsborough—I had a little good-natured malice in calling him that—we were not going much faster than I was accustomed to drive in my mother's carriage when we passed the trap.

'You must not call it a trap,' said the vicar, as if rebuking a penitent.

'I beg pardon,' I said, 'but I don't know any other name for it. I will use any name that is thought better. Would snare do?' said I, astonished at my own boldness. This was followed by a rippling laugh in court, and the vicar pulled down his brows and his cuffs, and was evidently about to say something severe, when all at once a diversion took place. The walrus, who had been sitting with his hand before his eyes after the squire's interruption, seemed to take a sudden resolve, and said, 'One moment,' and then bent over to the clerk, and they spoke together for a few minutes. All I heard was, 'No, sir, not for Ashwood Hill;' and then, 'No case on summons;' the vicar's face as he listened passing from angry to resigned, and the squire nodding eagerly. All at once the walrus, after looking with a scowl at the squire, and with a pallor that would have included his nose had that been possible, suddenly blurted out, 'The case is dismissed,' and he and the vicar at once rose and turned their backs to escape out of court.

For a moment there was no sound, the sudden collapse of the proceedings seeming not to be grasped at once. Then a thunder of applause rang through the court, and several youths who had succumbed to Vanessa's spell threw their caps in the air. Gruff orders of 'Silence!' were useless, and the walrus and the vicar disappeared. The squire, whose face was a study of genial expression, leaned over the Bench and said something to the clerk, who at once came across to mother and said that the squire would like to see us both at luncheon at the 'Red Lion' before we went home.

In the meantime Vanessa had again transformed herself, tossing up her veil, and dropping and handing the awful cloak to her maid, who was present, and from whom I had a shrewd suspicion that she had borrowed it; and she then joined her chaperon, who was delighted with the course of events, and said to her as I came up, 'My dear, what an actress you would have made!'

She laughed, and, turning to me, said, 'Well, that's all right, Mitey dear;' and she shook hands warmly with mother.

But I seemed to see something distrait in her look, and her eye wandered round the court once or twice as if she expected to see some one. Was she looking for my hero? I asked myself. He was gone. As I rose from my seat when the case was over, I saw him making for the exit, and we did not see him again.

(To be continued.)

OLD CHINA.

By Francis B. Cooke.

IT is a noticeable fact that whilst a man regards his own hobby as a particularly desirable and eminently sensible pastime, he is apt to view that of his neighbour as a mild but harmless form of lunacy. It is, therefore, in no wise surprising that the high prices realised at Christie's and elsewhere for fine pieces of old china should excite the wonder of those who know not the rarity and beauty of such triumphs of the ceramic art. The published reports of these auction sales, however, tend to stimulate public interest in porcelain, and are the primary cause of many people becoming collectors. Every year there is a steady increase in the number of 'bargain-hunters,' and as the quantity of old china that comes into the market is comparatively small, prices advance by leaps and bounds. Pieces that were sold a few years back for shillings now realise as many pounds, whilst fine specimens of early Chelsea, Worcester, and Bow are worth more than their weight in gold. This appreciation in values has led to the placing on the market of countless forgeries, which for the most part emanate from abroad. Many of these 'fakes' are in form, decoration, and mark faithful reproductions of the original, and can only be detected by an expert. To be a successful collector, therefore, one must have sufficient knowledge of ceramics to be able to differentiate between the genuine and its counterfeit, and to identify readily the productions of one old factory from those of another. Such knowledge can only be gained by experience, but much may be learnt from books and the splendid collections exhibited at the principal museums.

The first step in the collector's education is to learn how to distinguish china from earthenware. The acquisition of this knowledge presents but little difficulty; for, whilst the former is translucent, the latter is opaque. If a piece of porcelain be held up to a strong artificial light the shadow of the fingers is plainly discernible through the piece, but if a similar experiment be tried with an earthenware article nothing can be seen. This translucency of porcelain, however, varies a good deal according to the composition of the paste. If a plate fashioned at the old Nantgarw factory be examined by transmitted light, every colour of the enamel decoration can be plainly seen from the reverse side. Some pieces of old Bow china, on the other hand, are, owing to their thickness, almost opaque, and can only be distinguished from pottery by the feel and appearance of the paste.

China may be divided into three distinct groups. First there is the 'soft paste' or artificial porcelain made before the discovery of china clay. Then there is the 'hard paste,' or true porcelain, made at Plymouth, Bristol, and New Hall after Cookworthy had found the clay in Cornwall about the year 1768. Finally, there is the felspathic porcelain

introduced by Spode at the commencement of the nineteenth century. This last, a hybrid body incorporating the best features of soft and hard paste, being mechanically almost perfect, was universally adopted as the standard body, although Nantgarw and Swansea continued to make a singularly beautiful soft-paste china until about 1824. Although the commercial value of Spode's innovation cannot be disputed, it robbed china of much of its interest from the collector's point of view, as thenceforward the only distinctive features were marks and decoration.

The china most highly prized by the connoisseur is that fashioned in the eighteenth century in imitation of the porcelain imported from China and Japan. In the absence of the natural elements of which true porcelain is composed, the early factories evolved an artificial body infinitely more beautiful than that which they strove to imitate. This paste was of a delightful, soft, creamy texture, and imparted to the enamel colours used in the decoration a mellow tenderness that has never since been approached. The finer pieces were exquisitely painted by noted artists, the decoration usually taking the form of figure-subjects, flowers, fruit, exotic birds, and landscapes. The finishing touch was added to these early triumphs of the potter's art by a soft, vitreous glaze that lay upon the surface like the glass on a miniature. There is nothing so decorative as old china of this nature, and a few pieces judiciously arranged impart an air of refinement to a room that is otherwise lacking. Unfortunately good specimens of eighteenth century porcelain are not nowadays easily come by, and even the dealers complain of its ever-growing scarcity. Of the comparatively small quantity that finds its way into the market, much is sold to America and the Continent, whilst a good deal is absorbed by museums. There are still, however, bargains to be picked up by the energetic collector who knows his subject; but the beginner, if he go not warily, is likely to be badly bitten. All is not Chelsea that bears the gold anchor mark, nor Worcester that of the fretted square; while, as to Lowestoft, all the old factories combined could not have produced a tithe of the china said to have been manufactured at the Suffolk seaport town. The market is, indeed, flooded with forgeries innumerable, and in many cases the factory marks have been faithfully copied. The collector, therefore, can place no reliance upon such marks, although they may be useful to confirm an impression based upon the characteristics of the piece itself. He has, however, a certain safeguard, as these forgeries are almost invariably made of *hard paste*, whereas the originals were soft. It is, therefore, essential for the collector to be able to differentiate between 'hard' and 'soft' porcelain if he would avoid the traps laid to catch the unwary.

If one could always make use of file and magnifying-glass it would be a comparatively easy matter to ascertain the nature of the paste, but it is not every dealer that will permit a prospective purchaser thus to experiment with his wares. The collector must, therefore, learn to distinguish between soft and hard paste by mere touch and appearance; and until he has arrived at this stage in his education he should never purchase a piece of any considerable value without a written guarantee that the article is what it purports to be. To familiarise one's self with the characteristics of both descriptions of paste, a few pieces of artificial porcelain, such as Worcester or Chelsea, and of true china, say Bristol or New Hall, should be procured. As these are only required for purposes of experiment, it is quite immaterial how imperfect they may be as regards condition, provided that they are genuine specimens. If a file be applied to the pieces on a part free from glaze it will be found that the soft-paste china is readily cut, whilst no impression can be made upon the true porcelain. Having by this method learned the relative hardness of the two varieties of body, the collector can proceed to further tests. When they are examined under a magnifying-glass, it will be noticed that fractures in the soft paste are irregular in form, and the body has a dry, lump-sugary appearance, whilst hard paste breaks cleaner, with a comparatively smooth and slightly curved surface. The artificial china to the touch is warm, soft, and soapy; but true porcelain feels cold and hard. Then, again, soft paste is usually of a creamy whiteness in tint, while hard paste has either a chalky or bluish tinge.

The glaze is often a valuable guide to the nature of the paste, for with but few exceptions a soft glaze was used upon soft paste and a hard glaze upon hard paste. If the glaze can be scratched with the point of a knife-blade, it is pretty safe to assume that the paste is soft. In the absence of a knife the matter can be decided by other indications. The soft glaze used upon the old artificial porcelain was more or less porous, and the enamel colours of the decoration sank right into the paste, leaving the surface smooth. If the paste and glaze be hard the enamel remains on the surface, and can be felt if the fingers be drawn across the decoration. Another indication of hard porcelain is that the enamel colours are not so shiny as the rest of the piece, whilst in the case of soft paste the glaze covers the whole article like a thin sheet of glass. Scratches on the glaze and discoloration by use also point to soft paste, for hard porcelain is quite impervious to liquids, and could not be scratched by any ordinary usage. Still another sign of soft paste is the running of the ground-colours, leaving a ragged edge. To cover this defect it was the custom of the old factories to place a gilt border around the white reserves, the gold in very early specimens having a matt surface.

By such tests as I have enumerated, the connoisseur is able to distinguish between soft and hard paste porcelain; but it still remains for him to ascertain the origin of the piece he may happen to be examining. Of the eighteenth-century English factories, Chelsea, Bow, Worcester, Lowestoft, Derby,

Longton Hall, Caughley, and Coalport made soft-paste china; whilst Plymouth, Bristol, and New Hall produced hard porcelain. To differentiate between the wares of the various factories is by no means an easy matter, and sometimes even an expert is puzzled. Comparatively few pieces of old china bear marks, and even when they do appear they cannot always be relied upon, as marks are often forged. They should, therefore, be regarded with suspicion unless confirmed by other evidence of origin. Decoration, again, is not a safe guide, as it was by no means an uncommon practice for one factory to copy another in the matter of design. But, fortunately for the collector, the wares of every factory have certain characteristics that are unmistakable by the expert. Little differences in paste and glaze, and small blemishes that may easily escape the eye of the inexperienced, are eagerly pounced upon by the connoisseur. One little peculiarity may be shared by another factory, but when it is found in combination with others the identity of the piece is established beyond a doubt.

When a piece of china is being examined with a view to establishing its origin, every little detail should be scrutinised with the greatest care. After the character of the paste has been ascertained by the tests I have already enumerated, the decoration may be studied for a clue. Probably an impression will then be formed as to the identity of the piece. Say, for example, the article under examination is a plate of soft-paste porcelain, and the decoration suggests the Worcester factory. If when it is held up to a strong artificial light the white portions of the piece have a slightly green tint the impression as to its origin is materially strengthened, for this is a pronounced characteristic of early Worcester. But as much the same thing is sometimes observed in the case of old Swansea of the Dillwyn period we will go a step farther. If it be found on examining the base of the plate that there is a shrinkage of the glaze near the rim, we may safely conclude that our opinion is correct, for such a blemish is in itself almost a distinctive feature of Worcester. The china of almost every early factory has peculiarities which reveal its identity to the expert. Chelsea, for instance, may be distinguished by spur-marks on the base and greasy-looking discs known as 'moons' in the paste, Derby by crazing of the glaze and discoloration, Bow by its weight, opacity, and the thickness of the glaze, and so on; but after much experience the connoisseur arrives at a stage when he knows almost by intuition the origin of any piece submitted to him.

A practical knowledge of old china can only be gained by a good deal of patient study and experience, but the collector who makes it his business thoroughly to learn his subject will be well rewarded. Bargains are still to be had by those who know what they are buying, for it is a fact that the enthusiastic collector often has a greater knowledge of china than many of the small dealers. It stands to reason that a man dealing in a large variety of articles is not likely to know as much about any particular one of them as an amateur who devotes all his leisure to his hobby; but it is really astonishing how ignorant some of these miscellaneous dealers are upon the subject of ceramics. I have tested the truth of this assertion by submitting a piece of old china for identification to three small dealers. Each gave it a different name, and all were wrong. I think the explanation is that such men attend auction sales at private houses to buy second-hand furniture, and bid for old china should it be going at a low figure. Knowing but little about it, they add what they consider a handsome profit to the price they paid, and sell it as soon as they can. Such dealers are fair game for the collector, who need have no scruples about securing a prize should he have the opportunity, for he may rest assured that the man has made a good profit, and is well satisfied with the transaction.

A CASE OF CAPTURE.

PART II.

THERE was a pause.

'Would you like to send a message to my mistress?' the girl asked at length.

'No.'

'Will you promise not to attack Mr Graham if you are allowed to go?'

'No.'

'If—if I managed to help you to escape—in spite of your rudeness—what would you do?'

'My utmost to win my case to-morrow.'

'Why?' She flashed the question imperiously.

'Because I should be false to my task if I didn't,' Orr retorted roughly. 'Can nothing make you comprehend? You don't realise all that this means to me,' he continued with sudden, almost boyish, passion and distress. 'There will be caustic comments from the Bench at my absence to-morrow; there will be sneering exultation from the other side. There will be deep displeasure on the part of the Admiralty solicitors who are instructing me. This is my first case for the Board of Trade, and now all chance of further briefs for them will be jeopardised, perhaps lost for ever. For what am I to explain? That I was kidnapped in a fog at the caprice of a girl! The ridicule will be insufferable. Why, I shall be laughed from my career at the Bar! It will mean simple ruin—not to be borne!'

He exaggerated. But at the moment he spoke with complete conviction; and the girl, in whom he

was unconsciously confiding as to an equal, believed it true.

'And afterwards I will prosecute the author of this outrage,' he cried illogically, stung beyond endurance at his wrongs.

He sprang to his feet, hot with the shame of his capture. At this threatening movement the girl shrank back against the door, alarmed. Quick fear whitened her small cheeks. Yet never had she looked so lovely.

'Your promise—not to escape!' she stammered, scared.

Now, it is a matter for the speculation of historians what the subsequent events might have been had not the gray rat which had taken up its winter quarters on the yacht intruded at that psychological moment. But the rodent was desperately hungry, and the scent of the supper cheese was pungently alluring. Wherefore he descended impulsively from the roof by way of a curtain-rod without the due forethought of the wise; its polished surface was slippery, and he plumped with a terribly startling flop amid the crockery below. He whisked a hairless tail from out of the butter-dish where it had come to a disconcerting halt, and then sat up and stroked his whiskers with agile paws. A scene of terrific commotion followed.

The girl screamed with horror; the gray rat squeaked indignantly; Orr swore.

The animal hurriedly concluded that these two human beings were not so favourably preoccupied as he had imagined. The *contretemps* of the slithery curtain-rod had given an undesirable publicity to his arrival. He skipped and squawked with rat-rage as the brute of a man distributed a whirlwind of erratic whacks about the table with an umbrella. The resultant havoc among the china was nerve-shattering. Amid scenes resembling the uproar of earthquakes and hours of judgment, the umbrella splintered with a crack, and its ferrule missed the rat's nose by a fraction. It was prudent to retire from the cheese-quest at once. With a mighty spring the rat reached the convenient shoulder of a collapsed maiden on the locker. Thence a scuffling scramble led to the refuge of a friendly ventilation-shaft overhead. Thence the deck was gained with ease, and the rat vanished, leaving a baffled man breathlessly endeavouring to injure the ventilator with an umbrella-handle. A pregnant calm succeeded the hubbub.

A timid pair of the bluest eyes opened again. Is —is the monster dead?' asked their owner tremulously.

'Gone away,' the captive Orr consoled his fainting jailer. The girl was shuddering with feminine fright. Orr proffered whisky-and-soda as the nearest restorative.

"Keep cool; there's nothing to be scared at, and you're not hurt,' Orr comforted.

The results of a phrase are sometimes singular. This very ordinary remark supplied the link in the chain of recollection. To both man and girl came swift remembrance of a previous occasion on which these exact words had been uttered. In a flash both knew where they had met before.

The girl sat up, wide-eyed, astounded. Orr stared —and stared—and stared.

'Why, it was you—in Langham Place—that evening!' she gasped at length.

Orr's first thought was that he was dreaming; then the dream materialised.

Across the kaleidoscope of memory came the vision of that carriage accident in Langham Place six months ago. A brougham containing a lady in dinner-dress had collided with a motor-cab; the coachman had been pitched from the box, and the plunging, terrified horse had bolted madly down the road. Orr had had to be very quick indeed. What a job it had been to stop the brute! And the shaft of the carriage had hit his shoulder hard.

Stamped on his mind ever since had been the fleeting glimpse of the pale beauty of the girl-occupant of the brougham. Then the usual crowd had gathered, and the customary officious policeman had commenced to take callously copious notes, and then Orr had reeled to the ground with a broken collar-bone. He had occasional twinges in that shoulder still.

He was a man who hated fuss and publicity of any kind, and in the confusion the girl had been taken home. He had never heard whom he had rescued—till now.

'So you are not a servant at all.'

She flushed.

'That's your maid's cloak,' Orr guessed.

The wearer nodded. Sudden resolution grew in her eyes.

'I—I am Helen Graham.' She heaved a sigh of relief. 'Now we are introduced,' she announced naïvely.

She turned with a quick access of feeling and searched his face. There was nothing in it which a girl might not look upon, to which she might not respond. She measured him in breathless silence, red lips parted. He was her own kind. Her blue eyes lit with gratitude or with even something sweeter still.

'So it was you who saved my life! Of course I didn't know when'——

'When you captured me,' Orr ended, laughing.

'I don't wonder at your being angry—really.'

The half-entreating, wholly alluring, small face was contrite with remorse.

'I am quite glad you did it,' said Orr emphatically. 'We are—introduced.'

'And you don't think me very horrid, do you?' she pleaded. Her small mouth drooped ominously.

Orr hastened to reassure her on this point with immense sincerity. This anxiety was removed.

'The present difficulty,' speculated Miss Helen—and her gaze fell swiftly before something she read in his—'is how to get you back to London—now!'

Such is the inconsistency of human nature that at once Orr did not want to go.

'It's a dreadful dilemma,' she mused aloud. She

shot the briefest glimpse up at him from under her long lashes. 'After all the trouble I have had to—to secure you, I must allow you to return to your ruthless work.'

Orr was thinking swiftly. He was no longer so keen on proving the wilful wreck of the *Redan*. This would probably involve an everlasting end to his new friendship with the most charming little lady in the world. The problem was unsettling.

'What *are* we to do?' she murmured, perplexed.

Again an interruption came to their aid. This was Albert, an Albert sadly the worse for the refreshment in the fo'c'sle. The yacht's winter watchman slid unsteadily through the door and beamed with fatuous complacency on the inmates of the chartroom.

'Yer wansh more beer?' he proposed benevolently.

'Get out!' said Orr, suddenly savage.

Albert eyed him with maudlin severity. 'Strong liquor's hupset yer temper.' The inebriated one swayed on the threshold, pained and surprised. ''Fore yer best gal, too—shameful!'

For an instant Orr caught the startled flood of crimson colour in the girl's horrified cheeks. The watchman lurched indignantly.

'Kiss yer young woman, fat'ead, an' give 'er more beer,' he suggested.

Then Orr knocked him down. It was a pleasure to have some one to hit.

He fell ponderously deckwards. The scared yelp that followed indicated that the attendant dog was unprepared for the descent of a stout human body on top of its own.

Then it was that Miss Graham proved herself a maiden of singular reliance and resource. 'Come quick!' she called to Orr, and darted along the deck.

From the fo'c'sle hatchway came sounds of revelry by night. The chauffeur's voice was uplifted in shaky song.

'Shut the door and bolt it outside,' the girl whispered. 'Then they can't get out.'

Orr took in the situation with promptness, and the next minute the occupants below were safely immured. 'We've got the brutes beautifully,' Orr informed her, pleased.

'Good!' The girl's white little teeth closed with a snap. 'Now you get your things from the chartroom, and I'll fetch mine from the cabin aft,' she directed. 'My home is only three miles away. You can sleep at the village inn, and take the first train in the morning for town. Can you drive a motor?'

'No,' said Orr with painful recollection of the muddy lanes of Essex.

'Will you trust yourself with me as driver, then?' she asked.

'Rather!' Orr answered, reckless. And then he wondered why the lady seemed suddenly shy.

Orr departed to prop the intoxicated Albert against the side-rail.

Violent vociferation and much banging was proceeding from the fastened fo'c'sle door. Helen was waiting for him in the motor, slightly flushed, brilliant-eyed, perfectly self-possessed. A delicate, fawn-coloured driving-coat fitted her slender form to perfection.

Instinctively she raised a little gloved hand and patted the hair under a dainty motoring-cap. 'I'm ready,' she said. Her frank assumption of comradeship was adorable.

The motor purred away into the night.

The murky, vaporous fog was drifting in weird wreaths across the fields; passing objects loomed mysteriously for a moment, and then were lost again behind the veil of whiteness. It was a world indistinct and illusory in which Orr sat content by the side of the girl who drove. They seemed alone in a wonderful land of shadows. She steered with skill.

Once, indeed, she broke the spell of silence. 'How will those men get out?' she queried in some awe as she remembered the imprisoned ones behind them on the yacht.

'Albert will release them when he has recovered—from the beer,' he told her unromantically. And again the thrilling glamour of that night-ride wrapped around them both.

All too soon the motor jerked into a standstill at the entrance to a straggling village. The houses loomed with dimness along the deserted street.

'There is the inn,' the girl pointed. 'And I am close to home.'

Orr descended quietly from the car and waited. One of her hands was held in his.

'Am I forgiven—for the capture?' asked Helen Graham in a low voice.

He took the other small hand firmly with possessive grasp. 'There will be a penalty,' he sentenced.

Her eyes questioned. 'I—I don't know what you mean,' she faltered rather breathlessly. 'But you can call and tell me one day—if you wish,' she said.

. . . . . .

Next morning Orr was late in court. The presiding magistrate was speaking gravely as he entered.

'News has just reached me which I have to announce with great regret. This morning, on his way here from his house in Kensington, Mr Harold Graham, the ship-owner, was run over by a van; and it is feared that his injuries will prove fatal. Under the circumstances I am informed by the Board of Trade that this inquiry should be indefinitely adjourned.'

Then Orr understood how a reprieve felt. But he only muttered, 'My poor, poor little girl!'

. . . . . .

Four months later, one April afternoon, on the Riviera, a man and a girl were standing in a hotel garden by the Mediterranean Sea.

'What a big word "if" is!' said the girl, with the thoughtfulness of a philosopher.

Her companion laughed happily. 'If the *Redan* had not been cast away'——

'Had not jammed her steering-gear, you mean,' she contradicted.

'If you had not been the most daring, law-breaking maiden in the world'——

'And audaciously brave,' she added archly.

'If you had not kidnapped me in the fog'——

'It wasn't difficult,' she murmured.

'If I had not guessed all the time who you were'——

'Which you didn't, really, till I told you,' she corrected in parenthesis.

'If all this hadn't happened'——

'We shouldn't now be married,' Helen Orr declared demurely. 'Now it is'——

'The clearest case of lifelong capture that there ever was,' her husband ended fondly. Then he kissed the prettiest pretence of pout away.

THE END.

SOME CURIOUS EXISTING BEQUESTS.

IF we consider what tremendous changes have been wrought in the social life of these islands during the past half-century, if we remember how strong and how sweeping is the tendency of the day towards the substitution of what is practical and utilitarian for what is merely of sentimental value, we must be astonished that so much survives in our midst—and survives strongly—which has no practical *raison d'être*, and that threatened abolition meets with such sturdy opposition.

Of course we have lost much irrecoverably, but we seem determined to lose no more, if we may judge by the outcry which replies to every suggestion of discontinuance or substitution; and it may also be remarked that of all places in the kingdom, it is in the prosaic, matter-of-fact, apparently mammon-ruled City of London that the survivals of old customs and forms, and especially of the subject of this paper—old bequests—are the most numerous and the clamour against abolition the loudest.

It has been an interesting holiday-task of the writer to collect survivals of this character, and they are so curious and in some cases so opposed to the character of the times that he makes no apology for describing some of them.

In the year 1717 one Paul Jervis left a sum of money the interest of which was to be applied to the preaching of a sermon every St Paul's Day in St Sepulchre's, Newgate, London, on the excellency of the liturgy of the Church of England; certain sums also being paid to the preacher, curate, clerk, &c., twenty shillings each to the ten poorest householders of the Smithfield quarter of the parish, four pounds to St Bartholomew's Hospital, and the residue among poor men attending the service. He also made provision for the dining together of the clergy and church officers after the service.

Every 8th day of February is known in the Surrey parish of Wotton as 'Forty Shilling Day.' This is in accordance with the will of William Glanville, who died in 1722, by which twelve boys of the parish are to meet in the churchyard, and, with their fingers on the legator's tomb, are to repeat the Creed, the Lord's Prayer, and the Ten Commandments, and to read a certain chapter of the Bible. Each of five boys who successfully do this receives forty shillings.

The 27th day of February is known at Eton as 'Threepenny Day.' Provost Bost (who died in 1504) and Roger Lupton (who died in 1540) left money which gives every colleger threepence. Tradition says that the original bequest was half a sheep to each colleger, and that he now receives the equivalent in modern money of the value of half a sheep in the sixteenth century.

On Lady Day, the 25th of March, it was the custom at St Albans—within the last ten years at any rate, and it may be done now—to distribute cakes known as 'pope ladies' to the poor. The money for this was left by a noble lady of the fifteenth century, who, having lost her way at night on her journey to the monastery, found it by the aid of the clock-tower light, and thus emphasised her gratitude.

A custom of similar origin still obtains at Newark, where on the twelfth Sunday before Christmas, and for six Sundays, the bells chime at evening for an hour, in accordance with the will of Gofer, a local merchant, who, three hundred years ago, lost his way in the woods and was guided home by Newark bells.

On Good Friday a number of ancient bequests are still commemorated. The most interesting perhaps is that which is carried out at the oldest London church, that of St Bartholomew the Great, Smithfield. Twenty-one widows repair to a certain tomb in the churchyard, and each picks a sixpence from off it. The origin of the custom, which has been observed for four hundred years, is not known, but it is said that the original bequest was made by a lady (who was buried in the nave of the church in pre-Reformation times) for masses to be said for her soul, and that at the Reformation the money was put to its present use.

At All Hallows, Lombard Street, the sixty youngest Blue Coat Boys used, before the removal of the school to Horsham, to receive a new penny and a bag of raisins.

At St Margaret's, Lothbury, the 'Three Hours Service' was perpetually provided for by the bequest of an old parishioner who lived at the Reformation time, and who, as a Merchant Taylor, made it a condition that the officials of his company should be present. This is still observed.

A very curious old London Good Friday custom, although not a bequest, may be mentioned here. At the public-house of 'The Widow's Son,' in

Devons Road, Bow, every Good Friday, the landlord adds one to the many time-blackened buns which hang in one of the rooms. According to tradition, the house was once kept by a widow whose son, a sailor, started on his first voyage on a Good Friday. News reached his mother that he would return on a Good Friday, and she put a bun aside for him. He never returned; but the widow continued to put his bun ready for him every year, and succeeding tenants have kept up the practice.

On Easter Eve the singers of St Mary in Arden, Market Harborough, sing the Easter hymn over the grave of William Hubbard, who died in 1786, and who bequeathed a guinea per annum for the purpose.

In the little Kentish village of Biddenden the famous cake ceremony is performed every Easter Day. At least four hundred years ago there lived in Biddenden two sisters, Eliza and Mary Chulkhurst, who were joined together—so says tradition. One of them dying, the other very naturally died also. By their will some twenty acres of land were bequeathed for the benefit of the poor, and known as the 'Bread and Cheese Lands,' from that article of the bequest which provides that on the afternoon of Easter Sunday there shall be distributed six hundred cakes bearing the impress of the sisters, bread, and cheese. Hasted, the historian of Kent, can find no truth in the legend about the twin-sisters, and declares that the curious cakes, so eagerly sought after as mementos, do not date farther back than 1740, and that the bequest was made by two ordinarily constituted ladies named Preston. However, the distribution still takes place, and attracts a large company to the little place, once famous for its linen manufactures and —its smugglers.

Every 6th day of April there is sold in connection with a local charity at Bourne, in Lincolnshire, the 'White Bread Meadow,' by the following curious auction fashion. At the beginning of the bidding two boys start on a race, and the bidder at the moment when the winning boy breasts the tape is the tenant for the coming year. After the performance bread, raisins, and ale are provided.

On May Day a curious wedding is celebrated at St George's in the East, London, in accordance with the terms of a bequest by William Raine, who died in 1742. By his will a sum of four thousand pounds was set aside, the interest of which was to provide a marriage-portion for a girl from his schools in Old Gravel Lane. For this prize six girls, at the age of twenty-two, who had been brought up at these schools, were to draw lots from a tin tea-canister. The only conditions of the marriage were that the proposed husband was not to be a soldier or a sailor, must be of the Church of England, and be approved by the trustees. The excitement in this humble neighbourhood when the annual drawing for the munificent Raine's Bounty takes place can better be imagined than described.

On Whit-Tuesday there is preached at St Leonard's, Shoreditch, London, in fulfilment of the terms of the will of Thomas Fairchild, a gardener, who died in 1728, and left twenty-eight pounds for the purpose, a sermon which has for its text, 'The certainty of resurrection from the dead, as shown by operations in the animal and vegetable world, and changes in the operations of the animal and vegetable kingdoms.'

At Whitsuntide there is annually sold at Enderby, in Leicestershire, the grass of part of the Ratby Meadow, this meadow having been granted by John of Gaunt to fifteen men who answered his invitation to come to him at Leicester and receive from him a piece of land, as a commemoration of his joining in the local festivities of 'mowing-day.' The only condition of his grant was that this particular portion should be reserved for annual sale, and the proceeds applied to charity. It is said that the annual sale has only been interrupted during three years of the Civil War period.

At Shennington, near Edgehill, the church is strewn with freshly mown grass every Whit-Tuesday, in commemoration of the fact that the church was thus strewn at its consecration, it not being yet paved. To keep this old custom up, two local ladies bequeathed a piece of ground to grow the necessary grass.

A most unusual performance of a bequest is that which takes place every Whit-Tuesday at the parish church schools of St Ives, Huntingdonshire, when six boys and six girls from Church and Nonconformist schools cast dice for Bibles, in terms of the will of Dr Robert Wilde, who died in 1675.

On Midsummer Day, under the will of Isaac Duckett, who died in 1620, the interest of the sum of four hundred pounds, which he left 'in order to encourage fidelity and long service among domestics,' is distributed in sums varying from twenty pounds to five pounds among eleven people dwelling in the parish of St Andrew's, Holborn, who have been in one service seven years. Owing to various social changes since the first distribution was made in 1639—chief among them being the disuse of the City of London as a residential centre, and the fact that faithful domestic service has ceased to be an object of pride and self-satisfaction —the scope of this charity has been altered and widened. Of a similar character is the bequest of one Meyrick of Launceston, in Cornwall, by which, on 12th July, the first day of Launceston Fair, what is known as 'pretty maid's money,' amounting to two pounds ten shillings, is bestowed on an elected maid of good character and regular attendance at church.

Bequests for sermons to be preached on certain occasions are frequent. Thus there is a service at St Margaret Pattens, London, on the anniversary of the 'martyrdom' of Charles the First. At St Mary Woolnoth, in Lombard Street, on Easter Sunday, an egg upon which is written 'My Redeemer' is given to every worshipper out of bequeathed money. On the first Sunday in May

the 'Two Pound Sermon' is preached at Burnley, in Lancashire, according to the will of Henry Halstead, who died two hundred years ago, the text of it being from Hebrews: 'For here we have no continuing city, but we seek one to come.' At St Katharine Cree, in London, the 'Flower Sermon' is preached on Whit-Monday, the entire congregation bringing flowers, which are distributed among the hospitals. On 15th June the 'Kenton Sermon' is preached in Stepney Church, the Vintners' Company attending. This is to commemorate Ben Kenton, who rose from 'prentice to being one of London's wealthiest and most charitable merchants. The bequest, according to a frequent old custom, also provides for a dinner to follow the service. On 10th July the Company of Cordwainers attend at St Dunstan's in the West to hear a sermon in accordance with the will of one Fisher, who bequeathed them Falcon Court, in Fleet Street. Formerly his health was drunk in the church, but now the money for that purpose goes to the poor. On July 25th a sermon is preached in St Martin's, Ludgate, in commemoration of the salvation of our island from the Spanish Armada, citizen and Skinner Stodder having left forty shillings per annum for the purpose. One of the most interesting of these old London sermons is that which is still preached, as it has been preached for more than two hundred and fifty years, in the Church of St Katharine Cree every 16th of October. It was founded by Sir John Gayer, one of those fine old travelling, fighting Londoners who helped to build the greatness of our City, to commemorate his escape from a lion 'in an Asiatic desert.' He bequeathed two hundred pounds for charity and for the preaching of the 'Lion Sermon.' As the Stodder sermon at St Martin's, Ludgate, commemorates the Armada, so does the Chapman Sermon at Bow Church commemorate Guy Fawkes; but most of the many sermons of this anniversary character, in London City at any rate, have had their bequest-money changed into more practical charitable channels.

On the 1st day of August Doggett's Coat and Badge is still rowed for by young Thames watermen, as it has been since 1715. Doggett was a somewhat famous comedian, and he founded the prize to celebrate the Brunswick succession. The scullers, six young watermen whose apprenticeship had expired the previous year, started at the time of the tide when the current was strongest against them from 'Old Swan' Pier, London Bridge, to the 'White Swan,' Chelsea, but now finish about five hundred yards higher up. The first prize is the orange-coloured coat with the silver badge of the arms of Hanover. To this the Fishmongers' Company have added money, and to provide second and third prizes Sir William Joliffe left the interest on two hundred and sixty-one pounds. Although the Thames has ceased to be the highway which it was early in the eighteenth century, and the Thames watermen as a body have lost much of their old power and importance, the annual race for Doggett's Coat and Badge still excites the greatest interest and the keenest competition, and the day on which it is held is marked as a general river-side holiday.

At Sherborne, in Dorsetshire, September 27th is still known as 'The Earl of Bristol's Tolling Day.' By the will of Baron Digby, Earl of Bristol, in 1698, a sum of money was left for the bell of Sherborne Abbey to be tolled all day, and for a special sermon to be preached. Browne Willis, the antiquary of Fenny Stratford, was equally determined that his death should be kept in remembrance, for he left money for the annual firing of guns, known as 'Fenny Poppers,' for a church service, and a dinner at the Bull Inn. So was one Randall of St Miniver, Cornwall, who provided for a sermon to be preached on 27th December for one thousand years!

With the last public execution of criminals at Newgate disappeared the *raison d'être* of a very famous bequest, although for some time the money had been put to more practical use. In 1605 Robert Dowe, citizen and Merchant Taylor, gave to the parish of St Sepulchre's the sum of fifty pounds on condition that on the night before every execution-day, which was usually Monday, a man should go beneath the window of the condemned cell, and after giving twelve solemn strokes with a hand-bell, should recite an exhortation in verse to repentance and preparation for the approaching ordeal. Also, that the bell of St Sepulchre's should toll on execution-mornings, so that passers-by should be moved to pray for the poor sinners going to their fate.

Three bequests of more than ordinarily curious origin may fitly close this list. At Old Weston, in Huntingdonshire, the floor of the church is annually strewn with new-mown hay on St Swithin's Day, 15th July; the origin being that the villagers of Weston used to buy their new boots in July, with the result that when they came to church on St Swithin's Day they made an intolerable noise. This so annoyed a wealthy old resident that he left money for hay to be strewn in the church on that day! At Watlington, Oxfordshire, on 19th November, twenty poor men receive coats with the bounty of Robert Parslow, who seems to have got hold of the Royalist military chest which was left here on the eve of the battle of Chalgrove Field (at which John Hampden was killed) and never called for. John Knill, of St Ives, Cornwall, among other more or less eccentric bequests, directed that the sum of twenty-five pounds should be expended on St James's Day, every five years, upon various observances commemoratory of his death, one of which was that ten girls (natives of the borough, and daughters of seamen, fishermen, or tinners), not more than ten years old, should dance for a quarter of an hour at least on the ground adjoining the mausoleum, and sing the One Hundredth Psalm to the 'fine old tune.'

These are but a few samples of the many bequests of long ago, most of which are still scrupulously respected in an iconoclastic age, and which quietly and unostentatiously keep alive that sentimental spirit which goes so far to relieve the bare prose of everyday life.

LOCH ETIVE.

By F. G. Aflalo.

THERE are all the changing moods of human nature in the face of those Atlantic backwaters known as lochs: one day dour, surly, overcast; the next, all smiles and sunshine. Even in August their weather is of April. One morning in the harvest month I pushed off in a small boat from the shores of Loch Etive, which lay before me blue, gold, unruffled as a glass mirror. The next, having motored from Dalmally along the Pass of Brander, I found Etive in funereal garb, blurred with a driving rain, lashed to inky waves by a half-gale that kept the yachts at Oban idle.

Like most of those inlets from the northern ocean, Etive produces a strange blend of faunal and floral characters of fresh and salt. Since a hundred brawling burns, racing from the Black Mount, feed the loch, the water is scarcely saline to the taste. Sea-fish and river-fish sport together in the tiny bays that lie at the foot of the deer-forest, and dodge the bills of herons whose young ones clamour hungrily in the cliffs that overhang each winding glen. Back to the nests go relays of varied food, white trout and brown, with little eels and lythe; and equally mixed is the catch of those who troll with the blue phantom or cast the grouse-and-claret over purling shallows. Even on perfectly still days, when the burnished surface is unbroken by a ripple, the phantom takes toll of silly fish, but the grouse-and-claret has its failures.

These almost landlocked ocean-shallows, unappreciated by the tourist who knows them only from the decks of little steamers that keep to the deep water, are well worth exploring in a little boat that can navigate the hundred bays and creeks, and give you the intimacy of the beaches. It was on the finer of my two mornings that, having pulled as far against the tide, I ran my little bark ashore in a creek not far from where the Noe and Liver run down from their birthplace in the hills. The grating of the keel on the shingle beach sent many a fowl in a hurry from table. Half-a-score of solemn herons flew heavily away from an unfinished meal of stolen trout, and flapped guiltily to their nests in the recesses of Cruachan. Half-a-hundred mallards circled higher and higher round my head and sought sanctuary from a gun that existed only in their imagination. Fairy terns and more ponderous gulls, knowing their safety at all times, hovered, careless of our intrusion, over the shallows. Of waders there was more variety than could at a glance be appreciated; but even before we disturbed them we recognised a pair of oyster-catchers at work in the soft mud, and a merry company of greenshanks tripping under cover of some rocks at the farther end of the bay.

From a slippery rock, that offered treacherous foothold in the midst of a great natural bed of mussels, I watched an unconscious seal bathing in a pool not fifty yards from where I crouched on the wet weed. I held my breath as I watched the spangled moustaches bristle beneath the soft eyes. Then the *séance* was over, for, alas! the seal recognised that the enemy was in possession of its favourite basking-rock, and sounded out of sight. After lunch both the phantom and the fly were tried alternately in the shadow of the mountain, but the dazzling light must have blinded the fish, for not more than half-a-dozen fell victims, and all of these were returned as beneath contempt. Yet fishing mattered little, for there was rich harvest on all sides for the quiet eye, and the tide was with me back to Taynuilt pier, so that it was delightful drifting on a summer sea. Such was the finest day I ever saw on Etive. Cruachan smiled across a vale of haze at Starive, and not a breath of wind stirred the dwarfed trees along the north shore. Twenty-four hours later the lovely glens of yesterday were nowhere to be seen. Foreground, middle distance, and horizon were lost in a maze of blinding rain. Perspective was lost in an unbroken monotony of chill grayness. On the first day I understood the Scotsman's passionate worship of his native land. On the second, I understood still better why he has pioneered civilisation to the burning plains of India and to the frozen peaks that overlook the Yukon. Exile can hold few terrors for one whom, from the cradle, Nature educates in indifference to such quick changes as I saw in Etive's mirror.

SONNET.

INTERLUDE.

As some lone labourer in the quiet fields,
Pausing awhile from bending o'er the ground,
Rests his tired senses on the peace around,
And with freed hands his sun-dazed vision shields,
Hearing the lark's song thrilling toward the blue,
Seeing the hedges bright with beckoning flowers,
He turns to work again with freshened powers—
So, in the pause of life, my soul found you!

Then, glad with wonderment, dazed with the light,
I saw the wide horizon's circling bar;
And, lo! the fields for harvest ripe and white.
(Of all great good interpreter you are.)
Now, blessed am I who delve my lowly plot.
Ah! if I had not paused, or you had loved me not!

MÁHI-O-MARÁTIB

(THE FISH AND DIGNITIES).

By Colonel HUGH PEARSE, D.S.O.

THE Dignities have long faded from memory, and the Fish came to the hammer some sixty years ago. The name of its purchaser is unknown, and it may be that the present owner values it at its proper price as a rare historical relic, or more probably it may hang neglected in a dark corner of some country house, or be hidden in the lumber-room of an old curiosity shop.

The Fish makes frequent appearances in history, and we find a picturesque reference to it in a book which, while making no pretension to the dignity of history, yet brings pre-British India more clearly before its readers than any other work in our language. This book is the memoir of James Skinner, the soldier of fortune to whom it befell, almost accidentally, to become the owner of the Fish, as great good luck does sometimes fall to the young and adventurous.

It came about in the sanguinary battle of Malpura or Sanganir, fought, in the year 1799, near the city of Jaipur, between the Rajputs and the Marathas. In this fight the Rajputs made their last attempt to prevent the control of the moribund Mogul empire from falling into the hands of the Marathas.

The battle lasted a long while, and was stoutly contested, an unusual feature in the internecine conflicts of old India, in which it was usual for one side quickly to prevail. The Rajputs at Malpura, however, relied on the great numbers and proved valour of their cavalry, while the Marathas felt equal confidence in their powerful and efficient artillery and in their regular infantry trained to Western discipline by De Boigne and his successors and subordinates.

Before the final advance of the Rajputs brought the two armies into contact, Lakwa Dada, the Maratha commander, addressed his warriors in a pithy speech. 'To regain the old Patel's turban,' said he, 'I am resolved to conquer or to die. Hear this, oh ye sons of the brave!' Now, 'the old Patel' was Madhoji Sindhia, the national hero; and this reference to his hurried flight on an occasion when he incurred the dire disgrace indicated by Lakwa Dada stirred every Maratha heart. 'May God assist us!' they shouted in reply.

The doubtful battle raged for many hours, the brave Rajputs making furious charges upon the solid Maratha squares. In the end discipline triumphed, and the Rajputs were not only driven from the field but dispersed to their homes, leaving their camp exposed to the spoiler.

So heavy had been the losses of the Marathas that for a time they rested inactive, hardly realising the completeness of their victory. 'About noon, however,' says Skinner, 'running camels brought intelligence that the Rajah and all the troops that had escaped from the battle had retreated towards Jaipur. The three hundred cavalry attached to our brigade were ordered to go on and collect information. With them I volunteered, and was permitted to go. On reaching the enemy's camp I found the news correct—it was utterly abandoned; and accordingly I sent word of this back to Colonel Pholman [the German officer who commanded his brigade]. I marched into the encampment; it was the largest and best I had ever seen, but totally deserted. Here were most beautiful tents and large bazaars filled with everything imaginable, but not a man to be seen. My three hundred *sowars* dispersed and went to plunder, and I myself, with two of them, went on and reached the Rajah's wooden bungalow, the most beautiful thing I ever saw, all covered with embroidery and crimson velvet. I entered, and saw nothing but gold and silver. In opening one of the Rajah's *poojah* baskets I found two golden idols with diamond eyes, which I immediately secured in my bosom for fear they should be discovered. I found also several other trinkets, which I likewise took.'

 [*All Rights Reserved.*]

Skinner now, quite accidentally, stumbled on fortune.

'In coming away I found a brass fish with two *chauris* [yak's tails] hanging to it like moustachios. It attracted my curiosity, and I tied it to my saddle. On my way back I met numbers of Maratha chieftains going and coming, who all looked at me and laughed as I passed, for what reason I could not then imagine.'

Skinner then, with his inimitable simplicity, goes on to describe his interview on returning to his own camp with Lakwa Dada, the Maratha commander-in-chief. 'I found him sitting,' he says, 'along with several other chiefs, under a large tree, and on my approach Colonel Pholman ordered me to dismount. I feared that he might have heard something about my prize, which, however, I had secured in my *charjameh* [native saddle]; and, thinking that he wanted to examine my saddle, I began to excuse myself by saying that I was much fatigued and would be glad to have some rest. But Lakwa told me that he wished to see me, for I had saved "the old Patel's" turban in this day's battle. I thought that by this he meant to say that my battalion had especially distinguished itself in the charge of the Rhators; but he came closer to me, and Pholman, seeing me confused, perplexed me still more by his laughing. At last Lakwa asked me what it was I had hanging to my horse. I replied, "A brass fish." "Will you give it to me?" he said. "By all means," said I, "provided you will demand nothing more of me." "No," said he, "I will not." "Give me your word on that," replied I, and he immediately did so; on which I loosed the fish and presented it to him.

'"Well," said he, "dismount now, and let me embrace you;" and, as my orderlies and groom had now come up, I dismounted and he embraced me. He then explained that the Fish I had given him was the actual Máhi Marátib, or imperial ensign of honour bestowed by the king of Delhi upon the Rajah.'

Turning with regret from Skinner's entrancing narrative to more sober history, we find that many writers have described the strange emblem left in his flight by the Jaipur Rajah.

Mr Irvine, in his *Army of the Indian Moguls*, gives, indeed, a list of seven of the principal badges of honour carried before the kings of Delhi, or before the subjects whom they delighted to honour. Of these emblems, five were sacred to the 'Asylum of the Universe' himself, and their names and meaning were as follows: (1) Panjah (an open hand), said to have been originally a battle-honour, taken by Taimur in Kafiristan. (2) Alam (a flag), also a trophy of one of the early victories of Taimur. (3) Mizán (a balance), the emblem of justice. (4) Aftáb (the sun), in memory of the conquest of the sun-worshippers. (5) Azhdaha-paikar (interpreted as 'dragon-face'), an ancient object of worship in Hindu India, presented to Taimur as a peace-offering. The two other emblems, but little less in dignity, were bestowed on subjects of the highest rank, and in one instance only on an Englishman. Authorities differ as to whether these badges were conferred separately or went together. They were known as (1) Máhi-o-Marátib (the Fish and Dignities); (2) Qumqumah (a globe or lantern).

The emblems, it will be seen, were of great antiquity, and, though not of high intrinsic value, were prized by the Moguls and their courtiers in that they kept alive the memory of past glories. The seven insignia carried before the Mogul sovereigns typified the conquest of their great ancestor Taimur and his successors over the seven climes, or, in other words, over the whole world.

Such has been the art by which, in all countries and at all times, the rulers of mankind have taken advantage of the universal craving for marks of distinction; and the Mogul kings, says Mr Irvine, showed an exceptional ingenuity in 'converting things worthless in themselves into objects to be ardently striven for and dearly prized,' and in rendering the least of the seven emblems as acceptable to their proud Rajput vassals as to their own Mohammedan followers.

Observers of the foibles of mankind have very often commented cynically or benevolently, according to the bent of their humour, on the power exercised by honorary rewards. The apology of a great and good man, Lord Cornwallis, for this proof of weakness is well known. 'You will have heard,' he writes to his son, 'that soon after I left England I was elected a Knight of the Garter, and very likely laughed at me for wishing to wear a blue riband over my fat belly. I could have excused myself in the following lines:

> Behold the child, by nature's kindly law,
> Pleased with a rattle, tickled with a straw;
> Some livelier plaything gives his youth delight,
> A little louder, but as empty quite.
> Scarfs, garters, gold amuse his riper stage,
> And beads and prayer-books are the toys of age.

Another great Englishman of the same period, Lord Lake, had the unique honour of being the only European on whom the distinction of the Máhi-o-Marátib was ever conferred. This was in the year 1803, when Lake shattered the Marathas armies in Hindustan, while Arthur Wellesley was similarly employed in the Deccan.

Early in his wonderful progress of victory, Lake entered Delhi and thus freed Shah Alam, the blind king, from the thraldom of the Marathas. Great was the joy of king and people; and Shah Alam, whose treasury was empty, readily bestowed on Lake the highest honour at his disposal, that of the Fish, together with such appropriate titles as are still valued in chivalrous India.

The badge Máhi, as received by Lake a few months later, after his great victory at Laswari, is described by Sir William Thorne, who witnessed the presentation, as the figure of a fish, four feet in length, of copper-gilt, and placed horizontally on

the point of a spear. It is uncertain whether this Máhi was accompanied by the Marátib, which latter emblem is described as a ball of copper-gilt, encircled by a fringe about two feet in length, placed on a long pole, and, like the Fish, carried on an elephant. The two badges, as Mr Irvine tells us, are always spoken of conjointly by careful writers as 'the Fish and Dignities;' but it seems possible that in some reigns the Marátib was granted as a separate honour and was then styled Qumqumah.

We cannot tell if Lord Lake's Fish was the same one that Skinner tied on his saddle at Malpura, or another of the same description; but its history for forty-five years after Lake received it on the battlefield of Laswari can be traced without difficulty.

Lord Lake returned to England in 1807, and died early in the following year, worn out by the toil and hardship of his Maratha campaigns. On his death the Fish passed with his other possessions to his eldest son, Francis, who succeeded him as second Viscount, and died in 1836. General Lord Lake's second son, George, colonel of the Twenty-ninth Regiment, having fallen at Roliça, 'the admiration of the whole army,' the peerage consequently devolved on the third son, Warwick, third and last Viscount Lake, formerly an officer of the navy, who died 24th June 1848, when the title of Lake became extinct. A few months later the greater part of the personal property of the last Lord Lake was sold by auction. The reputation of his famous father still lingered in the memory of many veterans of the Indian Services, and the auctioneers were satisfied to publish their catalogue with the following preface:

'The name of the illustrious LAKE, so signally associated as Commander-in-Chief with the brilliant operations in British India at the commencement of the present century, renders it superfluous for the Auctioneers to do more than simply to announce the fact that the celebrated Trophy and other testimonials to the bravery of that highly esteemed Noble Lord and General are included in the present sale to render those objects peculiarly desirable to all connected with Eastern affairs, but more especially to the remaining few of his valiant comrades.'

Among the objects sold were some interesting pictures, the whereabouts of some of which is known and of some unknown. The strikingly virile portrait of Lake himself hangs most suitably in the Oriental Club, which also possesses a beautiful bust of the great soldier. A portrait of George IV. as a young man, painted by Gainsborough, and presented to Lake by the Prince, was recently exhibited in London, and preserves all its original brilliancy. We know not, however, who possesses another gift of the Regent to his friend and equerry, sold on this occasion, a portrait by Sir Joshua Reynolds of Mrs Lake, the General's wife, who died in youth many years before his elevation to the peerage. The picture, if now unknown, may perhaps be recognised by its description in the catalogue. 'The lady,' it says, 'is represented in the act of raising a mirror behind the head, so as to reflect her image in a toilet-glass, which, partly concealed in drapery, is placed on a table to the left. In the background, on the right of the picture, is seen the pillar of a bed, over which the curtains loosely fall. The ideal as well as actual beauty of the countenance and attitude of the figure deserve to be noticed.' Where, too, is the portrait of Lake's mother by Sir Godfrey Kneller? This lady is shown, we read, 'seated on a bank and surrounded by foliage,' the attitude being described as 'extremely graceful.' Lake was the handsomest man of his day, and the picture of his mother should be worth looking at.

Among the trophies sold were two pieces of plate presented to Lord Lake by his brother officers. The first was 'a gilt oviform vase and cover,' given by the officers of the Brigade of Guards after the victory of Lincelles; and the second, which excited the enthusiasm of the auctioneers, 'a most noble sideboard ornament, representing "the Temple of Victory," presented by the officers who served in the Maratha War,' may have been an artistic atrocity, but cannot be considered uninteresting.

All these objects, however, shrink into insignificance beside 'that curious trophy in gong-metal, in the form of a fish, with appendages,' which was bought, probably for a song, by some person unknown in November 1848. Who owns it now?

VANESSA.

CHAPTER IV.

N emerging from the courthouse, Vanessa, amid the admiring glances of the crowd, went straight across the street to a sweetmeat shop, and in a short time came out with an armful of packages, which she handed to her maid. We then all adjourned to the 'Red Lion,' meeting the squire at the door.

As we passed in mother held out her hand, but he did not seem to see it, his eyes being fastened on Vanessa; and as he looked that indescribable far-away expression I had noticed before passed over his face, and for a moment he was evidently lost to all but the lovely being before him. Then he seemed to awake, and greeted mother and me most warmly.

Vanessa would not come in. She said 'No,' she 'had a little business to do;' but she begged mother to let her drive me home in the car, and she would take tea with us.

Mother said she would be delighted, and then she took a thought and said, 'Will you not come and stay over night with us, or longer if you can? And I have a selfish reason, for I do wonder whether I would not enjoy a drive or two in the Car of Juggernaut.'

At this we all laughed, and Vanessa said, 'Would you really? That is delightful! Indeed, I will come if Mrs Marsden'—turning with a pretty air of deference to her chaperon—'will allow me.' At which the old lady beamed, as much as to say, 'That needs no reply.'

'That's all right, then,' said Vanessa. 'When I have done my business I will run home with Mrs Marsden, and fetch my things, and pick up Mitey here.'

The squire then, with charming old-style courtesy, ushered us upstairs to the inn's best parlour, explaining and apologising for having sent us a message and not coming himself to us, as he thought it would not do for a judge to come down into the body of the court. The explanation was quite unnecessary, we told him; and he did the honours and was everything a host should be, and, with excellent taste, made no allusion to the trial. But I could see—and I thought mother noticed it as well as I did—that dear old Uncle Goodman had something on his mind, and once or twice was on the point of opening it, but refrained. After lunch mother said she must do a little shopping before having the carriage out to drive home, and of course, as in duty bound, I thought I must accompany her. But the squire in a plaintive voice said, 'Must you go too?' and looked at mother, and added, 'If Mary may keep me company, as I have an hour to wait for my train, she would be kind, and you would be good.'

Mother smiled and patted his hand, saying, 'You promise you won't make love to her if I trust her to you?' and they both laughed. He laid his hand upon his heart and bowed, saying, 'My word of honour;' and then we all laughed. Mother gave us both a little nod and was gone.

There was silence for a minute. Uncle Goodman went to the window and stood looking out. Then he turned to me abruptly, and said in a tremulous voice, 'Who is she?'

I could not pretend that I did not understand him. 'She is an orphan,' I replied, 'whom I met at school and learned to love.'

'Oh Mary, tell me all you know! When she threw up her veil to-day I seemed to be carried back many, many years, to old happy days that had lain buried in a grave of sadness. What a likeness! *what* a likeness! Oh, can it be?' He sank down in an arm-chair, and I went on my knees beside him, and taking his hand in both of mine, said, 'Uncle Goodman, dear Uncle Goodman, what can I do for you? Tell me what to do.'

He remained silent for a little, and then he put his hand upon mine and said, 'Dear child, I will tell you all, and you must help me. I had a brother-officer in the Guards; and it was not that we were brother-officers, we were brothers, as if we had had one mother, although I was his senior by many years. We both loved the same woman, but he was the favoured one. I shall never forget the day when, not knowing how it was with me, he asked me to be his groomsman, nor the awful strain it was to me to stand by my friend at the altar and see her given away to him. Nothing but the certainty that she was given to happiness enabled me to bear it. We parted that day. I could not speak; but she took me by the hand, and with the tears running down her cheeks she said, "I know! I know! God help you, dear, dear friend!"'

The poor old man leaned forward and buried his face in his hands, and after a pause he whispered, 'My friend went to a staff appointment in India, and I never looked on her again. To-day I saw her every feature, her every charm, as vividly as if thirty years were but yesterday. And that voice, that warbling tone like the murmur of a sweet brook, it carried me back to the old days, and my poor old heart beat wildly. Mary dear, what does it all mean?'

I have put all this down as if it had been one long speech, but truly it was not. It came to me in snatches, as I stroked the dear old hand, watching my friend, alternately lighting up at the vision before him, and fading back into gloom at the realisation that it was a memory only.

'But why do I trouble you with all this, my dear child?'

'Don't say trouble, Uncle Goodman! I wish I could comfort you.'

'You do—you do, dear. There, there,' he said, waving his hand, 'that is enough;' and he got up and went again to the window, while I stood and wondered and admired a constancy so beautiful. When he came back I saw he did not wish to touch the subject again, and as good luck would have it mother came in with her purchases, in which I made believe to take an absorbing interest, and so diverted attention and gave our friend time to pull himself together. Presently he left us to go to his train, giving my hand a significant pressure as we parted. I saw mother off in the carriage, and waited for Vanessa, who appeared in a few minutes, and the car having returned from Larkhall with her things, we started off gaily for home, groups of people waving their hats to Vanessa as we passed through the town.

When we had left it a mile or two behind, and were approaching the scene of the trap, I noticed that Vanessa slowed the car down, and looking forward, I saw our friend Constable Sturgis standing in the middle of the road, and holding up his hand. To my surprise, Vanessa did not seem to be annoyed, but drew up close to him, and was going to speak, when he suddenly blurted out, 'I ax your pardin, miss, for stoppin' ye; but I says to my missis, says I, when I went 'ome to

my dinner, I'll stop the lady the first time I meets her, for I must say, "Thank ye for sendin' the doctor."'

'Oh, that was nothing,' said Vanessa, smiling. 'I was so sorry that that foolish boy had hurt you.'

'Well, miss, it was good of you, all the same,' he said. 'Aa wouldn't 'ave been well for weeks if 'e 'adn't 'ave cleaned my eye out. Aa didn't know it were peas, miss.'

'No, I am sure you didn't. Will you give a message to your wife for me?'

'Surely, miss, I will.'

'Tell her I congratulate you both on having such lovely children.'

'Thank ye, miss; that'll please the old 'oman. An' aa say, miss, if you see me lookin' the other way nex' time you passes, you'll unnerstand, won't you, miss?'

'Oh,' said Vanessa, laughing, 'you must do your duty, and not mind me.'

'Ees, miss,' with a twinkle in his eye, 'you may be sure aa *won't* mind you.' Then he grinned, and we both laughed, and went on our way.

This pleasant little encounter appeared to be only a break in the reverie into which Vanessa seemed to have fallen, for she had been very quiet before, and now she sank again into silence. I had guessed, when I heard her speak of the constable's children, where she had been after her visit to the sweetmeat shop. Nice thoughts for others was one of her great traits.

Well, I saw now that her mood was for silence, and we ran past the scene of our adventure and on for several miles without a word, when suddenly, without looking round, she said, 'What became of Mr Oldsborough?'

I was quite startled, it came so abruptly, and there was something about her tone that puzzled me.

'I last saw him striding down the street when we left the court,' I replied; and I added, 'Wasn't it good of him to come?'

There was a marked pause before she said, 'Well, yes;' then another little pause, and, 'Don't you think he might have given me a chance of thanking him?' Her eyes were still fixed ahead.

What was it in the tone that struck me? Could it be pique? I asked myself.

'Well, Vanessa,' I said, 'you know how your Englishman hates being thanked when he most deserves it, and perhaps he thought it more—more—what shall I call it?—more knightly to withdraw like a visored champion when the tilt for an unknown lady's honour was over.'

I thought this rather good; but there was a distinct, if slight, toss of the lovely head as she said, 'Mitey, if you can't say something better than that, don't say anything.'

Another long pause, as we ran a good mile, and then she suddenly turned to me, saying, 'Wasn't it good fun, Mite? I did enjoy it so under the brown cloak;' and as she spoke her eyes once more shone with merriment, and she made me shake with laughter as she alternately took off the walrus, pushing out her upper lip into the form of his moustache, and drawing in her cheeks to an ascetic smile as she quoted the vicar's 'sixty miles an hour.' And for the rest of the way home she kept on bringing up the whole scene with such touches of bright wit that I had only to listen and enjoy myself. Her fun was excellent; but my greatest enjoyment came from a subtle discernment that all this exuberant mirth was in a degree forced to cover up some deeper feeling that she would fain conceal, even from me.

That night she came along to my room in her lovely laced wrap, her hair, which she generally wore coiled in a crown round her head, hanging down loose far below her waist, and she threw herself into the old grandmother-chair beside the fire, declaring that she did not think she could sleep yet. I was busy with my own hair, and left her to her thoughts for a while; and then I slid into the chair on the other side of the fireplace, seeing as I did so a tear slowing coursing down her cheek.

Before I could make up my mind to speak she suddenly threw herself forward on her knees towards me, and laid her head in my lap with a sob. What could I do? I put my hands upon her head, and neither of us moved for a few minutes. Then one dear hand came up to mine and drew it to her cheek, as she turned that cheek downwards, so that it rested in my hand, and brought her face towards the fire, gazing into it.

Presently she put out her other hand seeking mine, which she clasped, and then said slowly, 'Mitey, I am a shameless girl!'

The tone was pathetic, and made impossible the usual conventional reply of 'Nonsense,' which is ordinarily thought appropriate as an answer to words of self-depreciation. I could only give a crooning murmur of sympathy, and, stooping down, kiss the sweet temple.

Her fingers left my hand and played abstractedly with the girdle tassel of my wrap, and, still looking into the fire, she said, 'If I ask you a question, will you tell me truly, *truly*, what you think?'

'Yes indeed, darling,' I replied, stroking her hair; 'for the truth is the only real help, isn't it?'

There was a pause, and then she said slowly and quietly, almost below her breath, 'Can a girl be a good girl who is always thinking of a man she has only seen once?'

I was not able to contain myself, and I raised her head and laid it on my shoulder, whispering in her ear, 'You have seen him to-day again, dear, haven't you?'

'Yes; but it was before that.'

'And why should that be naughty?' I asked.

'I don't know, but if it is I can't help it;' and she brushed away another tear.

I felt that my face was beaming with joy, and

taking her head in my hands, I brought it in front of me, saying, 'Do you think I could look like that if my darling was not a good girl?'

The sunshine burst through the cloud, and shone over all the adorable face; and, throwing her arms round my neck, she cried, 'How did you know?' I did not answer, and she quickly added, 'I am glad you knew. Say something to me.'

I told her she must be a brave girl, and trust and wait, and all that her friend could do for her to hold her up in patience she would do. She took both my hands, and rose with a new look in her face; and having wrung them, she let them fall and went straight to the door, and with her hand on the latch, and without looking round, said, 'Yes, a good word for the last good-night, Mitey dear,' and she was gone.

But that look remained with me, and next day it found its way into my Britannia, giving a something of added nobility which I could not have conceived possible.

(To be continued.)

INCIDENTS ON AN INDIAN LINER.

By an Officer.

A SEA voyage to many means only the sailing from one port to another; but to one who has travelled from London to Calcutta for many years, as an officer in a first-class passenger line, each trip is a little life in itself. From the time the passengers embark in the Royal Albert Dock or at Gravesend, as the case may be, until they reach the muddy Hooghly, many incidents are continually happening which to the landsman may prove interesting. It is with the object of bringing some of these before the reader that this article is written.

Good-byes having been said, and the ship cleared of all friends, the vessel has hauled out of dock before we have time to look round. This being done, however, and the river entered, we take a general survey of the passengers.

While the vessel is steaming down the river, in smooth water, these are generally in great evidence, most of them having changed from the conventional frock-coat, &c., and picture-hat to costumes by which, as a rule, they can easily be singled out.

First, take those who are making their maiden voyage. Everything is evidently new to them, though their great endeavour seems to be to convince others that all they see is familiar. They even go so far as to offer information to others who have been 'there before many a time'—not excepting the ship's officers. Next come those who have made many voyages, and who, to use a sailor's expression, 'know the ropes.' They may be seen settled in a quiet corner, or walking slowly up and down the deck examining the others carefully, and wondering with whom it will be safe to associate; occasionally, when an officer is within earshot, a word of Hindustani may be dropped as a sort of advertisement, but this is quite unnecessary to the officer—he requires no such sign. Now we see the Anglo-Indian who has finished his six months' holiday, and who is longing to return to the land where he has servants at his beck and call, whom he sadly missed in England. If the day should be warm he will probably appear in his solar topee, and the presence of his Burma cheroot, of which he has carefully reserved a few for the voyage, placards him at once. Lastly, we have the globe-trotter, conspicuous in soft felt hat, and with binocular-case hung round his neck; most of these are Americans, and all seem to be keen on gleaning information regarding the smallest detail, all to be entered in the diary with the day's doings. These to the ship's officer are generally the most interesting passengers.

For the first few days, if the weather happens to be at all bad, the ship presents the appearance of a poorly attended church. Many vacancies appear at the saloon table, while on deck only the hale old gent or the consumptive-looking girl is met. Both inform you, though in different tones, that they have never been seasick in their lives.

Having passed Cape St Vincent and got out of the Atlantic swell, the ship begins to behave in a more orderly manner, and then one by one new faces begin to appear. The sighting of Gibraltar seems to act like magic on the invalids, and by the time the Mediterranean is entered the deck presents the appearance of a marine parade. Ladies who have come up for the first time since leaving London assure you that they are really splendid sailors, but that they have been troubled with *such* headaches ever since leaving. Seasick? Oh dear no! Men, again, have a different tale to tell of slow recoveries from the effects of the 'send-off' given them by many friends—which, from the appearance of some, one is inclined to believe. All these excuses are taken by the officer with the usual 'Humph!' He knows better.

The sea being now smooth and the weather fine (though the Mediterranean can be very angry at times), cliques begin to be formed, and before Port Said is reached friendships have been made which may last for the voyage. The many shady corners have been annexed by different factions, and these keep to their places and very often to themselves.

This is all very interesting to the officer, who in his spare time and with his previous experience gets much more amusement at the expense of the passengers than they perhaps imagine. I have even known cases of men going so far as to bet on the

probable outcome of different flirtations, or on the chances of quarrels arising before a certain port was reached. In many instances they have turned out correct.

Arrived at Port Said, a general exodus is made during the coaling operations, with the exception of the children, who are very often left on board to fend for themselves. I may say in passing that I never envy any mother or father who has children on board ship.

The stop at Port Said being only for coaling purposes and to take the guiding light on board for use in the Canal at night, our friends have only time to walk round the town making purchases, which vary according to the taste of the buyer or consumer. In every case, however, an exorbitant price is sure to be paid. It is the proper thing to go to be robbed, and nobody seems to mind much, with the exception perhaps of the 'canny Scot' who can only count his 'bawbees,' and does not know the value of the coins (good and bad) which he receives in exchange. There are many of his countrymen amongst the Arabs, and the familiar sound of 'Jock Ferguson from Auchtermuchty,' heard at almost every corner, acts as a charm on him ; and all return to the ship more or less pleased with their outing.

The last baskets of coal are just being put on board when they arrive alongside, and as they come up the gangway ladder the officer again gets some amusement. Look at Miss ——, the belle of the ship, who went on shore in one of Bond Street's flowery creations. Now she appears in the regulation Port Said topee, which in Madras can be purchased for one rupee, but which she proudly tells you cost only seven shillings and sixpence. You smile but say nothing. Others of the first voyagers have been likewise taken in, but nobody has the courage to tell them so, or how ridiculous they look. They will find that out for themselves soon enough.

The Suez Canal affords an opportunity for the seasick contingent to disport themselves, and we hear of no headaches there, unless perhaps from the 'gilded youth' who really 'did' Port Said. He won't tell what he experienced, but from his appearance we can make a shrewd guess.

Suez is passed without any undue excitement, and then begins the sport of the voyage. A sports committee is formed, generally consisting of from four to five more or less convivial spirits, who between refreshments draw out programmes for all sorts of games and tournaments peculiar to ship-board. These are played off during the day, while concerts and dances are arranged for the evening's amusement. Sometimes they even aspire to theatricals, and I have seen one play at least on board ship that would have done credit to Drury Lane. I must say that the committee have no easy task to perform, as there is always the man on board who knows how things *ought* to have been done, but who was not proposed as a member of the committee. This as a rule is a first voyager! Nevertheless, in spite of all growls and complaints, the fun and the ship go merrily on, and before any one has realised that the temperature has gone up to one hundred degrees in the shade our vessel steams into Aden harbour and again drops anchor.

Here again the passengers have an opportunity of displaying their finery, and the boats are kept busy during the day taking different parties on shore and back to the ship. Why any one should wish to land at Aden I have never been able to discover ; but, like a flock of sheep, where one goes the others follow, and the arrival of a passenger-steamer is eagerly looked forward to by boatmen and *gharri-wallahs* (cabmen). The only things worth seeing there are the tanks or large reservoirs, built many years ago for the saving of water. These are generally visited by most of the passengers, but I do not think I have heard any say that they have really enjoyed their visit to Aden.

Aden left, the sports are again resumed, and the following eight days are perhaps the most interesting of the voyage. All by this time have become acquainted, some more than others ; flirtations have begun—ay, long before this ; even quarrels have arisen ; but on the whole every one seems content. The mere fact of travelling by a British India Steam Navigation Company's steamer means comfort to all, and that goes a long way towards tranquillity. Concerts are given frequently, at which the talent is sometimes of a very high order, and I have actually seen competition so keen as to lead to the breaking of friendships. I remember a case of two ladies occupying berths in the same cabin, and having been inseparable since leaving London, who almost came to blows over a discussion as to which had sung better at a concert the previous night. Voices raised above the ordinary were heard emanating from the saloon, and concluding with a call for the stewardess. That functionary, having evidently arrived on the scene of action, was ordered by one lady in withering tones to 'remove that person,' whereupon another scene ensued. This tumult was eventually quelled by one of the combatants retiring—the last word heard by the interested audience being 'cat.' Needless to say, there was a deadly feud between them for the remainder of the voyage. Dances are also got up, even to the extent of fancy-dress balls. These are always popular with passengers, and are invariably a huge success. It is really marvellous where the costumes come from, and one would almost think that all had come prepared.

Meanwhile, during the day, the heats of the tournaments have gone slowly on, and the finals are arranged to be played off on Gymkhana Day. This is *the* day of all others, and from 10 A.M. till dark all is bustle and excitement. The competition is very keen, and deafening applause proclaims the finish of an exciting game. Races and feats of all sorts, even to 'limerick' competitions, are gone in for by old and young, and many of those who left London resolved never to smile again forget their cares and renew their youth once more.

At last all the events are decided, and the energetic

committee are once more called upon. The prizes, which as a rule are bought at Aden, are selected, and an evening—probably that before we reach Colombo—is fixed for the presentation, when there is a scene of wild excitement; and as each successful competitor is called upon to receive the allotted prize he or she is greeted with rounds of applause. Not the least amusing part of the performance is the effort made by many to make a speech. These invariably end in hopeless confusion and shrieks from the noisy party. This generally finishes the sporting part of the voyage, and next morning the ship enters Colombo harbour.

Here the passenger has once more an opportunity of seeing something new, and all take advantage of it. Boats plying for hire surround the ship, and before long the vessel, so far as passengers are concerned at least, presents the appearance of a 'deserted village.' The gorgeous hotels of Colombo are too well known to require description, and wherever one goes comfort is always sure to be found. Should it chance to be a guest-night at any of these hotels many people remain on shore, where after dinner dancing is indulged in till a late hour.

Time does not often permit of a visit to Kandy, though I have known instances of passengers risking the journey and being well repaid for their courage. Two adventurous spirits some time ago were so well repaid that they had to cross to Tuticorin by steamer and proceed to Madras by rail. They did *not* miss the ship there.

I have always thought that the voyage ought to end at Colombo. Every one by that time has been long enough in the 'little world of its own,' and the passage to Calcutta *vid* Madras seems very flat after the excitement of the previous weeks. Madras harbour is not an ideal place in which to be cooped up on board a ship, and Madras itself to a stranger is uninteresting. Of course several have left at Colombo, and many more say farewell here, and discontent is beginning to show itself in many cases. Nobody is, therefore, sorry when, the cargo work having been finished, the vessel passes through the breakwater entrance and sets her course for the Sandheads. There we arrive two days later and meet the steamer from which comes the pilot to guide us up the winding Hooghly.

All is now bustle and confusion amongst the passengers, only those who have taken the precaution of packing up beforehand having time to look about. Couples may be seen together in different corners gazing into one another's eyes and making silly promises which will never be kept. I may say that of all the engagements I have known which took place on board ship only one came to anything.

All this time we are steaming up the river and wondering if we will be in time to moor at the pier. This we eventually manage to do in the evening, and when made fast the ship presents the appearance of some great animal breathing heavily after a long journey. The passengers and baggage are quickly landed, most of the former either forgetting or not deigning to say farewell. The decks being cleared, we go down to dinner, feeling another voyage 'nearer home,' and forget, with few exceptions, those who have travelled with us.

So ends the outward voyage, and we settle down for a week's rest before preparing for the homeward one, which will be more or less a repetition of the first.

FIELD-GUNS—BY THE 'GOLDEN CRESCENT.'

By Commander E. Hamilton Currey, R.N.

CHAPTER I.

Captain Ralph Heriot, master-mariner in the British mercantile marine, walked down Cannon Street with a happy smile on his bronzed and clean-shaven countenance; for Captain Heriot had this very morning achieved the apparently unattainable, and it had filled his heart with joy. When at sea this redoubtable master-mariner spent twenty minutes morning and evening 'punching the ball,' which, if it caused somewhat ironic comment among his brother-seamen, did not apparently incline them to accept his invitation to 'come and have a turn with the gloves,' which he held out to both officers and men. There was a reason for this, for Captain Heriot, standing six feet in his socks, could not get his weight below fourteen stone ten pounds, no matter how hard he tried, and his endeavours were consistent and persevering. When ashore he spent much time in all sorts of physical exercise; and lately, having rather specialised in boxing, he was accustomed to go every day to a school in the City kept by one Hawkins, an ex-driver of the Field Artillery, as good a man of his weight as ever put on a pair of gloves. Hawkins had been fairly satisfied with the progress of his pupil, but had of late been endeavouring to teach him a certain method of evading your adversary and of landing him with your right on the point of the chin, which, 'if you brought it off clean and clever,' to quote the ex-gunner, 'would stretch a man for dead same as if you'd hit him on the head with the kitchen poker.'

This very morning Heriot had accomplished the trick, and had sent his instructor flying, to land on his back on a gymnasium-mat some six feet away. Had it been in the P.R. the 'professor' would undoubtedly have been counted out, as it was some thirty seconds before he recovered sufficiently to sit up upon the mat and grin. 'Well,

you got it that time, captain, or rather I did, and I am precious glad it wasn't a four-ounce glove you were wearing. All I can say is that when you hit out with your knuckles bare I hope that I'll be there to see, only it won't be me what'll get what your givin'. It was beautiful, really beautiful; I couldn't 'a done it better myself.' The professor remained seated upon the mat for quite a considerable period ruminating upon the æsthetic perfection of 'the upper cut' which he had received, and then leaped nimbly to his feet. 'No more to-day, thank you, captain, all the same. I've been kicked in my time by a battery-mule; and, now I've been hit by you, of the two I think I prefer the mule. You're uncommon nippy for so heavy a man, and I'll have a crick in my neck for a week after this. Howsomever, you've learned the trick this time, and no mistake.'

This it was that caused the satisfied smile to dwell upon the mariner's countenance as he stepped lightly along Cannon Street to the office of his old friend and patron, Moses Gruber, of the firm of Volsass, Schmidt, & Gruber, which is situated at No. 1000A in that busy thoroughfare. Heriot skipped up the dingy stairs, and was received by Mr Gruber's familiar, an office-boy, who grinned widely as that gentleman expressed his opinion that the youth was growing in stature and villainy. He gave a sharp rap at an inner door marked 'Private,' and found Mr Gruber looking out of the window.

'How goes it, Grub?' said the sailor. 'How many millions have you made since I saw you last—ten months ago, was it not?'

'Ah, times, my dear captain, are not what they once were. Why, twenty, even ten, years ago trade was a very different thing from what it is now. What with the centre of Africa being as peaceful as Cannon Street, what with interfering people objecting to the very natural desire of the Arabs to conduct business on their own lines, and what with the rapacity of persons with whom I do business to-day, really, really I find it quite difficult to make both ends meet.'

The captain sank into a comfortable arm-chair, and accepted the excellent cigar proffered to him by his host.

'Don't you find it a bit fatiguing to keep up that professional cackle, Grub; or is it so much second nature that you can't help it? Anyway, it's all wasted on me, and that you know well enough. I've come here to talk business.'

From under his bushy eyebrows Moses Gruber shot a glance of exceeding shrewdness at his companion. 'If it is real business, my dear captain, I shall be glad to hear of it, for, joking apart, things in the City are shocking.'

'Well,' responded the other, 'you had my letter which gave you some inkling of what was up. Now I'll try to pitch the yarn as short as possible, and see if you're the man for the job; if not, of course there are others.'

'Always those others!' murmured Gruber.

'Yes, always those others, and all of 'em starving for the job, I can tell you, or, rather, I needn't, as you know it as well as I; but let's leave them out of the reckoning for the present until we see where we are.'

'I am all attention.'

'Very good. I am just home from up the Straits, as you know, where I have been "passing to and fro upon my lawful occasions,"' said Heriot with a broad grin; 'and on one of those said occasions I happened to be at Ragoven, in Monteblanco. Now, I don't meddle in politics; but a man can't help hearing things; and, as some johnny has remarked before, "it looks as if there'd be trouble in the Near East in the spring." From what I gather, the inhabitants of Teutonobia ain't exactly loved in those parts; and if there is going to be a scrap, the people who are going to do the scrapping want to be as well prepared for it as is possible, which is only common-sense. At Ragoven I got into communication with an exalted patriot, who looked like one of the pirates in *Peter Pan*, and owned a name as long as the maintop-bowline, which I can never remember, and which don't much matter, as he ain't the boy who signs the cheque. All I can recollect of his tally is that it ends in "Ics," and for the purposes of this yarn "Ics" will do.

'He paid me many compliments, and talked all round the compass for about a quarter of an hour, did "Ics," and at last he came to business: would I, or would I not, take on a contract to land two batteries of mountain artillery, guns, limbers, harness, ammunition, and the whole bag of tricks on the quiet? Naturally, I wanted to know why on the quiet, Monteblanco being a sovereign state. But he said that that was his business, and not mine. He was prepared to pay; was I on? Well, we went into the matter thoroughly, and I said I knew the right man for the job, and then "Ics" explained what he wanted done. The guns are to be landed in a place which he actually showed me. I left the ship and became the inquiring tourist, and went with him to the spot he had chosen; it hasn't got a name, for it is a mere sheltered indentation in the coast, but with an extraordinary sort of natural quay to it, alongside of which a shallow-draught lighter can lie. But—and here is where the fun comes in—this place is not in Monteblanco, but is in Teutonobian territory—only just, you understand, but that "only just" makes all the difference. Now, I must tell you that as far as I can see there are no flies on "Ics;" any fly that settled on him would have about as much chance as one which settled on you, Grub, and I can't say more for him than that. And friend "Ics" has thought this matter out in a manner which does credit to his head and his heart.'

Captain Heriot paused and flung the end of his cigar into the fire. His companion pushed over the box to him; he selected another, lighted it, and proceeded: 'It is so little over the frontier

line that you could throw a stone from it into Monteblancan territory; but there is a sort of frontier post of five men and a corporal, Teutonobian infantry, within a mile or so of this landing-stage. This I pointed out to "Ics," who smiled superiorly. "You have heard, no doubt, terrible stories of brigands in mountain countries?" he said; and I admitted that I had heard such yarns. "There are a great many such stories going about now," he said, "and if we attempt to bring off our little *coup*, you will find that the men belonging to that post will be chasing a notorious brigand over the mountains." Then he winked in a way that did you good to see. "Right-o," I answered, "that is one objection disposed of; but I can't bring the *Golden Crescent* into that beastly little boat-harbour, and I can't land the stuff in boats under a month of Sundays." He winked again, and then went on to explain that he had a big shallow-draught lighter worked by a petrol-motor, fitted with a crane also worked by motor, which would hoist the stuff out with sufficient clearance to put them on to flat carts upon which it would be transported, still in packing-cases, to wherever it was to go. 'Seems a fairly feasible plan; don't you think so?'

The business side of this proposition now came uppermost, and the men went out to lunch, came back, and sat immersed in papers and calculations until the roar in Cannon Street sank to a subdued murmur, and another day had merged itself into a murky winter's night. In the end Mr Moses Gruber said, 'The firm accepts,' and entered into a prolonged wrangle upon the subject of the commission to be paid to the mariner. The latter kept a stiff upper lip, knowing that the contract could not be carried out without him, and finally emerged the victor from a tough contest.

So it was that at the end of a fortnight the *Golden Crescent* cleared 'London River,' her hold packed with 'pianos,' 'casks of nails,' and 'hardware miscellaneous' for a port in the Mediterranean Sea. Going down Channel the name-plates changed themselves from *Golden Crescent*, London, to *La Belle Poule*, Saint Nazaire; but Heriot modestly refrained from flying the colours of the nationality which he had temporarily adopted. The weather was fine and clear passing Ushant; they caught the tail of a hard westerly blow crossing the Bay, which caused an uncomfortable roll, but had but little effect upon their speed; and when they reached the latitude of the Burlings on the coast of Portugal the sun came out and the weather conditions were decidedly prosperous.

Heriot held council with his trusted friend and auxiliary, Thompson the first-mate, to whom he now confided his scheme in its entirety. 'We ain't going to show on the coast in daylight,' he said. '"Ics" is on the lookout, and we're working to scheduled time. When we get off the spot we've marked down we lie off, and he sends a fast launch out to pick us up out of sight of land, and to let us know that everything is in train and quite all right; then as soon as it is dark we stand in to the coast, and the launch will lend a hand to bring out the lighter. Of course, the latter, being petrol-driven, can move for herself, but of course she ain't very fast, but with the launch lashed alongside will come out fairly quickly. Once the lighter is alongside we sha'n't take long.'

'Those new electric hoists we've had fitted,' answered Thompson, 'work like lightning. Given she'll hold the stuff, we'll have it out in a pig's whisper.'

'She'll hold it right enough,' answered Heriot. '"Ics" has worked the whole thing out by *x* and *y*, and from what I saw of him he's a born organiser and as keen as mustard. It's a very big thing, Thompson, and that's a fact; but a deuced unpleasant one for us if we're caught smuggling weapons of war ashore in Teutonobian territory.'

'What's the penalty?' asked the other man.

'I never stopped to inquire, but I don't expect that the inside of a Teutonobian prison's a particularly desirable place.'

The weather in the Mediterranean was ideal, the engines were running like silk, and Thompson and the chief-engineer tried the electric hoists for the satisfaction of their captain, who professed himself delighted at the speed at which they worked. At last, on the fourth afternoon after leaving the Straits, Heriot put the telegraphs to 'slow,' and scanned the horizon anxiously with his glasses; the sun was behind him, within an hour of setting, and presently, as he gazed, a speck grew over the sea-rim, the speck became a fine line, the line resolved itself into a funnel. Heriot closed his glasses with a snap. 'That's a smart fellow! To get us an hour before sunset is good goods. You can start and get the pianos and the casks of nails on deck at once, Thompson.' The mate, with a grin, gave the necessary orders, and as the launch dashed alongside the deck was already encumbered with piled-up cases.

A smart, active, olive-skinned, black-haired man, with the unmistakable air of a sailor, swung himself over the side and saluted Heriot.

'You are the captain of this vessel, sir, I believe?'

'Yes; and you?'

'Miguel Soeberass, from Malta, at your service, in the employment of the Baron Sasulojanovics, for whom you are fulfilling an important contract. With your permission, captain, I will now take charge, and pilot you in. There will be no moon, and I intend getting you as close as may be to the landing-stage. Here is a letter from the Baron for you, sir.'

Heriot took the letter. Turning to the quartermaster, he said briefly, 'This gentleman is the pilot. Take your orders from him,' and, walking aft, began to read the communication brought by Soeberass.

Once or twice he smiled, and again once or twice he whistled softly to himself as he read, and presently sent for Mr Thompson, who came hurrying aft to where he stood.

'What's the news, sir?'

'Well, our friend there'—pointing to Miguel Sceberass—'has taken charge as pilot, and he seems quite competent for the job. He's heading her E. half N., which is just the course I should have given her myself after fixing her as we did by our observations this afternoon, so we've nothing to do for the present but to consider this letter, which is from "Ics," or, if you want the whole jaw-breaker, from the Baron Sasulojanovics. First and foremost, he says that the coast is clear; that they have concocted such a yarn concerning the terrible doings of the brigands among the mountains lying east of the coast in Teutonobia that every available frontier guard is off to hunt them down; secondly, he makes it quite right about the money, which was paid in to the quarter we agreed upon, as soon as his English agent had assured himself that *La Belle Poule* of Saint Nazaire had shipped her pianos and cleared London River; lastly, he says that a very exalted personage indeed is most anxious for a personal interview with me, with a view to further business upon the same advantageous terms; that the E. P. (as we will call him for short) will send down a horse and a guide for me, and begs that I will land with the stuff and take a short ride into Monteblancan territory to confer with him.'

'Is that all?' asked Thompson.

'Yes.'

'Well, I don't see how you can refuse; and if it's going to put us on to another job like this, one of course you'd be mad to do so.'

'Naturally, I'm going. You'll have to be off just out of sight of land, as the E. P. says that the launch and Mr Sceberass will be at my disposal to bring me back to my ship, which must on no account be seen from the shore.'

'Well, I don't see any difficulty about that,' replied Thompson.

'No more do I; and now, like a good fellow, see that that stuff is got out without a second's delay. As soon as the lighter is alongside I will land in the launch; as soon as the ship is clear make your offing, keeping as near as possible opposite the landing-place due west, and wait for me.'

'Suppose you don't turn up?'

'Give me forty-eight hours, and *if* I ain't back then I'm either dead or returning overland; for, all chaff apart, there are brigands in these mountains, and, well—one never knows one's luck.'

As the first case landed softly on the broad deck of the lighter, Heriot stepped over the side into the launch; he had stuffed a heavy revolver into one pocket of his jacket, and a pocket-compass into the other.

Thompson gripped his hand. 'Good-luck, sir, and get back as soon as you can.'

Heriot returned the grip. 'That's all right, old man; see me in *twenty-four* hours, I expect;' and he was gone.

With the ride, which took some four hours through a mountainous country, and with the subsequently eminently satisfactory interview with the Exalted Personage, this tale has no concern. Suffice it to say that should the goods on delivery prove as satisfactory as the E. P. had every reason to expect they would, then a further and even larger contract might be expected in the immediate future.

With a charming courtesy, the E. P. saw Heriot off on his return ride. The E. P.'s last words were: 'You will not mind if your guide returns when he has put you on to the straight road to the coast, where you cannot miss your way. At the end of your journey you will find a man to take your horse, and the launch awaiting you. A pleasant trip and a safe return, my captain.'

Heriot bowed low, swearing to himself the while that here indeed was a man whom men would serve for love alone, so fascinating was his manner.

The gray dawn was making ghostly splashes of light among the mountain-tops when three hours afterwards his guide reined in his horse. 'Sir captain,' he said, 'you now cannot miss your way; it is straight onward to the coast. Go with God!' and so saying, he wheeled his horse round and galloped back on the track which they had come.

(To be continued.)

TRAMPS WHOM I HAVE MET.

BEING EXPERIENCES OF A PROFESSIONAL PHILANTHROPIST.

IT is so often said that 'a poet is born, not made,' that most people believe it, and they further think that he is the only person who arrives at his profession that way. The same thing is true of the tramp—only more so. A poet can really help being a poet if he tries, but a tramp cannot. The variety of tramps is considerable if we judge them by appearance, and almost infinite if we take them at their own description. I have found that they very largely call themselves travellers, and I remember one who described himself to me as a 'tourist.'

There is a common prejudice against this interesting class of people that they do not like work. This is a mistake. We must allow people to like things in their own way, and the tramp likes work—in his own way. In fact, he loves work. He can stand, or by preference sit, all day and watch people at it.

The first time that I became a friend of the gentle tramp was by accident. I was a student,

and he simply arrived and asked for me by name. He was tall, gaunt, old, and affable. He was covered with white dust, and looked as if he had been dug out of the ruins of an old mill. This was *the* element in his success. He said with direct simplicity that he 'had come to see what I could do for him.' I gave him a shilling at once, lest a prolonged interview should lead people to think that I knew him; but he arrived again with the same simple, naïve appeal. On this occasion I threatened to assault him, and he never came again.

Tramps display great ingenuity in finding out ways of raising money. I wonder the Chancellor of the Exchequer does not keep a retinue of them. Perhaps he does. One was waiting for me outside the church the day I was ordained. I do not know how he knew it, but he was a good judge. He got a shilling, and I felt good for ten minutes and sorry the rest of the day.

From that time I have been closely associated with them. The introductory sentence is usually to the effect that they have not tasted food or taken off their clothes for two days. I have heard of one who complained that his trade had been absolutely at a standstill since the previous Christmas. As this was in August he received much sympathy, until an inquiry drew from him that his trade was snow-shovelling. I did not know this one.

I have a garden, which I find a great source of health and enjoyment and expense. It occurred to me that I might benefit my travelling friends by sharing the enjoyment and the labour with them; and I have followed this plan for some years. It enables me in a rough sort of way to classify them. Some of them are grateful for this work-test and some are not. It illustrates the uncertainty of human friendships. Some of my old friends—known to unkind and uncharitable people as 'chronics'—do not call on me at all now; but many of them still come, and a number of new ones, so that one does not feel absolutely deserted. A favourite time for their call is when the rain is falling in torrents. At such a time the number of applicants for work in the garden is phenomenal. Of course they cannot get it, and money without labour is the consequence foreseen by them in their innocence. But sometimes the consequence does not come along, and the tramp departs sadly into the misty distance. Another kind of tramp never asks for gardening work until the shades of night have fallen.

When a man asks for work on a fine gardening day, with the sun shining and the weeds cheerfully and impudently spreading themselves everywhere, the natural assumption is that he wants it. The tramp sometimes does this, and it serves him right if he gets it.

I set such a man once to dig a fine piece of ground which I intended to plant with cabbages, cauliflowers, and Brussels sprouts. I had about a thousand young plants of these kinds in an adjoining border, just ready for planting and in splendid condition; and I said to my tramp, 'Take care that you do not go near these. Do not touch this border at all.' Then I went off on my apostolic duties, returning three or four hours later, to find that he had thoroughly and carefully cleaned up my young plants with the Dutch hoe. He had really made a good job of it as a piece of cleaning, but he had not done the digging which I wanted done. However, I suppose the digging did not matter by that time, as there were no plants left to put in. I remember my thoughts on that occasion, though I reserved my words, in deference to the sentiment of the couplet which I had learned in the days of childhood:

> Naughty little cuss-words, 'bother,' 'dash,' and 'blow,'
> With many other wuss words, send us down below.

This incident prepared me for another occasion, when I had a nice asparagus-bed ready for transplanting from nursery quarters into the place in the garden where it ought to be supplying the succulent vegetable to my table now. I surrounded it with large battens of wood, which the tramp was likely to fall over if he did not see them; and I then set him to the novel amusement of trenching the piece of ground beside the asparagus-bed. He did not avoid the asparagus-bed, nor did he fall over the battens. It seemed to have the same attraction for him that a candle has for a moth. But he was a careful man, and he removed the battens, placing them tidily on the path; and then he worked hard at the asparagus-bed. When he had finished it he came and told me that he had found a lot of funny roots in the ground. Since then I buy asparagus.

A real, thoroughly trained gardener on tramp is rather unusual. But there is one such man 'on the road' at present. His name is not Alister MacAlister; but it is not unlike this name in structure. He visited me several years ago, and I put him through a horticultural catechism which satisfied me as to his ability. He had occupied superior posts with all the Scottish dukes, with perhaps one exception. He worked well for two days, 'knocking off' at five o'clock as if he had been with me for years, and receiving his pay each day. At eight o'clock the second evening he returned, dispensing an aroma of sixpenny whisky through the neighbourhood. He explained that he had met a man, a foreman gardener, in the town, who was recommending him for a post as foreman to a well-known nobleman; and he wanted me to lend him two shillings to pay for the conveyance of his Sunday clothes from his former abode. I suggested that he should write for his clothes, and offered him notepaper and a penny stamp, besides promising to pay for the clothes when they should arrive. And in the meantime I advised him to come back next day and work for the two shillings. So he went away sorrowfully, and did not return for three years.

His return took place about two months ago. He came cheerfully into the garden, where I

happened to be meditating the cutting of a hedge. 'Hallo, Alister!' I said; 'on the road again?' He pretended not to understand. But after some genial conversation he admitted that he was Alister MacAlister, denying strenuously that he had ever been drunk. 'What do you want?' I asked. 'Work,' he answered; to which I replied, 'I can give you work until you're fed up with it.' He seemed rather taken aback at the prospect, but remarked that he thought he could manage a bit of it. So I said, 'Do you think you could cut that hedge?' He said he could; and I produced a hedging-bill and a pair of shears, and remarked, 'Go ahead.' But he answered, 'I think I'll leave it,' and departed in search of more suitable 'employment.' I fear he is one of those of whom the song says, 'We're looking for employment, but they'll only give us work.'

The story of how another modern 'knight of the road' got the better of me is instructive. He was tall, very well set-up, and looked thoroughly respectable. He worked very well for three days, doing his digging with such skill and neatness that I was convinced of his genuine reliability. He spoke feelingly of his wife and family, who lived at Perth, and he seemed to be a victim of bad trade. So when he informed me on the third evening that he had been 'saving up' to send his wife a postal-order for five shillings, and was now only two shillings short, and asked me to advance him the two shillings on the security of his future work, I stepped right in and gave him the money. But, in the words of another song, 'I am waiting, weary waiting, I am waiting still for thee.' He will come again, no doubt, when he has forgotten the incident, or thinks that I have forgotten him. But I have a good memory for faces, especially when one of them is on a two-shilling piece; and if this should meet my friend's eye as he dallies over the pages in one of Carnegie's palatial buildings let him be warned in time.

Perchance the reader would like to know the tale of the tramp who twisted his back. Most tramps have twisted their backs early in life, or have been born with a twist. But I forgot this physiological fact, and did not verify it in this case. I gave him a few lessons in work, doing the work myself while he looked on and drew a steady fourpence an hour and four square meals a day while looking. He seemed satisfied with the job at this stage, and did not express any objection when I set him to work himself. But his work possessed no redeeming feature beyond the fact that it was work. I stood him for three days, as tramps were scarce at the time, owing to the rosy prospects held out by distress committees. Then I dismissed him, telling him that I might give him a day's work three weeks later. This is the end of chapter one.

In three days he returned, with a request to be allowed to remove a large heap of coal-dross which he had seen in the back garden, and to dispose of it. In the meantime an important member of my family engaged him, without my knowledge, to tidy the back garden, which he did with much elaborateness, lifting rubbish from places where it was not seen and putting it where it could do most harm. I had lent him my wheelbarrow to remove the dross, and learned afterwards that he got six shillings for the coal-dross, and free lodgings for two nights. In a few days I was surprised to receive letters from *two* lawyers making a claim on me to pay my friend the tramp twelve shillings a week until such time as he should have recovered from a twisted back received while wheeling rubbish from my garden to a free tip for rubbish. I wrote to both, giving them each other's address, and inquiring as to which was to be regarded as the legal agent of the gentleman. This got rid of one of them, but the other held on; and this is the end of chapter two.

I made various inquiries, and found that the industrious one had been seen in the street with my wheelbarrow, going through a variety of evolutions which were as interesting as they were mysterious. A spectator informed me that he gave the impression that he was practising the 'Lancers' with a wheelbarrow for partner. This perhaps affords rather a good 'wrinkle' for those who expect to meet difficult partners at a ball; but my friend did not look like a dancing-man. The evolutions were brought to a temporary close with a somersault, in which both performers took part; and this suggested to the spectator that the performer had been dining on an empty—shall I use the word?—stomach. Fortunately I had insured against the employer's liability, and I handed the matter over to my company. It cost the insurance company several pounds, and this is the end of chapter three. And the sequel is that I next saw my friend in an 'unemployed' procession in the High Street of Edinburgh.

But these examples are not representative of the whole, although they are types of the vast majority. In days of stress and unemployment many an industrious man is put to 'tramping' the roads in search of whatever odd jobs he can get, and it is an encouragement to one to pursue this method of helping without pauperising if he finds that even one out of a dozen is right. And I have found in some cases that there were sick wives or starving children hidden away somewhere out of sight of the pitying many; and I have seen the drawn and hopeless features relax into an alert cheerfulness as the man was given a spade and rake, and told to go round to the kitchen for a decent breakfast before starting on a day's work.

A WINNING HAZARD.

DRIMMIE returned from meeting the postman with such a 'dour' face that his wife left her household duties to question him.

'Is it somebody deid, gudeman?'

'No, Mysie; it 's a letter frae Colin.'

'Frae Colin!' echoed Mrs Stewart, greatly excited. 'Whaur is he, hoo is he gettin' on, and is he keepin' weel?'

'The letter is frae London. He 'll be in Blair the morn, and wants to see me.'

'He 'll travel a' nicht an 'll get into Blair at half-past seven. I 'll tell Donald to yoke the dogcairt at six.'

'But he doesna say he 's comin' here.'

'Whaur else would the laddie gang? You surely dinna keep up your spite against Colin a' this time?'

'Have I no' reason? To quarrel wi' me at his mother's funeral'——

'That 's an auld story noo,' interrupted his wife. 'I would have liked to see him in the pulpit too. It 's no' for us to judge. He 's comin' here the morn.'

The worthy matron turned on her heel, for if Drimmie was supreme outside, she was mistress in her own house. Thus it was that when the express deposited Colin Brodie on Blair platform, Drimmie was waiting for him.

To the farmer, Brodie had altered for the worse. The pallor produced by night-work had usurped his former healthy hue, and he looked thin and underfed. The cut of his clothes and a slight English accent both offended Drimmie.

Their meeting was not cordial, though Brodie was effusive in his greetings. Drimmie's monosyllabic replies drove him to silence, and he lay back, trying to invest the bare hillsides with the glamour of his boyhood's days. As they passed the churchyard he saw, for the first time, the tombstone over his mother's grave. His head went down, and he did not raise it until they reached the farm.

His melancholy melted under the warmth of Mrs Stewart's welcome.

'Oh Colin, I 'm blithe to see you! Why did you never write or come to see us? We would have been glad—glad to meet you.'

'Though I would have given much for a kindly word from you,' said Brodie, taking her hand, 'I dared not write. How are Donald and Ailie? Has she changed much?'

'You willna ken her. You 're improved, Colin; but you 're altered somehow. Are you gettin' on weel?'

'Yes. I 've plenty of work at all events.'

Perhaps Brodie's strongest motive for accepting Drimmie's hospitality was to meet Alison Stewart again. Misfortune dogged him, however, for she had gone to the dairy when he descended. After breakfast he had to set to work, for Colin was a journalist, and his visit was not a holiday. The few words necessary to place his friendship with Ailie on its old footing were left unspoken; and when they met at dinner, the girl, who had drawn her own meaning from his seclusion, was simply polite. Colin proposed to spend the afternoon with the ladies; but Mrs Stewart informed him that they had their dresses to prepare for the tenantry ball, and he would be in the way.

Brodie went in search of Drimmie, and eventually found him in a turnip-field.

'It 's a long time since I was here, Mr Stewart. Much has changed since then.'

'Ay,' said the farmer dryly.

'We parted in anger. You remember that just before my mother's death I learned that you were paying my college expenses. It was my mother's wish that I should enter the Church. Her death released me, and I felt that I could no longer remain a dependant on your bounty. I am doing fairly well in my profession, and if you would allow me to square the account I should be grateful. Your kindness I can never repay.'

Save for a slight twitching of his under lip, Drimmie appeared as calm as usual. He spoke, however, in English, which he never used unless under excitement.

'Your mother's death released you, did it? That is how you regard the sacred legacy. If you would have entered the Church had she lived, it was your bounden duty to do so after her death. The money was a matter between your mother and me. When you went to college I rejoiced that it was permitted me to assist in making a worthy servant of the Lord. Then—over your mother's grave—you refused to complete your studies; a few months would have done it. In your infernal pride you must make a rogue of me, and I make it my boast that I never wittingly wronged a man.'

'Do not harbour up my foolish words. I was young and thoughtless then; I have since learned wisdom in a stern school. It was impossible for me to enter the Church. Let us be friends.'

'No, there can never be friendship between us.'

'I have another request to make. One reason for my coming here was to ask your permission to pay my addresses to Ailie.'

'No, Colin; no. Ance naething would have given me mair pleasure; but you 've made your choice, and maun abide by it.'

'Will nothing alter your decision? With this exception, I have not done anything to forfeit your esteem.'

'Oor ways lie apairt, and this meetin' has been sae sair on me that I trust we 'll never forgather again. Guid-bye, Colin.'

Drimmie spoke slowly and without heat.

Brodie had only brought a handbag to Drimmie, and he excused himself to Mrs Stewart on the plea of business. He informed her that he had to see the laird before the tenantry dinner.

The farmer came in to tea, bursting with information.

'Todholes was sayin' he saw the laird at the station this forenoon. Wha do you think is to be there the nicht?'

'Guid sake, man, you're michty excited! Is it your poleetical idol come at last? The laird aye said he would bring him.'

'It's him nae less. I wonder if he'll speak at the dinner. Man, it would be grand! What will Blawuddie say noo? I maun step ower and tell him.'

'He'll bide at hame then. Better wait till you get him there.'

The laird represented the district in Parliament. He was popular in his constituency, but the gift of oratory had been denied him. The visit, therefore, of one of the party leaders renowned as a public speaker produced a record attendance at the tenantry dinner. A Scots farmer holds a silvery tongue to be the highest gift of nature.

At the dinner Drimmie secured a seat opposite Blawuddie. That worthy man had the misfortune to belong to the opposite political party, and found his dinner, in consequence, a martyrdom. Drimmie's dry, caustic humour, if not appreciated by the victim, proved acceptable to his neighbours. When the tables were cleared all eyes turned to the leader, who sat on the right hand of the chairman.

It was Blawuddie who broke the spell in his corner of the room.

'Man, Drimmie, is that no' Colin Brodie at the laird's table? He mann have got on wonderfu'.'

This was a reflection on Drimmie, who had to confess he knew nothing of Brodie's career. He sat glum and silent till the laird, in his speech, alluded to his honoured guest, and hoped a few words would be forthcoming to his tenants, who were, he was proud to say, staunch admirers of his colleague. Necks were craned forward when the statesman rose to his feet. He delivered no set speech, but there was a potency in his voice and gesture which delighted his hearers.

A greater surprise followed. The toast of 'The Press' was given, and Colin Brodie responded. It was the first time Drimmie had heard Brodie speak in public, and the ejaculation he made at the end was shared by his friends: 'What a grand preacher was lost there!'

The tenantry adjourned to the dancing-hall, where the ladies were assembled. Ailie was besieged by the young farmers, but she contrived to keep several blanks on her programme. She intended these for Colin, though they were to be accompanied with reproaches at his defection. As the hours sped away without bringing him to her side, she began dimly to wonder if the laird's daughter was the cause.

After the interval the laird's party entered the hall. The laird presented many of the tenants to his guest; soon, however, the latter was annexed by Miss Renwick, the laird's daughter, and led to the corner where Drimmie stood alone. To meet the man who politically was his fount of wisdom, and talk as man to man, set the dour old Scotsman trembling.

Miss Renwick took the conversation in hand.

'I believe your opinion carries some weight with Mr Stewart. Can you say anything in Mr Brodie's favour?'

The statesman appeared nonplussed. 'I do not follow your meaning, Lily. Mr Brodie is a rising journalist, and I have entrusted him to-night with my views on the Eastern question.—I am able to address a larger constituency through the Press, Mr Stewart, than I can on the floor of the House.'

'It is a personal recommendation I want,' said the girl. 'Let me explain.' She touched lightly on Brodie's career, and then described his relations with the Stewarts.

'Now, will you say a word?'

'Mr Brodie has an excellent advocate. I think, however, that you place me in a false position. I have no right to express an opinion.'

'I am sure,' said the girl petulantly, 'that Mr Stewart will be glad to know if he has your approbation.'

'I have great sympathy with the position he has taken up. The Church offers the highest vocation in this world, but it demands the dedication of the whole life. The man who cannot give that should remain a layman.'

After uttering these words the statesman escaped.

It would be impossible to describe Drimmie's feelings during this interview. That his actions should be publicly canvassed appeared an outrage, and he stiffened his back, determined to yield not one jot. Miss Renwick divined his thoughts, and, woman-like, reversed her tactics.

'Oh, Mr Stewart, I am so sorry!' she said softly, with a suspicion of tears in her voice. 'I thought I could bring you to reason; but I have done nothing but harm. I admire Mr Brodie so much, he is so strong and manly. He is very much in love with Ailie, and I am sure she likes him. Why will you spoil both their lives?'

Was it a weak spot in the man's character that he could not bear to see a woman in tears? To have this lady—and she the laird's daughter—beseeching thus made him feel angry and ashamed.

She turned her fine eyes on him and repeated slowly, 'Why?'

Drimmie was red and confused. 'I dinna think Ailie cares for him. There's the minister'——

'Will you let her choose?'

The only possible answer was in the affirmative.

'Mr Brodie is going to the old cottage to-morrow at ten, before he leaves for London. If Ailie agrees, promise to send for him.'

'I promise.' The words came huskily through the farmer's closed teeth.

During the conversation Mrs Stewart was taking part in a lively set of quadrilles; but Ailie, who had pleaded fatigue, sat near enough to catch, in the lulls of the music, occasional mention of Colin's name. It deepened her impression that Miss Renwick was the cause of his absence, and the feelings with which she regarded her successful rival were not charitable.

Drimmie went in search of the minister, who did not dance, and explained the position to him. Ailie was so preoccupied when the young man took a seat beside her that he had to repeat his proposal more than once; she answered him at last, and though her words were gentle, there could be no mistaking the conclusive nature of her refusal.

The farmer had arranged to drop Mr Thomson at the manse. It was the minister's practice at these drives to share the back-seat with Ailie. To-night, however, the girl clung to her mother, and the minister had an abstruse theological problem to propound to Drimmie. The manœuvre was transparent to the old folk, but they wisely kept silent.

It is difficult to say who was most unhappy that night. Sleep, the consoler, came sooner or later to all save the old farmer. His ideas of duty and conduct had been rudely shaken; love and pride contended for mastery. Worn out with conflicting emotions, he escaped into the open at daybreak, and fought his battle on the silent hill. He returned for breakfast hard-eyed and gloomy. The women, who had taken counsel together, waited for him to begin, but it was not over the breakfast-table that he broke his silence.

When Ailie went to the farmyard to feed the poultry she was joined by her father. He laid his hand on her shoulder with a movement that was almost a caress.

'It couldna be?' he asked sadly.

'No, father.'

'Is it Colin?'

The girl blushed.

He was silent for a minute, and then, in a low monotone which did not betray a spark of interest, he said, 'I'd like you to gang ower to the auld shepherd's cottage and give it a redd up.'

When Brodie reached his old home he was astonished to find Ailie on her knees in the kitchen lighting a fire. For a space he was content to watch her; then he made his presence known, and her startled look convinced him that his appearance was unexpected. Perhaps this meeting was only an accident after all. 'I am glad, Ailie, that I have been able to meet you before I left. My visit so far has not been such a success that I shall care to repeat it.'

The girl rose from her knees and her cheeks were rosy.

'What is it, Colin, that has changed you so? We were once good friends, but now I will not be able to understand you. Before you went away we were as brother and sister; now we are less than acquaintances.' She was holding herself bravely.

'Believe me, Ailie, that I have made every effort. Your father—— I came here this morning with some slight hope that all might yet be well.'

'You came expecting to find me here?'

'Perhaps I ought not to say so much. This is the note Miss Renwick sent me last night.'

'I do not want to know what she wrote,' said Ailie coldly. 'I am thinking that I do not like her.'

'You foolish Ailie! She has been doing her best for us. Your father said no to me, and she has been trying to make him change his mind.'

'You told her about me? I do not think that was a friend's action.'

A light dawned on Brodie. 'Tell me, Ailie, why you came here this morning.'

'My father sent me.'

'Did he say anything about me?'

'I cannot repeat what he said.'

'Oh Ailie! do not hide anything from me at such a time as this. You see where I am. Unless I get your father's consent—and he has refused it—I may not ask you. Now, if there are words between you to warrant belief that he has changed his mind, tell me, Ailie dear.'

Her head was turned away and there was a droop in her figure. Suddenly she threw out an arm as if seeking for support. Brodie caught her hand; and somehow, when she spoke, her face was hid on his shoulder. 'He asked me, Colin, if I cared for you.'

Behind a boulder on the rigging of the hill Drimmie watched the shepherd's cottage through his glass. When Colin and Ailie emerged hand-in-hand the glass became so dim that he could not see them. To hide his emotion he threw a stone at his collie and asked it gruffly what it meant by wasting time there. Some hours elapsed before he could bring himself to join the gay party in the farmhouse.

THE CLOUD-FLOCKS.

By reeds and dunes shut out from view
Of marsh and river, trees and roaring sea,
I gaze with awe and reverence, due
For heavenly glories in the clouds, to Thee
Who madest them and their ever-changing hue.

Upon a ground of blue most delicate
Is worked a wondrous pattern by the hands
Of angel hosts, who thus do celebrate
Before man's eyes Thy triumphs in many lands.
Our joy therein to Thee we dedicate.

The Golden Fleece we still can see,
More bright, more beauteous e'en than long ago
It seemed to Jason's crew, for we
Behold it thrown o'er all the sky; and lo!
With glowing change the heavens sing to Thee.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

THE subject of the season has been the holiday, and where and how it should be spent. The matter of the location is so entirely one of personal taste and prejudice that it is not proper to make interference in it. Besides, fashion has something to do with the question also. A few years back the Continental holiday was the thing. Those who sojourned for a week or two at a cost variously of from five to ten guineas in some busy part of Switzerland or in a corner of France were considered to be living the higher and completer life, and possibly in some cases to be exhibiting a superiority of taste and culture. Not for a moment is it suggested that holidays spent in these places were not most excellent, abounding in interest and affording that complete change which many authorities insist is the first essential of a properly spent vacation. Nor is it disputed that as many people visit these foreign parts in the holiday season as was formerly the case. It may be so, or it may not; but, in either event, the Continental trip has ceased to be regarded as the fine thing it once was; you hear less of it, and it has in fact come to be something of a distinction of value never to have seen the Matterhorn, never to have lounged through the Champs d'Élysées. Now there is a disposition to make a cult of one's own country, and inducements are being set forward for the encouragement of it. In the south of England there has for long been an impression abroad that the next most expensive places to Monte Carlo and Cairo to stay for a while are some of the grander parts of Scotland. This view is now giving way, and again North Wales is being taken up more in earnest by the general holiday-maker than has been the case hitherto. Probably London, after all, is the best favourite among the holiday resorts in the whole world, and there is much to be said for, and but little against, spending one's annual period of complete leisure in the great Metropolis. The means for ensuring the maintenance of health here are completer than they are anywhere in the world. The general sanitary arrangements are the most perfect obtainable, and the conveniences for ease and comfort, the removal of all unnecessary irritation, and the pleasing of each passing fancy are here as nowhere else. These circumstances come home to the old Londoner when he wanders to other places whose boasts of health-giving advantages are clamorously made, and especially when he visits some of the seaside resorts. No doubt there are great differences among these places, according to the energy, the ideas, and the temperaments of the ruling authorities; but there is much evidence to show that the sanitary properties of some proportion of the apartment houses at seaside places with great reputations are far from being beyond question, and intending visitors must exercise great caution in selection.

* * *

However, leaving aside further consideration of this question of place, there is to be said forthwith that in a gentle manner there is something in the nature of a little campaign being made by the wise men of Harley and Wimpole Streets against the too strenuous methods upon which most busy Britishers conduct their holidays in these times, said strenuousness showing a tendency to increase. A few years since one of the foremost medical men of the day, one who ministered constantly to the most exalted in the land, promulgated a statement to the effect that people were taking years off their lives by too much hard work on their annual holidays, and that for the City clerk who spent his days in an office for fifty weeks of the year to occupy the other two by climbing mountains in Switzerland, when he would do better to lie in bed at home for the whole time, was a kind of long-drawn-out suicide. With modifications, this warning has been taken up with some generality, and everywhere now you will find the doctors preaching against the too active holiday. One of them, of great celebrity, tells us that it would be the making

 [*All Rights Reserved.*]

of the nation, as he puts it, if by any arrangement half of it could be sent to the seaside, and made to lie quietly on the sands, under surveillance, for a fortnight; the other half then executing the same process while the rested ones went back to the work that had to be done. At the end of this holiday period, so it is said, there would be such a fund of energy in the nation as would have a marvellous effect upon our commerce, industries, and our competition with foreign countries. Another authority says that for the principle of change being the essential of the holiday-time we need to substitute the principle of repose. That is the essence of this new preaching. They say that we are in a too nervous and too neurotic state, and that motor-tours and weeks spent in ceaseless worry on the golf-links are the worst things for us. Their advice is that as little as possible should be done or even thought about, and that solitude should be adopted whenever it may. Thus it is definitely advised as an ideal form of holiday for the busy man who in the course of his year has severe demands made upon his physical and mental energy that he should betake himself to some lonely mountain region, should house himself as near as possible to some likely hill, and there day by day, high up, he should lie down on his back and gaze as vacantly and listlessly about him as he feels able, reading nothing, and insisting upon it that he shall have no one with whom to engage in conversation and argument. At the most strenuous time of his life, Mr Gladstone used to say that periods of solitude spent among some hills of Scotland refreshed and invigorated him more than anything else.

* * *

It is urged upon us also that too many people make a serious mistake in imposing upon themselves tasks which are considered to be light and pleasant, but which are truly work, and are more irksome than is admitted. These consist chiefly in self-prescribed courses of reading. Conscientious folk feel that in the press of affairs and an easy obedience to social conventions the best tastes that they have, being those of the intellect, are woefully neglected. They go to the play; they read novels; they are in touch with the opinions that are expressed from day to day in the newspapers; but sometimes they feel a little of sadness when they let their eyes wander along the old shelves in the library, and they reflect upon the years that have gone since they read through or even in part any serious work of philosophy or history, or such other as required diligence of the mind, and whose chief function was not to amuse. Some day, they say, they will make a change in their habits, and the classics shall have full attention then. There are postponements, and more; but at last, when a new holiday is being begun, the resolve comes to fruition. Off from the shelves come some volumes of those dusty classics. Yes, *Evelyn's Diary* shall be carefully examined to begin with, and an agreeable alternative study shall be the *Canterbury Tales* of Chaucer. The lyrical dramas of Æschylus shall be put in the bag, and it is considered that it will be excellent to grapple with the maze of argument in Plato's *Republic*. It is a point as to whether the *Breakfast Table* series and Lord Chesterfield's *Letters* are not really too light for such an occasion as this; but they just win their places in the holiday course on the careful understanding that they are for Sundays only. And so this routine of reading is prepared. It is followed for a day or two, perhaps not that. The man then buys a paper-backed novel for fourpence halfpenny, and for the remainder of his stay is engaged in a luckless contest with his own weakness, feeling each morning the irksomeness of the task that is before him, and experiencing each night a sense of shame as resulting from unkept resolutions. In a measure the holiday is marred, and only a little self-respect is restored near to the end of it, when the schemes are finally abandoned, by the definite understanding being arrived at that on the return home a grander course of serious reading than ever could have been devised for holiday purposes shall be fully and faithfully completed. It is a good thing, as the wise men will tell us, to make no resolutions concerning tasks—pleasant, intellectual, or otherwise—for holidays, to forswear no pleasures or indulgences, to act only as the spirit moves us, and generally to fall to listless repose. The easiest thing to do in the world is to do nothing, and the best holiday is the easiest—so they say.

* * *

The other day we were speaking of the origin of some of the more famous parliamentary phrases, and we are just reminded that one of the best and simplest of them, 'His Majesty's Opposition,' was coined by Lord Broughton, who was John Cam Hobhouse; reminded because a book made up of some of the recollections of his which he wrote down, and some extracts from his diary—the whole edited by his daughter, Lady Dorchester, and got out under the title of *Recollections of a Long Life*—is one of the books of the lighter serious kind that are most and best discussed during the present season. There is, of course, no need to dilate at the present time of day upon the strength and interest of the character of this Whig democrat of a bygone age, the man who was the earnest advocate of all reform measures, the champion of oppressed nationalities, the enthusiastic admirer of Napoleon (at the mere sight of whom his eyes would moisten), the most intimate friend of Byron, and an active member of the London Greek Committee. The period covered by these diaries is only one of thirteen years, from 1809 to 1822; and though by such a selection the political side of Hobhouse's career has to be neglected, we are furnished with many most interesting notes about some of the other matters in which he was most concerned.

* * *

There was the friendship with Byron, about whom Hobhouse did always seem to have certain

underlying doubts, despite his exceeding fondness for him. After making a study of *Don Juan* in the manuscript or proof, Hobhouse was greatly alarmed, fearing that publication would do his friend much more harm than good, and therefore he did his utmost to prevent such publication, and conferred with his friends as to how that might be done. Byron, however, was determined in the matter, and just before the poem was published Hobhouse wrote: 'I do not think it so bad or so good as I did, not so indecent or so clever;' while a fortnight afterwards he went a point farther to the statement, 'I really do not think it clever.' In one place in his diary Hobhouse will refer to his friend as 'Dearest Byron,' and in another to 'this singular man.' At the end of their Continental tour we have Hobhouse saying how he and Byron had divided a bunch of flowers at parting, and Hobhouse in a despondent mood gives himself to think that that is the last thing that they two friends ever would divide together. Yet we have them together again not long afterwards, with Hobhouse declaring that he loves Byron more and more every day, and telling how they had sat up together until one o'clock in the morning dividing between themselves a new club—which is to say that they were making the rules of a club of which they only were to be the members. Still, we are not told some of the things about the Byron marriage failure that we are most anxious to know, and which Hobhouse probably knew about as few others did. In his notes upon the matter he treats posterity with scant favour and maintains the most absolute discretion. He was groomsman at the wedding, and he does tell us that he never knew a lover so little in a hurry as was his friend when journeying north for the marriage. Hobhouse thought the bride was 'most attractive,' and when he wished her happiness at the end of the ceremony she expressed to him her belief that if she were not happy 'it would at all events be her own fault.' Hobhouse knew before any other that there was trouble in the new home, for only two or three months had elapsed before Byron wrote to him advising him not to marry, although guardedly adding a not uncommon clause in such recommendations that he himself had 'the best of wives.' Three or four more months, and Byron writes to say that he and his lady had begun a little snubbing on money matters; before that year was out a daughter was born, and a month later Lady Byron left her husband's house for ever.

* * *

Now, as to Napoleon, it is recorded that as soon as ever Hobhouse heard that his hero had made his escape from Elba he hurried over to Paris specially to look at him, and rejoiced to be so near to him at a review as to be enabled to note that his watch had a gold face; and it was on this occasion that the excess of emotion led the tear-drops to dim his eyes at the sight of what he termed 'the world's wonder.' Hobhouse heard that Napoleon had said to a midshipman on board the *Undaunted*, the vessel that carried him to Elba, that 'the world was under a great mistake in thinking him a clever man; he was just like everybody else.' When Hobhouse left Paris before Waterloo he reflected that he could not help wishing that the French might meet with as much success as would not compromise the military character of their own countrymen. But as an Englishman he would not be a witness to their triumphs; as a lover of liberty he would not be a spectator of their reverses.

* * *

Apart from these two principal themes there are in these volumes of Hobhouse memories some most excellent tales concerning notabilities and others. Lady Charlotte Fitzgerald told him once of a guest at Lord Carrick's who was shown up to bed by the butler, who considerately laid a horsewhip on the bed, saying, 'Your honour need give only one crack, and they'll all run away'—the reference being to rats! Miss Bayley told Hobhouse that Mr Phipps the oculist told a gentleman, who told her, a rich anecdote of the Duchess of Devonshire, who was then the most recently deceased. The Duchess sent for Mr Phipps to come to Chatsworth to operate upon her eye. He stayed there for some time, and on his departure received from the Duke one thousand pounds as fee. Just before he stepped into his carriage a message was brought to him from the Duchess, as the result of which he returned to her chamber. She expressed the hope that the Duke had done what was handsome to Mr Phipps. The gentleman protested, 'Yes, and more than handsome.' 'It is an awkward thing,' continued her grace, 'to ask; but really I am *at this moment* in immediate want of such a sum, and if you *could*, Mr Phipps'—— What was the oculist to do? He produced his thousand pounds, took his leave, and, in the words of the narrator, 'has never heard of his money from that day to this.' Great folks had some odd diversions in those happy times. Some one told Hobhouse of a 'dressing-match' that took place, in which the Emperor Alexander and a certain Countess Wierbord were the competitors. They met, and by a signal left a common room. The Countess returned fresh-dressed in one minute and twenty-five seconds, while the Emperor took one minute and fifty seconds.

* * *

There is something that has been happening in recent days which has almost certainly brought a question to the minds of those among us who are least contemplative upon the wonders and mysteries of nature, but who for some odd hours do move away from the crowds and traffic of streets to places where there is green grass and open skies, even though the aspect be no more rural than it is upon a golf-course. The reader may be reminded that each year he has looked upwards to some few of the migratory birds that were hovering round in a

seeming mood of unsettlement, and reflected with a touch of sadness that the summer-time was ending, and that these feathered creatures were making for their departure; and thereupon he has marvelled once again upon that mysterious gift of instinct which leads those which had but recently learned to fly to travel, undirected by others of experience, unerringly to those distant parts where they all assemble and live through the months until May brings back the warmth to this country. Such reflections generally are brief, because the mysteries seem unfathomable; but they have a value for that they may sometimes bring minds that are affected with materialism or constant indifference to a realisation of the magnificent working of the higher forces. Where do they go, and how do they get there? With what splendid courage are these tiny scraps of flesh and feathers endowed that they face the storms on oceans which often enough do bring sad tragedies upon their families! Even yet you will find some of the humbler folk of the country who firmly refuse to believe that this annual migration is carried out at all, and they will tell you that the swallows house themselves and hide themselves until the spring comes again, and that some other birds change their character and appearance and feathered clothing so that they are adapted to the trials of winter; one particular of these beliefs being that the cuckoo never leaves us, but that in winter it is either the sparrow-hawk or the kestrel. Gilbert White, in one of his letters from Selborne, gave expression to his suspicion that some of the martins never went far away from his village, but that in some sheltered nook they slumbered out the uncomfortable months of winter. But though the investigations that he made gave no result that was favourable to his idea, they yielded an item of experience which served to increase the wonderment even in the mind of such an old observer. For even while he was searching for the supposed hiding-place of the swallows in a very early week of spring, when not one had so far been seen, there flew down the village the very first of the season, and without any hesitation or wandering it darted straight to an old nest, stayed there for a while, and then, as being satisfied, made some apparently casual flights about the houses, renewing its acquaintance with the familiar scenes of the homeland. Not for several days afterwards did others arrive. It will sometimes occur to the human traveller how complete and wonderful is our system of things when a man may wander for a season over the other side of the globe and return by land and water over thousands of miles so that he could place his finger on a pin-point that he touched when starting; yet what we do with the assistance of a multiplicity of conveniences these little birds do as surely and more quickly with the aid only of their wings and their instinct. One of the greatest of these mysteries of migration is as to how some of the birds that have never flown away from the locality in which they were hatched only a few weeks previously find their way alone to those places in the South where their experienced elders had departed earlier. It happens constantly that the young ones are unable or indisposed to make their start for their winter quarters so soon as the others. For instance, the veteran swallows are away by the first or second week in August; but some may be seen hovering about until September is far advanced, and these are of the same season's late-hatched broods, entirely ignorant of the ways of their kind. Yet, with no one to lead them away, they fly when the chills of the autumnal season become pronounced, and by their instinct they discover the others in those far-distant parts. A strange feature of these migrations is that though all these birds when in summer or winter quarters retire to their nests at sunset, yet they make the Channel passage at night invariably. Why is this? White tells of another curious circumstance that he once noted in connection with the winter migrations of the swifts from Selborne. In that year all the swifts withdrew about the beginning of August except one pair, which very soon was reduced to a single bird. White suspected that the late and lonely sojourn of this individual was occasioned by the strongest of motives, that of an attachment to her young, and he watched her, therefore, until the third week in the month, when he found that two young ones were putting out their white chins from a crevice under the eaves of the church where the nest was. These remained for three more days, gaining in strength and knowledge all the time, and apparently longing to be on the wing; and then all at once they were missing, and were not even noticed circling about outside, being taught by their mother the art of aviation as is generally the case. Then the eaves were searched, and there was found in the nest only two callow, dead, stinking swifts, over whose bodies a second nest had been formed, in which there was full evidence of young ones having been lately in occupation. It was clear that the first attempt at raising the season's family had been a failure, and that the pair, desperate for a better success, had remained behind after the proper time, one of them leaving the other to finish the business when it was seen that all was progressing well. Two broods in a season are very exceptional with these birds.

VANESSA.

CHAPTER V.

TIME passed, week upon week, and never again did Vanessa speak to me in words on what was in our hearts; but when we met there was a magnetic sympathy which each of us felt to be a blessing to giver and receiver, for true sympathy has all the qualities of mercy. Vanessa had too much character for the 'worm i' the bud' to cause her smile to lose its brightness or her hearty energy to fail her. But she needed sympathy, and I felt that, silent as it was, it reached and refreshed her, and so did not fail to make opportunity to meet her often.

In my own mind I often wondered about *him*, and whether all I had dreamed was but a dream, never to crystallise into form. But, do what I could, it was impossible for me to think so, and his disappearance after the trial, which others might have thought savoured of indifference, impressed me in quite an opposite sense. I felt that to wait was the only right thing to do, and that to manœuvre to bring them together was a thing not to be thought of. I wondered and did nothing, but I felt and knew that Vanessa's life was fixed. She was not one of those who could change. When she knew her own heart I believed of her that she could wait for years, and be bravely resigned if the only companionship that could content her spirit were denied to her. Where her treasure lay, there would be her heart—unchangeable while life should last. I knew she was waiting, and I waited with her. Perhaps it was a useful and a chastening time—the holding back of life's blossom by the March wind of life that the afterfruit of life's summer might be more full and satisfying.

But, oh, how that time made its softening influence felt, so that I could see that the Vanessa who had been to me a thing of perfection could still gain a something more of the graces that most adorn! Mother and I often spoke of her when alone, she with that refined reserve that even a woman can exhibit despite of all men's ignorant assertions about female curiosity, and I with that loyalty to Vanessa's secret confidence which restrained all disclosure of the truth. And yet I think mother knew even then. One day she stood in front of my work, looking from the clay to the pastel and back again, and then she slipped her arm into mine, and, kissing my cheek, said, 'Mary, it is wonderful; she is the same Vanessa I met three months ago, but refined, matured, and elevated, and you have got all the change there. What has done it all?' I said, 'Mother dear, if you don't know I can't tell you;' and our eyes met. She said very quietly, 'I rather think I do know;' and, patting my arm, she made a clever exit, arranging a petal or two of a flower as she passed along the conservatory and out on to the lawn.

A run in Vanessa's car was becoming a common occurrence, and mother confessed that she had entered a new and fascinating realm of enjoyment, of the delights of which she had not till then a conception. I could not but desire that in our drives we should visit Uncle Goodman's neighbourhood, feeling sure, as I did, that although the vision of Vanessa had awakened sad memories, there must ultimately be joy to him, who so loved the young, to become intimate with one who could give to his old age something of a reflection of the charm which had thrown a spell upon his manhood. Therefore I wished that they should meet, but not as if by intention. Consequently I was from time to time influencing Vanessa to drive to his part of the county, a long distance from Larkhall.

'Why do you fancy this drive so much?' said she one day.

The question came so suddenly that in a moment the cat was out of the bag. 'Well,' I said, 'that old magistrate fell in love with you, I think, and this is his corner of the county.'

'I should like to meet him, he seemed such a dear old man,' she replied.

Our meeting with him was to be something very different from what we had expected. Driving one day in that direction, and when coming to a cross-road, we saw a riderless horse standing a few yards up the side-road, with his bridle hanging down. Vanessa slowed and stopped the car, and we alighted, wondering what had happened. When the horse saw us approaching he gave a loud whinny, and, turning round, trotted up the road, looking round once or twice and repeating his plaintive neigh. Then we saw him stop, and he whinnied again. As we hurried up we saw him with his head down over a prostrate figure on the road. It was the dear old squire lying pale and motionless, with blood upon his temple. I nearly turned sick, and for a moment was giddy at the sight, but a word from Vanessa made me pull myself together. She was pale, but lost not a moment. Down on the ground she went and took the silvery head into her lap, while she stanched the blood oozing from a wound, and said to the motor-man, 'Run to the car for the pail and fill it with water from the rill at the side of the wood;' and then she said to me, 'Find his handkerchief and tear it into strips to make a bandage.' In a few minutes she had the wound washed clean and bound, and the pale face bathed with cold water. The accident had happened only a few miles from Starleyhall, his home, and Vanessa had sent the motor-man to bring the car up, into which we succeeded in lifting the sufferer, Vanessa supporting him, while her man drove us in quietly.

It was most touching to see the dear horse following, with his head over the side of the car like a chief-mourner.

He was carried in and laid on a sofa, while the car was despatched for the doctor, who arrived very quickly. After examination, he declared that there was no fracture, but that the squire had suffered a very severe shock; that the injury on his head might involve his eye; and that his shoulder, although not dislocated, had sustained a wrench and was badly bruised. He said that, of course, he must have a trained nurse, and that he would go and bring one.

'You need not do that,' said Vanessa. 'I will nurse him.'

'You, dear lady! I fear that will not do. We must have a trained nurse, you understand.'

'Yes; but I am a certificated nurse. I had a year in hospital in London.'

'Oh, but'——

'Please let me do as I wish. I should love to do it, and you will find me quite competent, I assure you.'

Nobody could withstand when Vanessa pleaded and had the tears in her eyes, and the doctor yielded.

'Well, be it so; only it is my duty to see a nurse's certificate, if she is a stranger to me, before trusting such a serious case as this to her care. Pardon my appearing to doubt, for I do not—your bandaging was a model of skill—but duty is duty.'

'Oh, certainly, that is plainly right.'

She at once wrote a note, and despatched it by the car, and her man returned in about two hours with her things.

'I am afraid, Barnes,' she said, 'that you have been exceeding the legal limit.'

'Well, miss, yes; but it was salvage duty, and I thought I would risk it. You aren't angry, miss?'

'Not very,' said Vanessa, smiling, and followed her things to the room she was to occupy beside the invalid's.

About half-an-hour later the doctor returned, and I knocked at her door and told her.

'All right, Mitey; just coming,' she replied. The door opened and out stepped a nurse. I could scarcely believe my eyes. There, in her snowy cap, collar, and cuffs, setting off her blue-gray gown that fitted her lovely figure like a glove, stood Vanessa holding a paper in her hand. She came forward to the doctor and handed him the paper, saying, 'My certificate, sir,' her face as quiet and demure as if she had never worn any other costume. The young doctor held out his hand mechanically for the certificate, while he gazed at her with unconcealed admiration. Then reading it over, he refolded it slowly and handed it back, saying in a low tone which my quick ear caught, 'Incomparable,' and it struck me from his look that the word included much more than the certificate.

Vanessa took his directions, and asked more than one highly intelligent question. He said that there was nothing to be done by us but to wait for a return of consciousness, and he left us, promising to return at short intervals.

Vanessa being thus brought into direct contact with Uncle Goodman compelled me to consider what should be done. I knew that to attempt to persuade her to hand over the nursing to some one else would be futile. What she undertook to do in kindness to others had to be gone through, and nothing would turn her from her purpose. What a blessed thing it is when strength of character goes out in such a way, and not in selfishness! As regarded the nursing, I knew that she had spent some time at a hospital in London after she came back from Frau Deckerschenk's; but that she—a lady and an heiress—had worked so hard to qualify herself and obtain such a certificate had never entered my mind. Indeed, in corresponding with her when she had gone from Larkhall to the hospital, I treated the matter as a huge joke, and she never undeceived me. Now, here she was with a business-like air already arranging the room for an invalid, and laying out bandages and dressings.

'Don't look at me like that, Mitey,' she said, 'as if I were a martyr. This is real happiness to me, and I hope it will be real help to your dear old friend.'

The tears welled up in my eyes, and I took her in my arms and kissed her fondly, thinking hard the while what I should do, for it was plain to me that if her patient was to come back to consciousness soon no time was to be lost. But the difficulty was that all was not clear. How was it that he himself seemed dubious, and had not suggested in his talk with me that he knew that his friends had a child, and if he knew it, that apparently he had never made any inquiry? I was puzzled and doubtful how to act. But all mystery was to be cleared up sooner than I expected.

The squire had an old soldier-servant who had attended him for many years, but who on the day of the accident was absent on a message for his master in the neighbourhood. When he returned and heard what had happened his affection was clearly shown by his manner, and one felt sure that the invalid would be well tended between Vanessa and the faithful Stocks, whom I knew well.

He seemed struck all of a heap when he first caught sight of Vanessa, and I saw him look at his master and then at her in a strange way. But the old-soldier discipline soon reasserted itself, and he pulled himself together and evidently stifled his excitement and concentrated all his attention on his duties.

It was noticeable how Vanessa at once took the lead, and how submissively the old soldier accepted her directions and carried them out. In all she did she inspired confidence that the best would be done for his master, whom he sat and looked at steadily like a faithful St Bernard, patient and watchful.

The squire, after lying for some hours motionless,

began to show signs of returning consciousness; and the doctor arriving, he and Stocks got the remainder of his clothing removed and replaced by night-gear, and himself comfortably ensconced in bed. Seeing that the shock to his system and the injury near his eye made him intolerant of light, the doctor bandaged his eyes, and forbade the removal of the bandage until he should see him again.

Presently Uncle Goodman began to speak, and said, 'Where am I?' and as I knew him so well I went forward and spoke to him, and told him how he had been found. He said, 'Ah yes, I remember. Batman put his foot into a drain that had fallen in. I remember that, and then all is blank.'

'Well, Uncle Goodman,' I said, 'you were badly hurt and cut, and you must be kept quiet, so please be good.' He had been trying to rise on his elbow, and Vanessa had firmly but gently held him down.

'Yes, Mary dear, I will.'

'We have got a skilled nurse for you, and you must be very obedient to her, won't you?'

'Yes, indeed, we old people find it much easier to be obedient than you young folks, eh, Mary?' and he smiled.

'Well, then, the nurse is here, and she would like to know whether you want anything.'

'A little water, please.'

'Yes, sir,' said Vanessa; and bringing the water, and deftly passing her arm below his head, she raised him and brought the glass to his lips. I saw Stocks looking at her with the same bewildered expression that I had noticed before, and heard him say under his breath, 'It do beat everything!'

Vanessa brought a moist sponge and gently smoothed her patient's hands and wrists with it, which appeared to soothe him, and he dozed off into what seemed a quiet and natural sleep. I motioned to Stocks to leave the room with me, so that there might be absolute quiet. When we were outside he said in an abrupt kind of way, 'Beg pardon, miss, but wot am I to call the nurse?'

'Nurse King,' I said, with a sudden feeling that the crisis was coming.

'I knew it—I knew it! She's a lady, ain't she?'

'Yes, certainly.'

'Then it's the same. Wasn't she born in India?'

'I believe so.' I was getting more and more excited.

'And her father was Captain King, who used to be in the Grenadiers?'

'Yes.'

'Well, miss, he was master's great friend, and master was his groomsman at his marriage. I was there.'

The whole matter was now clear and beyond doubt; but I made up my mind to keep my own counsel for a little, and enjoined Stocks to do the same until his master should be stronger. I intended at the first opportunity to enlighten Vanessa, and see if with her aid one or two obscure points could be cleared up.

Uncle Goodman progressed, if not rapidly (which at his age was hardly to be expected), at least steadily. He chafed rather at having his eyes kept bandaged; but Vanessa was firm, and said to him that Stocks would tell him that she was the commanding officer at present, at which he laughed. She watched his every wish, and the sound of her voice was evidently as sweet music to him, it being his great delight to hear her read to him. Indeed, he would not have any one else; and once, when he did not know that I was in the room, and when she proposed that I should take a turn at the reading, said that he would rather do without for the present, if she could not do it. 'Mary,' he said, 'does gabble so, while you are always soothing to me, my dear. I must be getting into delusions, I am afraid, for when I hear your voice reading I get saying to myself, "Surely that is a voice I know," and then I foolishly fancy that you are the lady I tried at Chipley.'

I saw I must intervene, and, coming forward, said, 'I don't think you are having any delusions, uncle dear. You will understand presently; but you must keep quiet, and not think, and do what nurse says.'

'Yes, yes, of course.'

'Yes,' said Vanessa, with whom I exchanged a glance, 'it is time for your sleep;' and, tenderly putting her arms round him so as to save his bruised shoulders, she turned him, gave him a little pat, and said, 'There,' as to a child.

We left him with the faithful Stocks, whose nursing was as tender as a woman's, but who, with his soldierly instinct, would never allow himself to take command, but appealed to Vanessa whenever obedience by the patient was called for.

He had cleared up many things to us, telling us how his master had been overwhelmed with grief when he saw a notice of the death of Vanessa's mother in a short paragraph copied from an Indian paper, and how he had sent off a letter to his friend, and had at once left home, and spent some years in South America, distracting his mind by hunting big game far away from civilisation, and supplying no address by which he could be found except to his bankers, under strict injunctions of secrecy. He told us how he only returned home when the duty of attending to the family property fell upon him by the death of his brother, and that it was on his return that he learned that his friend, Vanessa's father, had been killed when on a military Hill expedition not long after her mother's death. He said he was quite certain that his master had never come to know that Vanessa's parents had left an orphan child.

(To be continued.)

LEAVES FROM THE NOTE-BOOK OF CAPTAIN CUTTLE.

ALL who are in any way interested in the literature and journalism of the nineteenth century are likely to know the two volumes published by Bentley in 1888, and now by Macmillan, entitled *John Francis, Publisher of the 'Athenæum:' a Literary Chronicle of Half-a-Century*, compiled by his son, John Francis. It furnishes leaves from literary history covered by the active life of this publisher, and it is crowded with material of compelling interest. Mr John Collins Francis has continued his subject in a new volume, *Notes by the Way* (T. Fisher Unwin), which also comes as a souvenir of that useful periodical *Notes and Queries*, from which much of the material is drawn. The book is similar in binding also to that of *Notes and Queries*, whose motto, 'When found make a note of,' from Captain Cuttle, is an admirable one to put intelligently into practice. The book is enriched by loving tributes to W. J. Thoms, first editor of *Notes and Queries;* to Joseph Knight, dramatic critic and editor from 1883 to 1907; as well as to the Rev. Joseph Woodfall Ebsworth. Sandwiched between is much interesting information regarding literary jubilees and celebrations; the publishing firms of Bentley, Blackwood, and W. & R. Chambers, with a record of *Chambers's Journal* and other periodicals; the *Globe*, *Saturday Review*, and *City Press;* also something of trade dinners and auction sales.

Rather than characterise such a richly varied volume further, it may be better for us to concentrate on one of the biographies, that of the varied and interesting career of the Rev. Joseph Woodfall Ebsworth, who in later life maintained a warm friendship with Mr Francis and wrote him a weekly letter, closely written, and containing much pungent and pertinent criticism on the literature of the day. At his death all Ebsworth's manuscripts passed into the hands of Mr Francis as his executor, including the four water-colour pictures of Edinburgh done from the top of the Scott Monument. Should Mr Francis see fit to bestow them, these pictures would surely find a fitting home in the Edinburgh Municipal Museum or the National Art Gallery.

Ebsworth's father and mother were remarkable people. Joseph Ebsworth, senior, was a clever London watchmaker, with musical and dramatic talents, who became a member of an operatic company at Covent Garden, and afterwards turned to dramatic authorship. He removed to Edinburgh after 1826, when his son was two years of age, and became actor and prompter with his friend W. H. Murray of the Theatre Royal. On accepting a position as leader of the choir of St Stephen's Church he abandoned the theatre, and undertook the teaching of music in several educational institutions. Assisted by his wife, he continued to write or translate many successful dramas, and also published a collection of tunes. Ebsworth opened at Elm Row, Leith Walk, an 'English and Foreign Dramatic Library and Caricature Repository,' which became also a centre for periodical literature. Sir Walter Scott and Professor Wilson were frequent callers; and young Ebsworth remembered being patted kindly on the head by Scott. Very memorable to the youth also was the first purchase and reading of Scott's works, and that of Tyas's edition of Shakespeare. He remembered the Reform agitation of 1832, O'Connell's visit to Edinburgh, and the first visit of Queen Victoria to Scotland in 1842. Young Ebsworth had some instruction in art under Charles Heath Wilson, Sir William Allan, and David Scott, whose early death was a great personal loss to him. Four large water-colour drawings of Edinburgh, looking north, south, east, and west, taken from the top of the Scott Monument, two hundred feet above Princes Street, were exhibited at the Scottish Royal Academy in 1849. Of these only one, that looking to the north, was ever engraved. Ebsworth says of them: 'In that narrow and windy nook, whatever weather prevailed, unflinchingly against cold, but sometimes baffled by rain, these were wrought out in 1845, totally unaided by spy-glass or photo. In fact the public photography of portraits at that very epoch, in a singularly primitive manner, is shown at Howie's studio on the housetops, without any shelter or glasshouse, in the north view. Nobody ever helped me with them; they were drawn to give pleasure to my dear father. I never touched them apart from the gallery of the Scott Monument.' Hugh Miller noticed Ebsworth's pictures favourably in the *Witness;* and a later critic, commenting on the one published picture, praised the marvellous patience shown by the artist, and his remarkable skill with brush and graver. He drew with precision, engraved crisply, and had a rare sense of light and shade.

Ebsworth was for a time a lithographic artist in Manchester, and afterwards went to Glasgow, where he had further training in the School of Design. His pen was busy also, and he contributed regularly to the *Dumfries Herald*, then edited by Thomas Aird. Like Bayard Taylor, Ebsworth had a tramp through Italy and across the Continent, and his ample journalisings, along with other manuscripts, are now with Mr Francis. On his return, he was in Edinburgh until 1860, when he went to Cambridge to carry through a regular curriculum of study, was ordained in 1864, and from 1871 until 1894 was vicar of Molash, near Ashford, and recognised as the 'good, kind vicar of Molash, and friend of all.' Before settling here Ebsworth had some curious experiences as curate of Market Weighton, where he did not get on well with the vicar, but very well, as he says, 'with poachers and smugglers and other

vagabonds,' with whom he had some 'native affinity.' 'My long pedestrianism in Bohemia, Moravia, and other out-of-the-way places in the heart of Europe, my acquisition of the Tchek [Czech] language, and much of the Romany lingo, gathered from Borrow and others, made me free of every gipsy tent wherever I roved.' At Molash he wrote his *Cavalier Lyrics*, found time to write to *Notes and Queries*, and made those researches into ballad history which constituted him an authority on the subject. He completed the editing of *The Roxburghe Ballads* begun by William Chappell, and published for private circulation his *Cavalier Lyrics* in 1887; and his list of works connected with ballad history is a long one. The end came calmly as, 'seated in his garden at Ashford, Kent, looking to the lovely meadows beyond, so often described in his letters, in the sweet quiet of a Sunday afternoon, conversing with those of his own household, he passed away without a sigh,' 7th June 1908. This from an epitaph written by himself is truly characteristic:

> Others strove for power or wealth,
> He prized study, calm, and health:
> Slipt through life as though by stealth.
> Thus, good hap, was known by few,
> Never once was seen by you,
> For he was not oft in view.
> Bards and critics nowadays
> Haunt too much the public ways.
> While the crowds, with gossip, gaze,
> He made choice to lonely tread
> His shy paths, with flowrets spread,
> Half-forgotten, 'live or dead.

Mr Francis concludes: 'As we think of him we are amazed at the variety of his talents. What he painted shows the promise of a great artist; his charming woodblocks are, I do not think it is too much to say, equal to those of Bewick. . . . To his special study, the collection of ballads, he devoted years of labour—labour freely and cheerfully given, with the result that he has formed a Ballad History of England, which should cause his name to be remembered by his countrymen for all time.'

FIELD-GUNS—BY THE 'GOLDEN CRESCENT.'

CHAPTER II.

HERIOT, left to himself, jogged along, tired but contented. His present mission had arrived at a satisfactory conclusion. The commission which he held for the future was even more lucrative. All he wished for at the present moment was to get back on board his ship and have a good sleep, as he had, with the exception of about an hour and a half, during which he had been conversing with the magnate who had sent for him, been in the saddle all night. He was clear of the foothills now, riding down a sloping road which wound in sinuous fashion through a boulder-strewn plain; huge masses of rock here and there bordered the track, casting black shadows across the path in the now gathering light, which was momentarily growing stronger. Behind him the mountain-tops were changing from gray to violet and purple, and then to a rosy pink. Heriot was half-asleep on his sure-footed cob, and had reached a point hardly a mile from whence he had started, where a line of white posts marked the frontier between Monteblanco and the empire of Teutonobia. His horse, wearied like himself, had dropped into a walk, when suddenly from the shadow of one of the great rocks mentioned three men sprang out. One seized the bridle of his horse; a second pointed a revolver at his head; a third levelled a fixed bayonet at the lowest button of his waistcoat. He had just crossed the dividing line and was in the territory of Teutonobia.

His assailants all wore uniform; the man with the revolver was evidently an officer, the others obviously privates. 'You will dismount,' said the officer in perfect English.

Heriot was wide awake now with a vengeance, and his quick wits were working. Resistance was impossible. 'If,' he replied coolly, 'you will tell your man to take that toasting-fork of his out of the pit of my stomach I will do so.' The officer gave a sharp, guttural command, and the man ordered arms. The sailor dropped his reins, flung one leg over his horse's neck, and slid to ground.

There was a further order, and the man holding the horse wheeled it round in the direction from which it had come, then, picking up his rifle, pricked it so sharply in the flank that the blood spurted out.

'A perfectly unnecessary piece of cruelty,' said Heriot, as his mount galloped madly away. 'And now what is the meaning of this outrage?'

The keen blue eye behind the revolver never wavered; the hand that held it was steady as a rock. Another command, and the two privates, leaning their rifles against the rock by the roadside, advanced and searched the prisoner in a manner which showed that they were experts at such work. The man on Heriot's right plunged his hand into that gentleman's jacket-pocket and produced his revolver; at a word from the officer he first jerked the cartridges out on to the road and then flung the weapon itself into a pool of water at the roadside. The sailor's pocket-handkerchief, his compass, his penknife, his pipe and tobacco-pouch, and a handful of loose silver were all that his captors could find; the penknife followed the revolver into the pool; the remainder of his property was restored whence it came. Then one of his captors produced a length of thin, tough cord and proceeded to bind his hands behind his back.

Heriot turned to the officer. 'You speak English. This is quite unnecessary; you are three armed men to one unarmed. I give you my word that I will not attempt to escape for the present.'

The officer gave an order, and the man desisted.

'Will you give me no explanation of your extraordinary conduct?' demanded Heriot.

'I shall conduct my examination yonder.'

He pointed with his revolver to a whitewashed building with a slate roof some half-mile to the northward of where they stood. 'You will be good enough to march in that direction.'

The men picked up their rifles, unfixed their bayonets, and throwing open the breach, showed the prisoner that their rifles were loaded. They then stepped out, keeping their prisoner half a pace in front of them; the officer, with his revolver in his hand, bringing up the rear. In this fashion they covered the intervening space to the building, Heriot thinking hard all the while.

Arrived at their destination, the sailor saw immediately that it was the guardhouse of a frontier post; a massive door opening outwards gave entrance to a big, bare chamber, in which he counted the bedding of six men neatly disposed along the walls each in a tight roll; six wooden chairs, a big wooden table on which stood a paraffin lamp, a stove, and some cooking utensils completed the furnishing. Opposite to the outer door was another massive oaken one secured by a heavy lock and two massive bolts.

The officer bade one of his men give Heriot a chair, and took another himself on the opposite side of the table. In the course of his walk to the guardhouse the sailor had taken counsel with himself and decided that it would be to his advantage to speak these men fair; he could gain nothing by resistance—at present.

'Your name?' demanded the officer.

'William Graham.'

'Nationality?'

'English.'

'Where is your passport?'

'I do not possess such a thing. They are quite unnecessary in a civilised country in the present day.'

'Your business in Tuetonobia?'

'I am travelling.'

'Commercially?'

'No; for pleasure.'

'Whither bound?'

Heriot mentioned the name of the nearest great town.

The officer smiled unpleasantly. 'You are, at all events, likely to go there,' was his comment. He sat bolt-upright in his hard, wooden chair, his fine, nervous hand playing with the pistol, of which he had never relaxed his grip. 'Listen,' he said. 'You are an Englishman—yes; but William Graham—no. Who you are, and what you are, and what your business is we shall presently discover, for I have been sent down here owing to certain information which I have not yet been able to verify. The men of this post have been sent upon a fool's errand. You know that,' he rapped out sharply.

Heriot, with a perfectly unmoved countenance, made no reply.

'In the meanwhile,' went on his interlocutor, 'my men and I are worn out; we want food and sleep.'

'For the matter of that,' said Heriot pleasantly, 'so do I.'

'You shall have both,' replied the officer. 'When we are all refreshed I shall continue my examination, which, should it not prove more satisfactory than it has done up to the present, will oblige me to hand you over to my superior, as something has taken place in this neighbourhood during the last twenty-four hours which will have to be explained. At present I do not know what it is; you, my friend, do. We shall await your information with much interest.'

The door of the inner room was then flung open, and Heriot was thrust into it. He immediately recognised that it was the lock-up of the guardhouse. A truckle-bed with a straw mattress stood in one corner; the walls were immensely thick; high up in one corner was a small window heavily latticed with iron bars; the door was four inches thick. He recognised at once that escape from here was indeed impossible.

In the outer room there were sounds of a fire being lighted, and very soon a by no means unpleasant smell of cooking assailed his nostrils, and he remembered that he had had no food for fifteen hours. At the expiration of some three-quarters of an hour the door was opened, and a tray containing a sufficient meal, with a bottle of very passable wine, was thrust in by one of the soldiers.

By the time Heriot had finished this and smoked a pipe it was nearly eleven o'clock in the forenoon. All the time he had been thinking hard, but so far no solution of his difficulties had occurred to him. From the outer room there came the sound of snoring. He had noticed how wearied his captors had appeared to be, and recognised that this was very much his own state also. Pulling off his boots, he flung himself upon the bed and was asleep in a moment. It was late when he awoke, and the room was so dark and gloomy that he could only just see by his watch that it was nearly 6 P.M. In the outer room silence still reigned.

He sat up on the edge of the bed and lighted a pipe, and his fancy wandered idly for a few moments. He saw Hawkins stretched on his back, and laughed softly as he thought of that tremendous upper cut by which he had 'knocked him out;' then he considered his present situation and the bearing which the instruction he had received from the ex-gunner bore upon it. If he was to get out it must be by a surprise attack. So far he had conducted himself so meekly and humbly that that blue-eyed, fair-moustached officer would not suspect

him of sudden violence. Of course, should he receive him pistol in hand his chance was nil; if not—— Well, he could only wait and see. In any case, he remembered that the door opened outwards; and, best of all, he had noticed when they came in that one of the soldiers had unlocked the door and left the key outside. If he could get outside and lock his captors in the trick was done; if not, he was trapped, and, in his own vernacular, he must stand the racket.

An hour passed, and there were sounds of the men stirring; then he heard the scrape of a match, and a pencil of light shining under the door told him the lamp had been lighted. Then he heard the voice of the officer, and the sound of the key grinding in the lock and the noise of the bolts being shot back. He was ordered to come out, and stepped into the light of the lamp. Secretly he swung his right hand lightly behind him; every nerve in his body was tense, his brain alert for instant action. His first glance was at the door; the key was still on the outside. The two men were evidently still half-asleep, their eyes were heavy, and one yawned prodigiously. Not so the officer; he stood erect and composed in front of the table upon which was the lamp, and, best of all, his pistol.

Heriot advanced to meet him. His mind was made up, and he measured his distance to a hair's-breadth.

'You will be good enough to take that chair while I'—— began the officer; but the sentence was not destined to be finished. Up and forward swung that terrible right hand, meeting the very point of that finely moulded chin with a smack like that of a pavior's hammer on a curb-stone. The recipient of this awful and totally unexpected blow was lifted clean off his feet and flung against the table, which crashed to the ground beneath him, bringing with it the lamp, which broke and left the room in total darkness. Recovering himself with the quickness of lightning, Heriot flung out his left backhanded, meeting the soldier on his left full on the point of the nose with the back of his fist; then he sprang for the outer door, opened and closed it, and turned the key in the lock. He was free, and he knew that pursuit was impossible for the present.

Darkness had fallen, but his matches and his pocket-compass had not been taken away from him. West and a little south he knew that he should strike the landing-place, which was but a little over a mile away; but when he got there how was he to get off to his ship? The launch would not have waited for him all this time.

However, he must try, and about half-an-hour found him at the place where he had disembarked the evening before. The launch was not there. Heriot peered about him in the gloom, and at last discovered a small dingy rubbing softly against the side with the gentle lift of the sea. Had she oars? Next moment he was in the boat. She had both rowlocks and sculls. He cast off the painter and rowed thoughtfully seaward. 'I must chance it,' he reflected. 'Thompson will be on the lookout; but I don't like the look of the weather.' His seaman's instinct had not deceived him, as ragged masses of cloud were racing overhead, a thin strip of a crescent moon showing itself from time to time, 'sitting upon its back.' Very soon Heriot recognised that he had gone too far to get back, and was inclined to curse himself for his rashness. The sea was getting up momentarily; the wind was blowing him dead off shore. He now found his sculls useless, and it was, in seaman's parlance, blowing half a gale. The boat's painter was spliced into an iron ring in the cut-water, and the occupant of the dingy had no knife. However, he managed to pull out the splice, and luckily for him the painter was long enough for his purpose. Pulling up the bottom-boards, he unshipped the rudder, and then bound sculls, rudder, and bottom-boards together, and flung them overboard, keeping the inboard end of the painter secured to the bows; he was thus 'riding to a sea-anchor,' and had done all that was possible in the difficult and dangerous circumstances in which he found himself. All night he lay in the bottom of the dingy baling out with a small piggin the water which continually found its way inboard. Overhead the clouds flew before the keen easterly gale, and the cockle-shell climbed laboriously to the summit of one foam-crested monster wave, to drop like a stone into the hollow between it and the one following. Drenched to the skin, bitterly cold, and tormented by thirst, Heriot stuck doggedly to his baling; but ever the wind rose and the seas mounted higher and higher.

Gray dawn crept into the sky, and the sun flashed an angry, ugly yellow light over the waste of tossing waters; the cramped, shivering figure sat up in the bottom of his floating little prison and thought regretfully of his stone one ashore. 'Well, here's the end of Ralph Heriot,' he muttered miserably to himself. He dashed the salt water from his eyes and looked around. As he rose on the crest of the next wave his heart suddenly stood still, for he saw—a ship! For a long time he could not, in his blinded and dazed condition, make her out; but gradually the conviction deepened into certainty that it was not only a ship, but his ship, the *Golden Crescent*. Then he tried to wave a handkerchief, and failed; to shout, but the riot of the gale blew his voice back down his throat. He could only wait and watch. He saw the keen cut-water rise and fall, he marked the crash of the sea around her bows, and then—and then—no—yes, they had seen him; they were coming towards him. He crouched in the bottom of the dingy once more, with a lump in his throat, it is true, but every faculty keen and alert.

Thompson brought her down before the wind full split; then he eased his engines, and crammed his helm hard a-starboard till he lay broadside to the dingy; he started a full bucket of oil over the side to leeward, and bent a grass-line to a breaker, which

he floated down to the dingy in the temporary calm caused by the oil. Heriot was all alive now, fatigue, thirst, cold, all forgotten. Very skilfully they drew the small craft alongside, and in less time than it takes to tell the captain once more trod the deck of the *Golden Crescent*.

. . . . . .

When the trouble did break out in the mountains there was remarkably good shooting made by two batteries of mountain guns. A blue-eyed, fair-moustached officer of infantry in the army of Teutonobia was asked by a comrade, 'Where did they get them? How was it that we did not know they had anything so up-to-date?' The first man fingered his chin very tenderly. 'No,' he answered, 'we do not know. I think the only man who does, except the enemy, was that English rascal who escaped from the guardhouse and nearly broke my neck.'

THE END.

THE MONTH: SCIENCE AND ARTS.

HOUSEHOLD CLEANING BY VACUUM.

THE subjugation of dust, that bogey of the household, is a matter of complexity. Within the past few years numerous devices have been placed on the market for dealing with this fiend by mechanical agency, the idea being not only its more successful elimination, but the achievement of that object with less physical exertion and in a much shorter time. The basis of these devices is suction through the creation of a vacuum in the machine. Unfortunately, however, many of these appliances lack reliability, and, far from being a friend, are a nuisance. This result is due to the fact that bellows are resorted to for the production of the requisite vacuum, and such a system is totally unadapted to the rough, hard usage to which the appliance must necessarily be subjected. Recently, however, a notable improvement has been made which should have the result of popularising this form of dust-collector, inasmuch as not only is it strongly constructed and simple to work, but the possibility of its breaking down or becoming inefficient in operation has been reduced to the minimum. Instead of using the bellows, the vacuum is produced by means of a small, powerful rotary pump, driven by a small electric motor, the current for which can be drawn from the ordinary lighting installation in the house by the insertion of a plug and flexible connection in the lamp-holder or wall-fitting. The pump, though small, is capable of producing a vacuum of twenty-two inches at the filter-box, and this is sufficient to draw the dust either buried in or underlying any decorative fabric in the house, from a heavy pile carpet to curtains, without injuring the textiles in the slightest. The dirt is withdrawn and deposited in a box, which can easily be emptied as required. Some idea of the withdrawing-power of the apparatus may be gathered from recent tests, in which flour sprinkled on a floor and covered by a thick, heavy pile carpet was easily drawn through the latter. The machine, moreover, is particularly adapted to the cleaning of books in libraries, for which purpose one or two slight modifications in the design are necessary.

NEW METHOD OF PACKING FISH.

A recent development in the preservation of fish, the object of which is to deliver the article to the customer with all that bloom and freshness so strikingly observable when the member of the finny tribe is withdrawn from its native element, should arouse attention. Many efforts have been made to overcome the existent drawbacks to the present methods of packing fresh fish for lengthy transit; but it has been found that the water arising from the melting of the packing ice soddens the fish, and produces an unappetising, flabby appearance, while at the same time the flavour is seriously deteriorated. The new method which has been evolved by Captain Solling consists in cleaning and draining the fish in the usual manner immediately it is caught, and then wrapping it completely in specially prepared paper, the characteristic of which is that it is impervious to water. Consequently fish so treated and then packed in the ice-boxes do not become affected by the melting ice, and when unpacked hundreds of miles away from the scene of their capture are as fresh and solid as if just drawn from the sea, besides possessing the attractive bloom.

BRITISH *v.* AMERICAN RAILWAY METHODS.

Great interest has been aroused by the achievement of an American railway in the handling of a record goods train. The company in question has for years past been engaged in overhauling their lines, easing banks, and straightening curves. To determine the advantages arising from this, and what train-weight actually could be handled upon this modernised railway by a single engine under ordinary conditions, a goods train consisting of eighty-five trucks laden with four thousand four hundred and fifty-one tons of coal was hauled over a distance of one hundred and twenty-four miles by one of the most powerful goods engines in service. The train's total weight was six thousand one hundred and fifty-one tons, and its length from end to end practically three-fifths of a mile. To cover the distance occupied seven and a quarter hours, representing a speed of about seventeen miles per hour. No doubt this is a remarkable achieve-

ment, and represents a great advance on the general type of 'freighter' upon the American railways, which, crawling along at a walking-pace, constitutes such a source of amusement to the English traveller. The latter recalls the fine goods trains which ply between the north and south of these islands at a speed in excess of that of the greater proportion of the passenger expresses on the other side of the Atlantic. The celerity with which British railways handle freight is an eye-opener to American railwaymen visiting this country. True, train-weights are not so great here, but the consignee can form a tolerably precise idea as to when goods he has ordered in London are likely to reach him in the north of Scotland, and that is more than the tradesman on the other side can do. A journey of over four hundred miles—for instance, from London to Edinburgh—would take the Americans at least twenty-six hours on the above basis; the British railway does it in less than half the time. In the matter of the conveyance of goods the American displays an indifference which is strangely at variance with his usual character. It is no uncommon circumstance for goods purchased in New York, destined for San Francisco, shipped from the former port to the Atlantic terminal of the Mexican transcontinental railway, transported across the latter to its Pacific port, and again shipped to San Francisco, to reach the latter point in less time than if despatched by train straight across the American continent from New York.

MUNICIPAL SLAUGHTER-HOUSES.

One development which is of far-reaching significance to the welfare of the community might very advantageously be extended in this country. This is the public abattoir system, which has undergone such widespread extension on the Continent. When the doubtful conditions pervading slaughter-house methods in these islands—conditions which are widely divorced from the rudiments of hygiene, coupled with the perfunctory inspection arrangements—are recalled, the room for improvement is conspicuously observable. On the Continent, on the other hand, the tendency is more towards the municipal slaughter-house. Paris has one of the finest establishments of this character in the world, covering about one hundred and five acres, and handling some two and a quarter millions of animals every year. So successful did the experiment prove—for the meat so prepared for human consumption is above suspicion owing to the adoption of scientific and hygienic principles, combined with complete inspection—that Germany followed suit. In the latter country these abattoirs are an excellent investment for the ratepayers, for they have proved financial successes. The establishments are of the most elaborate character, and are equipped with the last word in slaughter-house machinery. Not only have the populace benefited from relief of rates and by more wholesome meat, but the price of the latter has also decreased. In America the movement has been taken up on an extensive scale recently; but in this case the motive has been rather to render the people independent of the machinations and arbitrary manipulations of the Meat Trust. In these islands but little advance has been made. Scattered throughout the country are public abattoirs, but with few exceptions they are neither comprehensive nor modern in character. What is required is legislation to compel the despatch of animals and the treatment of carcasses for food under a properly constituted and efficient authority. Then there would be less possibility of diseased meat being placed on sale, and those prosecutions for imperilling the health of the people which constitute such a disagreeable feature of our daily life would disappear. But under the circumstances, absence of legislative action might be supplanted by a little more municipal enterprise, seeing that in Germany the system is so financially successful; and if so there, why not here? The enhanced feeling of security offered would lead to widespread public support.

TINOL: A SOLDERING PASTE.

What amateur has not essayed soldering and experienced the difficulties attending the cleaning of the respective surfaces to be sealed together, the manipulation of the heated copper tool, and the eccentricities of the solder; and who upon surveying his unsightly success has not become convinced that it is an operation which, though absurdly simple, is one calling for no little skill? But the expert workman is not always available, and even that worthy admits that the operation is antiquated. To reduce these difficulties, a combined solder and flux in the form of a metallic paste has recently been placed on the market. Its composition is of powdered tin and lead in certain proportions, treated with deoxidising agents such as ammonium chloride or chloride of zinc, and made into a paste by combination with inert fluids having a high boiling-point. All that is necessary is to cover the joint with this paste, which works fairly easily, and then to apply the requisite heat. Such a composition as this tinol—as it is called—is one of those preparations which help to lessen the little worries of life.

FRUIT PRESERVATION BY VACUUM.

In times of glut, when luscious fruit is obtainable at absurd prices, the good housewife's instincts naturally turn to the preservation of the edible for use in periods of famine or when it is out of season. Hitherto, however, the only means of fulfilling this desire has been to preserve the fresh fruit in the form of jam; but its preparation is a tedious, speculative, and anxious task. Moreover, in the conversion to jam much of the natural flavour is lost. But the advent of the vacuum preserving process has completely changed all that. By its means the most inviting fruits can be served out of season with all their pristine flavour and appearance. The process is

simple and cheap. There is an outer vessel substantially made of metal, in which is placed a cruet-like holder carrying a number of bottles or jars. These jars are filled with the fresh fruit, vegetables, or whatever it is desired to preserve, the lids being attached and held firmly in place by means of springs. The boiler is then charged with cold water until the jars are completely covered therewith. The outer lid is then placed in position, together with a thermometer. The whole is then put on the stove, and the heat of the water raised to the desired temperature as shown by the thermometer, and kept thereat for the necessary time. Upon completion of this operation the carrying stand is withdrawn and left to cool slowly, the clipping springs securing the bottle-lids in position being retained until the jars are quite cold. The outer atmospheric pressure keeps the lid tightly pressed down upon the sealing ring of the jar, so that the entrance of outer air is quite impossible. When the contents are required, all that is necessary to be done is to pull the rubber sealing-ring slightly outwards to admit air, and the cover can then be easily withdrawn. If the whole contents are not required, the bottle can be resealed by submitting it to the sterilising process once more. So easy and simple is the whole process that twelve pounds of fruit can be preserved in an hour, and without any of those dangers of burning and spoiling the contents which prevail in jam-making. It is thoroughly reliable, and fruits, vegetables, or liquids so treated will keep indefinitely. No preservative or chemical being employed, the true flavour of the article is retained, and its dietetic value is not impaired in any way. For milk sterilisation the system is eminently useful. The acquisition of such a handy and inexpensive contrivance as this will offer a complete solution to many of the problems in this line that at present perplex domestic circles.

SOMETHING NEW IN CONVEYERS.

A difficulty of varying proportions in open mining operations is the economical removal of the top soil or callow, to expose the ore-beds below. This preliminary operation must be so carried out as to be not only efficient, but at the same time as inexpensive as possible, since it contributes by just so much to the cost of obtaining the ore. Moreover, in some districts where land is valuable it is essential that the soil should be dumped in such a manner that the pile will possess an even surface, so that when the land is turned to some useful purpose, such as agriculture, no initial heavy expense is incurred in levelling. These ends are ingeniously met by the new conveyer which has been evolved by a mining engineer, Mr R. A. Grossmith. This apparatus is entirely new in design, and possesses many ingenious features. In appearance it resembles a huge bicycle-wheel, being built up in the same manner, with a rim secured to a hub by wire spokes disposed tangent fashion. The wheel has a diameter of eighty feet. It is carried horizontally, and is supported upon a beam or cantilever arm on roller-bearings. Round the rim extends a flat, circular table forty-two inches wide, upon which the earth when excavated is dumped from a special revolving feeding-hopper, carried round and discharged at the opposite side or behind the machine. So beautifully is the conveyer-wheel balanced that although it weighs six tons it can be readily turned round by hand. The steam-shovel drops its load into the hopper, which in turn thrusts it in a steady, uniform stream upon the revolving wheel, and it is carried over the cutting in which the machine works and is shot off the table in the same steady stream by means of a fixed plough stretched diagonally across the table. As the conveyer travels up and down the cutting side by side with the excavator, the hill as it is cut away on one side is built up again on the other; and so easily can the discharge movements be controlled that the dump-heap has a perfectly even and smooth surface. The wheel is driven by a small steam-engine, as is also its pedestal support mounted upon a wheeled truck travelling on rails, and can deal with some five hundred cubic yards of earth per hour at six revolutions per minute; while the wheel can be inclined as much as 25 per cent. from the horizontal without any fear of the earth falling off. The machine has undergone prolonged and severe tests in the ironstone ore districts of Northampton with eminent success. Its recommendatory features are low cost in the first place, high efficiency, insignificant maintenance expense, and applicability to any description of excavated material without the possibility of fouling or blocking, as well as depositing the soil immediately in its rear as it travels to and fro. It marks a great advance upon the methods of handling such material at present practised in mining operations, and cuts down the labour bill by a significant amount.

MAKING MINERAL WATERS AT HOME.

A short time ago, in the course of referring to the food-value of mineral waters, we drew attention to the simple method now available of making aerated waters at home whenever desired, by the discharge of pure CO_2 into a special type of siphon from a small bulb or cartridge which is charged with the gas. The advantage of such a system is obvious, for there can be no suspicion as to the purity of the water used or of the carbonic acid gas by means of which aeration is secured, as may be possibly entertained in the purchase of siphons of aerated water. Again, the process is cheaper, for a siphon of aerated water of the usual size can be made for about one penny, which is from 60 to 80 per cent. cheaper than the usual article. The simplicity of the system has led to many widespread developments. Not only has demand resulted in the marketing of a new size double that of the ordinary vessel, enabling aerated water to be produced at about twopence per quart, but the invention has been applied

to suit the convenience of travel either in the form of a cane-covered bottle or traveller's flask. These two latter developments are especially ingenious and handy. Often it is required to make a still wine sparkling, or to aerate without dilution for improved dietetic purposes such liquids as milk or beef-tea, or alcoholic liquors, which are not adapted to siphoning owing to the excessive frothing that would result from such manipulation, and this is the only means by which this end can be achieved. Similarly, it offers an efficacious method of rejuvenating champagne which has lost its sparkle, the re-aeration restoring all the former excellent qualities of this wine. By means of small tablets similar to those rendered so familiar by tabloid medicines, effervescing and soluble salts can be added to the water before aeration. Consequently at the table one can produce potash, lithia, Vichy, Carlsbad, and so forth at will, and in a few moments. Even fruit crystals can be added, and their respective flavourings be available, or an invigorating pick-me-up composed of a certain proportion of phosphates of iron and quinine brought within immediate reach. There is no doubt but that the perfection of this ingenious invention, with its wide range of uses, efficiency, purity, and cheapness, has popularised the consumption of aerated water, to the ultimate benefit of the digestive organs.

CALCIUM CHLORIDE AS A DUST-LAYER.

A series of interesting experiments recently carried out at Ashford, Middlesex, serve to demonstrate the possibilities of calcium chloride as a dust-layer, and thereby overcoming one of the greatest prejudices against swiftly moving, self-propelled traffic. A mile of typical road of dry macadam, presenting a very dusty surface, was selected for the experiments. The dust-layer is a white granular powder, and is a product of the alkali industries. It was sprinkled over the surface of the road in a dry condition, and in a short time, in liquefying, formed a kind of skin or envelope to the road-surface, binding down beneath all the particles of dust arising from the disintegration of the road-metal. Twenty-four hours after the first application another sprinkling was applied so as to ensure the road-surface becoming thoroughly saturated therewith. After treatment, the effect of passing motor-traffic was observed. When the swiftly moving vehicle passed over the dressed road-surface there was a conspicuous absence of dust, but directly it reached an untreated stretch clouds of thick dust arose in its wake. The advantages of this treatment are that watering is unnecessary, for the simple reason that calcium chloride is hygroscopic, and readily absorbs the requisite moisture from the atmosphere to bring about liquefaction. Being a neutral salt, it is harmless. It is estimated that the cost of dressing a road with this material averages about one-sixth that of watering the same area, and that the relief is more permanent and the road-surface hardened. If the duration of the effect or life of a single dressing should come up to the estimates, and the cost of the raw material plus that of application is within reasonable bounds, it should prove useful in solving one of the most difficult problems at present engaging the attention of road engineers and the public at large.

FIGHTING TROPICAL DISEASE.

Thanks to the stern front that science is offering to the ravages of many of those virulent diseases incidental to the tropics, many countries which were formerly nothing more than 'cemeteries' are being rendered as habitable as the British Isles. An important part in this momentous battle is being taken by the Livingstone College at Leyton, Essex—work of that serious, practical character so essential to success in determining the causes of those terrible maladies and how they may be best overcome. It is due to such work as is here accomplished that the veil is being lifted from many of the worst spots in Africa—places where the sleeping sickness has reigned supreme—so that the stigma of the 'White Man's Grave' is being surely wiped out. The sleeping sickness disease has been most assiduously attacked by science, and the onslaught is already being attended with material success, as a perusal of the Proceedings of the Liverpool School of Tropical Medicine and the Proceedings of the Society of Tropical Medicine conclusively shows. It might be thought that the ignorance of the unsophisticated native would be an obstructing factor, but such is not the case. The native, like the civilised white man, is by no means stupid when his own interests are at stake. In many parts of tropical Africa the native is well aware that if his cattle are attacked by the tsetse fly certain death awaits them, and it only remains to educate him to the knowledge that the methods of the white man are to his own personal advantage. In this campaign of education all Europeans are lending valuable assistance, explaining the means whereby the man himself can avoid the disease, by giving wide berth to those places where the malady is notoriously rampant and resorting to the prophylactics that have been evolved as a result of scientific research as a precaution against the bite of this fly. It is an uphill fight, paralleled by the instruction of our own community in the efficacy of Jenner's vaccine against smallpox, and in India to-day by the application of Haffkine's serum for the prevention of plague.

THE SCIENTIFIC EXTERMINATION OF RABBITS.

The rabbit, like the poor, is always with the Australian, especially throughout southern Victoria, Queensland, and the west part of the continent. Like the rat, this animal is remarkably prolific, and having been left undisturbed in the Antipodean colony for a few years, it has multiplied at such a rapid rate that now it has become a pest. Various expedients for exterminating, or at any rate mitigating, the nuisance have been made, from virus to

crude distribution of poisons, but with little effect. One Australian, however, has hit upon what may be best described as the most efficient exterminating system that has yet been suggested, since it is in consonance with the fundamental laws of nature. As is known, the rabbit's instincts are essentially polygamous; but if the balance were reversed, and a state of polyandry produced, in a short space of time, the perpetuation of species being rendered impossible, complete disappearance of the plague would ensue. Such briefly is the solution advocated by Mr P. W. Rodier, and it is one with which every raiser of stock is perfectly familiar. It is the buck rabbit which is so ruthlessly slaughtered, the result being that the females preponderating in the rabbit-population produce young at an alarming rate, so that the last stage is worse than the first. No stock-raiser ever thinks of creating a position in which the proportion of one to the other is equivalent, or nearly so, since he knows that the increase in the resultant population will be either an insignificant quantity or probably none at all; whereas, on the other hand, if a condition of polygamy is provided, the numbers of his flock, herd, &c. multiply rapidly, and he takes care that such a polygamous state is always maintained. It is obvious that if polyandry is practised the males will persecute the females to death, while even any young that are produced are quickly killed, so that multiplication is absolutely arrested. After the medium of perpetuation has succumbed only the males are left, and these in due course either fall a victim to their predatory foes or die off, so that eventually the race will completely disappear. Mr Rodier naturally argues that all bucks caught should be released, and only the does despatched; but to the ignorant mind this seems such a suicidal proceeding that no one has the courage to support it. This, too, in face of the fact that he has proved the certainty of his suggestion upon a small scale. The remedy is so absolutely simple as to appear ludicrous, but is perfectly apparent to those who have only the most elementary knowledge of science or physiology. The sceptical, however, practise the antithesis simply to avert this very contingency.

DURABILITY OF IRON VESSELS.

Admiral Douglas, speaking recently on the navy at Sheffield, alluded regretfully to the comparative durability of the former wooden walls of England compared with modern ironclads. Nelson's flagship at Trafalgar was sixty years old, and yet the *Victory* was considered one of the finest men-of-war in that great battle. 'Where should we be to-day with battleships sixty years old?' asked the Admiral. Modern war-vessels undoubtedly become obsolete with ruinous rapidity; but this results more from outclassing in guns, armour, and machinery than from decay of the metal hulls. The mercantile marine shows many instances of iron vessels now in regular service at ages rivalling those of the ancient timber fabrics. Readers will recall the disastrous wreck of the New Zealand Union Company's steamer *Penguin* on Cape Terawhiti in February; but it will surprise many to learn that this vessel was built on the Clyde as far back as 1864 by Tod & MacGregor, the historic builders of Jules Verne's famous blockade-runner. The same year saw the graceful *Iona*, still accounted a model craft, take the water from J. & G. Thomson's yard. In 1853 the *Lough Foyle* was launched by J. Barr, Glasgow, in 1846 the *Mary Jane* by Tod & MacGregor, and in 1844 the *Edinburgh Castle* by Smith & Rodger. These packets, under other and well-known names, are still in active service, and are to all appearance as stanch now as when they were launched over half a century ago, though the firms who built them have long since disappeared. The boats named vary in length from about one hundred and sixty feet to two hundred and sixty feet, and are all paddle-steamers constructed of iron plates about a quarter-inch thick. Steel vessels have yet to prove their relative durability, as the oldest example now running is probably the comparatively youthful and popular Royal Mail steamer *Columba*, built in 1878 of mild steel from the mills of the Steel Company of Scotland.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

'REST-AND-BE-THANKFUL,' AT THE HEAD OF GLENCROE.

The path through sombre vale we long ascend,
Until at last is reached the wished-for height,
Where carved on stone a simple call we sight:
Rest ye not, Thankful! Whether cheered by friend,
Or by the unseen eagle's notes, which blend
In chorus wild o'er sky-born streams that shine
Resplendent, or with showering spray define
Their course down yonder mountain's rugged bend.
Now, while we rest, o'er lake and stream and mead
Is silence, save for the breeze of autumnal day,
Whose voice, inconstant, murmuring dies away.
Here in this sinuous vale my soul took heed,
Through faith, as if some angel spoke again,
Proclaiming, 'Peace on earth, good-will to men!'

REGINALD ROGERS.

*** TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

By H. A. BRYDEN.

CHAPTER I.

LATE on a fine afternoon of early spring in the year 1464 Sir Jeffery Aylmer, a young knight of Northamptonshire, rode home through the forest of Whittlebury to his manor-house of Wappenham. Sir Jeffery's fresh and extremely handsome face wore an air of seriousness and even of gloom very unusual to it. For, in sooth, his affairs, which of late years had been none too prosperous, were just now going very much awry. He was grandson of Sir John Aylmer, a warrior and diplomatist, who had fought at Agincourt and in the French wars of Henry VI., and had added largely to his estates under the Lancastrian kings. But his father, fighting against the Yorkists at Northampton, had been slain and the greater part of his estates—those in Huntingdonshire and Suffolk — confiscated. Sir Jeffery, who had fought and been severely wounded at his father's side, had, in consideration of his youth, been pardoned by the Duke of York, and now lived on the remnant of his ancestral property, an estate of some four thousand acres lying beyond the bounds of Whittlebury. Northampton fight was four years since, three years of which the young knight had spent in France. Since his return home he had lived in retirement at his stone manor-house at Wappenham, having by good fortune missed the fatal Lancastrian disaster of Towton, and so kept his head and his land in times the most perilous to subjects known in English history.

But it was not the remembrance of his father's death—his mother, the heiress of Wappenham, had died young—and of the family disasters which just now clouded the young knight's good-looking face. He was but twenty-three, and his spirits were ordinarily high enough. He was on his way back from Grafton, where lived one of the fairest ladies in all England, Elizabeth, Lady Grey, between whom and Sir Jeffery a very tender friendship had sprung up within the last twelve months. The Lady Grey was the widow, at an absurdly youthful age, of Sir John Grey, who had been slain in the second battle of St Albans. Her husband's estates had been seized by the Yorkists, and with her young children she had taken refuge with her father and mother at Grafton, nine miles distant from Sir Jeffery's seat. Her mother was a great lady, Jaqueline of Luxembourg, who had wedded the Duke of Bedford, and who, on her widowhood, had condescended to a match with the knight Sir Richard Woodville.

This day all the young man's dreams of the future had been smitten suddenly and without warning to the ground. At Grafton, where for a twelvemonth past he had been received in the most friendly manner and admitted to close intercourse with the beautiful widow, he had been to-day met with the coldest civility. He had, upon some absurd pretext, been denied access to the Lady Grey, whose face he longed to see; and upon seeking explanation of her mother, the Duchess of Bedford had assumed her haughtiest airs, and in her broken English had informed him that she and her husband had other views now for their daughter than a match with a knight of small estate. Sir Richard Woodville, to whom Sir Jeffery had spoken privily as he left the house, had, indeed, in a somewhat shamefaced manner, half-apologised to the young man. They had been good friends, and had had many a merry day in the field together hunting deer and boar or watching a flight with their falcons.

'Prithee ask me no more questions, Sir Jeffery,' he had said. 'Things have happened that might never have been expected, and we have plans for the welfare of Elizabeth which I durst not break to thy ears. I am right sorry for thee, lad; but—well, thou must e'en go thy way and forget thy friendship. There's no other road for thee.'

And in this enigmatical manner Sir Richard had

[*All Rights Reserved.*]

bowed him out to the courtyard and his attendants, and said farewell.

On his ride home by the forest road, Sir Jeffery's esquire, Thomas Cowper, had somewhat lifted the veil from before his master's eyes.

'These be passing strange tidings, Sir Jeffery,' he said; for he had always the privilege of speaking freely to his master, and was just now bursting with information.

'What news?' returned the young knight gloomily, brooding on his own cares. 'I heard nothing.'

'Why, that his Grace King Edward, who lies just now at Stony Stratford for hunting, hath twice been at Grafton in these last four days, and doth manifest great and wonderful admiration for the Lady Grey. They be all talking of it—squires, grooms, varlets, and all.'

The young knight turned sharply in his saddle, and with a face some degrees paler than its wont, stared hard at his esquire. 'Is this, in very sooth, true,' he queried, 'or mere idle gossip?'

'I am convinced it is very truth indeed, Sir Jeffery,' returned Cowper quietly.

'This, then, accounts for all,' muttered the young man to himself. 'I might have guessed something of the kind.'

They cantered on steadily for some time, no word passing between them. Presently they drew rein at a hill and walked their horses again. They were now in one of the wildest parts of the great forest of Whittlebury, which in those days covered a large portion of South Northamptonshire and North Bucks.

Suddenly Aylmer halted. 'Hark!' he said, 'I hear hounds and a horn. List! list!' he continued, lowering his voice to a whisper and holding up a warning hand. 'Ah!'

Two hundred yards away, across a broad clearing in the woodland, there ran a great red-deer stag, dark with water and sweat, and now labouring in his gait. He was to windward, and as the two men reined their horses, motionless as statues, he espied them not. Plunging into a thick brake of fern and gorse, the stag bent his proud head, and with his antlers struck fiercely at something in front of him. On the instant there leaped from the bracken another stag, somewhat younger and less bulky, which, thus driven rudely forth, cleared the covert in two or three magnificent bounds and made away through the forest.

The deep voices of hounds busily hunting the line came nearer, and in three or four minutes appeared the pack—massive, long-eared, deep-flewed, light-coloured hounds of the heavy type then used in English hunting. They drove past the crouching stag, and took the line of the younger deer just driven from its resting-place. Three or four of the older hounds, however, threw up their heads and gazed about them, as if not satisfied that the line was the right one. At that moment there galloped up to the spot three or four mounted hunters. The foremost of them was a tall young man, very handsomely apparelled. He was flushed with hard riding, and as he drew rein for a moment and cast his eye on the doubting hounds, he looked about him.

Sir Jeffery's hunting instincts had by this time utterly overcome his low spirits. He cantered up, and pointing to the brake of fern, cried, 'Fair sir, your stag lies there couched. He hath put out a young stag, and the main body of your hounds hunt at fault.'

The hunter darted a quick, keen look at his informant, and instantly put to his lips a magnificent hunting-horn, and blew loudly two or three recheats to call back the errant hounds.

'I thank thee, sir,' he said simply when he had dropped his horn. Then turning to two prickers who rode near him, 'Away with you, Jasper!—Away, Simon! Call off the pack, and bring them back hither at your utmost speed.—Do you, Philip, couple up yonder hounds,' pointing to the old hounds now nosing about for the right line, but manifestly at fault, 'and hold them up till the main body be recovered.'

While this was doing, Sir Jeffery had leisure to look again and more curiously at the leader of the chase. He was a young and very tall man, but so nobly proportioned that his great height was not apparent until he got off his horse and stood for a few minutes talking to three or four of his hunting companions who had now ridden up. Then Sir Aylmer could see that he stood some inches over six feet. His face was extraordinarily handsome. He had a fair skin somewhat embrowned by exposure, a straight nose, a strong chin, keen blue eyes, and golden-brown hair, which was cut short in front, and behind hung as far as the base of his neck. He wore a green felt hat with a round, rolled brim, decorated at the back with a single eagle's feather held in its place by a jewelled brooch. His tunic of rich green cloth was trimmed at top and bottom with sable fur and belted at the waist. To this belt was attached a short hunting-sword, hung in a handsome, jewelled sheath. Beneath his tunic he wore a long-sleeved vest of purple silk, fastened well up at the throat. His nether limbs were clad in cloth tights, striped lengthwise in green and purple. He wore buff leather hunting-boots pointed at the toes, and long silver spurs, and upon his hands were leather gauntlets. At his left side hung a magnificent hunting-horn, which at once attracted Sir Jeffery's attention. It was like no other hunting-horn he had ever seen.

Something in the bold, imperious air of the huntsman made a deep impression on Sir Jeffery Aylmer as he gazed at the noble figure before him.

A gentleman who was near walked his horse towards him. 'Know you, sir,' he said quietly, 'that it is the King's Grace yonder who hath dismounted?'

'Nay, I knew not it was King Edward,' replied the young knight in some confusion, instantly

alighting from his horse and taking off his cap. 'It hath not been my fortune hitherto to set eyes upon his Grace.'

In the young man's secret soul King Henry VI. was still his true liege lord. But though that unfortunate monarch was yet, in the eyes of his adherents, *de jure* lord of the realm of England, Edward of York now ruled the country by right of conquest. In any case, he was of the blood-royal of England; and, as Sir Jeffery's instincts warned him, this most commanding personage, victor already of many stricken fields, was now known to men as King Edward IV., and was no man to be trifled with. Nor could the knight's secret soul deny that the splendid prince standing before him, in the full flush of youth and vigour, was in outward semblance the most magnificent of all the long line of Plantagenets.

Meanwhile the errant hounds had been whipped off from the faulty chase, and were in a few moments brought back by the prickers. The King motioned that Sir Jeffery Aylmer should be brought to him. Leading his horse, the young man went forward, and, on nearing the King, bent on one knee and made his obeisance.

'Now, sir,' said the King genially, 'rise and show where our hunted stag hath taken lair.'

So saying, he swung himself lightly to the saddle, and all followed suit. Sir Jeffery led the way, and within thirty paces of the couching stag halted and pointed to the King the exact spot.

'Uncouple the hounds!' called Edward to the huntsmen, who held up the old hounds in leash. Then, in a wonderfully clear and melodious voice, he cried, 'Hyke, Cæsar! Hyke, Bowman! To him, Music! Good brache! To him, Blueman!'

With this encouragement and a wave of the hand, he threw them into the fern-brake. Busily the hounds worked the covert while one might count twenty seconds. Then, upon a sudden, from under the very nose of the red bitch Music, there leapt to its feet the hunted stag and was away.

'There he goeth! there he goeth! That's he! that's he!' cried the King ecstatically. 'To him, boys! to him!' And with several kindling blasts of the horn away went the chase again full cry, the whole pack following madly, with deep, resounding chorus, through the forest as the deer sped away into its depths.

For the space of another half-hour the hunted stag still held his own before hounds and hunters. As the lengthening shadows fell among the woodland, and the day drew in, the good hounds gained perceptibly on their quarry, and their glorious clamour increased; and finally, running from scent to view, they set up their stag in front of a grand old oak. Here, with his back to the tree, the beast still maintained his proud front, facing the baying pack, and occasionally dealing a stroke with his forelines at any hound that presumed to approach him too closely. Six or seven hunters, who had survived the long chase, galloped up, and the King, throwing himself from his sweating and now leg-weary horse, drew his short hunting-sword, ran swiftly behind the oak, and approaching the stag from the rear, dealt him a fatal stroke behind the shoulder. Then followed the mort, much blowing of horns, the paunching of the quarry, and the due rewarding of hounds.

Darkness closed in apace, and the King asked where he was and how far from Stony Stratford. Sir Jeffery informed him that he was thirteen or fourteen miles from that place, and was now but two miles from his house at Wappenham, where he offered refreshment to the royal party. It was against the grain, but there was nothing else for it. The King not only accepted the young knight's hospitality, but expressed his intention of taking up his quarters there for the night and hunting again on the following day. Meanwhile his prickers were despatched to Stony Stratford for fresh horses and hounds, to be brought out at daybreak.

That evening King Edward, with the half-dozen lords and gentlemen who were hunting with him, supped heartily on the good fare set before him, and drank deep of the excellent wine which the ancient cellars at Wappenham still held. His Grace deigned to invite his host to be one of the party; and although the young man could scarce hope to keep pace with such hard drinkers as his guests, he played his part respectably, and engaged in as much conversation as might be with men between whom and himself there could be but little real sympathy.

The Lancastrians were now beaten from the field and destined to be quiescent for some years after the recent defeats of Queen Margaret in the north at Hedgley Moor and Hexham, following on the dread slaughter of Towton; but thoughts of revenge still flowed in the secret currents of their souls.

But that evening neither the woes of the Lancastrians nor the triumph of the Yorkists ran much in the mind of Sir Jeffery Aylmer. Something else riveted his attention, fascinated him. It was a strange and wonderful thing to watch there, sitting at his own board, exchanging jokes, hunting-stories, and adventures with his chosen companions, Edward of York, that ruthless and most masterful youth and hard fighter, the victor in many grievous battles, who already at the age of twenty-three had waded through seas of blood to the English throne. What fascinated Sir Jeffery was not so much the King as the King's hunting-horn. The young man had noted it on his first sight of Edward. He had held it in his hands as the King divested himself of it on entering Wappenham, and it now reposed on the great oak buffet against the wall, in the centre of the hall, in full view of the supper-party. It was in truth a wonderful horn, and the curious thing was that Sir Jeffery Aylmer knew and recognised it the instant the King had placed it in his hands.

'That is the prince of hunting-horns, your Grace,' he ventured to remark as it was delivered to him to put away. 'I never set eyes on its fellow.'

'Ay,' had returned the King carelessly, ''tis a fine horn, in sooth. I got it from a Jew merchant in London, from whom I buy jewels and rare curiosities. He knew nothing of its history save that it had come from Allemain or Muscovy, and that he had paid a great price for it. And, by'r Lady, he charged me sorely for my fancy. Nathless, 'tis a choicely good horn and a rare one to wind a note upon. I have never known a better, nor ever shall, though I live to be a hundred.'

As the young knight took it from the King and carried it reverently to the buffet, he gazed at the horn long and closely. He knew now its whole history. When, two years since, he had been at the Court of France, where his father and grandfather had been well known and he himself was welcome, he had met a young Lithuanian count, between whom and himself a great friendship had sprung up. Stephen Janusz was wandering about Europe for the completion of his education and for the purpose of seeing service in foreign armies; but he was charged also with a mission from his King, Casimir IV. of Poland, from whom had been stolen a celebrated family hunting-horn which had descended to him from his ancestor, Casimir the Great.

Young Stephen Janusz had told him that the King of Poland set so great a store by the horn that he would endow the finder and restorer of it with great rewards. And the count himself hoped to be the lucky man. He had shown the English knight a fair drawing of it, and the moment that Sir Jeffery set eyes on King Edward's hunting-horn he believed—he knew—that here, indeed, was the lost trophy. It was made, as Count Janusz had told him, from the horn of a wild Lithuanian bison, mounted in gold, and most beautifully chased and inlaid in the same precious metal with hunting scenes depicting the pursuit of the wild beast from whose shaggy front it had been taken.

Again and again that evening Sir Jeffery's eyes stole to the hunting-horn as it rested upon the buffet, and much he pondered upon its singular history. Little could he then understand the strange influence it would have upon his fortunes!

(To be continued.)

INTELLIGENCE DEPARTMENTS.

By An Ex-Intelligence Officer.

ALTHOUGH from time to time the British public hears a good deal about the uses of 'intelligence' in connection with naval and military operations, and it is a matter of common knowledge that most countries spend a good deal of money in acquiring information about the naval and military resources of their neighbours, the actual methods pursued are known to comparatively few.

As there is nothing at all secret about the system, as distinct from the results attained, a brief sketch of the means which a military Intelligence Department commonly adopts in order to keep *au courant* with developments among possible enemies may be interesting and help to dispel some foolish fallacies. In particular, it may serve to discount any notion that the prime duty of Intelligence Departments is mere espionage. Of course all countries who desire to know their neighbours' secrets have to resort more or less to agents who are sometimes nothing but spies pure and simple, if indeed purity and simplicity can be mentioned in any such connection. But the everyday work of an up-to-date Intelligence Department is of a much less thrilling and more business-like character than it possibly would be if conducted on the lines of a private inquiry office. It is the more successful for the reason that military intelligence, to be really useful, should be, as a rule, derived from a variety of sources, some of them, at least, more trustworthy than those with which occasional revelations of espionage of the baser sort have rendered all the world familiar.

Of course different countries have different systems and organisations. In the German army, for instance, the whole General Staff is, practically speaking, one vast Intelligence Department, and in time, no doubt, our own newly created General Staff may have similar functions. But in most cases, our own included, the definite duty of collecting, collating, and compiling information regarding foreign countries is entrusted in peace-time to a comparatively small body of selected officers, with a highly organised clerical establishment, and an associated topographical branch for the preparation of special maps and plans. With us, intelligence work is directly supervised by a Director of Military Operations, who in his turn is subordinated to the Chief of the General Staff. The Indian army has a separate Intelligence Branch which is similarly controlled. In time of war it is usual to appoint a Director of Military Intelligence, who remains with headquarters, while a number of other selected officers carry on intelligence work either under his direct control or in association with the various divisional staffs. Intelligence duties in the field are, however, outside the scope of the present sketch. They are naturally more concentrated and less comprehensive than the work of an Intelligence Department in time of peace; and sometimes, if the work has been thoroughly well done, are largely confined to collect-

ing and recording minor details likely to be useful in future campaigns.

System naturally plays an all-important part in the everyday procedure of an Intelligence Department. The scope of the department's operations being more or less accurately defined, certain countries are allotted to certain sections, the whole work thus at the outset being conveniently decentralised. Without going into details, it may be taken for granted that the collection, collation, and compilation of the right sort of military information concerning even a small foreign country is a matter requiring infinite pains, considerable capacity, and a very careful sense of proportion. It happens that from time to time our own Intelligence Departments both at home and in India have issued to the outside public compilations—from which, of course, all confidential and secret items have been eliminated—and some of these to an observant student will afford a pretty clear indication of the process pursued, which is fairly uniform, at any rate as regards the more important publications.

Let us suppose that all of a sudden the kingdom of, say, Ruritania, hitherto completely obscure and unimportant, sprang into such military prominence that special attention to its resources, topography, and indeed to every circumstance in connection with it, became desirable. The procedure of all up-to-date Intelligence Departments, whether in this country or on the Continent, would probably be on much the same lines, and essentially as follows. Ruritania, being already allotted geographically to a certain Section, would become to that Section a matter of urgent concern, and orders would go forth for a report or compilation to be put in hand at once. The officer selected would naturally, in the first instance, have recourse to the fine library of the Department, and if any recent books on the subject of Ruritania had appeared these would be procured forthwith and their contents collated under the ordered subject-headings which the Department considers to be most convenient for the purpose. Simultaneously, special attention would be paid to the abstraction of all references, pictorial as well as literary, to Ruritania in the very numerous newspapers and magazines, home and foreign, with which the Department is kept supplied. In this way alone an astonishing amount of information may be collected and rearranged in a convenient form within a very few weeks; and it is surprising how valuable even a compilation in which there is not a trace of confidential information can be rendered by a competent hand working on an intelligent system.

So far, the Department will only have done what any private individual could do with a well-filled purse to draw from. But naturally it has other and special means at its disposal. In the first place, there may be papers relating to Ruritania in the archives of the Foreign Office or of some other great State department, and these of course are promptly available. Also, in one of the larger countries adjacent to Ruritania there may be an Embassy on the establishment of which there is a Military Attaché. Now, a Military Attaché, more especially a British Military Attaché, must jealously preserve the good name of his country and army by abstaining from taking undue advantage of his peculiar and very honourable position. But of course his business is to keep his eyes and ears open, and the Military Attaché at the Court of the country nearest to Ruritania would certainly, in the circumstances suggested, receive a hint to send along any odds and ends of information locally procurable as to that now interesting little State. It is even conceivable that the Attaché, wearied by the constant social calls of the gay capital in which his Embassy is located, may think fit to go shooting or fishing among the Ruritanians, with whom his knowledge of the language, his good sportsmanship, and his perfect tact and knowledge of the world will probably render him vastly popular. On his return to his Embassy, the letter-bag of the latter may shortly carry home some observations on Ruritania which have curiously little reference to its birds, beasts, or fishes.

In cases where such a proceeding on the part of a Military Attaché would be objectionable, either a foreign agent or an officer of the Department might be deputed to visit Ruritania, not exactly as a spy, but on what may be termed a sort of private reconnaissance, such as can be correctly undertaken by any one, and very advantageously undertaken by a man of trained intelligence and faculty of observation. Of course it is essential that he should speak the language perfectly, and the British army is none too well supplied with linguists. Still, a fair number of officers have qualified as interpreters in all the principal languages, and the interpreters' test is extremely exacting.

Lastly, of course it is possible that the service of regular spies may have to be requisitioned, and information obtained by methods which unfortunately are almost imperative in certain extreme cases. It is not desirable here to go into the ethics of espionage, and without any pharisaical self-righteousness it may be surmised that of all civilised nations we probably pay the least for information of that particularly vile sort which traitors of all countries have for sale. But that English gold should be sometimes paid for knowledge thus, in the first instance, communicated is in any case unavoidable, since any service of confidential information must include agents into whose individual methods it is impossible to inquire too closely. As a matter of fact, of all 'intelligence,' that which is procured directly or indirectly from corrupt sources is probably the least satisfactory. In this connection it is worth while recalling the cynical observation of a Russian officer of high rank, who remarked to a foreign military friend, 'What a pity it is your country and mine cannot be more open with one another! We should each save a lot of money, for neither of us has a military secret

worth having which the other has not bought and paid heavily for.'

It is not difficult to imagine that, with all these various means at its command, an Intelligence Department can soon get together a most useful selection of details concerning the military resources, topography, and so forth of any part of the world. To cast these details into shape is a very ordinary piece of book-making; and if there is any near prospect of trouble in regard to the country in question, the precaution may be taken of having the report, or whatever is the form of the publication decided upon, set up in type and a number of copies confidentially printed for distribution to General and Staff Officers proceeding on field-service.

Of course there are interesting matters connected with Intelligence Departments which it is not altogether expedient to discuss. But the foregoing brief sketch will serve to show that, apart from its more secret operations, a modern Intelligence Department is essentially a concern for collecting and compiling information, enjoying special advantages of course, but conducted on a simple and business-like system which might be, and perhaps occasionally is, applied to quite private literary and other enterprises.

VANESSA.

A MOTOR IDYLL.

By Sir J. H. A. MACDONALD, K.C.B., LL.D.

CHAPTER VI.

I HAD asked Vanessa, whenever I began to be sure of my ground with the aid of Stocks's information, whether she had any papers that would tend to clear matters up. She told me she had been a ward of Chancery from her infancy, and that it was possible there might be some documents in the Chancery Office. She sat down at once and wrote a note which she brought to me. It said:

'DEAR LORD CHANCELLOR,—I am one of your wards, and I am now grown-up. If there are any private papers of my father and mother, may I have them? I think I ought to have them. I know so little about my parents, and I want to know.—Believe me your most obedient ward,

'VANESSA KING.'

I said to her, 'But surely, Vanessa, it should be some head-clerk, or secretary, or somebody, you ought to have written to, and not to the great man himself?'

'I don't agree with you, Mitey,' she replied. 'When a lady writes she should always go to headquarters. What would be a cool proceeding from a man may be looked on as compliment from her. Besides, he knows me. I had to be taken to him, as he wished to see me about my desire to have hospital training, and he is a dear old thing, and was most kind.'

I felt that his knowing Vanessa made a great difference, as he could not but take an interest in her. And she was right. A kind little note came, franked to her through the post, and a registered packet followed the day after. I saw the tears running down her cheeks as she turned over the contents, and came here and there upon something that enabled her to see into the past—the loving letters that had passed between her parents on the few occasions when military duty had parted them, and the sweet little trifles that each had treasured as tokens of life's devotion. But there was one unaddressed envelope, in which she found an unfinished letter, on looking at which all mystery was cleared away. It was written by her mother, and had evidently been got ready so far for despatch so as not to run the risk of missing a mail. Vanessa had not read more than the first few lines when she looked up eagerly, and beckoned me to sit beside her, and we read it together. Its first words were: 'Dearest Friend,' and every line showed that it was intended for Uncle Goodman, telling him of her hope of soon being a mother, and saying that she and her 'Jack' wished that he should be its godfather. It said, 'He or she shall be named after you, dear Van; and should the day come when our little one needs a loving help we know what you will be.'

'Ah dear, that was not sent,' I said, 'for your mother was never able to send it, and so there it has lain undelivered all these years.' Vanessa laid her head on my shoulder and wept aloud.

I waited a little, and when she was calmer I patted the dear head, and said in as playful a tone as I could muster, 'So I need not wonder any more at your name.'

'What do you mean, Mite?'

'Don't you see, "Dear Van," that was their short for Vandeleur; and so, as you could not be Vandeleur, they made you Vanessa?'

It was all clear now, and it made me very happy, for if nothing was to come of my great thoughts this new interest in life would be a help to my darling, and would bring, I felt sure, great happiness to the declining years of my dear old friend.

The day came when the doctor said, 'In the evening, when the light is waning and not shining into the room, you may remove the bandage off his eyes.'

While he had been in darkness the tender care

of Vanessa and the sweet sound of her voice had awakened in the dear old man an affection which found expression in every word and gesture when she was beside him and in his eagerness for her return when she was absent. We had thought it wiser, in consultation with Stocks, not to tell the patient of our discovery until there were unmistakable signs of convalescence; and when we got the sanction of the doctor it was arranged with Stocks that he should give the first hint of what was coming. This he did quite cleverly. He began to fumble at the bandage, saying, 'The horders are this is to come hoff now, sir; and please, sir, you're agoin' to 'ave a heye-opener that you will enjoy, sir.'

'And what is that, Stocks?'

'Oh well, sir, beg parding, sir, nurse will tell you that, sir, she's 'ere, sir'—and off came the bandage.

Vanessa stood looking down on him, the great eyes beaming with love, and waited a few seconds until his eyes got accustomed to the light, which was soon evidenced by the bright look that came into them as he looked up at her. Then her lips pursed sweetly, and, bending down, she said with a warbling tremor in her voice, 'May I kiss you?'

What a smile lighted up his face, as his unhurt arm went round Vanessa's neck, pressing her to him as she brought her lips to his cheek, murmuring as she kissed him again and again, 'Godfather, dear, dear godfather!'

The squire started as she raised her head, and she nodded bewitchingly, saying, 'Yes, it is true, your nurse is the daughter of your dear friends; and, although you did not know it, I am your godchild.'

He seemed dazed for a moment, but her smile could not fail, and the truth seemed to flood him suddenly, his face becoming transfigured with a joy that was delightful to look upon, as he brought the bright head down on to his shoulder, and returned her kiss, saying, 'Thank God! thank God!'

What an evening that was! I suppose no four people ever shared a sacred and a chastened happiness as did Uncle Goodman, we two girls, and the faithful Stocks. Vanessa sat beside the bed with her godfather's hand between her own; and when he was quite calm she said to him, 'Would you like to have a letter that never reached you, that was written before I was born?'

'A letter?'

'Yes, here it is; you will know the handwriting. Don't read it just now, it tells you what you have just heard. So, dear godfather, it was no delusion when you were so surprised at the trial.'

He took the letter, looked at it, and with tears in his eyes passed his hand with it out of sight, and a sob shook him. Vanessa put one hand on his shoulder, and smoothed his forehead with the other, and a reaction of quiet set in after the excitement of the last few minutes, and presently the squire was able to talk in his usual way. He told us how ever since the case at Stickleton he had carried with him a vague but not to be dissipated feeling that something new was coming into his life, "as it has now so charmingly,' he added, patting Vanessa's hand. And then, brightening up, he added with a twinkle of his ordinary fun in his eye, 'Why did you take an *alias* when you were summoned?'

'An *alias*?'

'Yes, I got your name and took it down "Fanny Sarkey." It sounded odd.'

'Oh,' I broke in, 'I can explain that to you. The constable jerked out "Wanisarking" all in one, and you got it wrong. You see, Uncle Goodman, your goddaughter is called Vanessa after you—that is what made us sure about it all.'

'Ah, so that was it, was it? I know I am deafish; but, my child, I always hear what you say,' he said to Vanessa.

'Yes,' I said, laughing. 'She is not like Mary. Mary does gabble so.' And we all laughed.

When the doctor came next day he was astonished to find his patient so revived and bright, and praised Vanessa, saying to me, 'You see what a nurse that is really a nurse can do. I never expected to see him as he is so soon.' I told him how Vanessa was more to him than a nurse, and when he heard the story he said, 'Well, it has plainly given him new life. I can see that there is little need for doctors here now. The sooner he is taken away to have a change the better.'

He named a sanatorium in Yorkshire, which he said was attended by an old college chum of his own who was a specialist in nervous shock cases, and could be trusted to bring the squire round to his normal health, with the aid of fine air and change of scene. 'And' he added, 'if Miss King will go with him I should not wonder to see him on his horse again in a month.'

Two days later, Uncle Goodman was carried to the carriage, beside which, at Vanessa's suggestion, stood Batman, led by a groom. Batman, when he saw his master, exhibited the keenest delight, and thrust his head over the side of the carriage, where it was fondled by the squire with keen pleasure. 'It wasn't your fault, dear old boy,' he said as he stroked him.

At Vanessa's request I went with them for a few days to help them to settle down in a new place, and I was glad to go. I wished to give Vanessa a little more liberty after the strain of nursing, as it had been impossible to make her spare herself, and no one would the squire have to turn or move him but Vanessa, her skill in saving him pain being wonderful. Stocks, on one occasion when his offered help was rejected, said to me half-pathetically, half-comically, 'If it wasn't Miss Vanessa, I think I sh'u'd be jealus.'

Our new abode was upon high ground not far from a well-known town which is the shrine whither the gouty hobble for a cure. The air was invigorating and the views splendid. On the day after our arrival I bought a map of the district to study it for drives, and putting down my finger on the spot where we were, I gave a sudden start, for there, just above my finger, was the word 'Oldsborough.' Not a sign did I make as I folded up the map and put it in my pocket, resolved that no one else should see it. But from that day my planning of drives had a strange tendency to put us on the Oldsborough road either going or returning.

And so it came about that on the fourth or fifth day of our excursions, when we were returning by Oldsborough—of which I had evaded giving the name—sitting opposite Vanessa and the squire I suddenly saw the blood mantle over her face, and then at once recede, leaving her pale. For a moment her eyes looked straight before her, and she seemed to desire to remain immovable, but she could not. The man's hand had lain in hers with her consent, and to cut him was impossible. As he passed on his horse her eyes looked towards him for a single moment, and the graceful head drooped ever so slightly, the lips taking that indescribable gentleness of curve which was her most potent charm. Thus encouraged, his hat was raised gallantly, while his look was a study in astonishment as he saw the face framed in the nurse's veil. As on the former occasion, his hat did not return to his head, and he reined up and gazed after the carriage till a bend in the road hid us from view. I carefully avoided looking at Vanessa, who began busying herself about the plaid that was on Uncle Goodman's shoulders, notwithstanding his emphatic asseverations that he was quite comfortable: 'Indeed I am, dear.'

Of course I had bowed also when my hero passed, and the squire inquired when Vanessa stopped her plaid-settling, 'Who is your friend?'

'Oh,' said Vanessa jerkily, and with a badly put-on assumption of want of interest, 'didn't you recognise him. That is Mr Oldsborough, who was a witness at the trial.'

'Yes, now I remember him. He said he came from Yorkshire.'

Vanessa was very voluble all the way home, talking about anything and everything, and saying 'Don't you think this?' and 'Don't you think that?' and breaking into little laughs, all to my intense amusement and the squire's astonishment.

'Dear child,' he said, 'this fine air seems to be acting on you like champagne.'

She blushed, and putting her head down near his shoulder, she said, 'I am not the only person it is doing good to—eh, godfather.'

'You first, and the air afterwards,' said he, looking up lovingly into her eyes.

When we reached home I went straight to Vanessa's room to wait for her while she presided over Uncle Goodman's transfer from the carriage to his sofa. In a short time she joined me, and, putting my hands on her shoulders, I looked straight into her eyes, which simply shone.

'Well?' said I.

'Well?' said she, and, turning aside from my look, she pulled her nurse's bonnet-strings and threw the bonnet on to the bed.

I felt that now that they had come in contact again it was impossible for me to leave her in ignorance any longer, and I said, 'You told a fib without knowing it to-day.'

'What do you mean, Mitey?'

'You told Uncle Goodman that it was Mr Oldsborough we met to-day.'

'And so it was.'

'No, dear, it was not.'

'Mite, don't! Mite, don't tease me. Do you think I would not know him among a thousand?' She spoke almost fiercely.

I put my arm round her, saying, 'You know I would not tease you, dearest; but indeed it was not Mr Oldsborough for all that.'

I was going on, but she broke in, 'What do you mean? Oh, I can't bear it, I can't, I can't!' speaking almost passionately.

I patted her gently, and said, 'Dearest, there is nothing wrong. His name is Oldsborough, but Mr is wrong; he is a marquis.' And pointing out at the window, 'That great castle, that you can just see the top of there, is his.'

She turned round, and a blank look spread over her face. 'A marquis?' she said.

I nodded, saying, 'Indeed it is true.'

'Oh Mitey, Mitey!' she exclaimed, and, breaking from me, she threw herself down upon the sofa and buried her head in her hands, saying, 'Pity me, dear; pity me, only a poor hospital nurse.'

'Pity you!' I cried, 'not until there is some better cause for it. Just now I don't pity you one little bit. Things don't happen by accident. Here we are, and I venture to believe that it will not be long before this hospital nurse'—smoothing her hair—'will be singing—

> But how can a great lord like you, sir,
> Think on a puir lassie like me?'

'Mitey, don't put things into my head; don't please, don't turn my head and make me foolish.'

'I won't make you anything that you don't like, darling; but Mitey thinks she knows.'

I bent down my head and whispered into her ear, 'I believe Mitey can say she is sure.'

She looked down and stroked over her nurse's bag and chatelaine with her hand, and said quite low, 'Sure of what?'

I raised her chin with my finger, and pointed with my other hand to the castle, and said, 'Of that.'

She leaned forward and kissed me, and walking over to the window, she threw it up, and spreading

her hands across the frame, stood gazing out. I felt she should be alone, and slipped noiselessly out, passing into the room where the squire was lying on the sofa.

'Where is my dear child?' he asked.

'She is occupied about something,' I said. 'I will take care of you till she can come.'

It was a good hour before she left her room, and when she came to the squire's side she seemed to be her old self again, and all signs of agitation had disappeared. She was once more the sweet and ministering angel filling the sickroom with the sunshine of her presence.

(To be continued.)

THE REAWAKENING OF ARCHÆOLOGY IN ITALY.

By Salvatore Cortesi.

THERE is now in Italy a most remarkable revival of interest in all branches of archæology, so that excavations, researches, and the creation of museums are taking place very generally in Latium, while only a few years ago, once outside of Rome—with the exception of Ostia, Corneto, Veii, and a few other spots—the whole country remained undisturbed, much in the same condition as it was left by the ancient barbarians and the more barbaric destroyers of the Middle Ages.

The present blossoming of love for the past is due in part to the more cultivated condition of the people; in part, strange as it may seem, to the influence of the motor-car, which opens up regions hitherto inaccessible; and, finally, to the efforts of some scholars who have encouraged and spurred local initiative by awakening an interest in antiquities. Most prominent among these is Professor Dante Vaglieri, who has gone over Latium inch by inch, and who has organised the already flourishing museums of Terracina, the ancient Volscian Anzur, Palestrina, the original Præneste, Velletri, the Volscian Velitræ, Marino (the old town in the Alban Hills), and Civita Vecchia, which stands on the site of the ancient Centum Cellæ, known later under the name of Port of Trajan.

Most important excavations are being carried out at Palestrina, that exceedingly interesting but unfortunate town in which, for over twenty-five centuries man seems to have done his best to destroy and deface the glorious monuments of religion, art, and history which it contained. The Romans were the first, under Cincinnatus, to conquer the town and inflict ruin upon it, as we find recorded in the inscription on the statue of Jupiter Imperator brought from Præneste to Rome. The Lombards continued the work of the Romans, which the Popes carried on, Boniface VIII. reaching the apex in the orgy of destruction by ordering that Palestrina, with the exception of the Cathedral, should be razed to the ground. These instructions were savagely executed, and the plough made its furrows over the Temple of Fortune, of which Cicero spoke with admiration, and over the shrine to the Oracle of the Sortes Prænestinæ. The town sprang up again; but the cruel Giovanni Vitelleschi, Bishop of Recanati, a century and a half later, emulated Boniface VIII., and, after having conquered the place, ravaged it for forty days with fire and sword, this time even the Cathedral not escaping. Only ten years after, the House of Colonna, against whom the Pope and the bishop had been fighting, had the authorisation from Nicholas V. to again rebuild it; but modern vandals have been not less dangerous than the ancient, as, up to the present interest in archæology, the grotto containing the remains of the Temple of Fortune was used as a cellar, and casks of wine concealed the beautiful mosaics, representing fish and water, in the cavern where the shrine of the oracle stood. The excavations have especially been continued where the Necropolis was known to have existed, important discoveries being made, including a fine large staircase in travertin stone, several beautiful heads, other fragments of statues and architectural ornaments, painted vases, arms, mirrors, an interesting collection of weights, inscriptions, &c.

At Marino researches on local initiative led to the discovery of some prehistoric tombs and of remains which at first were supposed to belong to Roman villas; but as they extend for miles a more accurate study has convinced the archæologists that they are the ruins of the antique Castrimonium. Pliny says that Castrimonium was a colony, and contained one of the fifty-three peoples of Latium, having princes, patrons, and decurions of its own, and was later assigned by Nero to the tribunes and the soldiers. The many inscriptions found confirm all this. The Latin colony of the town of Castrimonium disappeared after Antoninus Pius, so that historians have not been sure about the exact spot where it stood, only knowing that it was near Marino, a village the name of which appears between the tenth and eleventh centuries.

Marino's history begins with that of the famous Roman family of Orsini. The first we hear of it is that Rainaldo, a son of Orso (Bear), took refuge there in 1265 to fight Enrico, Senator of Rome. Orso, who had come from Germany to Rome with five children, known as the Orsini (Little Bears), occupied the famous Theatre of Marcellus (inside which still stands the Orsini Palace), the Castle of St Angelo, the hill called Monte Giordano, and (outside of Rome) Nettuno and Marino. Through the present

discoveries it is ascertained that the site of Castrimonium occupied the slope of Monte Crescenzo, standing out from the cluster of Alban Hills above the valley towards Rome, which can be seen in the distance, with the blue Tyrrhenian Sea. A slight fall in the ground separates it from Castel Gandolfo (Castrum Gandulphi), which took its name from the Gandolfi family of Genoa, but is supposed to have been built by Cardinal Scarampi, Bishop of Albano, on and with the remains of Alba Longa, the most ancient town in Latium.

The excavations, however, which attract most attention are those of Ostia, which are carried on under the personal direction of Professor Vaglieri, he having discovered miles of ancient roads (showing the vastness of the town, which constituted the port of Rome), and has brought to light also tombs, sarcophagi, fragments of statues, columns, capitals, &c., a large part of which have gone to enrich the collection kept in the fine mediæval castle built at modern Ostia by Sangallo. Mr Gavin Hamilton and Mr Fagan (the one time British Consul in Rome), who were the first to undertake regular excavations at Ostia, would be astonished and gratified if they could have seen the care and scientific manner with which the work is now conducted.

The Road of the Sepulchres has been thoroughly excavated, bringing to light shops and private dwellings, and joins the Forum of Ceres (the scene of many early Christian martyrdoms) to the Mithræum, which stood on the land granted by Commodus for the worship of Mithras. Besides, a road has been found which from that of the Sepulchres joined another, now in course of excavation, which leads to the entrance to the Theatre. On the left are remains having the character of a Mithræum with mithraic reliefs, a circular depression in the centre for the blood of the sacrificial victims, and podiums at each side. However, as the inscriptions found here do not refer to Mithras, but to Jupiter and the Numen Cæleste, probably it was a small temple dedicated to both these Oriental divinities. A long portico has been found which originally had pillars, of which up to the present twenty-one have been unearthed, many half-destroyed, as it must be remembered that the magnificent buildings of Ostia during four or five centuries gave the marble which was turned into lime. Once, it is recorded, when Cosimo de' Medici and the historian Poggio Bracciolini visited the place they found an entire temple being burned into lime. Behind the pillars was the long portico into which the Tabernæ opened, and also an access to the baths constructed by Antoninus Pius. This portico, opening on a broad road, is most imposing, and is perhaps the most important discovery at Ostia, with the exception of the great temple dedicated to Vulcan, the fine columns of granite with their capitals having been overthrown into the middle of the road.

Another road which is also being excavated goes to a second entrance to the baths, which leads to the great hall containing the well-known and fine mosaic of Sea-Horses driven by Triton, son of Neptune. Among the fragments of sculpture, one of the most interesting is a trunk of Bacchus, and a bas-relief with a Satyr, while among the inscriptions one to Mithras deserves notice. Altogether, the ruins of the ancient town seem to go from modern Ostia to Portus, the harbour built by Claudius, from where that emperor started the expedition to Britain.

A very important discovery has been made in the ancient Formiæ which stood on both sides of the Appian Way, precisely to the west of the modern city of that name. It consists of a funeral monument, fragments of which were used in the first centuries of Christianity for the construction of the antique Church of Santa Aurea, itself now in ruins. The monument was dedicated to Aufillia, of the celebrated Mamurra family, to which belonged the Mamurra mentioned by Pliny, Cicero, and Suetonius, and violently attacked by Catullus in his poems, who called him Decoctor Formianus. He was the Præfectus Fabrum, or commander of the Engineers, in Cæsar's army in Gaul, and amassed great riches, became celebrated for his refined elegance, and was the first Roman to cover all the walls of his house with layers of marble and to have really solid marble columns. The monument dates from the end of the first century of the Empire.

In the same territory was found a little marble statue without a head, which represents a young Satyr, having on his shoulders the leopard skin, plainly taken from an original by Praxiteles. A little farther on was a small Amor, a beautiful work of art. The whole weight of the body lies on the right leg, causing a most graceful line of the hip, the little figure being in an attitude of abandon, with the head reclining, crowned with flowers and leaves, and with a short mantle on his shoulders. On the left is a cippus, ornamented with festoons and surmounted by a tiny female figure, which serves as a support for the Amor. A life-size Venus was also found which is on the lines of the Capitoline Venus, although the work has, especially in the modelling, evident defects, and must thus be attributed to an epoch in which art was showing traces of decadence.

Passing from Latium to Rome, the excavations which at present are attracting most attention are those of the Villa Mills, constructed on the ground which covered the ruins of what in the Middle Ages was called the Palatium, that marvellous palace of Augustus which he built during his old age, just on the top of the hill where he was born, and from where his extraordinary fortune sprang. The palace of Augustus was not only a magnificent residence, as the emperor built within its walls a temple to Apollo, which in its turn contained a Greek and Latin library and a temple to Vesta. Ovid, speaking of these wonders, says that only a third-part of the palace was retained for the emperor

personally, the other two parts being consecrated to the two above-mentioned deities.

These marvellous edifices, of which the historians Suetonius and Propertius describe the incomparable beauties, are buried just under the Villa Mills, the demolition of which is being carried on with the prudence and care necessary for excavations of such extraordinary importance. A discovery has already rewarded the workers. In a room of the villa, and more precisely in the refectory of the nuns who vacated the premises, there came to light a wall in the middle of which was hollowed out a little apse, where there were traces of frescos which when cleaned showed a sacred representation, but unfortunately they were so damaged as to be in many parts nearly unrecognisable. It was then remembered that some memories gathered in the *Liber Pontificalis* narrated that the Emperor Valentinianus had brought from Terracina to Rome the relics of the martyr St Cæsarius, and had deposited them in a cubiculum of the Imperial Palace, turned into an oratory, and that in this very old church two Popes were consecrated—St Sergius I. (in 687) and Eugenius III. (in 1145), and that the antique cubiculum of the Palace of Augustus had become a real Capella Palatina (Palatine Chapel). When a new emperor was elected at Byzantium his image was exposed at St Cæsarius in Palatio in the very oratory part of which has now come to light in the Villa Mills. The church, to which a convent was annexed in the eighth or ninth century, was later abandoned, for what reason is unknown, and the ruins are now being sought. So far, an antique altar has been discovered in a subterranean part of the villa, which leads to the almost sure conclusion that this spot has great surprises in store for the lovers of antiquity.

A very important find, interesting the whole Christian world, has just been made in one of the most ancient churches of Rome, that of San Marcello. It consists of a pagan altar which served as the basis for a Christian one, and formed the sepulchrum or urn containing the bodies of the martyrs, which, according to the custom of the early Church, were put inside the altars and worshipped. The pagan altar is profusely adorned with the glorious military ensigns of the Roman Empire, and is supposed to be the first altar which St Marcellus, the Pope of the Christian triumph, dedicated in the church which afterwards took his name, and which stood in the largest hall of the palace of the Matron Lucina. This altar can, therefore, be considered as the triumphal monument of the final victory of Christianity over paganism after two hundred and fifty years of bloody persecution. It was erected near the triumphal arch of Diocletian and Maximian, who, together with Emperor Galerian, had decreed and conducted the last persecution with the object of annihilating the religion of Christ.

On another of the historic seven hills excavating is going on with magnificent results. While digging for the foundations of some houses in the Viale Glorioso on the Janiculum, a statue of Bacchus was found, showing copious traces of gilding. The statue is certainly the work of a Roman artist of the best period, and a copy of a Greek work of the fourth century B.C., the original unfortunately being lost, but of which some copies are well known. The god is completely nude, his right hand holding the cantharus, while the left arm is lifted and bent over the shoulder, the hand evidently having held the thyrsus. Also on the Janiculum other discoveries of considerable importance have lately been made by a French archæologist, almost by accident. He brought to light the shrine and a small statue of an unknown goddess, which have put the experts in a quandary, as each attributes and explains them differently. The goddess is evidently from the Orient. Her entire body is wound about by a serpent, the head of the reptile coming above her forehead, and when found the statue was lying on its back, with a real egg in each of the coils of the serpent, the eggs, it is said, being in a perfect state of preservation. Here, then, was unmistakably the shrine of one of those foreign deities admitted to worship during the decadence. The niches for the gods in the shrine are still quite recognisable, as is the inner shrine, which could only have been for secret rites, while there is a row of amphoræ as yet not entirely unearthed. This spot ranks after the Roman Forum and Palatine in interest, with regard to further discoveries even more so than the first, which has now been pretty thoroughly explored.

As a summing up of this reawakening of archæological work it has been decided that the principal feature of the festivities with which the Eternal City will celebrate, in 1911, the jubilee of its proclamation as capital of United Italy, will be the redemption of the Baths of Diocletian, now in part degraded by wine and coal shops and other extraneous offices. These undesirable tenants will be turned out, and the beautiful Thermæ, which were the double in area of the perhaps better known Baths of Caracalla, and could accommodate three thousand bathers daily, will be transformed into a museum for an exhibition of Roman antiquities lent by all the regions of the ancient Roman Empire. Greece will contribute a steamer full of important remains, such as statues and fragments of statues, household utensils, vessels from the ancient temples, &c. Many objects are also announced from the United Kingdom, including a most precious map of ancient Rome preserved at Liverpool. To demonstrate that the exhibition will be a success it is sufficient to say that its organisation has been entrusted to Professor Rodolfo Lanciani, the well-known archæologist and scholar of ancient topography, whose four hundred and thirty-six archæological and historical publications are known throughout the world.

AN OLD LOVE-AFFAIR.

By Lady C. Milne Gaskell.

THEY had been engaged for many years. He was poor, very poor, and now knew he could never be rich. She knew that youth had gone, and that if she ever married that it would mean the direst economy—in fact, an hourly pinch for bread and cheese. Freddie Gilmour was thirty-five and Hugh Halston fifty.

Years and years ago they had had a love-affair, and had become engaged; and then, because Captain and Mrs Gilmour had opposed the marriage tooth and nail, and had screamed, and in the language of schoolboys cursed and been in a bait, the lovers had stuck to it—in fact, it had become the religion of their two dull lives.

Freddie had been rather pretty when quite young. She had had a rose-like complexion, and her eyes had been blue and clear. Now her pretty looks had disappeared, streaks of early gray had come into the once attractive auburn hair, the gold had gone, and her eyes had grown too prominent and watery on cold days. The lisp remained, it is true, but who cares for a lisp after the first blush of youth?

And Hugh had changed too. He was bald in places, and had become pompous and long-winded, and had grown bitter with failure. He still worked in a Government office; but he realised that nothing bright or gay lay before him. He had given up parties, given up society, drove in motor-busses, and now came down regularly every fortnight to see his fiancée. Mrs Gilmour, a petulant old lady, for the last seven years had allowed this.

It was never likely to be anything but an engagement. Of course it was a folly, but for peace's sake the engagement was acknowledged. There had been war, persecution, and parental fury; now these were past, and as the captain was dead there was nothing else to be said but that it was foolish, and had been foolish since the year one, and would remain foolish until the end of time.

Freddie lived with her mother in a cottage outside Richmond Park. The modest residence had been left Mrs Gilmour by an aunt. The means of mother and daughter were small, for Harding Court and the town-house had both been left to Charlie, the only son; but the two women lived in a careful way, gave a few tea-parties it is true in the year to friends, and occasionally received a few relations from London; but otherwise saw little of the world and knew few of their neighbours.

It was one gloomy day in November that the lovers took a walk. The rotten leaves lay thick upon the ground in Richmond Park; alone a few chrysanthemums glimmered in soaking parterres in the gardens with sodden cobwebs hanging round them.

'It's miserable being out,' said Freddie drearily to Hugh, as he walked beside her.

Hugh did not attend to his fiancée—in fact, he hardly heard her. He had grown rather deaf, was preoccupied, and was talking loudly of some old grievances—a quarrel with his chief, the preferment of a younger man, and his neglected appeal for higher pay.

Without a word, Freddie walked on in silence by his side. It struck her that Hugh's voice was harsh and unmelodious, and she noticed that his hair was quite gray. Then suddenly she became aware that he pushed against her almost roughly as he walked, that his manner and bearing were careless, to say the least.

She suggested that they should keep to a higher path on account of the moisture underfoot. 'I have thin boots,' she pleaded; but Hugh took no notice.

Then Freddie repeated her remark as they plunged down a sodden walk, and the wet from the trees fell upon them in showers as they moved; but Hugh was immersed in his grievances, and took no heed of his love's discomforts. He talked unceasingly, bitterly, repeated himself, and gave her no time to answer.

What a bore anybody can become who recounts their sorrow for the hundredth time! And Hugh's was a stupid sorrow at best. A fresh grief is well enough, but an old sorrow hammered out is like a hackneyed quotation or the echoes of the opera on a worn gramophone—intolerable. Yes, it was very tiresome. Freddie remembered the quarrel between Hugh and his chief. It was ten years old at least. How it had fired her in old days! How she had gone through it point by point! She recalled it wearily: the letter to an M.P., the Minister's courteous but guarded answer, the abuse, the ridicule, and then the oblivion. They were all familiar to her. Now they all belonged to the last century, and decent burial was all she begged for them. Certainly men had no tact. It was with sopping feet and a bespattered skirt that Freddie regained her mother's house.

'Had a pleasant walk?' asked the invalid with malice. 'It is one of the things at least that I can be thankful for in growing old, I need not go out on wet days.'

Freddie sat down and tried to cheer her mother, but Mrs Gilmour was in the dumps. 'My dear, it is all very well for you,' she said; 'you have a lover, and then I suppose the sun always shines. Now I'——

But Freddie would not hear more, she took up a novel and began to read to her mother aloud. After five minutes Mrs Gilmour yawned.

'I cannot stand these modern books that you get down from the library. Love in small print,

doubts, and women's aspirations, that is what you call it now, I think;' and Mrs Gilmour laughed spitefully. Freddie did not answer, but went on reading. A little later Mrs Gilmour's head fell back upon some cushions. In a little time she was asleep.

Freddie would have gone on reading, but Hugh strode across the room. 'My dear, read this,' he said authoritatively. 'I am stating my case to Henderson. You know he is in our office now.'

'Had you not better leave matters alone, Hugh?' said Freddie gently. 'Mr Henderson never was a friend of yours.'

'What has that to do with it? So like a woman to mix up friendship and public business!' exclaimed Hugh impatiently.

'I do not think that he will do anything for you.'

'I don't want favour; I want recognition.'

'You forget, Hugh, that Mr Henderson has only just been appointed.'

Then Hugh got excited. He abused his chief, abused the office, called his colleagues names; and at last, in a fit of temper, told Freddie that she did not care for him, that she took no interest in his concerns, and all the while he got crimson in the face, and looked, it must be confessed, little short of ridiculous.

Hugh's loud tones at last awoke Mrs Gilmour. 'What is all this?' she asked.

'Hugh's grievance,' said Freddie wearily.

'Then I wish he would keep it to himself. I am quite tired of Hugh's grievance. He never seems to me to have anything else.'

Freddie at any other time would have let the matter pass, knowing that her mother was difficult, and hating war; but to-day she was angry too with her lover, and she too turned and fizzed, as children say. 'Cannot you leave things alone, Hugh? You will only stir up old disagreeables for nothing, and get into fresh hot-water.'

'I will let Henderson know what I think of that beast Jackson.'

'Mamma must have her nap before dinner,' said Freddie, and got up. At this Hugh glared and then went off, banging the door behind him.

It was after tea, when Mrs Gilmour had gone off to her bedroom, that Freddie and Hugh, in schoolboy parlance, had it out.

She told him that it was a mistake not to let sleeping dogs lie, that no good would come by stirring up the mud of the past. But he would not take her advice. He was angry—riled, to use his own expression—that she had ceased to sympathise with him, or, as he called it, took no interest in his concerns. And she was tired, bored, and longed to be free. The French have a bitter old saying, *que tout casse même la loyauté;* and Freddie felt that her love was worn-out, that her old engagement was a mistake, and at last her patience gave way. 'I can't bear it any longer,' she said. 'It must all end. Our engagement has been foolish.'

At this Hugh caught fire, abused her roundly, said that he might have done much better, that there was a widow with means, and that he had lost everything by caring for her.

Then they parted. He fled from the house by the first train on the following morning. And Freddie cried; but then came peace, for her old love really seemed dead. At first she missed his letters and the occupation of answering his letters, but after a little while she threw herself into church work—mothered orphans, arranged the flowers in a church on Saturdays, embroidered banners, and the recollection of Hugh faded.

A little later there came a widower, a retired banker with a big house near, and the possessor of four little fat dogs, and he gradually acquired an influence over her. Mr Sanderson took to coming to tea, and after a while the church work ended, and the orphans mothered themselves, and somebody arranged the flowers for the church, whilst Freddie took to washing and combing the little fluffy dogs instead, and suddenly developed an interest in a rockery, and began to talk of plants two inches high by their Latin names.

Then suddenly one day, when her old life and her old engagement with Hugh Halston had become a thing of the past, Freddie got a letter from her former lover. It ran: 'I have been very, very ill. For the love of God, dear, do come, see me, and forgive me;' and it was signed feebly, blurred by a blot. And that was all.

When Freddie showed Mrs Gilmour the letter her mother begged her not to go. 'You had much better write Hugh a nice little letter, and send him some papers; but don't go. You yourself said that your engagement was a mistake. You have given him up. You must now be firm. Remember that if you go it will all be over with Mr Sanderson.'

Freddie shook her head.

'You don't think it will, but I am sure of it. Remember, if anything happens to me, what your income will be.'

Freddie did remember, but she determined to go all the same; and she went, although her mother said she was a perfect goose for doing so, and declared that nobody could expect her to do more than send some hothouse grapes, but that she might send a tin of turtle from the stores if she wished.

Freddie went up and found her lover very feeble, much aged, and so weak that he could hardly walk across the room to meet her. Later, she called upon his sister Fanny Delaport, who, after scolding her well, fell a crying, and the two women wept together.

At last, when Freddie could get in a word, she said between her sobs, 'I want to marry Hugh.'

'Marry him! But he is too ill.'

'But I would be his nurse. Only help me, Fanny, and then I would do everything for him.'

And Fanny, who was romantic, and her friends said not too wise, got a clergyman to come, and a special license, and the two were married.

After this Freddie declared herself rapturously happy. Night and day she nursed Hugh, and at last got him on his legs again.

And now she tells all her friends that she was in love all her life with her husband. She has quite forgotten the interlude of coldness—in fact, if you told or reminded her of it she would say you were misinformed, and believe that she was speaking the truth. And when Mr Sanderson offered to give her a fluffy puppy she scornfully refused it, and declared that some people's impudence knew no bounds. Hugh Halston has now become her passion; and though he has only two stories in the world, she never fails to laugh at the right place in each; and as to the old grievance, she has canonised that by moist eyes every time she hears it recounted.

PRODUCTS OF KASHMIR.

By MADAME L. M. BOURBEL.

PART I.

SHAWL-WORK.

FROM the remotest antiquity Kashmir has been famous for its shawls, of which the beauty of texture, the delicacy of colour, and the intricacy of design have rendered them valuable in almost every country in the world. It is said that every curve, and every colour in one of these shawls is a colour or curve found in the beauty of this, one of the most beautiful places in the world.

The designers of these shawls are said to have lain flat on their faces, with half-closed eyes, as they drew their patterns from the intricate curves of the Jhelum, the towering masses of the Himalayas, the blossoms and fruit of the almond, the glorious cup of the lotus, and quaint forms of the zingara; whilst the exquisite colours were those of the flowers that cover this lovely valley at all seasons of the year.

History is supposed to record that when Dhritarâstra received Krishna, sent to the Court of the Kurus as a delegate from the Pandus, his present to Krishna was said to include ten thousand shawls of Kashmir. It is also claimed that the 'divers colours of needlework, of divers colours of needlework on both sides,' mentioned in the fifth chapter of the book of Judges, verse 30, were Kashmir shawls; and that the embroidered work brought by merchants in chests, and rich apparel bound with cords and packed in cedar, referred to in Ezekiel, were also these same shawls.

In the time of Akbar, however, there are authentic records of a very large trade in shawls. In the *Ayeen Akbari* of Abdul Fazal, he says: 'His Majesty is very fond of shawls. By the attention of his Majesty the manufacture of shawls is in a very flourishing condition.' Bernier, the great French traveller, in 1665, speaks of them as 'the staple commodity which particularly promotes the trade of the country and fills it with wealth.'

The two principal kinds of shawls are the loom and the hand made; but of these there are several varieties. The loom-shawls, it is said, were first made in the reign of Zain-ul-Abdin, the result of a weaver, Naked Beg by name, cutting his finger, from which the drops of blood fell on the thread, producing a red-and-white pattern, which suggested to him the idea of using dyes. The first shawl manufactured from the dyed wool was shown to Zain-ul-Abdin, which so charmed him that he immediately ordered the manufacture of loom-shawls. From this time forward they were in great demand, especially in Persia, to which country they were exported in thousands annually.

With the advent of the Moguls the trade grew immensely, and a further powerful impetus was given during the Afghan rule in Kashmir, when the annual income from shawls was over forty thousand pounds.

During the earlier part of the Sikh rule the trade was in a most flourishing condition; but an awful famine in the latter part of that time gave a crushing blow to the industry for several years, though Moorcroft, in 1822, says: 'The whole value of shawl-goods manufactured in Kashmir may be estimated at about thirty-five thousand lakhs of rupees per annum.' The lakh at that time was ten thousand pounds. It revived again in the reign of the Maharajah Golab Singh, in 1846-69, when the income from the shawl-trade again rose to about seventy thousand pounds annually.

Just about this time came an enormous demand from Europe for these beautiful fabrics, and the revenue from shawls rose in the later part of the reign of Maharajah Golab Singh and the beginning of that of Maharajah Rambir Singh to two hundred and eighty thousand pounds. The Franco-German war in 1870-71 inflicted an almost mortal injury to the trade, which received its death-blow by the famines of 1878 and 1879, although the Maharajah advanced one hundred thousand pounds to the weavers and manufacturers; but the trade never recovered from the shock. Some few of the finest shawls were, however, made between the years 1865 and 1872.

The wool used for these shawls is that of the Tibetan goat, a soft sort of down growing under the long hair, and called *pusm*. There is another and coarser kind called *asli tous*. The Mogul merchants imported *pusm* in very large quantities, and exchanged it for shawls and *pushmina*, for which the demand in Russia was enormous. The

name *pushmina* is used for all fabrics made from the *puem* wool, which in the earlier days was never any colour but white or natural shades of grays or browns called *khudrung*.

The weaving of loom-shawls is very interesting, and the marvellous dexterity of quite small boys in handling the sticks of different coloured wools is astonishing. The warp being fixed in the loom, the sticks of coloured wools are placed in a basket alongside, and the shawl begun. The shawls are made in quite small pieces, from a bit an inch square to a foot square. It takes at least two people for each tiny portion—the weaver and the *ustâd*, or dictator, who sits in front of the weaver, and dictates the colours: 'lift two, use red;' or 'lift one, use green.' This dictation is called *talim*. When all the bits are made (and there are sometimes one thousand five hundred in one shawl), the portions are joined together by very fine needlework, much as a patchwork quilt is made.

Now comes the process of washing. No one seeing it before this operation would have the faintest notion of the beauty, quality, or colour of the work. The spot chosen for the washing is generally a green bank by some clear stream, where there are plenty of stones—and these large ones. No soap is used, but the shawls are beaten on these stones, pressed, kneaded, stamped upon by the feet, until, watching the scene, you would imagine nothing of the beautiful fabric could possibly remain. It is then shaken out and held for some time in the running water. After this it is dried, and taken to the *dagshawl*, or shawl-marking department, where the Government stamp is affixed, and thence to the tailor's hands, who does any finishing, after which the merchant claims it.

Every portion of the shawl has a separate name. The border—which may be single, double, or treble—is called the *hashia;* the main field of the shawl, or running ornament, is the *dhour;* the decorated ground, *under* the running pattern, is named *mutum;* the embroidery at the ends of a scarf-shawl, *pulla;* the clusters of flowers or cones in the four corners, *koonj*. If the row of cones be double it is called *dokund;* if more than two up to five, *sekud;* and anything above five *tukadur*.

Dr Mitra, the curator of the museum in Srinagar, who has given the whole history of these shawls in a most interesting booklet he has published says, 'Some believe the cone-pattern is really an elaboration of the Egyptian coccus of ancient origin.'

In the *toshkhana* (or treasure-house) of H.H. the Maharajah of Jummoo and Kashmir are some exquisite shawls showing different colours and even different designs on both sides. The other sort of shawl called the *amli* or *topa kom* is needlework, and very beautiful it is.

Unfortunately, the importation of European wool, aniline dyes, and the execrable taste of the thousand-and-one people who think their horrible requests for cresta, monograms, or so-called 'art' patterns are an improvement on the taste of these, the most artistic people in the world, are ruining the shawl manufacture. The imported European wool, mixed with a little cotton, is now woven into a stuff called *raffle*, very much cheaper than the beautiful *pushmina*, but often sold to the unwary as *pushmina*. The latter is marvellously soft, pliant, and delicious in texture, the *raffle*, on the contrary, is rough, and does not fall into the beautiful folds that *pushmina* takes; but *raffle* at two shillings and eightpence a yard is within the reach of many to whom the price of costly *pushmina*, varying from ten shillings and sixpence to thirty shillings a yard, would be prohibitory.

About thirty years ago the shawl-trade gave employment to no less than thirty-eight thousand people annually; the census of 1901, however, registered only five thousand and thirty-seven, and these now work mostly on shawls for exportation to Persia and Armenia. Many of the weavers have migrated to Lahore and Amritsur, where their descendants carry on a trade in so-called loom and *pushmina* shawls of a quality basely inferior to the beautiful productions of Kashmir.

For a trade to have been so great as it undoubtedly was there must have been honesty in work and honesty in dealing amongst the Kashmiris. In both these matters their reputation is of the worst now; at the same time it is possible that were the trade revived they might be taught to understand and perhaps act on the proverb 'Honesty is the best policy;' for as matters now stand it would be impossible to have any business dealings on a large scale with people so reckless alike of time, compacts, or fair dealing as the present race.

TEXTILE FABRICS AND EMBROIDERIES.

The textile fabrics of Kashmir, though not many in number, are very good of their kind. Of the *pushminas*, or materials made from *puem* (the soft down of the Tibetan goat), I have already spoken in 'Shawl-Work;' but the hair and rougher wool of this goat are utilised in other materials.

The *louis* (or blanket), used by all Kashmiris, is a very warm and useful article. It is generally about four and a half yards long, and very narrow, seldom exceeding twenty-seven inches in width. When used thus it is called *ekbari* (one-width); but to be of real service two widths are generally sewn together, when it is called *dobare* (two-width). It is very seldom that these are made in any colour except *khudrung* (natural colour). No coolie is without one of these blankets; the people live in them by day, use them as coverings by night, and in bad weather they gather one end up, tie it tightly round with a grass rope, and then, placing the knotted portion on their heads, draw the rest of the blanket round their persons, thus turning it into a very good mantle against inclement or rainy weather. If they have loads to carry, the blanket

is used as a sack in which the load is tied up; and one often sees it utilised as a tent, stretched across two upright sticks, whilst the owner lies asleep in its shade! The *louie* being so universally used, it is not surprising to find its annual addition to the income of the State amounted in 1907 to one hundred and seventy-six thousand nine hundred and nineteen rupees.

The *puttoo* is a kind of homespun woven in almost every village. This is made from sheeps' wool, and is made in many patterns, striped and checked, strongly resembling Scotch tweeds. *Soot-puttoo*, woven from a mixture of cotton and wool, is much in demand in India, especially since the Swadeshi movement was started some two years ago. Merchants came up in hundreds to buy all and every kind of material they could, with the result that men's shooting-suits, coats, caps, &c., suddenly sprung up in price from ten rupees eight annas to thirty rupees, or a rise of twenty-six shillings a suit. Fortunately, however, this did not last. The Kashmiri being a gentleman who under no circumstances knows the word 'moderation,' immediately refused making suits at anything but these prices, firmly convinced that if in February they cost thirty rupees March would see them costing at least fifty rupees. Great, therefore, was his surprise when, instead, he found the place flooded with cheap European suits, and prompt and decisive was his climb down.

Of *raffle* I have already spoken. It is a material of firmer structure than *soot-puttoo;* but Dr Mitra accounts it a most despicable production deserving wholesale annihilation.

The cotton cloth used by villagers is mostly woven in the villages on looms of the most primitive pattern, from both Kashmir cotton, wool, and imported twist and yarn. When made it is brought into Srinagar to be dyed the various colours the villagers fancy, and is used for almost every purpose, from wedding garments to dish-cloths.

Of late years, however, imported cotton goods are finding favour amongst the people, and the brighter and more gorgeous in colour the better are they pleased; the beautiful rich mellow crimsons and purples, the light of the exquisite real saffron-dyed cloths, which used to rejoice the eye of the traveller, giving place to hideous aniline-dyed cloths in appalling shades of magenta, pink, gas-green, or sky-blue. In the villages one sometimes still sees the glorious colours of vegetable dyes; but in Srinagar the people mostly use imported cotton clothing or get themselves up in a grotesque imitation of European dress. To the traveller who gets sufficiently far away from the region of civilisation, the evening hour, when the women come out to fetch water to cook the evening meal, is a feast of unadulterated joy in exquisite colour, for the aniline dyes have not yet found their way into the mountains. Consequently, the eye is delighted with glorious crimsons, gold, and purple against sunset skies of the most gorgeous fire, surrounded by the deep-blues, the purples of the mighty hills, and the dusky greens and indigos of pines. In all these outlying villages, also, a great deal of the beautiful embroidery for which Kashmir is famous is done. The most exquisite work is produced on almost any material, the four special styles being *amli*, a sort of darning; *chikan*, minute satin-stitch; *doori*, knot-stitch; and *irena*. These stitches, which originally were used entirely for shawl-work, are now being utilised for all sorts of things, such as table-centres, counterpanes, neck-ties, handkerchiefs, &c.; and the hundreds of visitors who yearly spend the summer months in Kashmir unfortunately too often insist on having their own choice of colours used, instead of leaving it to the taste of these most artistic people, the consequence being that one sees crowds of natives going round showing all sorts of the most fearful productions which in many instances go by the names of the artists who have given them forth—as 'Jones sahib's pattern,' 'Smith sahib's colour,' &c.

Really beautiful felt druggets covered with the most exquisite embroidery can be bought for quite a small sum, prices ranging from seven shillings to eighteen shillings, according to size; the embroidery being a sort of chain-stitch closely worked. Other druggets, again, are made of appliqué work on *louies*, serge, felt, or drill; the various coloured cloths applied being all embroidered round the edges with various stitches. Really beautiful curtains are made in *doori* (knot-stitch) with coloured or white yarns on *louies* or drill. About three thousand people are now engaged in the production of these particular kinds of embroidery, people who formerly devoted their whole talent to shawl-making. It is interesting to talk to them and hear their views on the decadence of work in Kashmir, when, as one old man remarked, 'In the old days, mem sahib, it took a whole family a lifetime to make a shawl, but it lasted for ever. Now it takes a whole family two years to make this'—holding up a very fine muslin curtain—'and the first time it is washed, behold it is no more!'

THE COMEDIAN.

If, when I die, you are my friend, then say,
'Let us not weep, for ever he loved mirth.
Come, friends, draw close, and laugh this pain away,
Of choice conceits surely there is no dearth.
Say! It is night—then there has been a day;
The goodly ring that binds this crowded earth
Is welded so that ever death joins birth.

'Our lives are mines whose dross is toil and pain,
But which hide gems of laughter everywhere.
Guard well the jewels that he strove to gain
And gladly handed to our friendly care.
What matter if a little sleep detain
The toiler who worked with us? Rest is fair!
So let remembrance only gladness bear.'

THE MEANING OF MONEY.

By WILLIAM GRAHAM, Author of *The One Pound Note in Scotland*, &c.

WHEN such a writer as Mr Hartley Withers, City Editor of the *Times*, emerges from his anonymity to address 'the average reader'—as he does in a popular work entitled *The Meaning of Money* (London: Smith, Elder, & Co.)—he is in every way entitled to a respectful hearing. 'The average reader' may, however, be excused a sigh as he learns from Mr Withers's opening paragraph that 'the object of this volume is to explain a matter of plain, positive, practical fact which is very important, very dull, and very little understood.' This is not thrilling for a beginning; but the reader may take courage, for the author does not in vain adopt on his title-page Goethe's lines from *Faust*:

> Grau, theurer Freund, ist alle Theorie
> Und grün des Lebens goldner Baum.

If the green and gold of Life's Tree are not so obvious in this work on London finance, we must remember it is Mephistopheles who so traduces Theory, and it is not the grayness of death which sets forth Theory in Mr Withers's pages. Rather it is the 'silver point' of a masterhand, content to place in graphic outline the leading features of an important theme, which, though 'caviare to the general,' is here treated with an attractiveness which brings the greatest money-market of the world within the view of every reader. Indeed, it is not 'gray old theory' but solid fact which stands soberly forth, and the threatened dullness disappears with the first page.

'The meaning of money' is a question on which economists have wrangled since the days of Aristotle; but the wisdom of centuries has not improved on his definition, 'Money is the measure of values.' John Locke's definition of 1691, 'Money is the measure of commerce,' is more popular but less exact. To add to these definitions that 'money is a medium of exchange,' or to adopt any of the inventions of modern economists, is merely to amplify or mystify the perfect dictum of one whom even Dante calls 'the master of those who know.'

The derivation of the word 'money' illustrates with what solemnity the Romans regarded the issue of their public coined money. The root lies in the Latin *monere*, to warn; whence also 'monition,' 'admonition,' &c. Livy tells how, in the old days of Rome, Juno Moneta (the Adviser) was the patroness of the city finances, and in her temple, built by Camillus in 384 B.C. on the Arx or northern peak of the Capitoline Hill, was the official Mint of Rome. From *moneta* came 'mint' and 'money.' Dull as the subject may seem to the uninterested, none can even briefly consider the history of money in its relations to human life without amusement at the truth of Hood's odd lines:

> Gold, Gold, Gold, Gold! . . .
> How widely thy agencies vary:
> To save, to ruin, to curse, to bless,
> As even thy minted coins express,
> Now stamped with the image of Good Queen Bess,
> And now with a Bloody Mary.

We need not pass the shores of Britain for evidences of the widespread misery caused by the crimes of rulers in the issue of money. Debasement of the currency was the favourite resort of every royal rogue whose extravagance compelled him to find some 'new way of paying old debts.' England's two greatest sinners were Edward I. and Henry VIII. The Emperor Charles V. set an example for Henry in 1529 by arbitrarily increasing the value of his gold coins, without any increase of their gold weight. His silver coins were debased in 1542 by an increased proportion of alloy, which his subjects were commanded to accept at the former value. The irritation ensuing in the busy cities of the Netherlands was one of the later causes of the great Rebellion and Eighty Years' War, so graphically portrayed in *The Rise and History of The Dutch Republic*. Henry VIII., most wasteful of kings, excelled Charles to an extent which may be studied in Mr Thorold Rogers's delightful *Six Centuries of Work and Wages*. Briefly, he and his son Edward VI. increased the alloy in the silver coins six times between 1543 and 1551. In the former year the alloy bore the proportion of nine-tenths of an ounce of alloy in twelve ounces

 [*All Rights Reserved.*]

of metal. This was coined into forty-five shillings. In 1551 the base metal had risen to eight ounces, and the fine silver had sunk to four ounces; and from this vile mixture forty-eight shillings were coined, a total degradation of 66 per cent., the royal bankrupt thus paying his creditors six shillings and eightpence per pound. The latter in turn passed on their coins to the lower strata of the population, from whom none willingly accepted them in return save at actual silver value. Thus the poorest and most ignorant were the sufferers from this common crime of kings. Though Henry's debasements were corrected in sixteen years by his daughter Elizabeth, their influence for evil affected the long record of labour and wages for two centuries. His son Edward continued his wicked practices. Mary burned as heretics any who refused to contribute relief to the sufferers from her father's crimes; but doing nothing to remove the cause of the suffering, she lives in history as 'Bloody Mary.' Her sister and successor at once set to work to restore the coinage, and perhaps to this as much as to her later policy and character she may be indebted for the name of 'Good Queen Bess,' by which the poor of her people remembered her. 'The Royal Wild Beast' Henry—according to a tradition the origin of which is uncertain—is said to have his Tudor ancestry and his public thefts commemorated in the well-known lines:

> Taffy was a Welshman,
> Taffy was a thief.

Thus the poor have their revenges in the epithets of history and the verdict of posterity. In England the pound sterling of silver has been reduced to one-third of the original *pondo* or *libra*. Scotland's financial miseries have been twelvefold greater, so that by 1601 the Scots pound was worth only one shilling and eightpence sterling. In France, how few recognise in the *franc* (value ninepence halfpenny) the probable successor, through the French *livre* and Venetian *mark*, of the ancient Roman *libra*, the first constituent of £ s. *d.*, still recalled by the *lira* of modern Italy. The years of low prices and distress caused over the whole world by the demonetisation of silver and the largely increased supplies of that metal, after 1871, afford a reminder of the suffering caused to the human race during long centuries by debasements of coined money.

If the suffering has been such from an abuse of metallic money, the distress arising from the misuse of paper or representative money has been vastly greater. Although these substitutes for money have existed for ages from China westward, as witness in England the leather moneys of King Edgar of Wessex (959–75), and of King John in 1215, yet those early examples are insignificant compared with the prodigious issues of paper money during the last two centuries, since the founding of the Bank of England, the growth of modern banking, and the opening of the western hemisphere to the vices of civilisation. The story of paper money is, however, a world in itself, and we are less concerned to deal with it here, as the question of representative money is not one of the principal themes of Mr Withers's work. The money he writes of is not so much the tangible gold, silver, or paper of our coins or bank-notes, as that incorporeal thing called money of the London money-market, which can be borrowed or lent for a day or a week or a month. 'The loan of money,' says Mr Withers, 'is the sense in which the word [money] is used when we speak of a money-market or a price of money, phrases which are wholly incomprehensible to those to whom this difference of meaning is not made clear. . . The money-market is the place in which money down is exchanged for the promise of money some day. And as the borrower (the man who wants money down) must obviously offer the lender an inducement to let him have it, it will always be found that the amount of money promised some day by the borrower is bigger than the amount of money paid down by the lender. The difference between the two figures is the rate of interest, which is often loosely and confusingly described as the price of money.'

It is then shown how monetary transactions may be divided into three main divisions: (1) Those in which money is exchanged for any kind of commodity or service; ordinary buying or selling. (2) Those in which time is a consideration, as where 'money down' is exchanged for the promise of 'money some day;' these include all kinds of loan operations, from the discounting of a bill due sixty days hence to an issue of a War Loan by the British Government. (3) Those where money is transferred from one place to another under what are called 'exchange operations,' simply exemplified by the purchase of a postal order in Edinburgh for payment of a debt in London; leading up to such operations as converting sovereigns into Shanghai *taels*, or into the deeper mysteries of the value of payments expressed in an inconvertible paper money at a huge discount, as in some of the South American republics, the most complicated kind of monetary business. In all these operations there appears one constant factor, 'money here and now, or cash;' and the proportion which the abundance or scarcity of this 'constant' bears to the demand or absence of demands for its use rules the amount or price of money, high or low, which is exacted by the lender or offered by the borrower for such use.

In writing of the transition from barter to the use of coined or other moneys Mr Withers refers to the use of cattle as money, and says 'the prevalence of beasts was sufficient to lead etymologists to consider at one time that the Latin word for a beast, *pecus*, had been enshrined in the name for money, *pecunia*, which has come down in English in its negative form, "impecunious." This derivation is now abandoned, comparative philology having decided that *pecunia* is the same word as the English "fee." Mr Withers might have noted the positive form of 'pecuniary' still current, and his further contention

is not borne out by either the *Century Dictionary* or by Dr Murray's colossal work, both of which prefer the derivation from *pecus*—'cattle,' not 'beast'—in the great majority of its uses. Both works also admit the affinity of *pecus* with 'fee' through the well-known rule of Grimm's law, by which the *p* of the Latin *pecus* becomes the *f* or *ph* sound of the Gothic *faihu* ('cattle'), whence the English 'fee.' Both *pecus* and 'fee' have their root in the Sanskrit *paç*, a thing bound up—a head of cattle; whence also 'pack,' 'package,' 'pact'—things fastened or bound.

In dealing with the precious metals, especially gold, as the best available basis for monetary operations, the author has some suggestive paragraphs: 'It is doubtless a mere convention that gives gold its commanding position, and it may be contended that it would be much simpler, cheaper, and more civilised to conduct exchanges by means of pieces of paper secured on national property, as the French Revolutionists tried to do with their *assignats*, or to abolish all need for mediums of exchange and help ourselves to whatever we want, rendering honest service in exchange by the impulse of our own consciences. But we are not concerned at present with any theoretical questions of an ideal currency or absence of currency. The only currency that is of practical and everyday importance is that which is endowed with the virtue of universal acceptability. . . . And the fact cannot be gainsaid that gold is the one commodity which is universally and at all times acceptable in all civilised communities, and that all forms of promise to pay, or paper money, are acceptable in proportion to the readiness with which they can be turned into gold. Consequently we shall find, when we come to deal with the more interesting problems of the manufacture of credit, that the convertibility of credit into gold is a matter that its manufacturers always have to consider and allow for carefully.'

Owing to its comparative indestructibility, its great value, and the immense quantity in existence, gold maintains a fairly even value; and this is as great a recommendation for its use as a measure of values as equality of weight or bulk is in measures of weight or quantity. The fact that British law compels the Mint to coin all gold offered to it into sovereigns at the rate of three pounds seventeen shillings and tenpence halfpenny per ounce troy is often assumed as a proof that gold does not vary in price; but its real exchange value varies, as that of every commodity does, in the proportion which its supply or demand bears to that of other commodities. Being a measure, however, and so fixed by law, its alterations are not apparent, because all other things are measured and move in price in relation to it. In addition to such slight though hidden fluctuations, there occur sometimes movements stretching over a long course of years, when a special scarcity or abundance of gold may gradually effect vast economic changes for better or worse to mankind. Or perhaps man and not nature is at fault—as, for example, during the eighteenth century, when, through an error in the bi-metallic tie between gold and silver, the latter was slightly undervalued. It was regularly bought up by merchants for export abroad, where its true market-value was got. The Governments of the period disgracefully neglected the issue of silver coins to replace those exported, and a famine of silver currency ensued, causing a distress and inconvenience scarcely credible in modern days. To supply the deficiency, many corporations and shopkeepers issued metal tokens or paper money for the most trifling sums; tradesmen promised to pay so much value in their craft on demand, or alternatively so much money. Though there was no real scarcity of the precious metals abroad, the evil in Britain was not remedied until the Government renewed the coinage in 1816 on the basis upon which it is now regulated—free coinage of gold only, silver to be legal tender for sums not exceeding two pounds, and bronze for sums not exceeding one shilling.

Having thus laid a foundation for monetary transactions in coined cash, Mr Withers carries his readers into the mysteries of paper cash or bank-notes based on mutual confidence and indebtedness, dealing with its regulation, and Sir Robert Peel's Bank Act of 1844. Our author scarcely sufficiently accentuates the evil influence which the Bank of England's monopoly exercised on the growth of English banking. It is customary to blame the character of early English bankers, but the law of Queen Anne (1708) effectually prevented any strong banks from coming into existence. To secure the Bank in its monopoly, the Act of that year prohibited any body—other than the Bank of England—exceeding the number of six persons from issuing notes on demand. As the prevailing idea down to 1830 regarded joint-stock banking to be impossible apart from note-issuing, the above law prevented the formation of such large joint-stock banks as have been so successful in Scotland for two centuries, or such as those gigantic institutions which have revolutionised English banking in the last quarter of a century.

Under joint-stock banking the expansion of paper cash or bank-notes has been vastly exceeded by cheque money, or use of cheques in payment of debt, which in Britain and America has multiplied paper credit a millionfold. The cheque system is yet in its infancy in many Continental countries, and its extension there would do much to relieve the precious metals from the drudgery of currency, and would also reduce the currency in bank-notes. The Bank of France, for example, has upwards of two hundred million pounds of its notes in the hands of the nation as currency, as compared with the Bank of England's thirty million pounds.

From cheque money Mr Withers leads on to bills of exchange as a form of cash or money, covering those operations of internal or foreign trade where money at a different place or some other day is distinguished from the 'money down' of the cheque system. The bill of exchange, according to Sir J. B. Byles, is of

'immemorial antiquity,' and the present author quotes Cicero asking Atticus whether the monetary requirements of his son at Athens could be provided by 'exchange operations'; which, if not absolute proof that such writs were then extant, affords a safe assumption that the quick-witted Greeks exchanged credits against the goods bought and sold in their cities. Mr Del Mar, in his *History of Monetary Systems*, gives a great antiquity to bills of exchange, asserting that 'there are examples of their use in India and China to remote historical eras, in ancient Babylon, in Pontus during the fourth century B.C.' There is nothing improbable in an assumption of their use in the earliest ages soon after the art of writing became general, as the basis of a bill of exchange is simply a letter by one person asking a second person to pay a sum of money to a third person.

Thus treating of the various forms of money in turn, Mr Withers surveys and describes coined money, paper money of cheques and bills, bank credits, all as the tools of the financial trade as used by the various workmen of the craft; the keen bill-broker (with his small profits, quick returns, and large turnover), the sagacious and experienced banker, the great bill-accepting houses for foreign trade, the invading foreign banks—each as seen daily in the mighty workshop, the money-market of London, the hub of the world's finance.

Even a hub, however, has a central point around which it revolves, and this to an Englishman is the Bank of England, the Old Lady of Threadneedle Street; for shortness and *par excellence*, 'The Bank,' The Keeper of the Nation's Balances, The Bankers' Bank. At once a private company and a State Bank, with the freedom of the former and the strength of the latter, it is yet controlled with a sobriety and an independence which have made it the admiration of England and the envy of the foreigner. For two hundred and fifteen years it has stood the brunt of time and chance, of evil and good report. What floods of criticism it has endured and neglected! and it stands to-day a monument to English character. Mr Withers's closing chapters are devoted to its position; and none who may wish to be conducted intelligently through that great institution can do better than accept his guidance. It is no mere tramp through bullion-vaults at the heels of a hasty porter. The reader is taken into the directors' room, and realises something of the responsibilities which lie on those who guide its destinies. The difference between the minimum rate charged by the Bank as announced every Thursday and the open market rate, the methods adopted to bring the latter into line with the former in times of pressure, the increased difficulty of doing so caused by the growth around the Bank of so many immense joint-stock banks, the necessity for mutual agreement amongst these great banks on the lines of that so well maintained amongst Scottish banks, the Bank's Weekly Return and what it means, the gold reserve of the country and its adequacy or inadequacy, suggestions for its enlargement or for other reserves—are all taken up in turn and discussed with a lucidity which encourages the lay reader to fear less an excursion into the realms of finance when he has its features thus set forth in his own language with a clearness that is as commendable as it is rare.

VANESSA.

CHAPTER VII.

ON the next morning a most magnificent basket of flowers arrived, addressed to the squire, with a note which said:

'DEAR SIR,—I understand you have had a bad accident, and are still much confined. Will you kindly accept some flowers for your room? I feel that I may take the liberty of sending them, my late father, Colonel Blount, having been a brother-officer of yours in the Guards, and in my boyhood I often heard him speak of you with affection, so that I shall consider myself honoured in being allowed to pay you any slight attention, and I hope to be permitted to call on you.—Believe me, yours truly, OLDSBOROUGH.'

Vanessa had gone down to the town for some bandages, and on her return found me with a mass of flowers in front of me, which I was arranging.

'Oh how lovely!' she exclaimed; 'where did they come from?' I noticed that her colour heightened.

The squire replied, 'From Oldsborough.'

'For me,' she cried, and instantly seeing her blunder, and the colour rising still more, she hastily added, 'Oh no, of course not. I was forgetting I am only a nurse here.'

I handed her the note, and as I did so I made my lips almost silently express to her, 'They were for you, all the same,' and she shook her head in a sort of deprecating negative, but I could see that she was pleased.

The squire asked her, as his arm was still painful when he used his fingers, to write a note of thanks for him, and she put together this:

'DEAR LORD OLDSBOROUGH,—Accept my warm thanks for the beautiful flowers you sent to me, and which have made my sickroom so bright. It will be a great pleasure to me to see the son of my old friend, whom I have always remembered with affectionate regard.—Believe me, sincerely yours,

'(Signed for Major Sargood) NURSE VANESSA.'

She handed the note to me with a curious half-humorous, half-inquiring expression about the

corners of her mouth; and having got my imprimatur, she read it to the squire, and sent it off by the faithful Stocks.

Vanessa assisted me in arranging the flowers, carrying a small handful of the most sweet-scented blossoms to the squire that he might inhale their fragrance. We made the room look delightful, and as we were finishing our work I saw Vanessa pick up the blossoms she had laid down after taking them to the squire, and carry them from the room. When she returned they were nestling in a fold of her dress. I went towards her, stooped down and drew in the scent, and as I rose again our eyes met just for a moment, and the glance meant something to each of us, undefined, nebulous, but to friendship intelligible.

She said to me, 'I must not be there when he calls. What do you think, Mitey?'

'Well, perhaps I would say yes to that.'

'Mitey, it is going to be all very difficult. I feel sure I shall do something *gauche* and foolish, and perhaps be rude because I would fain be the opposite. You must help me, dear.'

'Of course I will, Vanessa; but how?'

'I am going to do what you tell me, because for once I don't want to be a wilful Vanessa. That lady has lost all confidence in herself for the time, and must lean, and not try to stand alone.'

'Dearest, that will be indeed a change of rôles; but you know I will do anything for you, only, as you say, it is difficult. But I will take courage, and be all I can to you.'

We were expecting mother, as I, having a sort of feeling that the course of events might call for the protecting wings of a chaperon more fitted for what was on hand than an old bachelor like Uncle Goodman, had written to her begging her to come and join us, pleading that I could not leave our patient till he was well, and that Vanessa would not let me go. I took our hired carriage to the station to meet her, and as I passed through the booking-office towards the platform came suddenly face to face with my hero. Conventional stand-offishness was impossible. I held out my hand, and he took it heartily with anything but the reverential gentleness of his handclasp with Vanessa on the road. Somehow we seemed both to feel instinctively that there need be no embarrassment about introductions between us, that our mutual good offices to Vanessa had made us friends. I told him that I had come to meet my mother, who would I knew be glad to make his acquaintance. He returned with me to the platform, and we had no time for conversation, as the train steamed up almost immediately. When mother and I had embraced, I turned to him, and said, 'Let me introduce Lord Oldsborough, who is a son of Major Sargood's old colonel, and has just been sending some lovely flowers for his sickroom.'

Mother was a person of wonderful self-command, and greeted him kindly, saying, 'It was very good of you to come to our friend's trial.'

'You are kind to say so,' he replied, and insisted on relieving her of her bag and seeing her luggage put upon the carriage.

'When are you coming to see the invalid?' I asked as we were about to leave the station.

'If I may I will call this afternoon,' he said, raising his hat as we drove off.

Mother looked at me, and said, 'Oh Mary, Mary, are you plotting?'

'No, mother dear,' I replied, 'it has all happened of itself. The marquis' place, Oldsborough, is close to where we are living.'

'Marquis?'

'Yes, mother, real live marquis,' I said laughing. 'You must forgive me, for I knew it all along, but I had reasons for saying nothing.'

Mother shook her head at me with a merry frown as we drove up to the door, to find Vanessa waiting on the steps, where they embraced fondly, heedless of the astonished sanatorians lolling in deck-chairs under the veranda, to whom Vanessa had been a puzzle, supplying a topic for much gossiping conversation and speculation, the one sex expressing their admiration with many a 'stunnin'' and 'rippin',' and the other with varying expressions and shrugs giving vent to a good deal of insinuation and disparagement, only a few joining with the men in kindly appreciation.

About four o'clock a splendidly appointed car drove up, with my hero at the wheel. Mother and I were sitting in the veranda, and greeted him. After we had shaken hands, I asked him to wait, while I went up in the lift, saying that I would send down a message when the Major was ready to receive him. I wished to make sure that Vanessa was out of the way, as that seemed on the whole wisest. For myself, I do not think that I should have objected to their meeting at once; but, on the other hand, I could not help feeling in my own mind that where a lady's friends have a desire to bring about a happy issue of a love affair the proverb that 'the course of true love never did run smooth' called for consideration in aspects not often thought of. One way of bringing about roughness on the road is for friends to be too obtrusive in smoothing the way, and thus tempting human perversity to contemn what is being won too easily. Another and a better way is for friendship to make the proverb true by strewing a few obstacles in the path of love's progress, and so to reveal to a lover's soul the intensity of its own eager longing to reach the goal.

All I did was, on entering the doorway, to give a tiny motion of the head to Vanessa, who at once rose and passed into her room at the side, while I went forward and said, 'The marquis is here. Shall I have him brought up?' and, receiving an assent, I told Stocks to go down for him. The meeting was most cordial, and I left them together and joined Vanessa, finding her standing and gazing out of the window. I passed my hand through her arm and twined my fingers in hers, and so we stood

silent for a few minutes. But I think that, *ohne Worte*, we spoke to one another in a language that we both understood.

Suddenly we were awakened from our reverie. Vanessa had insisted on the squire having a bell on the table beside him, so that he could summon her at any hour of the day or night, and now we both gave a start as we heard its *ting*. I was loosening my fingers to go in, but Vanessa held me firm.

'No,' she said, 'I will go. I am the nurse.' She had the look which told me that it was no use remonstrating.

'Very well,' I said, and our hands relaxed, she saying as she turned to go, 'Come in, dear, in a little,' and she passed into the sitting-room, leaving the door open.

'This is my goddaughter Vanessa,' said Uncle Goodman in his simple, straightforward way; 'and this is Lord Oldsborough, the son of my oldest friend in the Guards.'

I could not see, but I knew exactly how she was looking into his face as their ungloved hands met for the first time in their lives, while the squire went on, 'She has been more than a daughter to me for three weeks, for she has taken advantage of her starched cap and ruled me with an iron hand, so that I am getting well fast.' I knew how she would be leaning over him as I heard her say laughingly, 'Iron hand, indeed! There has not been much call for that, godfather; you have been a very good boy; but you are naughty now, trying to make Lord Oldsborough think that I am a termagant.'

'Well, child,' he said, patting her hand, 'it was in a wonderfully soft velvet glove.'

At this point I stepped in, and the picture was charming to my artist's eye—Vanessa caressing the old man's head with her hand, her neck gracefully bent forward, and her look half-playful, half-pathetic, and the unmistakable lover taking it all in with eager eyes. Instinctively I felt that there might follow an awkward moment when she must turn, and the man and the woman come face to face, and have to hide what was in the heart under a cloud of ill-acted social banalities. I was about to try to create a diversion by getting conversationally between the two, when the door on the landing opened, and my ever-tactful mother appeared, followed by a servant with a tea-tray. This was a diversion indeed, and enabled us all to come to ease. Nothing is such a relief to a man when in circumstances that tend to self-consciousness than to have something to occupy his hands, and to enable him to move about, even if it be only teacups and cakes. Oh, those hands! is it because they so often are traitors to their owners, and tell too much, that they must be thrust down in pockets or hid behind backs—anything to get them out of sight? Mother, with her cups and her cake-dishes, relieved the situation, and we fell into conventional afternoon-tea manners, and our marquis shortly took his leave, cordially inviting us all to make ourselves free of the Oldsborough demesne. I was not surprised at the abruptness of his departure; but I thought Vanessa was, and was not sure what it meant. I knew he felt that he must either risk embarrassing her by too marked attention, or put on an air of looking past her, which would be impossible for him to attempt. I went down to the door with him on the plea that I wished to have a better look at his car, and he expressed the hope that mother and I would join him on another day in a drive on it, which I said I was sure she would gladly do. He did not mention Vanessa, at which I was not surprised; but as we shook hands and parted he looked me full in the face, and I felt he was saying, 'I know you are my friend.'

Vanessa was in a strange mood when I joined her. She had thrown off her cap, and sunk deep into an armchair, with her hands resting listlessly at her sides. She did not look up when I entered, but took my hand when I came near, and said quietly, 'How did I behave?'

I bent down and said, 'The only way you could, dear.'

'I hope so,' she said with a sigh, and, raising herself up, she suddenly changed her mood and laughed outright.

'It is all very funny, and I sometimes wonder whether it is all a dream out of which I shall awake presently;' and then after a pause she sank back again, and murmured low, 'I would not like to wake.'

I sat down on the arm of the chair, and, bending down to her ear, I whispered, 'I don't think, dearest, that there is much dreaming going on; dreams generally go too quickly.' Then I thought it wise to change the subject, and asked her why she did not have her motor-car brought from home, telling her that mother had confided to me that she was longing for some runs over the lovely moors.

'A happy thought,' said Vanessa; 'but what has a poor nurse to do with the luxuries of motoring?' and she laughed.

'Oh well,' I said, 'your nursing is nearly over now, and you can't escape from coming out in your true colours soon.'

So the car was sent for; and Tommy, who now had the dignity of seventeen and a driver's license, undertook to drive it up, bringing Mrs Marsden with him. 'For,' said Vanessa, 'I know that the dear old thing would stay on alone at Larkhall without a murmur; but it will be nice to have her, and a change will do her good.'

Tommy drove the two hundred and fifty miles in two days, and Mrs Marsden gave him a good character for carefulness on the road. 'He is a dear boy,' she said, 'when you are alone with him and he has no one to tempt him. He is one of those that can have a feeling for the old.' Tommy had evidently appreciated that he would be responsible to Vanessa for the credit of her car, and had driven with consideration both for Mrs Marsden's nerves

and for the other users of the road. As he said, 'I knew Van would make it hot for me if she heard that I had been making the dust fly, and that if I dropped into a trap she might choke me off altogether.'

Vanessa joined us at the door, having heard the car coming up, and her duenna flushed all over her face with pleasure at her sweet greeting. Tommy's face was a study when he caught sight of Vanessa. She was going to kiss him in the old boy-and-girl way, but he with the dignity of his seventeen-year manhood was not going to be seen kissing girls, and the way in which he held her off in shaking hands with her was masterly.

'Hallo,' he said, 'what's all this,' taking hold of her cap-streamer; 'is it going to be a fancy parade?'

'No, jackanapes,' said she smiling, 'it isn't.'

'Well, you do look stunnin', anyhow. Oh I say, look here, hang me if we didn't meet that chap you grovelled to on the road, and I think he knew me, at least he knew the car, for I saw him looking round; and I say, hang it all again, here he is,' he went on, as the marquis in his car swept round to the door.

After he had shaken hands with us, and been introduced to Mrs Marsden, Vanessa said as she presented Tommy, 'Do you remember my cousin, who was with us that day on the car?'

'Yes indeed,' said the marquis, shaking his hand heartily. '"Beastly cheek," wasn't it, my stopping you?' and he laughed pleasantly. 'Oh don't apologise; you were quite right from your point of view at the time;' and then he added, 'I hope we shall have some runs together.'

'All right,' said Tommy. 'I'll back Van's car against yours for a fiver.'

'Tommy!' said Vanessa, with just a *soupçon* in look and tone of Bellona, and the swagger faded out of him in a moment. He shrank back, and made believe to be very busy at something about the car's bonnet.

The presence of young Tommy seemed, however, to have a wonderful effect on the relations of the two in whom I was so deeply interested. Strange it is, but true, that one still almost a child in years will often unconsciously help to give wings to love's chariot. The breezy unconventionality of youthfulness seems sometimes by its presence to change the atmosphere from the chokiness of social etiquette to a more free-breath tone. Many a love has begun to flow swiftly in a ten minutes' romp with a child which had been till then stemmed back in two breasts, unable to find outrun when they were alone together. Although there is much truth in the saying that 'two is company and three is none,' yet not unfrequently a young creature has an unconscious magnetic power drawing two hearts to sacred union that were at the time hovering in alternate attraction and repulsion, just as the lines of force in the ether surrounding a charged body may draw into contact other bodies coming within their influence. It is always as a child that we think of Cupid.

Mary, Mary, this won't do; you are wandering into a physiological lecture, and mixing your metaphors. Stick to facts, my dear, stick to facts, and let the reader do his own imagining as to how things come about.

(To be continued.)

TREASURE-SEEKERS OF SOUTH AMERICA.

By Oswald H. Evans, F.G.S.

A STRIKING analogy may be drawn in comparing the condition of the Spanish-American countries to-day with that of Egypt during the Middle Ages. In both regions we find an alien people dwelling among the ruins of a departed civilisation of which they know little and care less. The ruined buildings are used as convenient quarries from which the materials for the construction of wretched huts may be readily drawn; the great public works of a nobler age have been allowed to sink through neglect into utter inutility. As a result of allowing the splendid aqueducts to fall into ruin, Peru to-day has barren wildernesses where, under the wise rule of the Incas, the valley slopes were made beautiful with fields of maize and cotton. Shiftless treasure-seekers haunt the ruined cities and desolate burial-places, finding little but destroying much.

If we may correlate the dominant classes of Spanish blood with the Arab rulers of Egypt, the miserable fellaheen may not inaptly be compared with the unhappy and degraded descendants of the conquered Indians. Free and equal as they may now be considered under the republican law, long centuries of oppression have ground them to the dust. It would seem that the more sensitive and intellectual part of the population have yielded to the strain and died out, whilst only those of duller temperament have survived, to become brutalised by slavery and alcohol. How different are the faces of the natives who gaze at one with heavy-eyed sullenness from those of the gladsome, gesticulating race whose features we see depicted on the ancient Peruvian portrait-pottery! I have often wondered what thoughts and emotions lie hidden behind the stolid, expressionless, mask-like countenances of the *cholos* (the Indian labourers). Do they remember the past glories of their people? Do they await the advent of some Indian Messiah, or did the last gleam die out when Tupac Amaru's insurrection was crushed so terribly in 1781?

A day will come—indeed, it is already dawning—when, as in Egypt, organised scientific investigation

will penetrate every quarter of Spanish America, and add many fresh pages to our knowledge of the world's history. The republics are slowly waking up to their duty in this matter, and the future is full of hope. With what regret must we contemplate the havoc wrought among the pathetic relics of a vanished people by mere human ignorance and greed! However wide the field still remaining to be investigated, it represents but a tithe of that irrecoverably lost to science.

We do not greatly wonder that to a people such as the Spanish-Americans—in whom, with honourable exceptions, no great zeal for the advancement of science has manifested itself—the presence of innumerable remains of a former civilisation, credited by common tradition with the possession of immense riches, has acted, and still acts, as a powerful stimulus to the pursuit of hidden treasure. In its fullest development it is a mania closely akin to the gambling spirit which is a prominent characteristic of the Latin nations. In every country men are to be found who prefer to work hard in a dubious speculation rather than expend half the labour in obtaining an honest livelihood. The Peruvian treasure-seeker has at least the excuse of precedent. His forefathers came to the land to win unearned gold; shall their descendant be blamed for following, however humbly, in the steps of Balboa, Cortes, and Pizarro?

The west coast of South America has been well described as one huge cemetery. Along almost its entire length the endless line of Pacific surf washes forgotten Indian graves, the lowly burial-place of the Chilian or Patagonian savage, and the vast, well-peopled cities of Peruvian dead, where every gale strips the sand from rags and tatters of humanity. An extract from old Surgeon Lionel Wafer gives a good idea of one of these strange places in 1680.

'We put ashore,' he writes, 'at Vermejo, in ten degrees south latitude. I was one of those who landed to seek for water. We marched about four miles up a sandy bay, which we found all covered with the bodies of men, women, and children. These bodies, to appearance, seemed as if they had not been a week dead; but if touched, they seemed dry and light as a sponge or piece of cork. We were told by an old Spanish-Indian whom we met that in his father's time the soil there, which now yielded nothing, was well cultivated and fruitful; that the city had been so numerously inhabited by Indians that they could have handed a fish from hand to hand till it reached the Inca; but that when the Spaniards came and laid siege to their city, the Indians, rather than yield to their mercy, dug holes in the sand and buried themselves alive. The men, as they lie now, have by them their broken bows, and the women their spinning-wheels and distaffs, with cotton yarn upon them.'

From this account we must take away the spinning-wheels, unless the old traveller used the term to mean 'spindle-whorls.' It is highly probable that the sand-dried mummies he describes antedated by many centuries the coming of the Spaniards, for the interments vary greatly in the periods to which they belong. The curious idea as to the self-immolation of the Indians must be widely current among the present natives, for I have heard it advanced on two occasions by Chilians in order to account for the numerous graves found on every headland along the desert coast of Atacama.

Such cemeteries as this, and more especially the ruins of ancient towns, palaces, and temples, are the happy hunting-grounds of the treasure-seeker. There can be no doubt that instances have occurred, even within the last few years, of a lucky discovery conferring wealth upon some diligent excavator. In the meantime, the amount of damage done is out of all proportion to the value of the finds, from every point of view save that of the treasure-hunter. Squier remarks, in his work on Peru, of the *huaca* or pyramid of Toledo: 'It has been so worked upon and into in the course of three centuries as to have lost all shapeliness, and it now stands a great uncouth mass, honeycombed and pierced in all directions by shafts, passages, and adits, some quite recent, that must have cost hundreds of thousands of dollars to excavate.' Elsewhere he says: 'The ancient monuments of the country have suffered vastly more from the hands of treasure-seekers than from fanatic violence, time, and the elements combined. The work of destruction has been going on for three hundred years, and still actively continues.'

In the years following the conquest of Peru it was not infrequently found that to acquire the deserted palaces and temples of the conquered Indians as house-property proved to be an unusually profitable speculation. A good many cases are on record of immense treasures being found in or about such premises. Take for example the good fortune of Hernando de Segovia. This gentleman purchased from Pedro del Barca half the former convent of the Virgins of the Sun, which the latter, one of the Conquistadors, had received as a portion of his share of the spoil. Soon after the property changed hands, the new owner found hidden under the paving of the courtyard a treasure of golden vessels amounting in value to seventy-two thousand ducats. After hundreds of years have passed, one can still feel a certain sympathy for the less fortunate Don Pedro. Antonio Altomirano, again, seems to have found antiquarian research well worthy of attention. Under the *patio* of the palace of the Inca Huayna Capac he discovered, among other objects of price, a great golden jar for brewing the royal *chicha* (maize beer), weighing well over two hundred pounds, the entire *tapada* being valued at eighty thousand ducats. Well-authenticated stories of this nature, which in England would be listened to with the proverbial 'grain of salt,' are still very interesting to the impecunious and none too energetic Spanish-American. The traditional 'treasure lore' of the Pacific coast would be well worth collecting; but, like all oral tradition, it is

far from easy to obtain. I have only known one avowed treasure-seeker, a man who wasted a long life in wildgoose-chases, only to find that the pot of gold was still buried at the foot of the rainbow. Ragged old '*tapada* Gomez' had none the less many a good tale to tell, for he was in spirit a true descendant of the adventurers after El Dorado.

When Don Pedro Cieza de Leon was collecting information for his projected great work on Peru, he showed wisdom in availing himself of the conversation of those members of the old aristocracy who still dwelt in diminished splendour under the half-contemptuous protection of their Spanish conquerors. On one occasion, he tells us, he chatted with the Christianised Inca Paullo, like a true Spaniard, about the reputed treasures of the former dynasty. Said Inca Paullo, 'If all the treasures hidden in the *huacas* (burial-places) were collected together, that which the Spaniards have already taken would appear very small, as it were one drop taken out of a large vase full of water.' To render his illustration more striking, he took a measure of maize and dropped one grain of it. 'That much represents the Spanish spoil; as for the rest, it is so well hidden that we ourselves do not know the place of it.' It is, of course, very possible that Inca Paullo was drawing the long-bow for the benefit of his Spanish friend; but it is evident that his hearer accepted the startling statement in good faith. The idea is widely current, and is in great favour with contemporary novelists, that the Indians know more about the hidden wealth of their race than they can be persuaded to divulge, even under torture, and that there may even yet exist in one of the still unknown forests of Central America or the Amazon some city wherein the white man's foot has never trodden, and where the old gods still receive acceptable sacrifices from the summits of unpolluted altars.

Perhaps some reader may recall the interest taken in this strange tale by Stephens, as described by him in his *Travels in Yucatan*. It was, indeed, an enthralling story that the *padre* told him in his little mission-house, buried away in the depths of the primeval forest, of how he had climbed to the summit of the distant Cordillera, and seen afar off, gleaming white in the sunset, the walls and *teocallis* of the mysterious Indian city. As year by year passes, however, and exploration presses on in the van of commerce, the unknown area grows more and more circumscribed, and many a golden dream is proved to be but an illusion.

One of the best South American treasure-stories is buried in a footnote in Prescott's *Conquest of Peru*. Quoting from a Spanish author, he says: 'It is a well-authenticated report, and generally received, that there is a secret hall in the fortress of Cuzco, where an immense treasure is concealed, consisting of the statues of all the Incas, wrought in gold. A lady is still living, Doña Maria de Esquivel, the wife of the last Inca, who has visited this hall, and I have heard her relate the way in which she was carried to see it. Don Carlos, the lady's husband, did not maintain a style of living becoming his high rank. Doña Maria reproached him, declaring that she had been deceived into marrying a poor Indian under the lofty title of Lord or Inca. She said this so frequently that one night Don Carlos exclaimed, "Lady, do you wish to know whether I am rich or poor? You shall see that no lord nor king in the world has a larger treasure than I have." Then, covering her eyes with a handkerchief, he made her turn round two or three times, and taking her by the hand, led her a short distance before he removed the bandage. On opening her eyes what was her amazement! She had not gone more than two hundred paces, and descended a short flight of steps, and she now found herself in a large quadrangular hall, where, ranged on benches round the walls, she beheld the statues of the Incas, each of the size of a boy twelve years old, all of massive gold. She also saw many vessels of gold and silver. "In fact," she said, "it was one of the most magnificent treasures in the whole world."'

The name of the little Lake of Urcos, not far from Cuzco, may have a familiar sound to some of my readers. In this lake, you must know, the great chain of gold was thrown on the approach of the Spaniards. This was the chain from which Inca Huascar took his name; its links were thicker than a man's wrist, it was hundreds of feet in length, and required the united efforts of a small army of sturdy warriors to lift it from the ground. Even in Garcilasso de la Vega's time attempts were made to drain the lake in the hope of disclosing its hidden wealth, for a company of merchants of Cuzco drove a tunnel to carry off the water, abandoning their enterprise, however, when they came to a rock-mass so hard that the tools of their workmen 'struck out more fire than stone.' Since this early speculative company failed to effect its object, the attempt has more than once been renewed, or at all events the American newspapers have published circumstantial accounts of such operations. I am inclined to think that this lake occupies the same place in American journalism as the giant gooseberry does in our own 'silly season.' Notwithstanding this, I must admit myself to be a believer in Huascar's chain. Peru is still the headquarters of romance so far as I am concerned.

Journeying southwards into Chili, we find the treasure-hunters still active, even though they have by no means so favourable an environment in which to carry on their hobby. When wandering over the bare deforested hills behind Valparaiso, one not infrequently comes upon the marks of recent excavation, here a solitary hole of a foot or two in depth, there the mounds and hollows of quite extensive operations. Many a time I had passed these over without much attention, assuming that they represented the work of prospecters, since the valley-gravels are known to contain gold, and mineral veins occur in the massive rocks. At a later date a friend informed me that the diggers of

these holes had other game to follow—nothing less, in fact, than *tapada del Inca* (the Inca's treasure). The story goes that Chili, as a conquered dependency of Peru, yielded annually a huge tribute of gold and silver.

Don Vicuña Mackenna, a voluminous writer on Chilian politics and history, quotes an early author in support of the statement that this tribute was reckoned in hundredweights of the precious metals. It is curious that the mines whence this wealth was drawn have not since been discovered. It has been conjectured, not without reason, that the great aggregate amount of the tribute was made up of small individual values from many minor sources scattered over the country. Ancient mining implements, such as stone hammers and bone scoops, have occasionally been met with associated with early mine-workings in localities where gold-mines are at present under development. According to the tale, as it was told to me, the tribute-bearers were jogging along on the road to Cuzco, probably bearing the aforesaid hundredweights of gold and silver in litters on the shoulders of Indians, furnished in relays by each community they passed through on their journey. At that time Chili possessed no beast of burden, for the Peruvian llama does not range so far south, and the wild guanaco has not been domesticated. At some unknown point they were met by the swift Peruvian post-runner, who brought the almost incredible tidings of the landing of Pizarro and the murder of their sacred Inca. The leader of the escort, it is said, decided to bury the treasure and await the further development of the situation before proceeding on his journey. This was done by night, and it is reported, as usual, that the eternal silence of the assistants was ensured in the customary manner.

Making due allowance for the element of exaggeration that has probably greatly enhanced the value of the tribute, there is nothing impossible in this tradition, which undoubtedly exists. Such dislocations of the customary tribute caravans must have taken place on the road from every province of the empire when the Spaniards fell like a thunderbolt on the wealthy and populous, but comparatively feeble and war-exhausted, Indian race. The difficulty arises, where was the tribute buried? The treasure-hunter has well over a thousand miles of mountain, valley, and desert to search in without a clue.

The province of Chiriqui, in Central America, has long been a noted hunting-ground for the treasure-seeker. So frequently were objects of gold buried by the aborigines with their dead that even in 1642, according to Holmes, the Spaniards 'passed a law claiming all the gold found in the burial-places, the whole matter being treated merely as a means of revenue.' There is no evidence of the former existence in Chiriqui and its immediate neighbourhood of a civilisation at all comparable with that of Yucatan or Peru, and the origin of the peculiar gold-work of the district remains a mystery, the very method of its manufacture being still to some extent uncertain.

The treasure-seekers of Chiriqui trouble themselves but little with the conflicting theories of ethnologists. Armed with long iron rods they probe the ground in likely spots, for the graves present no external features to attract the eye, and are, moreover, sometimes hidden among dense tropical vegetation. Long experience has taught the 'antiquaries' to discriminate by touch alone between disturbed earth and natural soil. I have seen the same plan adopted with success on rocky ground in Northern Chili. In Central America it would seem that the gentry with the iron rods are occasionally well repaid for their untoward exertions. Holmes, in his monograph on the antiquities of Chiriqui, mentions the fact that one cemetery gave up in one month one hundred and thirty pounds' weight of gold figures alloyed with copper, whilst from an area of only twelve acres treasure to the value of fifty thousand dollars was extracted.

Needless to say, by far the greater portion of these remarkable finds is for ever lost to science. In every land the State takes some cognisance of 'treasure-trove,' and very rightly does so; but the law no doubt frequently shortens the journey of the articles found from their hiding-place to the melting-pot. The genuine treasure-hunter is a very vandal. Beauty and quaint ugliness are the same to him, the weight and intrinsic value of the material of his find alone appeal to that greed of unearned gain which is his strongest characteristic.

THE KING'S HUNTING-HORN.

CHAPTER II.

NEXT morning, soon after sunrise, all were stirring at Wappenham. Fresh horses and hounds arrived by seven, and the King was already arraying himself for the chase. Sir Jeffery went down to the hall to see that everything was prepared. Thence he ascended to the gallery by a short flight of stairs, and thrusting aside a curtain of arras, opened up a cupboard for the purpose of getting out a pair of spurs for the day's hunting. As he did so the door of the King's chamber opened, footsteps approached, and the King, speaking earnestly to some one with him, came to the deep bay of a window which overlooked the garden. The first impulse of the young knight was to issue from his place of concealment and announce his presence. He hesitated, and the next minute he was not sorry he had done so.

The king was speaking to Robert Knevett, who had ridden that morning from Stony Stratford, and, as Sir Jeffery knew, had been straightway shown up to the royal bedroom. Knevett was squire and body-servant to Edward, and, as all Lancastrians well knew, was one of his most trusted spies and informers. The two now stood within twelve feet of the knight's elbow, and Knevett was answering some searching questions.

'The Duchess of Bedford and Sir Richard Woodville desire their humble duty to your Grace,' he said, 'and will take great joy in entertaining your Grace at Grafton to-night.'

'And of the Lady Grey,' pursued the King, 'what tidings?'

'She is rarely well, your Grace,' replied Knevett, 'and presenteth her loving duty to your Grace with this reply to your letter.'

The King took a scroll from Knevett.

'And what further have you learned about her ladyship?' demanded the King. 'Hath she had any affairs of love since the death of Sir John Grey, her late husband? It behoveth me to be well acquainted with any such matters.'

'None, your Grace,' answered Knevett, 'save'——

'Save what?' pressed the King in a harsher tone.

'Save that, your Grace,' pursued Knevett in a somewhat lower voice, 'there have been certain passages betwixt her ladyship and the young knight here, Sir Jeffery Aylmer, who hath indubitably a great affection for her. Before the coming of your Grace it seemed that a match was like to have been made between these twain, the lady and her father, Sir John Woodville, being not unwilling.'

'God's blood!' said the King quickly, 'I will take order upon this right soon. The young cockerel's comb is easily clipped. I will have none dangling about the Lady Grey but myself. She is the one woman in all broad England meet to be a Queen, and Queen she shall be. None—not Clarence, nor Warwick, nor Montacute, nor the rest of them—shall dare to say me nay. As for this springald Sir Jeffery, he may hunt with us to-day—'twill keep him in our purview. To-night, when he returns hither, do you arrest him and take him by Stony Stratford to London. There lodge him in the Tower. His father and grandfather were traitors to my House, and for the present he is better under bolt and bar. Ride to Stony Stratford after you have broken fast, take a dozen men, and come back hither on this duty. Now, return with me to my chamber and I will write you due warrant for your task.'

The two men moved off again.

During these few pregnant sentences Sir Jeffery, behind his place of concealment, had stood like a statue, not daring to move a limb. The blood had rushed swiftly back to his heart, and his ruddy cheek had paled. But he was none the less resolved. No sooner had the door of the King's chamber closed than he went swiftly to his own room, unlocked a strong coffer, and took from it a flat leather belt filled with gold pieces. This he put on next to his skin. He filled his outer pouch with more gold; and sending for his squire, Thomas Cowper, provided him also with a secret belt containing as many gold nobles as he himself carried. He gave him, also, due warning of what had passed; and directed him to take, about noon, two of the best and freshest horses in his stable and ride towards Grafton, and there await his master in a certain piece of deep woodland known to them both. In the days of the Roses men of rank and position were in constant jeopardy of their lives, and had to be prepared for sudden emergencies such as the present. Thus it was that the store of gold, belted on by the two men, had lain ready to Sir Jeffery's hand. Under the ruthless Edward, as the young knight well knew, imprisonment in the Tower meant long immurement, probably death and deprivation of his estate. He intended to escape that fate if by any human possibility it might be accomplished. How to evade the King's hunting-party during the day was the problem that lay before him.

They rode forth soon after breakfast, a small but gay and gallant band—all, save Sir Jeffery, as light-hearted as the glorious March morning and the prospect of sport might warrant. The young knight showed no trace of his anxieties, but rode just behind the King, exchanging cheery jest and hunting converse with his companions.

Edward, always a consummate actor, showed no hint of what had passed between himself and Knevett at Wappenham; but occasionally turned to Sir Jeffery, and in the courteous manner which none knew better how to assume than himself, asked him various questions connected with hunting and the country through which they rode.

Aylmer's head-forester had a warrantable stag harboured for him on the verge of the forest; and after three miles of riding they approached, and the deer, a great stag of twelve, was roused and the pack laid on. Then ensued a long and stirring chase—one of the greatest runs, as King Edward was long after heard to avow, that he had ever taken part in. Quitting the woodlands, after a turn or two, the great stag led the hunt by Plumpton and Moreton Pinkney to Canons Ashby, whence, swinging left-handed, it passed Culworth, Sulgrave, and Marston St Lawrence. Then, soiling in the stream that runs below Helmdon, it gained the hill and reached the forest of Whittlebury once more, having described a wide circle and covered something like eighteen miles of country. They passed close to Wappenham Manor; and, by great good fortune, the King and Sir Jeffery, who had far outstripped the rest of the field, were able to replace their tired horses with fresh ones. They galloped on another mile or two, still alone with the pack, which now hunted steadily through the vast woodlands with a magnificent cry.

Presently, in descending a deep and well-bushed hollow, the King's horse, ridden somewhat reck-

lessly in the heat of chase, stumbled and rolled to the bottom, the King being violently thrown. Sir Jeffery, who was not far behind, expressed his concern and proffered help. But Edward was uninjured, and, active as a marten, sprang to his feet again, caught his horse by the bridle, swung himself into the saddle, and with a 'Nay, I am nothing hurt!' was away again.

The next instant the gleam of metal caught the eye of the young knight as he descended the hollow. It was the King's hunting-horn, which, torn from its owner's shoulder, now hung suspended from a stout branch in the midst of the thicket. The leather baldric still retained one end of the instrument, but at the other end the rivet had been torn from the bison-horn into which it was fastened. In his fall the King had not noticed its disruption, and was now speeding through the forest all ignorant of his loss.

The sight of the wonderful trophy before him instantly changed the current of Sir Jeffery's thoughts. He was as devoted a sportsman as the King himself and as bold a rider. In the heat and hurry of the wonderful chase the stag had set before them he had well-nigh forgotten the pressing matter of his escape, the nearness of the danger that encompassed him. He was alone, and the hunting-horn was his for the having. To-night, or to-morrow at the latest, he would be a prisoner. That wonderful horn was not King Edward's; its rightful owner was Casimir of Poland. He owed neither service nor thanks to Edward, but in sooth stood in imminent peril of his life and liberty from him. With that horn he might seek Poland, restore the trophy to King Casimir, and perchance obtain favour from that monarch. England was no place for him, for the present at any rate.

These thoughts ran swiftly through the young knight's brain as he halted there amid the blackthorn and briar. His mind was instantly made up. He alighted from his horse, picked up the horn, thrust it into the breast of his hunting-tunic, remounted, and rode off eastward in an exactly contrary direction to that taken by the King. He was alone and unperceived; the hue-and-cry would not be raised for him for some hours; he would make the best use of his time.

It was now noon, and after riding three or four miles Sir Jeffery took meat and bread from a wallet that hung from his saddle and stayed his hunger. Then, after a drink from a clear stream, he went on his way.

His thoughts, as he cantered through the forest by a path that led towards Grafton Regis, ran much upon the Lady Grey. If, indeed, she had cast aside all further thought of him, how could he blame her? What woman could refuse a King, and a King so handsome, so resistless, so bold and unrelenting as Edward, whose will not the strongest and bravest man in the whole realm durst now oppose? But, if he could, the young knight meant to have one more glimpse of Elizabeth Grey before he quitted England—meant to have speech with her, if possible. He knew that she often rode in the afternoon, after the noontide meal at Grafton, through a certain piece of secluded woodland, where he had frequently met her in the happy days of the last six months. Before taking flight he would make an effort to see her once more, even if in doing so he exposed himself to some risk of capture.

Cantering along briskly on his fresh horse, therefore, he accomplished another five or six miles, and, rather more than an hour after noon, reached the place he had in his mind. It was a wonderfully sequestered glade, set among forest-trees and carpeted with short grass. Everywhere around pale primroses starred the earth, and the wild hyacinths, now bursting into flower, were already casting their shimmering spell of bloom far and wide through the ancient woodlands. Arrived at this fair and lonely spot, Aylmer dismounted and prepared with moody impatience to wait there for the next hour, during which at any moment the Lady Grey might ride that way.

Fate willed, singularly enough, that he should not be kept long in suspense. In a quarter of an hour his keen ear distinguished the tramp of horses and the jingle of a bit. Drawing with his horse behind a stout oak, he waited. Something within him told him that he would not be disappointed. It was even as he had wished and hoped; and in a few minutes Lady Grey, accompanied by Anthony Blackford, the discreet and faithful groom, who always attended her on these occasions, rode into the clearing. Sir Jeffery instantly quitted his place of concealment, led his horse forward, and doffing his cap, bowed low. The colour ran swiftly to the cheek of the lady as she recognised the young man in front of her. She reined in her pony and returned his salutation.

'Can I have speech with your ladyship for a brief space?' he asked.

She glanced with some apprehension round about the glade. Then her courage came to the rescue, her eye brightened, and her resolve was made.

'Anthony,' she said to her groom, 'do you wait here while I go forward with Sir Jeffery for a brief space. I would wish him farewell.' The groom was in most of Lady Grey's secrets; she knew she could trust him with her life.

He saluted and replied, 'An' it please your ladyship.'

The lady rode forward fifty paces into the woodland, the young knight walking by her side, and beyond the bole of a giant beech-tree they halted. They were a goodly couple, in truth, as they communed there. Elizabeth Grey, as queen of Edward IV., was reckoned the most beautiful princess in Christendom. Never, thought Aylmer, had her wondrous fairness, her tender blue-gray eyes, her thick, shining hair, more become her than to-day, when he was to lose her. And he, though Edward the King might overtop him in stature and commanding magnificence, was, with his slim,

athletic figure, broad shoulders, dark hair, sparkling brown eyes, and clear complexion, every inch a man. Theirs was but a brief interview. Sir Jeffery, knowing now all the facts, had not the heart to upbraid her upon whom he had staked his happiness. The temptation to match with a King was too splendid for any woman, and moreover there was no yea or nay in the matter. The King, her mother the Duchess of Bedford, her father, and all the Woodville kinsfolk were forces that were not to be resisted.

'Tell me, Elizabeth,' he said at length, after mutual explanation, 'had it been any other than King Edward should I have been put aside?'

'Indeed, Jeffery,' she said softly, 'not by me. Before this shadow of the throne fell across my path I had been content—nay, more than content—with thee, and would have joined my poor lot with thine, as thou knowest well. Prithee, put me from thy mind and forget me as swiftly as may be. Nothing can alter, nothing mend, this discomfiture of thine save time alone. Now, fare thee well. Kiss me once, in token of forgiveness, and let us part. I do risk much in thus meeting thee. Farewell, and think not too harshly of me.' The tears stood in her eyes and fell upon her soft cheeks.

Sir Jeffery raised his arms to the lady as she bent towards him from her saddle, and clasping them round her neck, kissed her upon the cheek and lips. 'Farewell, my sweet!' he said simply. 'Though I lose thee, thine image, as thou art to-day, will ever be in my heart.'

'Where goest thou now?' she asked.

'I ride this night for the coast,' he said, 'thence to take ship for France. But that is my secret and thine. King Edward hath designed me for the Tower, and perchance worse things, and I am already in flight.'

'Oh!' she gasped; 'I never dreamed there was danger for thee, Jeffery!'

At that moment there came from far away in the forest the deep, melodious baying of hounds in full cry.

Sir Jeffery sprang to his horse and gathered up his reins. His eyes now sparkled with the light of action. 'There come the royal hounds!' he exclaimed; 'and behind them rides your King, but not mine. Farewell, sweet; I must ride instantly!' With a last look at the lady's face and a wave of his hand, he plunged into the woodland and was gone.

Sir Jeffery Aylmer found his squire, Thomas Cowper, at the trysting-place, as he had expected. In wallets slung on either horse, Cowper had provided his master and himself with a change of raiment, and various small articles which he judged Sir Jeffery might require. That night they rode eastwards through the shires of Bedford and Cambridge, and after three hours' sleep at a quiet inn, continued their journey through Suffolk till, late at night, they reached the little fishing-hamlet of Walberswick on the River Blythe, near Southwold.

Sir Jeffery chose this tiny port for two reasons. First, he believed, when the hue-and-cry came, that he would be sought at King's Lynn, the nearest sea-town from Northamptonshire; secondly, at Walberswick there dwelt an old tenant of his father's, a fisherman, with whom he hoped to get passage to France or Flanders.

All turned out as he had hoped. The good fisherman, Sim Duncombe, was delighted to welcome the son of his old master, and to assist him every way possible. He had a large hoy; and in the vessel he could carry, not only Sir Jeffery and his squire, but, with a little contriving, their three horses.

Next morning, then, by noon, they put to sea; and, making with a west wind for Flanders, the young knight was put ashore at Ostend, and from there reached Bruges. It fell out as Sir Jeffery had expected. The hue-and-cry was not raised after him until the morning after the day of the King's hunting from Wappenham. Thanks to the precautions he had taken, his route to Suffolk was unnoticed, and the pursuit presently died down.

More than two months after landing in Flanders Sir Jeffery and his esquire, after devious wanderings through Germany, reached Poland, at that time and for long after well described as the Heaven of Nobles, the Paradise of Clerics, the Gold-mine of Foreigners, and the Hell of Peasants. Pushing their way through a barbarous and uncouth country, much of it wild and interminable forest, they reached at length, after many adventures, Warsaw. Here, while they rested for a few days and renewed their equipment—for they were very wayworn—they learned that the King was at Troki, a royal hunting-castle near Wilno, in Lithuania. Thither they directed their footsteps, and after more rough travelling, presently reached their destination.

Sir Jeffery, who, as a knight from England charged with important news for the Polish King, was hospitably welcomed by the castellan of Troki, was presented next morning.

Casimir IV., King of Poland, was of mixed Polish and Lithuanian blood, his mother, the beautiful Queen Jadwiga, greatniece of the famous warrior Casimir III., surnamed the Great, having married Ladislaus Jagiello, Prince of Lithuania, and thus united that principality with her own kingdom. Casimir was in stature somewhat above the middle height, with a long, lean face, resembling much, as Sir Jeffery long afterwards remembered, that of Henry VII. He spoke with a curious lisp.

The young English knight was duly presented in a great timbered hall, in which much magnificence of a somewhat barbaric kind was everywhere displayed.

The King spoke no French, and Sir Jeffery had not yet acquired sufficient Polish to make himself understood in that language. The interview was, therefore, conducted by a noble who was familiar with French, and acted as interpreter.

Sir Jeffery, having knelt and kissed the King's hand, and been questioned courteously concerning his journey, was asked to declare his mission. The hunting-horn lay within the breast of his handsome purple tunic. On the previous night he had taken it from the soft leather covering in which he had long kept it sewn for safety, and had carefully cleaned and polished it, so that, as he drew it forth, it shone resplendent. With both hands he now held it forth to King Casimir. 'Sire,' he said, 'I have come oversea from England and travelled far through Europe to deliver to thee this horn, which I believe to be thine own.'

No sooner had Casimir set eyes on his long-lost treasure than he sprang from his chair, held up both arms, and with an expression of mingled joy and fervour, exclaimed, 'By the Splendour of God! my lost hunting-horn! Mother of Jesus! I thank thee this day!'

Then, taking the trophy into both hands and kissing it, he blew on it three noble blasts, which rang loudly among the dark roof-beams of the great hall. Thereafter, breaking into a mighty laugh, he clapped the young English knight heartily on the shoulder and said, 'Thou hast done well indeed, Sir Knight. That ancient horn is worth to me a king's ransom; and if Casimir of Poland can make return to thee at any time for the great thing thou hast done for him, never look to him in vain. Now, tell me thy story, and how thou knewest the horn and of my loss!'

So Sir Jeffery told him all his story, omitting not a single detail of which the reader has cognisance.

King Casimir was as good as his word. He took Sir Jeffery into his service, bestowed upon him a title and an estate, and to the end of his life never failed in favour to him and his children.

Sir Jeffery Aylmer fought in the King's wars against the Teutonic Knights, and after the peace of Thorn, having performed much good service, was endowed with further favour and possessions. Some years after his entry into Poland he married, at the King's suggestion, a daughter of one of the great Polish nobles, and by her had children.

After the death of Edward IV., Sir Jeffery, who had long been in communication with the Lancastrian party, journeyed to Brittany and had audience of Henry Tudor, Earl of Richmond. He became one of the Earl's devoted adherents, and advanced him money for his descent upon England in 1485.

When Henry Tudor crossed the sea and defeated the usurper, Richard III., at Bosworth Field, Sir Jeffery was by his side and took part in that famous victory. Thereafter, by favour of Henry VII., he was restored to all his English estates, to which his eldest son subsequently succeeded. To his second son, upon his death, he bequeathed his Polish and Lithuanian possessions. It is perhaps worth recording that, although the lineal descendants of Sir Jeffery Aylmer have died out in England, to this day you may find, in what is now the south-west of Russia and Northern Prussia, direct representatives of the young English knight who had the good fortune to become the restorer of the King's hunting-horn to its rightful owner.

THE END.

PENGUIN-EGG COLLECTING.

YING off the south-western corner of Cape Colony, and a little to the north of Capetown, are a group of islands of which Dassen, Jutten, and Malagassen Islands are the largest and most prominent. They appear nothing more than rocky islets, whose jagged rocks projecting above the level of the sea offer an emphatic warning to the navigator not to venture too closely. Should the passing vessel approach sufficiently near, the traveller will observe the islands to be crowded with birds, and probably will dismiss them from his mind with the thought that they are merely the isolated and well-nigh inaccessible strongholds of the sea-fowl clustering on their barren sides.

Such, however, is far from being the case. Although the three above-named islands, which constitute the largest and most important of the group, do not cover in the aggregate more than from twenty to thirty acres of ground, yet they are the centre of two flourishing industries. The islands are the property of the Government, and their sanctity is carefully preserved. No one is allowed to intrude upon their shores without express permission. They are as closely protected as a hoard of treasure, and upon each island is stationed a resident official or ranger, for whom comfortable quarters are provided, and who on behalf of his employers maintains a practically autocratic sway. Though one might probably search in vain for traces of precious metals or gems, the existence of which might be suggested by the thoroughness of the reservation, yet they yield two articles of commercial value which repsent a satisfactory revenue to the Colonial Government. The first of these is guano, of which huge deposits are to be found on these sea-girt rocks; the other is penguin-eggs.

The last-named industry is becoming of more importance every year, and a decided stimulus has been imparted to the trade by the recent successful introduction of the eggs into Britain. In South Africa the edible is as common as the ordinary hen's egg, and is a favourite addition to the breakfast-table. In fact, owing to its peculiarly easy digestible qualities, combined with an appetising flavour, it is greatly preferred to the smaller product

of the domestic fowl; while the fact that it is considerably larger renders it a good square meal in itself.

In general appearance the egg resembles somewhat that of the goose, to which it also approximates in size. A peculiarity in cooking, however, is that the white or albumen never becomes solidified and white, as is the case with the hen's egg, but preserves its jelly-like consistency of a very pale-blue colour. No matter how long cooking may be prolonged, it will always retain this character, though the yolk itself will become set in the usual manner. It is owing to this peculiarity that the albumen of the penguin's egg is so easily digestible and constitutes such a valuable dietetic for invalids. In view of the fact that the bird depends for its sustenance upon fish, it might be conceived that the egg will necessarily have a fishy flavour; but such a conclusion would be quite fallacious.

Upon these islands the penguins thrive in their thousands, or it might truthfully be said in their millions, for they jostle and fight one another for their very existence. Being under severe protection, they multiply exceedingly, and although their nests are remorselessly robbed of their contents during a certain season of the year, their ranks suffer no diminution. Among their native haunts the birds are very tame, and will allow the visitor to walk among them without being molested. In fact, to wend your path over the beach is a somewhat difficult matter, since, owing to their great numbers, they stand shoulder to shoulder, and refuse to budge an inch to make room for you to pass. Should, therefore, one be in your way, to effect progress without injuring it you must unceremoniously push it on one side, an unprovoked summary assault which the bird will often immediately resent by attacking its neighbour. Such tameness is somewhat extraordinary, since those that occasionally become cast up on the mainland, which is only a few miles away, by unfavourable currents, exhibit extreme timidity, and immediately beat a retreat to a safe refuge upon man's approach. So densely are the islands covered by these birds that the quarters of the Government rangers have to be surrounded with low walls to keep them from flocking into the private precincts of the dwelling.

Under the peculiar conditions prevailing, the islands offer unique advantages for studying the habits and movements of these birds at close range, and from the results of such privileged investigations our knowledge concerning these interesting birds has been considerably extended. They are a well-ordered community, and carry out the law of self-preservation to the letter. They have a code of laws to which they adhere very closely, and woe betide the venturesome one who should dare to exceed its limits. In the first place, each bird selects its own particular site for its nest, which is the crudest structure it is possible to conceive, existing in many cases in name only. Upon its return from a foraging or other expedition a bird will immediately return to its home, and although one is as like another as two peas it never makes a mistake. At the same time, the bird is rather fond of embellishing its rude home with any odds and ends which it may find. It may be the rim of a discarded piece of headgear, a scrap of iron, a nail, or a screw. This it bears triumphantly to its home, lays it in the desired position, and then stands guard over it. Possibly other birds, jealous of such decoration, attempt to take forcible possession of the trophy, or will perhaps resort to surreptitious theft during the owner's absence. In any event the upshot is the same. A terrific combat ensues between rightful owner and purloiner, the other birds observing the battle-royal with the utmost unconcern.

As the penguins, from their peculiar build, must necessarily live on the strip of land fringing the sea, other winged inhabitants must take up their abode beyond the limits of their settlement. Should one inadvertently settle in the penguins' domain, the latter make an attack in force and the intruder is either despatched right away or beats a hurried retreat. The result is that a state of civil war is eternally raging on the islands between the various kinds of birds. This is illustrated more strikingly on Malagassen Island, where the internal districts constitute the abode of the indigenous goose. There is an understood frontier-line dividing the colonies of the two species, and should one or the other trespass over that invisible line of demarcation a general mêlée ensues. Hordes of each community hurry up to the scene of action, and a conflict all along the line is waged, the contest being maintained for hours. The two colonies of birds are thus in a constant state of suspicion and suppressed warfare, but so long as either side keeps religiously to its own preserves peace prevails.

At the same time, however, the birds show a highly developed intelligence in the art of warfare. In some instances, when the penguins wish to land upon another island already indisputably tenanted by some other representative of the winged tribe, they do not make individual sallies at various points, but select a suitable landing-place. Then they assume a wedge formation and make a combined attack, literally forcing their way through their opponents' ranks, viciously fighting inch by inch. It might be thought that, being unable to fly, the penguins are at a great disadvantage, but this is by no means the case. They are veritable Spartans in warfare, and each member will fight until he drops, when another is immediately available to fill his place. The result is that in ninety-nine cases out of a hundred the efforts of the penguins prove successful, and they cut their way through the forces of the defenders until they reach a suitable spot, where they will assume possession and defy to the bitter end any efforts to dislodge them. Under such strategic circumstances the penguins invariably remain the victors.

These birds are most prolific layers, and the

collection of the eggs is attended with a certain amount of excitement. The collecting period is prescribed by the Government, and falls into the months of March, April, and May. The egg-gathering is systematically set about. Upon a certain day the whole of the nests will be cleared, and then a few days allowed to elapse before another similar wholesale raid is made. The right to exploit the islands is allotted by contract, and about seven men are despatched from the mainland with the requisite instructions, to be carried out under the supervision of the resident ranger.

The collectors protect their legs with some stout material to preserve them from the snapping bites of the birds, and are equipped with a short stick having an iron crook at the end. Naturally, the birds resent such robbery of their homes, and vigorously contest the depredations. They cannot be frightened from their nests, and sit over their eggs in sullen obstinacy. To attempt to remove a bird from its position by hand would be to invite a savage snap, so the collector unceremoniously inserts his crook beneath the bird, scoops the eggs out, and then picks them up.

The eggs when collected are packed in boxes and despatched to the mainland at frequent intervals during the season. On the last day of this ordained period the collectors make a final onslaught upon the nests, and pick up every egg they can find, so that not one is left. From this time onwards, however, the penguins are permitted to continue the even tenor of their way without fear of molestation. During the whole of the breeding-season the rangers maintain an unceasing vigilance to protect the penguins from any disturbance. Owing to the thorough character of this preservation the ranks of the birds suffer no depletion from sportsmen or other visitors to the islands bent on securing the plumes of the neck and head, which are of commercial value for tippets and other forms of feminine decoration. Similarly, during the guano-season, which is similarly officially prescribed, the birds suffer no untoward interference.

Some idea of the extent of the penguin-egg industry and the value of these isolated rocks to the revenue coffers of the Government may be gathered from the fact that on the average some five million eggs are annually collected. They find a ready market in South Africa, and, as already stated, constitute appreciated comestibles. Lately, in the search for a new market, the Cape Colonial Government despatched a consignment to Britain. Britishers who had already become familiar with the digestive and nourishing qualities of the penguin-egg while in South Africa rapidly availed themselves of the opportunity to renew their acquaintance therewith, and, as their characteristics were soon recognised in other quarters, a certain steady demand was produced. At first, however, they rather constituted an addition to the table of the epicure, being sold on the average at about six shillings a dozen; but as the supply has since been increased the market price has fallen by over 50 per cent., and in a short time the eggs will be brought within the reach of all.

As in domestic circles, the penguin has his marital and matrimonial troubles. The fancies of a male bird will be centred upon some fascinating member of the opposite sex. The chances are that he will find within a short time that the latter's admiration has already been bestowed upon another, or she has been already mated. Having no court of law to appeal to for redress, the intended or husband promptly takes the matter into his own hands, and proceeds to administer timely castigation to the impertinently amorous one. A savage conflict takes place, invariably in the presence of the cause of the controversy, who stolidly stands by or maintains occupation of her nest, regarding the combat with complete indifference. Such battles are often maintained for several hours on end, until the rival is vanquished, when the conqueror returns to the company of his lady-love.

TO A DREAM.

While yet the world was gray,
Ere the hot glories of the nascent day
Had set the skies aflame,
Swift to my slumber-weighted soul you came,
And swiftly passed away.

The wind blew cool and sweet
Across a sandy beach, that stretched to meet
Ocean and azure sky;
And white-capped waves caressed unceasingly
The pebbles at my feet.

Afar, dark pine-trees bent
To give the perfumed air a drowsier scent;
And shadowy hills arose,
Pale in the splendour of untrodden snows,
Toward the firmament.

And by the water clear
A woman stood, whom once I held most dear,
With starry eyes that shone
Even as they had done in days bygone,
Ere envious Death drew near.

She smiled. It was as rain
On the parched earth wherein my heart had lain;
She bent her lips to mine,
And through my veins there ran the fiery wine
Of Youth and Hope again.

So stood we for a space,
Till a strange darkness hid her radiant face.
It passed. A throstle broke
Into wild melody, and I awoke
From my dream trysting-place.

I ask no more than this
Of the great gods who grant such transient bliss:
That, waking, I may keep
One jewelled moment from the crown of sleep—
The memory of Her kiss!

THE AIR-SHIP IN GERMANY.

By RICHARD THIRSK.

THE problem of conquering the air has exercised the imagination of man ever since the creation of flying things. Long years before he had any command over the sea, while its extent was still unknown to him, he was ambitious to soar up into the third element, and to wander literally among the clouds.

In the myths and sagas of most countries, even of distant Mongolia, we find some reference to the fascinating problem of flying. It was not, however, until the discovery of the buoyancy of hot air, and later of gas, that anything practical was possible. In the interval the idea of flying had undergone a curious change. Instead of perpetuating tradition and fashioning wings like a bird, ambitious aeronauts constructed air-ships in the form of fishes. The first invention of this kind ascended in France in 1784, and flew a distance of some twelve miles. Exactly one year prior to this the famous balloonist Montgolfier, the propounder of a scheme to land troops on Gibraltar in hot-air balloons in order to wrest it from the English, made his first successful balloon ascent.

Little more than six years later an 'aeronautic fish' made its appearance in England. The object of its inventor, a Mr Assgil, of Wooler, in Northumberland, was to make it swim against the air-current in much the same manner as a fish swims against the stream. That there was something practical in the device is proved by the fact that he managed to remain in the air for nearly half-an-hour; and although at the end of that time something went wrong with the machinery, he was able to return to his starting-place.

As this was practically the first air-ship which was under the control of its conductor, the following report, taken from an old chronicle, is of more than passing interest. The writer says: 'Its interior machinery, which served the double purpose of setting the wings and sails in motion, also made it possible to alter considerably the shape of the fish. When I arrived the fish was just being filled with gas, and after everything was in readiness it rose into the air with ease. The monster animal, wriggling through the air and moving its tail with all the appearance of nature, was indeed a wonderful sight.'

Experts have found that a bottle-nosed bow and a sharp-pointed stern offer least resistance to the air, and such air-ships can therefore not only travel faster, but balance better and are consequently more reliable. For this reason most air-ships are now constructed in the shape of a huge cigar—a form first adopted by French inventors, and dating from the 9th of August 1884, exactly a quarter of a century ago. On that date the brothers Renard stayed in the air for twenty-five minutes, returning safely at the end of that time to the place from whence they started. Since then the French have done much to further the science of aeronautics, and Bleriot's crossing of the Channel in his aeroplane on 25th July excited world-wide applause.

As an earnest of the diligence with which the task is being prosecuted, it need only be mentioned that the universities of most progressive nations are founding chairs of aeronautics. In this respect Germany, where its practicability has been conclusively proved, is leading the way. Already there is a large army of professors and workers in connection with the universities and technical high-schools, and their number is being constantly increased. These men are paid for devoting their time entirely to the subject of aerial navigation and for instructing students in its theory and practice. Attached to all these institutions are suitable places for experimenting on an extensive scale; and the importance of the work being done in this way is amply proved by what Germany has already accomplished. It is to the healthy competition among these diligent workers, and to the business-like way in which they have grappled with and overcome the most disheartening difficulties, that Germany owes the great advance it has made in this regard compared with other nations.

Considering that the present type of air-ship is

[*All Rights Reserved.*]

now twenty-five years old, it must be admitted that progress has been somewhat slow. Many reasons are given for this, chief of which has been the difficulty of obtaining suitable driving-power and of inventing sufficiently light motors. Yet there is nothing so very discouraging in this, especially when we bear in mind the long and tedious process through which the steamship had to pass before it evolved into its present stage of perfection. Another point that must not be lost sight of is, that until the flights accomplished a little over a year ago public opinion was antagonistic to air-ships, and the pioneers were looked upon as being crack-brained idiots who courted death. Now that they have been able to prove that there is some method in their madness people are beginning to take them more seriously, and to encourage them with the necessary financial support, which has enabled them to make such astounding progress.

To the residents of Berlin air-ships manœuvring overhead have become an everyday sight, and any one who has watched them carrying out their evolutions over the housetops with as much ease and certainty as a ship on the sea can no longer doubt that the air-ship has come to stay, and is fast becoming a recognised institution. It requires no prophet to predict that in less than a decade people will be stepping into the car of an air-ship and travelling from place to place with as little thought as they to-day board a steamer. The former will be looked upon as being as much a part of everyday life as the latter, and will excite less wonder than did the first voyage round the world.

Already the Kaiser and a number of royal personages have travelled in air-ships, and arrangements are being completed for the inauguration of a passenger service between Hamburg in the north and Lucerne in the south. In connection with this line of air-ships, halls or stations are being built in a number of the more important towns on the Rhine lying within the line of route. It is freely mooted that Berlin and Munich will also be linked up with this system. The Hamburg-Switzerland line is to be opened next spring, and the estimated cost of the whole journey for one passenger is twenty-five pounds. Between twenty-five and thirty passengers are to be carried at a time, for whom adequate arrangements are to be made for eating and sleeping during the journey. This undertaking is being financed by the Zeppelin Air-Ship Company, whose latest scheme, in which the Kaiser is taking a great interest, is to make some air-ship explorations in the polar regions next spring. According to the official programme, numerous voyages are to be made northward from Franz-Josef Land and Spitsbergen. There are reasons for believing that this programme is somewhat misleading, and has been made public so that in the event of failure the reputation of the company may not suffer. It will be remembered that a similar course was adopted in connection with Graf Zeppelin's famous Whitsuntide tour. When he left Friedrichshaven he was officially announced to be merely making a trial trip, whereas the real intention was to reach Berlin if possible. Although the company has denied it, there cannot be the slightest doubt that the object of going into the Arctic regions is to make a dash for the North Pole. An interesting feature of this journey is that the air-ship is to travel all the way from Germany to the north, through Norway, without any assistance whatever.

It is not, however, the object of this article to deal with future plans and schemes, but with accomplished facts. In this regard it must be admitted that, as far as Germany is concerned, nearly all the work on air-ships has been done by army officers, most of them supported by the military authorities. When private individuals or companies have constructed independently, it has always been on the strict understanding that their air-ships, if successful, would be bought by the German Government. The reason for this is not far to seek. The authorities are convinced that the air-ship is destined to become a very important branch of both services, and is likely entirely to revolutionise modern warfare. A similar idea actuates the inventors themselves, for Graf Zeppelin explained that he strove 'to invent a means of travelling that will make it possible to connect naval stations with an army by the shortest possible route; which will be able to carry persons, despatches, and the like; also, for observing an enemy's fleet, and for discovering strategetical advantages in a hostile country, such as the arming of fortresses, collecting and movements of troops, such information being sent to headquarters by means of pigeon-post or signals. The only possibility for such a means of travelling is through the air.'

Ever since Montgolfier's scheme, to which reference has already been made, and Napoleon's famous plan for landing his troops in England by means of balloons, the subject has continued to make a strong appeal to military men. History records to what practical use balloons were put during the siege of Paris by the Germans in 1870-71. During those five eventful months sixty-five balloons left the besieged city, carrying in them important despatches to the French army scattered throughout the country. As nearly all of them had carrier-pigeons on board, communication was thus established between the besieged and their friends outside. Although the Germans knew this, and also that the Dictator Gambetta had managed to make good his escape by this means, they were powerless to prevent it. Their cannon-balls failed to reach the floating targets in the air, and only some four or five of the balloons fell into their hands.

Graf Zeppelin, who previously had some experience in military ballooning during the American Civil War, having made his first ascent in a captive balloon at St Paul, in Canada, was an eyewitness of these siege balloons, and was so impressed with their great possibilities in time of

war that immediately on retiring from the army he began those experiments which have made his name famous.

After practising with air-propellers for driving small boats on Lake Constance, he built his first air-ship. The initial trials were only partially successful, and had to be given up entirely in October 1900 through lack of funds. For an interval of five years nothing was heard of it until, on again making its appearance, the air-ship fouled the tug-boat used for bringing it out of its hall, resulting in serious damage, and necessitating its return to the repairing shed. On the 17th January 1906 it rose to a height of four hundred and fifty metres. Suddenly the motors stopped working, and the air-ship was driven inland, where during a storm it was almost completely wrecked.

Nothing daunted, the plucky inventor set to work again. He had received pecuniary assistance from the Government, and on 30th September a new air-ship was completed, in which he made an eight hours' journey. In the same dirigible he voyaged into Switzerland and back on the 1st July of the next year, remaining in the air twelve hours. Encouraged by this success, he set out on the 4th of the following month, with twelve passengers on board, to attempt the long-distance test required by the Government before buying his invention. Soon after the start one of the motors broke down, and after five hours a landing had to be effected to discharge ballast and five of the passengers. The defect was temporarily repaired, but the motor stopped again on the morning of the 5th. A strong wind was blowing, against which it was impossible to make progress with only one motor, necessitating a second landing. In the course of twenty-one hours a distance of six hundred and fifty kilometres had been covered. Unfortunately a violent thunderstorm arose before the motor could be put in order, and the air-ship was driven from its anchorage before the wind on to some fruit-trees. The force of the impact and the electricity generated by the friction ignited the gas collected between the inner balloons and the outer covering, causing a terrific explosion, and in a few seconds the whole structure was totally destroyed.

Disheartening as the disaster proved, ruining the patient toil of many years, it was nevertheless accompanied by good. It proved the turning-point in the fortunes of the inventor, for the sympathy of the nation went out to him, and the financial support of which he stood so much in need was immediately forthcoming. On receiving official information of what had happened, the Government telegraphed to the Graf twenty-five thousand pounds, a public subscription was opened without delay which realised over two hundred and fifty thousand pounds, and a limited company for the building of air-ships of the Zeppelin type was formed, having a capital of one hundred and fifty thousand pounds.

Out of the public funds the *Zeppelin I.* was built. While it was still making its trials the Kaiser and various members of the Imperial House went for lengthy trips, and expressed their great satisfaction at the ease with which it could be manœuvred in the air. Later it performed the journey from Lake Constance to Munich and back, and has now passed into the possession of the military authorities to do service at the fortress of Metz, under the charge of the air-ship battalion.

From the wreckage of the exploded air-ship was constructed the *Zeppelin II.*, in which the journey from Friedrichshaven to Berlin and back was undertaken. Though unfavourable weather conditions prevented the capital being reached, and an accident on landing to take in a fresh supply of benzine almost ended in disaster the career of *Zeppelin II.*, this remains the record performance up till now accomplished in any dirigible balloon. It was in the air for no less than thirty-nine hours, during which it travelled in a given direction close upon seven hundred kilometres.

Meantime *Zeppelin III.* has appeared, and promises to do better than all its predecessors, and prove a great advance in the science of aeronautics. Work in connection with other Zeppelin air-ships is so far advanced that as soon as the halls, or harbours, as they are called, are ready it will only be necessary to put the parts together. As one of the bylaws of the Zeppelin Company forbids the use of their air-ships outside of Germany, and as all air-ships are placed unreservedly at the disposal of the military authorities in the event of war, it can readily be understood that in a short time the nation will be in possession of a large air-ship fleet.

In appearance the Zeppelin air-ship resembles a huge, sharp-pointed, sixteen-cornered column, one hundred and thirty-six metres long and thirteen metres broad, floating horizontally in the air. Hollowed aluminium tubes form the ribs, which are held together by cross-beams and steel wires, so that on our looking into the interior it resembles the spokes in a cycle wheel. By this means the interior is divided into eighteen parts, each of which contains a separate gas-balloon. Hence it is possible that in warfare a bullet may enter one of the balloons, causing the gas to escape, and still not bring the air-ship down or put it out of action, since the remaining seventeen balloons would most probably remain intact. Over the whole framework is stretched a waterproof covering of specially prepared cotton-wool, having a silvery sheen and polished to offer less resistance in the air.

Underneath is a long carrier, like a ship's keel, for strengthening the structure and supporting the two aluminium cars, one fore and the other aft. Connecting these is a covered-in way, along which a little truck runs on rails for carrying the tools and implements necessary when travelling. As the weight in the truck is very considerable, it is employed as moving ballast, and plays a most important part in ascending and descending. When the truck is near to the aft cage the bow naturally

rises, and when the truck is pushed forward the bow dips, shaping the course downward.

This middle way is a special feature of the Zeppelin air-ship, and is fitted out more comfortably and luxuriously than a first-class railway carriage. It has celluloid windows at the side and in the floor, through which one may look down upon the moving panorama beneath. Both ends are closed by revolving celluloid doors against the cold wind, and the interior can be electrically heated and lighted at night. On either side are upholstered seats and collapsible dining and writing tables. Swung from the roof are hammocks in which the crew may sleep between watches.

In each car is a Daimler benzine motor of one hundred and five effective horse-power. The front motor drives two air-propellers, port and starboard of the bow, while the rear motor turns the propellers situated right and left of the stern. The steering and working, the regulating of the air-flaps, gas-valves, and distributing of the water-ballast—no sand-ballast is used—are all managed from the fore car. In it are also found the charts and compass, and a number of sensitive instruments for measuring speed, wind velocity, and such like, together with a barometer for showing automatically the varying heights at which the air-ship is travelling.

Jutting out from the bow and stern are fin-like projections for balancing and giving stability to the air-ship. Together with these are the vertical and horizontal rudders; the latter for ascending and descending, the former for steering the course. These are mounted on light frames covered with stout canvas.

This is by far the most comfortable of the three distinct types of air-ships in Germany, which are the Zeppelin, or rigid type; the Gross, or semi-rigid; and the Parsefal, or flexible. Though the first, which is the largest and most expensive, is the most popular, experts are divided in their opinions concerning its merits or advantages over the others. Experience seems to prove that each type has its own advantages, and the likelihood is that when air-ship fleets come to be composed after the manner of naval fleets all three systems will be employed; the Zeppelin being the battleships of the air, the Gross resembling cruisers, and the Parsefal resembling torpedo-boats for scouting and reconnaissance. This last is the cheapest; next to it comes the Gross, costing ten thousand pounds; while a Zeppelin amounts to seventeen thousand pounds. According to this computation, something like two hundred and fifty air-ships can be built for the price of one first-class battleship, which means that an almost limitless air-fleet could be kept up at a fraction of the present naval outlay.

The Gross air-ship is called after its inventor, the commander of the air-ship detachment of the German army. It contains four thousand five hundred cubic metres of gas, and is propelled by two motors. Under the cigar-shaped body is a light framework to which the cage is hung. This framework holds the balloon firm; hence its name—semi-rigid. The collapsible Parsefal can be transported in carts when emptied of its six thousand seven hundred cubic metres of gas. In shape it resembles a sausage, and the cage, in which ten people can be accommodated, is hung on to the balloon by broad bands. A distinct novelty of this system is the method of ascending and descending. In the bow and in the stern are small balloons which can be filled with air from the cage and emptied at will. On filling the stern balloon, that part of the body is made heavier, and in consequence the bow rises, pointing upward, in which direction the air-ship is driven by the motors. For landing, the reverse process takes place; and for balancing on high, both air-balloons are emptied.

Both the Gross and the Parsefal may be seen almost any day over Berlin, where they are stationed. They have been tested at army manœuvres, and have given the greatest satisfaction in scouting, reconnoitring, and carrying despatches. Quite recently the Gross was supplied with a special system of wireless telegraphy, by means of which it is hoped to establish constant communication with headquarters and also with other air-ships of the fleet.

At present this airship fleet consists of three Zeppelins, three Parsefals, and two Gross dirigibles. To these must be added a number of air-ships built or building by private companies. Most important among these is the monster measuring one hundred and thirty-five metres long by sixty metres wide now being built at Mannheim. Nineteen thousand cubic metres of gas will be required to fill it, and the four motors of between five hundred and six hundred horse-power are intended to drive it at a speed of fifty to sixty kilometres an hour. This air-ship is to be ready in the autumn of this year, and, according to the model, is to be a combination of all the three systems, though it will be lighter than the Zeppelin, which weighs as heavy as the sleeping-car of a corridor train.

Another air-ship promised for the autumn, of which great things are expected, is the Siemens-Schuckert, on which a staff of engineers has been employed for the last two years. It is of the Parsefal type, measuring one hundred and twenty-five metres long by thirteen metres broad, and having a gas-holding capacity of thirteen thousand cubic metres, divided between two gas-bags made of specially prepared three-ply cotton-wool. In the fore cage there are two Daimler motors of one hundred and twenty-five horse-power each, and another pair of the same strength in the aft cage. In the middle of the body is a third cage for the steering-gear and aeronautic instruments. Particular interest attaches to this dirigible, as it is expected to decide the dispute regarding the merits of the rigid and collapsible types. Experts fear the increased danger of having so much gas in one balloon, and also draw attention to the great wastage

Yet it is a remarkable fact that all inventors add to the size and gas-holding capacity of every new air-ship they build, also to its motor-power.

As has already been pointed out, it is as an instrument of war that the air-ship is regarded in Germany. All the construction going on in the country is partially financed by the Government on condition that the naval or military authorities shall have the first offer of purchasing after the initial trials.

Since its establishment in 1884, the air-ship detachment of the German army has continued to increase in importance until now it has become a recognised branch of the service, consisting of several battalions, to which large drafts of officers and men are commanded for certain fixed periods of theoretical and practical training. Hence the number of competent men is not limited to those serving at the depôts for air-ships, and a strong reserve is always at hand to man each new dirigible that passes into the possession of the authorities.

Extensive practice is carried out in dropping dynamite torpedoes on targets; photographing forts and positions of troops, and sending the films by means of pigeon-post to be developed and printed at headquarters; and in signalling by means of a number of balls hung over the side on a rod, especially employed in connection with artillery target-practice.

In this the navy also takes part. Flights are made from Heligoland and Kiel, and it is suspected that the *Parsefal I.* and *Gross I.*, both of which disappeared mysteriously from Berlin some months ago, are now used for this purpose. Naturally, the greatest secrecy is observed in all these preparations, and much of the experimental work is conducted under cover of the night; yet it is clear to all who have had occasion to study the subject even from a distance that those responsible for the services of the army and navy air-ships are doing all in their power to make them as perfect instruments of war as human invention can contrive.

VANESSA.

CHAPTER VIII.

THE next fortnight passed in a delightful manner. The marquis and the squire became great friends, and his lordship insisted on sending daily to the sanatorium a comfortably springed, low-set phaeton which his uncle, to whom he succeeded in the title, had built for his wife's convalescence after a bad hunting-accident, and which had been unused for years. In this Uncle Goodman drove daily through the Oldsborough woods, sometimes with one of us and sometimes with another, but never with Vanessa, who pretended that she must recreate in her car after the confinement of nursing, of which up to this time she had made light.

'You don't mind, godfather, do you?' she asked; and he, with an amused look in his eye, acquiesced.

He said to me when we were driving one day, 'Mary, does Vanessa ever come into these grounds in her car?'

'I don't think so, uncle.'

'I suppose she does not want to appear as if she were taking possession already, eh?'

'I think, dear, she is quite right,' I said. 'If ever she comes here it will not be in nurse's uniform.'

'No, I don't suppose it will; but something tells me that the pleasures of this lovely place admit of being enhanced to me, and to more than me,' he said dreamily.

I put my hand on his and pressed it, saying, 'It is all the place needs to make it perfect to us, isn't it?' And he smiled and nodded.

Vanessa told me that same day that when she had the car out one of her driving chains had snapped at a link and come off, and that while she and Tommy were looking ruefully at it lying like a serpent in the road, 'he'—she always called him 'he' to me now—came up on horseback, and finding out their dilemma, had sent Tommy on the horse to fetch his motorman and a new chain—fortunately both cars were fitted with Brampton chains.

'And what do you think he said to me?'

'What?'

'He said, with his own smile, "My dear Miss King, if I had the charge of you, you would not be out in your car without a spare chain in your locker."'

'And what did you reply to that?'

'I don't know,' she said quickly. 'What should I have said, miss?'

'Well,' I said laughing, 'you might have told him that you did not know yet what it was to go about always with a chain.'

'Indeed! Well, that was not what I said, so there. I will tell you what I said.'

'I thought I heard you say just this moment that you did not know what you said?'

'Mitey, don't be nasty! What I did say was, "You see I am only a woman."'

'Oh, and I know how you looked when you said it!'

'Do you? Well, I think I was really meek for once in my life. I had a feeling of being mastered.'

'And what did he say?'

'Oh, well, he didn't say anything; he looked, and I felt that our eyes spoke. And then he suddenly changed the subject, and said, "But you have some tools." And in a trice he had the locker open, and, picking out a spanner, set to work at

something underneath—I don't know what. I could not bear the silence, and I said, stooping down to look, "What is that you are working at?" And he said, "A male and female screw."

'"A what?" I asked, going down on my knees that I might see better. "A male and female screw. I suppose they call it that because sometimes they fit so close that there is no separating them, and sometimes it is difficult to get them to join at all." "Oh indeed! That is a joke, is it?" "No, indeed, it's often no joke by any means."

'I was getting nettled, and on the point of giving a sharp reply, feeling that my sex was being attacked; but Tommy arrived on the scene in *his* car, and with the motorman and the new chain, and *he* immediately began to put it on.

'"Had you not better let your man do it? You will get so dirty and tired," I said. He looked up at me, and all the banter was out of his face, and he said, "If you knew what a pleasure it is to me to do anything for you, you would let me do it." And, Mitey, I felt he meant it, and wished me to feel that he did, and I must have blushed, for as I raised myself up Tommy made a little grimace and grinned, so that I could willingly have boxed his ears.

'We were soon off again, and he insisted on coming to the gate in case the chain required any adjustment.

'"May I thank you?" I said as we parted. "Please do not," said he; "why should I be thanked for half-an-hour that has been one of the happiest I ever spent?" Mitey, that half-hour was the first I ever passed alone with him, and it was impossible to see his face and to doubt. I wonder what he saw in mine. I could not pretend. I hope he did not see more than—more than'——

'Never mind what "more than,"' I broke in. 'Your Mitey understands perfectly, and knows exactly what he saw, and that it was what he ought to have seen, and no more.'

'You are a helpful dear!' was all she said, as she passed into the squire's room.

Next day, when mother and I were in the sitting-room alone, I told of this adventure on the road, and had only done so when a waiter came in with a card on a tray. The name on it was Mrs Saxilby. When mother had read the name aloud she said, 'Show the lady up.'

While we were waiting I said, 'That is the lady whom I have dubbed "The Dame of the Fifty Crests," as the harness on her great horses is like a silversmith's window. I wonder why she is calling on us.'

'Oh, it is good-natured of her to think of it,' said mother, who always believes the best of people if she can.

We heard the *frou-frou* of heavy silks coming along the corridor, and the German waiter announced 'Misteress Saxeelbee.'

Mother and I rose, and there entered a severely bonnected, broad, and heavily cloaked person, to whom mother said, 'It is most kind of you to call,' and asked her to sit down. Whereupon she spread herself out upon the sofa like a great hen having a hatching on; but we soon found that there was more of the cockatrice about her than the baradeor fowl.

'Oh ma'am,' she said, fiddling with her reticule, 'it is, I regret to say, not a society call I am making. It is with regard to certain painful matters which have come under my observation that I desire to speak. Being the wife of the mayor here, I have a duty to do.' She hesitated and then said, 'I would prefer that we were alone,' with a gesture towards me.

I rose to leave the room, but mother said, 'No; please stay, Mary.' And then to her visitor, 'My daughter and I have no secrets from one another, and I would rather that she should remain. You cannot have come to say anything she should not hear.'

It seemed to me that mother preferred to have a witness, scenting already something unpleasantly offensive in the air.

'Very well, ma'am—very well, if you compel me to speak in the young lady's presence,' said my lady, waving her fat hands outwards and again back into her capacious lap, 'of course you must take the blame yourself.'

'I do not know what you mean by blame,' said mother very quietly. 'You had better proceed with what you came to say.'

The mayoress seemed rather disconcerted at mother's well-bred quietness of tone, and said, 'I would have preferred not to come on this mission.'

'Mission! Pardon me, but if you come from some one else I should like to know who it is before you go further.'

She looked embarrassed, and picked at the arm of the sofa with her fingers, saying, 'Oh, well, when I said "mission" I did not exactly mean—but you understand, don't you?'

'No, I am afraid I don't.'

'Well, I have come because I have a mission as the wife of the mayor to maintain the "*convenances*," as the French say, don't you know?'

'Oh, do they?' said mother, without moving a muscle. 'Pray proceed.'

'I shall perhaps surprise you?'

'I do not think you will do so more than you have done already.'

'It is about the nurse who is with your party. I do not suppose you can be aware of what is going on.'

She paused, but mother looked straight at her and said nothing. My fists clenched, but I kept still.

'It is really very difficult. I do not know how to begin.'

'I am afraid I cannot help you.'

'Are you aware that she takes out a motor-car and drives it herself?'

'Yes, I am quite aware of it.'

'Well, it is my duty to tell you that, passing along the road this morning, I saw her and a gentleman of position in this neighbourhood crouching behind the car at the side of the road, so intently occupied with one another that they did not even notice my carriage as it passed.'

I leaned forward, bursting with anger, and was about to speak, when mother with a gesture stopped me, and said, 'And, pray, is that all you wish to tell me?'

'All! I should think it is quite enough.'

'*Quite* enough.—Mary, ring the bell.'

'But, madam'——

'Excuse me, I do not desire to hear anything more.'

At this moment Stocks appeared, and mother rose and said, 'Please show this lady down.'

Her ladyship fairly gasped. 'Do you mean to turn me out?'

'I understood you had said all you had to say; and, if so, you will not wish to intrude any longer.'

Stocks discreetly went outside the door. My lady rose and raked us both with what was doubtless intended to be a withering glance, but which almost made me laugh, and she fired a parting shot: 'It is plain to me that you two are in league with this designing woman to entrap the marquis, but he shall be warned.' And she swept out of the room with an air that was intended to represent the dignity of outraged decorum as she rustled through the doorway.

Mother looked up at me, and her shoulders gave an almost imperceptible shrug. 'Mary,' she said, 'keep your own counsel about this, and leave me to deal with it. I am glad I was able to keep calm.'

'I was amazed that you could,' I replied. 'I should have liked to take her by the shoulders and push her out.'

'Yes; but that would have been coming down to her level.' And then mother gave a little laugh, and said, 'I should like very much to see the scene between her and the marquis, if it ever comes off.'

At this point we were interrupted by a visit of a very different kind. Another card was brought up, and a lady, Mrs Arthur De Burgh, was shown in. Mother was, I thought for the moment, suspicious; but a first glance was enough to show how different a person we had to deal with from the mayoress. Dear reader, has it not been your lot once at least in life to meet one of whom it would be flattery to say that she had one good feature from the beauty-show point of view, and yet the face with its glowing, healthy complexion, and its eager, honest eyes, had an irresistible attraction, every glance and flickering dimple speaking for the cheerful, kindly, glad soul within, capable of only one selfishness—the personal greed of making others happy? Such was neat, sweet, dainty Mrs De Burgh. It was like a sudden glow of sunshine after the dirty cloudiness of the other visit. And with her came a picture of a child some ten years old, which reflected all the mother's sweet charm from a face of real beauty. It was impossible not to be at ease from the first. Frank, hearty conversation made itself at once, and the little one slid into the arm that mother held out to her, and stood beside mother's knee; and Mrs De Burgh, instead of the usual stupid 'Don't bother, Mrs Bellair, dear,' said, smiling, 'I see you like children;' to which mother only replied by pressing the little one closer and kissing her, to her mamma's evident pleasure.

'And now,' said she, with an eager look, 'I must tell you really what I have come about. Our Automobile Club in this Riding is organising a fête, and Lord Oldsborough has kindly given us the use of his grounds. We have noticed that your party has a car here, and the ladies' committee have asked me—I am secretary—to invite you to join us. I thought it would be less stiff if instead of sending a formal note I came to see you first, and your kind reception of me shows that I was right.'

'Kind!' said mother; 'it is you that are kind. But the car does not belong to me; it belongs to our friend.'

'Oh, does it? That is the lady we see in nurse's dress. Of course any one can see that she is a lady.'

Mother told her how Vanessa had gone through a hospital course for the love of it, and that her godfather had had a bad accident, and she, desiring to attend him, had, on the doctor insisting on having a trained nurse, overwhelmed his objections by exhibiting her first-class certificate.

'I certainly think, if I may say so,' said Mrs De Burgh, 'that the very sight of her must be much to a patient. She is delightful to look upon. Then, may I ask, is she a friend of yours?' And seeing eager assent in our faces, she added, 'I should like much if you would introduce me to her.'

'With great pleasure,' said mother; and, leaving the room, she returned almost immediately, followed by Vanessa, whom she introduced with a smile as Nurse Vanessa, adding, 'When she is at home we call her Miss King.'

Mrs De Burgh and she were on happy terms at once, and we all discussed the coming fête. It was to include a decorated car and costume procession down a splendid green avenue in the Oldsborough grounds, weather permitting; and if not, then in the great riding-school that the former marquis had built for his regiment of Yeomanry. When I heard this, it recalled to me at once how I had seen *him* lost to his surroundings as he gazed at my Britannia in the conservatory at home, and I registered a secret vow that he should see the living Britannia on the day of the fête. I said nothing at the moment, but I had it all planned out as mother and Mrs De Burgh and Vanessa chatted pleasantly by themselves, while I went to the writing-table and made out a telegram to my faithful Lily, bidding her strip my lay-figure of helmet and cuirass and robes, and send them with the trident and shield by the first possible train.

(*To be continued.*)

PRODUCTS OF KASHMIR.

PART II.

CARPETS.

PERHAPS the industry which is likely to become one of the most important of all in Kashmir is carpet-making. Pile carpets have been manufactured in Kashmir for several centuries, being made both in Persia and Kashmir from the same wool of which the shawls are made. Many of them are of quaint and some of very beautiful design. The former often represent mosques, wild animals, fish, &c.; some, again, depict the chase, where a tiger such as never breathed on earth is being hunted by beings apparently from the nether world, and is swallowing a whole stag, *en passant*, as he flies through the jungle, a cobra hanging on to his tail, whilst a parrot with outstretched wings and open beak appears to be shrieking overhead. The colours, however, are exquisite, so softly blended, so delicate yet brilliant, that it is a real joy to possess one. There are amongst the really beautiful old carpets many the groundwork of which runs through the gamut of the warm shades of purples, madders, and crimsons. On this underground is, again, tracery in slightly lighter shades, the main design being pine-cones, pine-apples, or the conventional rendering of the lotus flower in bud. Sometimes the zingara-nut—a water-nut which constitutes the food of a vast majority of the poorer classes during one part of the year—forms the leading design.

Dr Mitra, the curator of the museum in Srinagar, says: 'The carpets of Kashmir, however, soon deteriorated. Twenty years ago no decent carpet was made in Kashmir; the modern craze for cheapness spoiled this as other works of art. The quality of the material was not equal to that of the past, the workmen lost the large conception of their ancestors, the patterns lacked repose, and there was not the time nor the inclination to produce the bold and highly conventional design on a ground of extreme closeness of stitch. But the greatest evil was wrought by the importation of aniline dyes. In place of the cool harmony of colour, bright magenta appeared. The old Persian test of dropping a piece of live charcoal on to the pile to see if any traces of the injury remained after brushing away the singed top is one we should hesitate to apply to a modern carpet.'

Sir George Birdwood, writing in 1880, said: 'As a striking illustration of the corruption of native designs under European influence, it is only necessary to compare the two old Cashmere carpets lent to the Indian Museum by Mr Vincent Robinson with the large Cashmere Durbar-carpet exhibited by him at Paris in 1878. The two former carpets were probably made early in the last century. The ground in one is pale yellow, and in the other rose of varying shades, and the floral pattern decorating it is in half-tones of a variety of colours. The borders are weak, as in all Cashmere carpets, not being sufficiently distinguished from the centre; but the colouring and general effect are so serene and pleasing that this does not really appear as a defect. The Cashmere Durbar-carpet exhibited by Mr Vincent Robinson at Paris was a typical illustration of the modern manufacture of Srinagar. The large scroll laid about its borders in such agonised contortions had evidently been copied from the shawl-patterns introduced by the French houses into Cashmere about ten years ago. The wool of these modern Srinagar carpets is good, and the texture of the carpets themselves is not bad, but it is hardly possible that they can ever again be made to satisfy a critical taste. The colours introduced are not suited for the floor of a room, particularly the green, even if they were harmoniously blended. The floor of a furnished room, in which the great need is to see the furniture distinctly, can scarcely be too grave in tone, and it is evident that the Cashmere dyes are fitted only for shawls and portières and tapestries for walls, where it is a pleasure to the eye to be attracted by lively colour.'

This criticism was passed nearly thirty years ago; but I take the liberty of entirely disagreeing with Sir George Birdwood when he says 'it is hardly possible that they can ever again be made to satisfy a critical taste.' Because a bad influence is brought to bear on a naturally artistic people, because their very existence compels them to meet the demands of execrable taste, that does not mean that the soul panting to give forth only the beautiful will not immediately blossom into rich being so soon as the undue pressure and influences are removed. Such has been the case in the present instance. Since the time of which Sir G. Birdwood writes a great impetus has been given to carpet-making, and some very beautiful carpets have been produced, the colours used being vegetable dyes only, and silk and *pusm* being freely introduced to carry out both design and colouring, just as the Persian weavers used to give their carpets the beautiful density and pliancy so much admired.

The Ardabil carpet in the Victoria and Albert Museum has been recently reproduced in exquisite finish of workmanship. Herati carpets have also been produced, and the old designs of the Tree of Life, the Swastica, and the Trisula.

A magnificent carpet made in Kashmir two hundred and fifty years ago was sent from Bijapore

to the Delhi Exhibition, and made many of the workmen from Kashmir who visited the Exhibition realise how great had been the backward step Kashmir had taken in the last half-century. Even in the last three years the extraordinary progress made alike in design and colour is very remarkable; but it is because the higher class of manufacturers are refusing absolutely to look at so-called 'art' designs, and are seeking from Mother Nature only their inspiration.

The celebrated Ardabil carpet, so named from a Persian town in Azerbaijan, is thus described: 'The main design comprises a large central medallion in pale yellow, surrounded by cartouches of various colours disposed on a dark-blue ground, diapered with floral tracery. Each of the corners is filled with a section of a large medallion surrounded by cartouches. The border is composed of long and circular panels alternating with lobel outlines on a brown ground covered with floral embellishments, while at the summit of the carpet is a panel bearing a devout inscription tending to the inference that the carpet was originally used as a veil or curtain for a porch, and that it was the work of the slave "of the Holy Place, Maksoud of Kashan, in the year of Hegira 946," corresponding with A.D. 1540. Now, Kashan, on the high-road between Teheran and Ispahan, was founded by Zobeide, the favourite wife of the Caliph Haroun-al-Raschid. It has been destroyed once or twice by earthquakes, but it is at present a flourishing town, adorned by a palace for the Shah, many large and beautiful mosques, and a number of caravansaries and public baths. At Kashan many manufactories of carpets, shawls, brocades, and silk fabrics are still carried on; but in 1540, when Maksoud, the slave "of the Holy Place," executed this marvellous work, admirable alike for its fineness of texture, its beauty of colour, and symmetry of design, Kashan, with the rest of Persia, was under the sway of the Sophi dynasty, and the town is alleged to have contained no fewer than one hundred and fifty thousand inhabitants.'

There is small doubt that the manufacture of carpets has a very great future before it, but it must be conducted by people of taste and knowledge. Dr Mitra tells us the State would greatly help in this if a really prohibitive duty were imposed on the importation of aniline dyes. The present ruler, Maharajah Pratap Singh, is most anxious to raise in every way the industries of this beautiful land and artistic people; but he is unwilling to help the production of work which will throw discredit on the earlier and most beautiful products of his country, and very justly so. Large quantities of hideous and common carpets are made by the smaller manufacturers in the city, in which the aniline dyes only are used. These carpets find a ready sale in India, where, going by the name of Kashmir carpets, they throw discredit on the really lovely work of the country. To give a faint idea of the mischief done to this great and beautiful industry by the aniline dyes, I may mention the following statistics. The import of dyeing materials into Kashmir in one year was: Indigo, fourteen maunds, or one thousand one hundred and twenty pounds, value one thousand one hundred and eighty-six rupees; madder, eight maunds, or six hundred and forty pounds, value four hundred and twenty-one rupees; other kinds, chiefly aniline dyes, one thousand three hundred and thirty-nine maunds, or one hundred and ten thousand five hundred and ten pounds, value twenty-one thousand eight hundred and twenty-six rupees. These figures, alas! speak too plainly to be disregarded.

METAL-WORK AND PAPIER-MÂCHÉ IN KASHMIR.

To the traveller, perhaps one of the most attractive industries of Kashmir is the metal-work, in which Kashmiris excel; but here again the European visitors have done all in their power to ruin the true art of the country; they will send to England or Calcutta for an illustrated list from some jeweller, and hand this over, ordering a Queen Anne tea-service, a James the Second milk-jug, or a Georgian claret-jug, utterly regardless of the result of asking such things from a native silversmith. What is the result? Mr Jones likes the plain, solid shape of the Queen Anne. Mr Smith does not, and thinks he will improve upon it according to his fancy; so he orders the Queen Anne shape, with its fluted lower portion, and a marvellous design of shawl-pattern all over the upper portion, leaving a lozenge or diamond for an elaborate crest. This monstrosity is produced, and much admired by Mr Smith's equally inartistic friends, with the result that Suffia Joo walks off with a preternaturally grave expression, which expands into a broad grin as he meets his comrades; and ten days afterwards he reappears with twelve or fourteen of these abortions of Smith sahib's brain, which he holds up for approbation, telling you, 'Latest fashion, mem sahib; very fine teapot him. Esmit sahib's pattern.' If you have any artistic perception you mentally consign 'Esmit sahib' to the nethermost depths of the sea!

The shapes of the old Kashmir silver things are really very beautiful, graceful, delicate, and light; and the pattern, which consists of fine tracery and engraving, is done in many designs, such as shawl, double-shawl, Bokhara, Kashgar, &c. All these designs are strikingly different, but equally all spring from some form, curve, flower, or leaf in nature. The art is said to have been imported into Kashmir by the Moguls; but here again the natural taste of the people has shown itself in the elaboration and adaptation of nature to conventional design, keeping in almost everything to the beautiful curves and lines one sees around. The lotus vases and candlesticks, taking their shapes from the flower, their stems from the long, curving stem of the lotus, and their stands being represented by the large, flat, undulating leaf, are most attractive. There are

other very beautiful and quaint shapes, such as the Bokhara vase, the Kangri, the Zarkand vase, Lhassa bowls, and the Aftaba—all absolutely Oriental and certainly quite unlike anything one sees anywhere else.

Engraving on copper is also done, but as the metal tarnishes very quickly it is not satisfactory.

Another form of metal-work is wonderfully attractive. It is said to be Turkoman, introduced into Kashmir. Deep engraving is made on copper, of any design the worker chooses. On this tin is then soldered, and all the interstices filled in with a sort of black lac. This makes a dark background, from which the design stands out almost like silver. The natives constantly use samovars of this work for their tea. It is very pretty and effective, but the tin soon loses its brightness and is difficult to clean. Specimens taken to England have been tinned, but the delicacy of outline is lost, as the retinning sometimes runs into the lac.

Enamelling on silver, brass, and copper is done, and for large articles is very effective; but it will not stand comparison with the exquisite enamels of European manufacture.

One other kind of work deserves mention as being quaint and in some instances rather effective—namely, lacquer-work on brass and copper. The designs are nothing to speak of, but the laying on of the lacquer in red, black, and green on the glowing colour of copper is very taking and satisfying.

The cleaning of all these forms of metal-work is most interesting. The native makes a stew of dried wild apricots. When the fruit is reduced to a pulp the articles are thrown in, stirred about for a moment or two, then scrubbed with brass-wire brushes, plunged into fresh-water, and dried by artificial heat.

In reference to the silver-work, Dr Mitra has again tried very hard to make these people understand how foolish they are in their penny-wise and pound-foolish mode of conducting business. All his efforts to introduce the silver and metal work of Kashmir to the general public have been frustrated by their hopeless dishonesty. The alloy in the silver sometimes amounts to as much as 50 per cent., with the result that his efforts to introduce the work to European firms failed. He says that it will be absolutely necessary to protect all honest work by a system of hall-marking, and the honest workers are most anxious that this should be done.

The papier-mâché work of Kashmir was at one time in great demand, and some of the old specimens to be seen are very beautiful. In the thirties and forties, when the shawls of Kashmir were in special demand in Europe, they used to be sent over packed, each shawl separately, in large, shallow papier-mâché boxes. It is very interesting to see the papier-mâché made. The paper, reduced to pulp and in an absolutely sodden condition, is laid layer on layer in a mould of the desired shape. When sufficiently dry to be removed from this mould it is covered with glue, and one fold of muslin laid over the whole surface, outside and inside. This again receives another coat of glue, and when dry is ready for painting. Now comes a coating of the ground-tone of the design, which may be anything brown, red, blue, gold, &c. When this is quite dry the work of the decorator comes in, the patterns being drawn with very fine brushes in water-colour. Some of the effects are very charming, one especially where the ground-tone is a beautiful shade of ultramarine, the pattern being in gold outlined with a hairline of lake or deep crimson. The result is most rich and subdued, and almost gives the impression of metal. When the colours have all been laid on and are quite dry, the whole is varnished with a thin wash of copal varnish dissolved in turpentine. Some of the specimens of this work that one occasionally sees are wonderful in their richness of tone and colour, as, for instance, an old circular box about sixteen inches long, and one and a half inches in diameter, used to contain a petition for presentation to one in authority. The petition-paper inside is a long scroll very much resembling parchment in appearance, but really only paper, decorated at the top for about five inches in depth in the same style, and the rest of the scroll covered with a lovely floral design in gold, on which the petition used to be written in ink. Koran covers also were made in this work, as well as bowls for holding dry stores of various sorts.

Dr Mitra says there exists in the family of Pundit Vashkak a copy of the *Bhagavat Gita*, written in a beautiful hand, every page ornamented with different designs, and copiously illustrated by pictures most beautifully painted. He says the work is priceless. From his description, one is led to believe it must be very like some of the ancient illuminated missals to be seen in the British Museum.

THE BLACK FLAG.

THE STORY OF AN ESCAPE FROM PORTLAND PRISON.

By F. C. V. Harcourt.

CHAPTER I.

THE black flag was floating from the highest point on Portland Island. The prison was in a state of frenzied excitement; gangs were being hurriedly marched into the safe seclusion of the cells; warders were rushing from one landing to another, double-locking the iron doors preparatory to starting out in a body to engage in a 'man-hunt.' The fishermen and hunkersliders on the Chesil Bank were all alive with excitement and speculation. The signal-gun had boomed out the intelligence far and near that a convict had escaped, and the black flag told them he was still at large.

Fierce and fiery, the sun was sinking into the dense cloudbank that seemed to rest on the distant sealine. Cold and keen as the edge of a scimitar, the north wind swept over the white-crested waves, as in savage merriment they chased each other shoreward till they broke with a muffled roar on the shingled strand. In another hour darkness would come to the fugitive's assistance, and the work of recapture be rendered tenfold more difficult.

So the whole island was busy as a beehive, for, except in the case of a wreck, the Portlander enjoys nothing better than a 'man-hunt;' and the reward of five pounds given for the recapture of a runaway convict is sufficient inducement to make almost every man, woman, and child on the rock turn out to take part in the chase.

The fiat had gone forth from the Governor's office that Dick Darrell, known on the prison register as Convict 31, was to be recaptured and brought back to the prison alive or dead; if dead, so much the better—a dangerous character would have ceased from troubling, the Governor's mind would be at rest, and a stormy career would end with a coroner's inquest.

Dick Darrell was in Warder Gunter's gang, and Warder Gunter was as choice a specimen of official ruffianism as the convict service could produce; and its capacity for changing men, whether officials or offenders, into something lower and more savage than brutes is truly marvellous. For downright ferocity of disposition and a keen relish for human suffering it would have been hard to find Gunter's equal anywhere or in anything wearing the outward semblance of humanity. His personal appearance was in exact conformity with his mental and moral configuration, combining the chief characteristics of the head-hunting Dyak of Borneo with the hideous facial peculiarities of an Andaman Islander.

It may well be imagined, therefore, that under such a man Darrell's life was scarcely one of Eden-like happiness or unbroken peace of mind. To him Warder Gunter was a very fiend incarnate; and to the warder, Darrell was the embodiment of all that nature held in the shape of evil.

On the afternoon in question Warder Gunter's conduct had produced an effect upon the tempers of his men similar to that occasioned by a swarm of mosquitoes on a naked body. He had exhausted his whole vocabulary of vituperation, compiled and completed as it had been in the academic seclusion of a barrack-room. He had worried and bullied his miserable victims till he had thoroughly tired himself out, and, unable to swear and swagger any longer, stood in scowling silence waiting for the prison bell to ring out its welcome relief alike to tyrant and to slave.

The last huge block of stone was being hoisted out of the quarries for the night, when suddenly it slipped out of its slings and came thundering down into the workings, as if it resented being torn from its parent bed where it had lain through the long slumber of untold ages. There was heard the crash of splintered rock as it bounded from one level to another, a warning shout from many voices, and then a stifled scream, followed by a silence, which, though only momentary, seemed to press upon the heart with the weight of centuries. The stone had reached the bottom of the quarry, but under it lay the mangled and unrecognisable remains of what a few seconds before had been a living, suffering, sin-defaced image of the Creator.

For a few moments after the accident all was hurry and excitement; for even to minds hardened by brutal treatment and degrading associations, even to hearts habituated to the daily exercise of severity, the swift and sudden blotting out of a human life must seem appalling. It startled even Warder Gunter, and he peered nervously over the edge of the quarry to swear some direction to the convicts below. That momentary relaxation of vigilance, however, was just the chance for which Dick Darrell had been waiting. Dropping his pick-axe and stooping down, he ran along the whole length of a line of roughly squared stones which concealed him from observation, and was a good two hundred yards away before Gunter noticed his flight. In an instant the rifle which he carried was at his shoulder, and rock and ravine echoed to its sharp report. The bullet struck a boulder not a yard distant from the fugitive, who, regardless of danger, continued his headlong flight, dashing over the uneven ground like a hunted wolf. Another bullet followed, but again wide of the mark. Finding it impossible to stop the runaway, Gunter was forced to give the alarm and collect his men together, till assistance arrived from other gangs, and they were marched inside the prison, leaving their dead com-

rade sleeping under his rocky tomb, and their still living one to enjoy the exhilaration of being hunted down as though he were a man-eating tiger.

Soon the signal-gun boomed abroad the intelligence; the black flag, its frayed edges looking like the fringe on a funeral pall, fluttered forth the news; and then sick and maimed, and those whose business prevented them from joining in the hunt, waited in eager anticipation for the result, anxious to know who would be the lucky individual to earn the coveted five pounds.

But the sun sank in the west, and from out the east the friendly darkness came with swift and silent footsteps to aid the fugitive. Half a mile away from the quarry a beetling crag overhung the sea, which chafed and fretted at its base two hundred feet below. Towards the edge of this precipice the desperate man directed his course, the pursuit losing sight of him owing to the inequalities of the ground. When they reached as near to the edge of the cliff as they deemed it prudent to venture, their quarry had disappeared, only his cap and jacket being found where he had thrown them before making his terrible leap. No one was so madly daring as to follow him, for death alone could be the result of such an act, and that prisoner '31' was dead and done for no one for a momont doubted. So, dispirited and disappointed, the search-party returned to the prison to report the death of the runaway.

But Dick Darrell was not dead; in fact, it had never entered into even his reckless, hope-forsaken heart to attempt so desperate a feat as to leap over a cliff two hundred feet high on a mere chance of striking the water alive, and then seeking safety by swimming. The fact was that, unknown to the prison officials, Dick Darrell was well acquainted with that part of the island. He had been a sailor, and years before had served on the guardship stationed in the bay.

On one occasion, when he and some of his companions were ashore on leave, in a freak of half-drunken bravado he had attempted to scale the face of that identical cliff. Up its jagged and perpendicular front he had mounted till within twenty feet of the top, when farther progress was rendered impossible by the gnarled and twisted branches of an old thorn-tree that had taken root in a crevice of the limestone rock to which it hung, and had extended its tough, elastic branches in a tangled and matted growth eight or ten feet out from the face of the cliff. This had formed an insuperable barrier to the daring climber, but it had also saved his life; for, when exhausted with his efforts, and unable to return, it was amongst its friendly branches that he found rest and shelter. He had remained there, suspended between sea and sky, until his comrades, by means of a rope let down to him from above, rescued him from his perilous position. In the handshaking that ensued the rope was forgotten, and having been allowed to dangle at the edge of the cliff, it gradually slipped over and lodged upon the branches of the tree.

'31's' plan, though desperate, was not altogether a hopeless one; only, the hope was so faint and intangible that none but a despairing wretch, wearied with the burden of a barren existence, could see in it a reason for attempting a feat almost unparalleled in the annals of human daring.

Making for a point a few yards above the well-remembered spot, he hastily divested himself of cap and jacket, which he threw on the ground. Then, running along the very edge of the precipice, he paused and peered over into the fearful void beyond. Sheer down twenty feet below him, his view was intercepted by the projecting, but now leafless, branches of the still hardy and stubborn bush. With beating heart and nerves strung almost to the tension of madness, he closed his eyes, stepped forward out on to nothing—out into space!

In one brief second of time he seemed to have traversed a distance equal to that which separates the earth from the stars. Then came a crash, a sudden upheaval as if from a score of earthquakes, and his downward course was arrested. There was a motion of swaying up and down in the cold evening air, a motion which gradually subsided, till it seemed like the gentle undulation one experiences in a boat out on a calm sea. He was clutching something with both hands, clutching it tenaciously for dear life, as a drowning man clutches at the floating spar when the ship has gone down under him and he is alone amidst the waters, with death tugging at him from below. His senses came slowly back to him. He was in a perpendicular position, supported under both arms by a sinewy branch; in fact, he had fallen plumb between the fork of the two strongest boughs which sprang from the parent stem.

His weight and the impetus of his descent had strained the sturdy old plant almost to breaking-point, but it had driven its powerful tendons into every crevice and cranny where it could find or make an opening; and though scarcely noticed from beneath, and never seen from above owing to the danger of approaching so near the edge of the cliff, it really formed a sort of fibrous platform quite capable of supporting the weight of a man.

Here, all the livelong night, half-frozen by the biting wind, afraid almost to move for fear of losing the support of the friendly branches, the escaped criminal waited and watched for the return of that blessed light which, only a few hours before, he had prayed might fade quickly out so that darkness with her dusky mantle should cover his almost hopeless flight. Fortunately for him, the wind veered round a few points to the west, and he was sheltered from its icy attentions by a rock which jutted out to his right. At last darkness slowly melted into dawn, and soft wavelets of amber light came slowly rippling up the sky.

Stiff with cold as well as from his cramped position, which he had been compelled to maintain through so many long hours, and almost famished from hunger, '31' began to survey his airy position

and wonder how he was going to extricate himself from it. By gradually working himself nearer to the face of the cliff he was able to plant his foot on a narrow ledge of rock immediately below him. This relieved the pressure on his arms and set them free for use. The opportunity for exercising them soon occurred, for presently a large gannet, quite oblivious to the close proximity of a human being, came and perched itself on one of the branches within reach of the convict's hand. To seize it, drag it to him, and wring its neck was the work of an instant; and Dick breakfasted on the raw flesh with as much gusto as if he were eating a trussed turkey.

Strengthened and refreshed by his meal, his next concern was how to reach the foot of the cliff without breaking his neck. As the morning advanced he saw one of the harbour-boats approaching from the side of the breakwater. It was full of warders, and he knew they were in quest of his dead body, which they doubtless expected to find on the narrow strip of beach at the foot of the cliff—for it was not low-water—or amongst the rocks farther out to sea. They searched carefully everywhere, but of course without success. About four hundred yards from the shore lay the hull of an old wreck long since stranded. This also was carefully but unavailingly scrutinised; and an hour later Dick saw the boat round the point towards the harbour and disappear from view, the warders fully impressed with the conviction that '31' had at last gone where the wicked cease from troubling.

Then began the consideration of the all-important problem: how and by what means was that terrible descent to be effected? And what was to be done afterwards, supposing the bottom of the cliff could be reached without a broken neck or some less fatal injury? The tide was on the turn, and a few hours later it would make a difference of at least twenty or twenty-five feet. He looked down, and, steady as his head was, it grew dizzy as his eye measured the distance between the two points. As he turned his gaze away to prevent himself from yielding to the awful impulse of springing out into empty space, his astonished glance rested on an object that made his heart give one sudden bound and almost caught away his breath. There, within reach of his grasp, and resting between the thick and interlaced branches of the old thorn-tree, was the identical rope which years before had been let down to rescue him from a similarly dangerous position. Yes, there it was, looped and twisted and lying in a bundle like a coiled snake, wet and weather-stained, but to all appearance with every strand as strong as when his nervous fingers grasped it eight years ago.

Praying was not much in '31's' line, but at the sight of this unlooked-for aid a rough but fervent 'Thank God!' escaped his lips; and for the first time, perhaps, in his life, he felt his heart swell with a throb of true gratitude to Divine Providence.

Bending forward, with one hand outstretched and the other clinging for dear life to the swaying branch, he drew the rope towards him. Then, having secured the end and fastened it near him, he slightly shifted his position so as to get both legs twined round the largest branch, and, with both hands at liberty, managed to test its strength in places where he thought it showed signs of weakness. The hemp, however, was good, and the dressing of Stockholm tar it had originally received in the Navy Dockyard had preserved it from time and weather. It was a good thirty feet in length, and would bring him at high-tide within forty or fifty feet of the water. And then? He shut his eyes, and tried to think what lay beyond that terrible 'then.' He was a splendid swimmer. But if, after his fifty-foot plunge, he succeeded in coming to the surface, and if his strength and skill enabled him to battle with the fierce currents that swept round the island, and which might easily carry him into the seething vortex of the terrible 'Portland Race,' where he would be sucked down by the treacherous under-current, only to be cast up with the next tide on the Chesil Bank, a naked, battered, unrecognised corpse—yes, if he escaped all these dangers, seen and unseen, and succeeded, spent and exhausted, in reaching the shore of the mainland, what then?

Wretched, hopeless, fraught with deadly peril as his present position was, it was a very heaven compared to the hell from which he had but lately escaped. The cold wind kissed his dirt and blood begrimed cheek with no unkindly touch; the scream of the startled sea-mew as it circled round him was music in comparison with the harsh voices of the prison warders; the very death that might await him at the foot of that beetling crag seemed sweet contrasted with the prison infirmary, its soul-depressing silence, and its rigid, lifeless routine.

He watched the rising tide as it slowly obliterated the strip of glistening shingle at the foot of the cliff. Slowly it crept up, lapping round the black hull of the battered old wreck, and leaping over her torn and riven sides in playful glee. The sun shone high in the cold but cloudless heavens, and its rays imparted some warmth to his chilled and emaciated frame. A slight breeze had by this time sprung up and broke the surface of the ocean into crisp, white-crested wavelets.

Suddenly a loose plank that had for some time been swaying up and down in the rise and fall of the sea became detached from the hulk's side, and came floating shorewards to the very foot of the cliff. The incident was not much in itself; but to the escaped convict it came fraught with all the possibilities of hope, of freedom, of life. From his airy conning-tower he could see other planks in the old hull that a slight additional force would wrench away. With three such shreds of timber he could construct a raft on which he would not fear to entrust himself to the mercy of the waves. If he could only reach the wreck quickly, by the time darkness set in his raft could be ready and, with the ebbing tide, would be well out to sea, where he

might stand a good chance of being picked up by some passing vessel.

He could see some frayed and tattered cordage flapping loosely over the side of the old hulk, and a closer inspection of his position showed him that right below him was a rough ledge sloping downward on one side till it reached another ledge not more than fifteen feet above the water. That position must be gained at any risk, though a slip might easily precipitate him on to those jagged spikes of rock, whose sharp points barely showed above the fast-encroaching waters.

Seizing the rope, he rapidly untwisted one of the strands about twelve feet, making a rough but secure splice; then took soundings, and discovered, to his joy, that should the separated strand only bear his weight his feet would just rest on the ledge below. Fastening the strongest end of the rope round the largest branch of his 'nest,' he took a rapid survey of his position; and, seeing everything favourable for his attempt, with a half-muttered prayer—the first he had uttered since he knelt at his mother's knee—he swung himself out into space. The old tree bent and swayed and creaked as he hung over that awful abyss, and the boom of the waves below came up to him like the sound of a muffled dirge.

Swiftly the desperate man slid down the straining cord till he reached the place where he had effected the splice, and there he realised the danger of his descent was about to begin. Should the slenderer length give way, he knew what his fate must be. Closing his eyes, as if to shut out the peril that was only too apparent, he reluctantly trusted himself to these few fragile threads, and glided through what to his overwrought imagination seemed immeasurable depths, till at last his feet came into contact with some resisting substance. He opened his eyes and looked down. Thank God, he was safe for the present at least! He stood on the rocky pinnacle of that sloping ledge, and there beneath him, almost within reach of his grasp, bobbed and butted against its base the plank which he had seen severed from the vessel's side.

A moment's breathing-time to steady his nerves and to think, and '31' was in the water clinging to that floating plank with the strength of a newborn hope. The tide was coming fast, and the coast-current swept him gradually in a direction that brought him nearer to the old hulk. At last he managed to reach her battered side, and by the aid of some cordage soon mounted to her deck.

It was no easy matter to retain a footing, for every now and then a wave would break over her, sweeping her from stem to stern. Just abaft the main hatchway was a great gap where the deck had been torn up by the compressed air in her hold after she had struck, and a number of loose planks were at once detached by the convict and formed into a rudely constructed raft.

Fortunately he discovered an old axe jammed between the deck and the broken stump of the bowsprit, with which he was able to cut asunder some of the tattered halyards, and with them to fasten the various parts of his raft together. By the time this work was accomplished hunger and exhaustion began to tell upon him, and the cold and salt water to benumb and excoriate his limbs. Still, he worked on for dear life, and a kind Providence rewarded his efforts. He managed to penetrate into the forecastle of the ship, and here, on a shelf over one of the seamen's bunks, he found a bottle half-full of Hollands gin, a piece of pigtail tobacco, and a ship's biscuit. These articles were a veritable treasure-trove, and for a brief moment he enjoyed a faint glimpse of the sensualist's heaven. The weevily biscuit allayed the fierce hunger-pain that was gnawing at his vitals; while the genial spirit warmed his frozen limbs, imparted fresh energy to his sinking heart, and made him forget for a brief period that he was a fugitive criminal, and that in a few hours he might be lying either in the dark and silent cell of the neighbouring prison or at the bottom of the dark and silent sea.

So the hours passed slowly but not unpleasantly along till the sun sank low in the west, and the strange, sobbing sound of the waves as they coursed and swirled and eddied round the old hulk told that the tide had turned. Reluctantly—as a fond woman leaves the man she loves—the receding waters left the shore, and on their briny breast rocked that fragile raft to which the convict had securely lashed himself, away from the side of the old ark in which he had found shelter, away from the land, away from the prison with its clanking chains—out into the measureless ocean, God only knows where!

The sun went down and the wind arose, and the babble of the billows all around him sounded like strange spirit-voices, telling of mysteries about which his rude, untutored soul had never before dreamed. The darkness came on, and the stars one by one came out, gazing down upon him like angel eyes full of pity and of love—alone upon the waters with Nature and Death and God all around, beneath and above him!

It is in such circumstances that the soul has the fact of its immortality forced in upon it with awful certainty. It is at such moments that we become aware of the dawn of a new light, the birth of a fresh power, a subtle something rising within us—a something with which baffled reason vainly strives to grapple, but which eludes her futile grasp and mocks at all her efforts to comprehend.

So it was with poor '31' during the terrible hours that he passed after casting off from the side of the old wreck. What penal servitude could not accomplish, what the prison warder and the prison chaplain had failed to achieve, solitude and the perils of his lonely position, speaking as God's interpreters, told him of: a love so great that it could save him even in the hour of his extremest

need. He was at the mercy of the waves, but he looked to Him who can rule the storm and who holds the waters in the hollow of His hands so to direct their course that they might drift him at last to freedom. And the raft sped away out to sea on the roughening breast of the ebbing tide, and the low muttering of the distant storm-fiend boomed along the labouring deep, and the stars were blotted out as the 'night-rack came rolling up ragged and brown' out of the north-east.

Now and again, as the raft rose on the crest of a wave, he could see the beam from the breakwater lighthouse flashing its welcome rays far over the waters. Now and then, too, he fancied he could perceive the twinkling light from the masthead of some passing vessel, and his hopes would rise at the thought that if he could only hold on till daylight some outward-bounder would be sure to cross his track and come to his rescue.

The wind, however, was rising fast, and the sea becoming more rough and choppy. The four or five planks which stood between him and death could scarcely keep together if the weather freshened into a gale. It was, moreover, intensely cold. His limbs were becoming numbed and his senses paralysed. Would the blessed daylight never break?

Little by little the torpor which is the precursor of death stole over him, and his weakened brain played strange, fantastic tricks. At times he would fancy himself a child again, romping about in cowslip-spangled fields or listening to the babble of running streams. Anon he would be sitting in the back-pew of the dear old parish church beside his mother, listening to the organ pealing forth its sacred harmonies or joining in the responses. A smile would flicker like the shimmer of summer lightning over the ghastly face, and the cracked lips would murmur the name of some long-ago dead and buried comrade. Then the smile died away; the voice was no longer audible; the raft rolled and tossed and tumbled on the rising waves. But it was all the same to 'Convict 31.' The dark angel was flapping his raven wings above, and the moaning waters seemed chanting a funeral dirge around; but he saw nothing, heard nothing, felt nothing.

(To be continued.)

A WHITE WOMAN IN WEST AFRICA.

By MARY GAUNT, Author of *Fools Rush in*, &c.

A WHITE woman feels rather a valuable commodity in West Africa, and, like many valuable commodities, she is also something of a care. The menfolk feel responsible for her. She must not be left alone. If she travels, some one in authority must go with her; if it is by train, a white man must travel in that train—she must not be at the mercy of a black driver and guard; if she goes by boat, all endeavours are made to make that boat as comfortable as possible.

But Africa holds out no lures to a woman. The very landing is a difficulty. My remembrance all along three thousand miles of coastline is of struggles to get off the ship into a surf-boat, to get from the surf-boat to the shore. Sometimes the sky wept passionate tears as if it would never stop, and sometimes the sun blazed down so that the glare from the water smote you in the eyes, and in any case an umbrella seemed a necessity. But how get down an accommodation-ladder into a surf-boat at least five feet deep with an umbrella up? I gave up the umbrella generally, and hoped to keep my skirts clear of the dirty water that invariably, wet or fine, was in the bottom of the boat. Even that was out of the question if the sea was at all rough. Then I jumped, and prayed devoutly that I might not break my ankle; and when I was there I hoped that I might not be seasick (it is so undignified in company), and then that I should not be upset and drowned; and, finally, when we had shipped enough water to make me dripping wet, I counted myself lucky that I was safe ashore, and gave no thought to my personal appearance, though I might be going to interview the Governor himself.

But once ashore all is new, whether you land in Freetown, Sierra Leone, where the black brother, a descendant of the slaves for whom the colony was bought over one hundred years ago, is specially objectionable; or in Elmina, where the ghosts of bygone days haunt the castle; or in Calabar, which is so lovely that one should be twenty-two and in love to enjoy it thoroughly. From Sierra Leone to San Paul de Loanda, from Ibadan and Kumasi to the dreaded bar at Lagos, it was all delightful.

I landed and found a hammock and bearers waiting for me. Sometimes I sat back as in a swing, sometimes I lay at full length and had some difficulty in seeing anything but the ridge-pole of the hammock over my head, and sometimes (if the bearers were not expert) I have been carried uphill feet foremost; but always I have felt an Eastern potentate. So might the Queen of Sheba herself have travelled. Besides, you cannot walk. The sun that blazes down from a cloudless sky, the heat that rises up from the earth, the steamy, enervating atmosphere, all forbid exercise; and even at night, when the moon and stars make a new and a fairer world, a world that sets one longing for the unattainable, you would a great deal rather be carried.

The two things that strike one most in Africa after the vivid green of the luxuriant foliage are perhaps the teeming population and the intense loneliness. A white man is often alone. Often he has but one or two companions; he sees the same white faces from one month's end to another, and if he wearies—well,

it has always been an argument against matrimony that a man might tire of seeing the same face opposite him every morning for the rest of his life. But of the black people there are always plenty: picturesque sometimes, when they appear draped in cloths, ludicrous when they ape the European. Their English and their clothes are alike ridiculous. Why a man should 'lib for dead' instead of being simply dead I cannot say any more than I know why a white woman is a 'white mammy,' or why the average native just come into touch with civilisation should wear a tourist cap of a violent check on the wool which for centuries has been protection enough from the sun. I wish some artistic Colonial Secretary would forbid the importation of the tourist cap into Africa. After all, though, if he were really artistic he might have to forbid a good many other things.

I have been borne to a surf-boat in the arms of a bronze statue clad simply and effectively in a dilapidated top-hat; but I prefer him to the black gentleman clad in frock-coat, stiff collar, gorgeous tie, and creaking brown boots. His wife perches on her wool a creation of artificial flowers, chiffon, and ribbon, and her arms and neck show purple through the open-work lace of her fashionable blouse. The effect is peculiar and somewhat comic. And yet beside her is that other coloured woman, clothed gracefully in a cloth, her beautifully modelled arms and bosom bare, her walk that of a queen, stately and dignified. In her youth the negro woman, though her face has no pretensions to beauty, is certainly good to look upon as a whole; but unfortunately her beauty does not last. She is either a bronze statue or a withered old hag, and I am sorry to say the withered old hag stage lasts the longer.

One thing you never find, and that is poverty. No black man is poor as the submerged tenth in this our civilised Britain are poor. I never saw a child whom it was not a pleasure to look at, a baby that I would not gladly take in my arms. They are generally clad simply in a string of coloured beads, their little bodies are soft and round, their skins are like velvet, their eyes are large and dark and a little pathetic, but their faces are laughing and their white teeth flash. Apart from certain customs enjoined by fetish, I do not suppose one ever heard of a case of deliberate cruelty to or neglect of a child in all the length and breadth of heathen Africa. On the West Coast, speaking generally, a son is desired, but a daughter is a valuable commodity, for she may be sold—she is as willing as the English girl is willing to marry—for much gold.

Going out, I met a small black boy, very consequential and very important, servant to a white man, and I thought that white man no better than a slave-owner. Before I had been in Africa a week I had a small boy of my own in attendance, and he was equally proud and consequential. He looked after me like a father, he maintained my supreme importance, he brought me my tea, he got my bath, he considered he had entire charge of my wardrobe, and when I unpacked my own boxes he stood by with an aggrieved countenance. He had his revenge, though. I was staying, the only woman in the place, in the fort in an up-country town that is just beginning to come under the influence of civilisation. I got up early in all the glory of a tropical morning to ride round the native town in a hammock, and when I had gone a little way a merciful Providence made me turn my head.

A sentry in khaki and red, rifle on shoulder, marched up and down at the gates of the fort maintaining the dignity of the Empire, a small company of the same soldiers were drilling in front of the fort, and from the veranda railings in the full glare of the sunlight hung my very feminine wardrobe. Nightgowns, petticoats, and stockings were all displayed, and when I rushed back to remonstrate with the over-officious Joseph he looked at me more in sorrow than in anger. 'That be ploper palaver,' said he; 'the sun be good for missis's clothes.'

I learned to value Joseph when I had lost him. Once at Cape Coast my entire wardrobe seemed to have taken unto itself wings. I searched wildly, but it was not forthcoming, and at last I called downstairs for the boy who waited upon me. I represented that my clothes were missing. He grinned affably, and jumping through a window, clambered on to a neighbouring roof, and there, spread out on the corrugated iron, I saw my clothes! And once again at Lagos, looking into the wardrobe when I went to dress for dinner, I found that my boy had hung on every peg a pocket-handkerchief, while my white lace evening-dress was stacked up with my boots in a corner of the room.

GOOD-BYE, SUMMER!

Elm-trees by the river-edge
Showing gold among their green,
On the wild-rose in the hedge
Berries where the bloom has been.
Good-bye, Summer!
Leafy shade and lightsome sheen!

Harvest-fields, where stubble-gold
Trembles with the feet and wings
Of the hermits of the wold
And the timid woodland things—
Busy gleaners
That the bare September brings!

Bluebells out on every bank,
Nodding on their slender stems;
Rowans in a splendid rank,
Offering scarlet diadems;
Hills in shadow
Dim behind their purple hems!

Deeper mists on moor and glen,
Fiercer winds from out the west,
Wild-geese flying to the fen,
Swallows wheeling in unrest.
Good-bye, Summer!
Good-bye, flower, and song, and nest!

Will H. Ogilvie

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

IT is said by some that there is a crisis in the book trade, and that consequent upon it there is another one pending in the profession or calling of the writing of books. It is chiefly to works of fiction that reference is made when one speaks thus of books, but in a certain measure the production of general literature may be affected by this 'crisis.' The public are supposed to be greatly interested in it, but as a fact are not. They have always been able to obtain as good fiction reading as they wanted at a price they were able to pay, and it is questionable whether the enormous advantages conferred upon them by the publishers' enterprise in the matter of what have come to be known as the 'sevenpennies' is appreciated at its proper value. The publishers made the demand; it was not made before they took action. Perhaps some firms have done well from this new business, but it is a dangerous thing to spoil a public with too many rich things; and, indifferent as we have said the great body of readers are to this 'crisis,' it may nevertheless be realised that it will now be difficult to withdraw the cheap editions or not to continue the publication in cheap form of modern novels that only a season or two back were in demand at the established six shillings. In the meantime there are new experiments being made. One doubts from what can be gathered in circles intimate with the affairs of the book world whether a small reduction in the price of absolutely new novels will be appreciated by anybody, while it must surely cost publishers and authors something. Somehow, the British public maintain a very considerable belief in price values. If they see a thing marked at six shillings they believe absolutely that they are getting just the kind of thing that they mean to pay their six shillings for. The quality of the novel, if it is a novel, may be poor, and the effect upon the reader may be disappointing, but still he does not doubt that it was a six-shilling novel. Now offer him a far better novel at three or four shillings, representing some great risk and enterprise by author and publisher, and he is sometimes full of doubts and sceptical. He thinks this cannot be the thing he wants. It may not be a real six-shilling novel, and if he does buy it he enters upon his reading of it with considerable prejudice. The simple truth is that the modern reader is thoroughly accustomed to his six shillings (which generally he does not pay direct—his library pays it), and it will be difficult to convince some of those who are interested that there is any urgent demand for anything else in the way of new books. What would seem to many minds to be a most satisfactory arrangement would be the publication of new novels at six shillings, and a convention among authors and publishers not to let their works come down to the sixpenny or sevenpenny stage until two years after first publication. Of course no novel would come down to that even then unless it had given up the ghost as a six-shilling book. One can recall a number of the successes of recent seasons that are not yet sixpennies or sevenpennies, and are not likely to be for some years. There is particularly one beautiful story by a writer who is a great artist, and who has infused a wonderful atmosphere into his narrative. It is the fact that this book, now four or five years old, is still selling far better than even fairly successful works that have only been launched in the present season, and there is some reason for mutual congratulation in this state of affairs as showing that there is still a reward for good work, despite all the pessimists who say that literature is done for as a means of making a living. There is and always will be a demand for new fiction, written in the newest modern vein, just as there is for new plays. The public could not live on Dickens and Scott any more than they could get on with nothing but *Hamlet* and *The School for Scandal* as their nightly entertainments. But there is a feeling in many quarters that too many facilities are given to authors of no merit or promise for the production of their efforts, and also that there is too much

 [*All Rights Reserved.*]

'booming' by advertisement, in the modern method, of books that without it would scarcely be successful, and that could not complain of failure. Thus it is concluded that if any one is damaging literature, and the authors and publishers with it, it is those publishers themselves, who should be brought to a proper sense of the enormity of their faults!

* * *

In the meantime one is impelled to compare some of the present pessimistic statements and prophecies concerning the novel market with a series of semi-official observations that were made by leading publishing firms only six years since. One of these was moved to say that 'there never was a time when the budding novelist had a better opportunity than he has at present;' and another that 'a good society novel with a really clever dialogue always finds a market.' A third firm stated that there always had been and always would be 'an enormous demand' for well-told stories of either love, adventure, humour, or of domestic interest, and that the demand for all these stories exists at the same time. Another would have it that anything out of the common, or above the ordinary run of novels as regards its literary merit, was almost certain to find a place. Times, if we are to believe some of the things that are said, do seem to have changed since then. There is much behind the scenes of authorship and publishing that the readers are seldom or never permitted to know; and in the present circumstances it is interesting to recall a little explanation, the details of a concrete instance of an average kind in modern publishing, that was given only a little while since by the head of a leading firm of publishers of fiction, who at the time was bewailing the advances that had to be made on account of royalties to modern authors, such advances, by the prevailing custom, never being returned, no matter what the measure of success attained by the book might be. This gentleman said that not long since he accepted and paid for a novel by a popular author, for which he paid the sum of three hundred pounds in advance and on account of a royalty of 20 per cent. of the nominal selling price, which was six shillings. 20 per cent. on six shillings came to nearly fifteenpence a copy, and on the special cheap colonial edition the royalty was threepence halfpenny a copy. The publisher printed five thousand copies of the book, and of this number he sold two thousand eight hundred and ninety-two of the six-shilling edition, and one thousand seven hundred and fifty of the cheap colonial edition. It cost him nearly two hundred and thirty pounds to produce and advertise the book, so that altogether he risked about five hundred and thirty pounds. His profit, without deducting office expenses, was forty-four pounds sixteen shillings and tenpence, while the author, who had no financial risk, made three hundred pounds. In the case of another novelist who was paid the sum of one hundred and twenty pounds in advance of a 20 per cent. royalty on the six-shilling edition of his book, and threepence per copy on the colonial edition, three thousand copies were printed, and of these one thousand three hundred and seventy-nine were sold in the six-shilling edition, and one thousand in the colonial, leaving six hundred and twenty-one unsold. The cost to the publisher to produce the complete edition was one hundred and twelve pounds, and over and above this amount he spent forty-eight pounds in advertisements. His profit was one pound seventeen shillings and eightpence, as against the author's one hundred and twenty, and he did not seem to think that this was a fair arrangement. But it might be urged against this complaint, which has been very general in recent times, that the publisher might and very often did produce fifty or even more such novels in the same time that the author was writing one, and that out of some of them he would make far greater profits than the author, and out of the sum-total of all of them, if he were a shrewd publisher, he would do far better than any of his authors could possibly do, and that without any great travail of mind or burning of the midnight oil such as is involved in the writing of good fiction. Complaints of one kind or other by authors and publishers have always been fairly general since fiction emerged from the green-backed part and the 'three-decker' stage, and one imagines that the circumstances of the case ensure a continuance of such for a long time to come. The reader's only complaint is that he is sometimes fooled into the belief that he ought to read a certain new novel, and is brought to realise afterwards that he ought to have done nothing of the kind.

* * *

It may reasonably be suspected that never in history before did the short and almost unpremeditated act of one individual accomplish such a change in the general conception of the possibilities and probabilities of the future of the world as did the cross-Channel flight of M. Blériot by an aeroplane at the dawn of a Sunday morning recently. It became clear at once that aerial flight would be not only a likely means of locomotion in the future, but a certain one, most extensively practised; and in less than one hour it seemed as if the most important feature of the map of the world was changed, or was in process of change. It was as if the English Channel no longer existed as a prime factor in regard to the arrangements of the world, and that Britain had lost that insularity which had been its safeguard since the establishment of the nation, and the thing that most confounded its enemies. It did not matter that it was generally expected that the feat would be accomplished before very long. Here it was done and was brilliantly successful, and there was all the enormous difference in the minds of the people between expectation and realisation. It was a fact of no consequence that the Channel had only been crossed in this way

once. It mattered much more that the aviator steered to a precise point and gained it without difficulty, and that he crossed from the one country to the other in thirty-seven minutes, which for the time being is beyond the possibilities of steam. And what had been done by one could well be done by thousands; and what had been done well for the first time would for certainty be done much better in the near future. Then it was seen that men who could navigate the air could have no regard for frontiers, and there was a more striking significance than was generally realised in the puzzlement of the Customs officials at Dover as to what they should do in regard to the machine and the aviator who had swept down upon them from France. They could only decide to do nothing.

* * *

There was something exceedingly dramatic in the circumstances surrounding the event, as well as those of it. It happened at a time when the nation, the resources of which had been severely drained in the provision of armaments, particularly battleships, was in a state of some agitation consequent upon proposals for new and increased taxation; and it happened only a few hours after the end of the week when in the river Thames a demonstration of the extent and power of the Navy which they had bought was given to the British people as it had never been given before. Now suddenly there loomed up the possibility of a navy of any kind being comparatively useless in the future, and of the necessity of air-power being established by us just as we have established sea-power, with an enormous increase in the difficulty of the new process. We were plainly at the beginning of a mighty revolution the consequence of which it was impossible to underrate, although there was some disposition at the outset to suggest that it was very easy to magnify the effect that the new achievement would have ultimately upon war operations. It was argued that aeroplanes were uncertain in performance, that they were quite useless until they could fly at a greater height, and that as no passenger had been carried nothing of real service had been demonstrated. Of what use would be an aeroplane, it was asked, when not for a second dare the one man it carried take his hands from the levers that controlled it? Such were the suggestions of men who were pessimists in the matter of progress but optimists concerning the future welfare of nations. All difficulties will be overcome, and at this time one inevitably recalls the circumstances of the first great trial-run of a number of motor-cars, which was from London to Brighton, and how badly the majority of the cars then did fare. It was a wonderful achievement in its way. It attracted enormous attention; but considered as the result of many decades of study and experimentation in the direction of automobilism it seemed to many minds to be somewhat disappointing, and there were not a few people who were ready to suggest that the motor-car would never be a really effective implement of commerce. Yet it is less than thirteen years since that event took place. The study of aeronautics is being pursued with not less intensity than was that of automobilism in recent times, and many of the points gained in the latter go directly to the assistance of the other, as, for instance, the enormous improvement that has been effected in the small motor. It cannot be doubted that man-flying will be a common thing in the future, and it is not to be overlooked that the first thing done by the inventor or his representatives after the feat was accomplished was the booking of numerous orders for aeroplanes, many of which are now being experimented with by British amateurs. The aeroplane industry is already a big and busy thing. In March of this year four companies associated directly with it were registered in this country; in May there were three more, and in June there were five. It is true that many of these concerns were and still are in a very quiescent state, waiting for the most part for inventors to do something, but their existence is evidence of the readiness of capital to back the inventors to the full. And in the meantime it is being just mentioned that something like five thousand aeroplanes that would really fly could be built for the price of one *Dreadnought*, and that one of the aeroplanes might in certain circumstances not by any means inconceivable be able to effect the most enormous damage to the battleship. Inventive ingenuity will now be directed with considerable power upon the construction of guns specially adapted for firing upwards and of night-lights for the searching of the air for these new instruments of the anxiety of nations which do not fail to exhaust every possible resource in armament.

* * *

It is the elementary reasoning of the general public that 'if things go on as they are doing,' meaning that if Germany insists upon a maintenance of her policy of constant increase in her navy and Britain replies always in the usual and necessary manner by building more ships than ever, there must eventually come a time when the resources of one nation or the other will be exhausted, and then there will be a stoppage to this competition, with in all probability a naval war provoked by the party that finds that the time for giving in has come at last and is not agreeable to abandon the great enterprise without a fight of some kind. This, as we say, is the simplest reasoning as to the probable outcome, and it is obviously to be complicated by a hundred considerations and circumstances which materially affect it. However, in the meantime we have been interested in our own domestic politics with such a battle on the Budget as had not been experienced by any of the present generation. At such a time it is a matter of particular concern to us to examine in what ways

Germany has just raised a total of twenty-five million pounds in new taxes which have become necessary to meet her constantly increasing liabilities. Some of these methods have no novelty for the people of this country, though even in such cases it is of interest to examine the amount that the rival nation raises from these different sources, while in the Fatherland some one or two substantial hauls are made from the taxpayer indirectly by methods which we do not practise. There are, for instance, the taxed matches; and any one who has done only a little of foreign travel, spent but a day or two in Boulogne or Paris, will always feel that there is a great joy in the British match, and will be unwilling that it should ever be tampered with in any way. Germany, however, raises a million and a quarter from her matches; and, again, she gets a million from incandescent gas-lamps and a million from her taxes on railway-tickets. Railways in this country are not generally doing so well that they could accept any new taxes on them, even such as could easily be reimposed on the passenger, with equanimity. From receipts for cheques Germany takes a million, from share coupons a little over a million and a third, from stamps on bonds and shares a quarter of a million less, and from bills of exchange a hundred thousand pounds. Her biggest gain is five millions from beer. Four millions are taken from spirits, a quarter of a million from champagne, and over two millions from tobacco. Two millions are secured from transfers of real estate, a million and three quarters from sugar, and about that amount from coffee and tea, while a million and a quarter is gathered in from an increase of the contributions of the federal states. It is an interesting list, but it was not made without a fierce struggle between contending parties. And now in the contemplation of Germany's resources we are reminded of some information that was furnished a little while since on the authority of the statistics that had been privately compiled by the Berlin bankers concerning Germany's holding of foreign obligations. It was said then that the value of these holdings reaches the enormous figure of eight hundred million pounds, which is four times the amount of the indemnity which Germany secured from France at the termination of the war. These figures were drawn forth at a time when it was being said that financial stress would restrain Germany from contemplating seriously a great war. It was observed by one of the leading financiers of Berlin that within twenty-four hours of the declaration of hostilities Germany could simply flood the bourses of the world with this paper torrent, and even though it brought about a shrinkage of seventy-five million pounds, the proceeds would provide a national war-chest of practically inexhaustible dimensions. The total includes huge holdings of Russian, Turkish, Spanish, Portuguese, Argentine, Brazilian, Mexican, and Japanese Government and private bonds.

VANESSA.

CHAPTER IX.

WHEN Vanessa and I were alone I told her of my scheme, and, to my surprise, she looked rather grave.

'Won't it make your Vanessa rather conspicuous?'

'No, dear. I heard some talk in the veranda about the fête, and there are other cars that are to be splendidly done up with great historical and mythological characters in them. Anyhow, this is going to be an artistic business; and Mitey, R.I.B.A., gold medallist, &c., is going to issue the orders, and the model has nothing to do with it but to pose and look splendid, as she is told. So there!'

We both laughed, and the matter was settled.

The time had now come when Uncle Goodman's nurse could be discharged, and one morning, when we had got the doctor's sanction, Vanessa told us all to come in and see the fun. She walked straight forward to where the squire was hid behind the *Times*, and said abruptly, 'Beg parding, sir.'

'Eh, what?' said he, lowering his newspaper.

She dropped a prim curtsey, and with a grave, demure face, said, 'If you please, sir, I wish to give up the sittuashion, sir.'

He entered into the joke at once, and said, 'This is very sudden. Does the place not please you, or is it a rise you want?'

'Oh, please sir, I lyke the plyce well enough, sir, but'——

'Well, but—— Speak out, woman.'

'There's no work to do, so please give me me wyges, an' let me go.'

She stooped over him, and he, with a beaming face, said, 'How much?'

'As many as you like to give me,' said Vanessa, as his arm went round her neck, and he kissed her fondly again and again. She took his head between her hands, and said in her own warble, 'I suppose there will be no difficulty about my character?'

'If I give you a character it will be that you are a witch, who can make a new man out of an old, smashed scarecrow.—Now, come you all and take leave of Nurse Vanessa.'

We all embraced her, and she ran from the room, while we crowded round the old man and congratulated him on his recovery, he assuring us that he knew whom he had to thank for it.

Presently she appeared, capless, in a lovely, soft-falling, creamy dress, with a few simple corn-flowers

at her throat and a belt of silver coins. She knelt down at his chair, and laying her head on his arm, said, 'May I exhibit the effects of my nursing by taking you for a run in the motor-car this afternoon?'

His look was comic as he said to me, 'Do you think I can trust her, Mary?'

'Well,' I said, 'ask mother.'

'Oh,' said she, '*I* do, and an old soldier must be as brave as an old woman.'

He laughed and patted Vanessa's head, saying, 'I suppose I dare not be a coward.'

So that afternoon there was a sensation at the veranda. Tommy drove up with the car, giving a vigorous *teuf, teuf*, and presently the squire appeared, leaning on Vanessa's arm, she in her Di Vernon motoring-coat and a ravishing three-corner hat with a white rose in it for a cockade—a compliment to Yorkshire. The loungers gazed in wonder, hall-porters and waiters and page-boys crowding to the door. She tucked the squire tenderly into the front seat, with a final familiar little pat on the shoulder as she asked smilingly if he were comfortable. Then, with a laughing remark to me in the tonneau, she slid behind the wheel and bade Tommy 'Start her away,' and in a few seconds we were gliding down the avenue, followed by the gaze of scores of eyes, as Mrs Marsden told me afterwards.

Vanessa drove us down through the town, and at my request stopped at the circulating library to get some books which I had promised mother to bring. I handed my order in, and the shopman had just brought me the books when I saw Mrs Saxilby coming from the back shop, and I stood aside to let her pass, which she did with her chin well in the air—at least that half of it which could be moved by her jaw. I followed her to the door. When she reached it and caught sight of Vanessa she staggered back and nearly fell into my arms. I said on impulse, 'I am afraid you are ill,' when she turned on me a look of fury, and hurried off as fast as mayoral dignity made permissible.

We had a delightful drive, and the dear old man evidently enjoyed it, Vanessa being very careful, and going along in a very different way from that of her runs with me. He seemed to be astonished at the ease with which she controlled the car both in speed and steering, and when we reached home was quite voluble to Mrs Marsden and mother about Vanessa's skill.

'It appears almost to have life under her hand,' he said. 'I quite got over my nervous feeling before I had been a quarter of an hour out.' And he added, speaking to me personally, 'Indeed, Mary, I am bound to confess that I began to feel as if we were going very slow, and was much tempted to ask her to drive a little faster.'

'Oh, uncle,' I said, 'blows the wind in that quarter?'

'Well, you know, she did that straight bit at a good pace, and when she came down to what she declared was twelve miles an hour I could not believe it, although her recording instrument showed it; it seemed like five.'

'All right, uncle; you are getting on. I shall tell Van what a slow-coach she is.'

'Oh no, please, leave her alone; she and I will get on all right, my child.'

'I declare, uncle dear, if things go on like this I shall get quite jealous,' said I, laughing, and left the room.

The preparations for the fête went on apace, and we had more than one interview about it with delightful little Mrs De Burgh. It was arranged that, as far as possible, the characters and the decorations were to be kept secret by the car-owners, so that the element of surprise might add to the enjoyments of the occasion.

I had enlisted Stocks's help, as he had served an apprenticeship as a joiner and cabinetmaker before entering the army; and with the aid of Tommy, who was good with his hands, prepared a light frame in boat-shape, going outside the wheels and projecting beyond the bonnet. A rock for Britannia was made up at the stern, which was painted by me, and not badly painted, although I say it that should not. A flag-pole leaned out from the stern, at which hung the Union-jack. Stocks took off the wheel, and made up a ship's upright wheel in the centre, of the true ship's steering style, and with the aid of Barnes, Vanessa's mechanic, fitted up an arrangement below, which he called a bevel something, by which the chains of the ship's wheel worked the steering. In front, on the top of the bonnet, we placed a compass borrowed from a yachting friend. With Mrs De Burgh's assistance, whose husband was in the navy, Tommy was rigged out correctly as a man-of-war's quartermaster, that he might take the wheel. Lastly, I persuaded her to allow her lovely little girl to be dressed up as a naval officer, to stand in the bow with a telescope, and give the orders for the course: 'Port,' 'Starboard,' 'Steady,' &c.; Tommy to respond in as gruff tones as his seventeen years admitted of.

Tommy and I were certain that we were safe for first prize.

The day came lovely and bright and warm, and all the cars that were to compete were marshalled in the riding-school, to have their decorations put on there, so that they might be seen for the first time in the procession. The fête was to be utilised to raise funds for a local object; and the public, who were freely invited by the marquis, were to decide the competition by their votes. Each person on entering received an envelope in which to place his or her contribution, and in it were three cards, red, white, and blue, marked, 'First,' 'Second,' and 'Third,' the printed directions requesting that the numbers of the cars which were thought to be best might be marked on the cards according to their degree of excellence, and these returned to the stewards with the contributions.

It was announced that the wife of the mayor would present the prizes to the competitors who

were successful, and this to mother and me promised some amusement, particularly if Vanessa should take a prize, as we were confident she would succeed in doing.

It was a very fine display. The marquis, who did not compete, had chosen Neptune as his character, and his car represented a magnificent opalescent shell, in which he sat with his trident, while from a great twisted shell on his wheel he blew vigorous blasts from time to time. And there were witches' cauldrons, and floral bowers, and Watteau groups, and comic wild beasts' cages, and a coronation carriage, and many others, as the papers say, 'too numerous to mention.' The marquis led the procession, and the stewards marshalled the cars, placing Britannia last, as a fitting close to the display.

The course, down the long, green avenue of lovely trees, ended in a great, oval space, which the former Yeomanry colonel had constructed with high, sloping sides all round, forming an amphitheatre, in which he had a great pride in showing off his corps at tent-pegging, lemon-slicing, Saracen's head-sticking, and musical rides. From the slopes the spectators, who numbered many thousands, had a perfect view. The various competing cars were greeted by their partisans with applause, and here and there one came in for special approval. But when, at the end of the long procession, Britannia came down the course, and at the shrill cry of 'Port' from the little officer swung to the right into the amphitheatre, and was steadied and starboarded to go round, he gazing through his telescope, there was first a murmur of admiration, and then an outburst of cheering which swelled louder and louder till Tommy, at the shout of 'Port,' had steered her into the course, and responded to the order to 'Steady.'

Then the procession went back down the course, and the stewards and their assistants collected the envelopes, which were brought back to the riding-school and examined, while some non-competing cars gave a demonstration of driving between posts and in and out of enclosures, and of rapid steering and stopping on dummy bodies being thrown unexpectedly in front of the drivers.

Our party were too excited to enjoy this display much. Uncle Goodman held me by the hand, and fidgeted a little; and mother and Mrs Marsden talked jerkily with little Mrs De Burgh, who was as eager for her little one to be on the winning car as we were to see Vanessa triumphant.

While we were waiting a distraction took place, which had its comic and its pleasant sides.

The mayoress, leaving her seat of honour, came across to mother, looking as pale as she could ever be expected to look, and said, 'I want to ask your pardon. May I sit down beside you? It will be less awkward for me.'

Mother, the most forgiving of souls, made room for her, and she sat down, saying as she did so, in a series of gaspy jerks, 'I am a foolish old woman. I made a great mistake. I thought I had a duty. I know the truth now. I *am* sorry.'

Mother put her hand in the mayoress's, and said, 'Please don't say any more; it shall be as if it had not been.'

'Oh, you are good!' burst from her. 'It makes me feel it all the more.' And then, with a curious and anxious look, almost comical in its anxiety, she said, 'Does Miss King know that I took her for an adventuress?'

To which mother replied, assuring her that not one word had been said to Vanessa.

She held up her hands, and exclaimed, gushing, 'Oh, *how* good of you! How I thank you! It is all a lesson to me.'

Then came the difficulty—the retreat. How was she to get away? She fidgeted, and suddenly showed a touch of genius. 'I have given her my vote already. I hope she will win;' and, rising, she shook hands with mother, and as she turned to go I held out my hand, which she took in both of hers, and with half a sob, said, 'You *are* good to me—you are!'

As she left us mother said to me quietly, 'I *am* glad! It only wanted that to make the day perfect.'

At this moment our attention, which had been diverted, was called back to the business of the hour by the loud toot of the marquis's shell-horn, and we looked down the course, to see Vanessa's car coming first, with little May De Burgh waving a golden banner embroidered with a figure 1, followed by two other cars with silver and bronze banners 2 and 3.

The band struck up 'Britannia the Pride of the Ocean' as the car sailed into the arena, and, followed by the whole procession, went round amid vociferous cheering.

Tommy's face was a study in stolidity, but the dear little officer was all smiles; and so kindly was the greeting that Vanessa was perforce led to relax her statuesque expression, and smile and gently incline her head in return.

After the procession had gone round, the cars were drawn up in line in front of the reserved seats, in the middle of which, at the orthodox red baize table, sat the mayor and mayoress.

Vanessa alighted, handing her trident and shield to Tommy. She then lifted little May De Burgh from the bow, and set the girl beside her. As she did so, Neptune, who had descended from his car, handed his trident to his motor-boy, who was most comically dressed as a seal, and, advancing to Vanessa, offered her his hand to lead her up to the dais. When she raised her left hand, my quick eye saw that both hands were trembling, but the tremor ceased as they met, and she gently inclined her head.

The spectators cheered with true, ringing, British cheers, which echoed and re-echoed from the surrounding woods, as Vanessa stood with her tiny Admiral by her side, her long draperies billow-

ing over the steps of the dais adding commanding height to the allegorical figure.

The first prize was the gift of the marquis; and as it could not be known whether each individual prize would fall to a lady or a gentleman, he had provided two cases, one containing a scarf-pin and the other a diamond hoop for the wrist—a simple and modest bracelet; but when I saw it sparkling in the sun I knew in my own mind that such diamonds would not have been selected if he had not hoped in his heart that it would fall to the woman he loved.

The mayoress was evidently a little flurried. I saw her hand shaking. She took up the wrong case, and was about to deliver the gentleman's scarf-pin to Vanessa, when the marquis checked her, and, opening the other case, handed her the bracelet. She, evidently having lost all memory of what she had intended to say, clasped it on to the beautiful arm, and laid her hand over it, saying, 'God bless you, my dear; and may every happiness be yours as long as you live to wear it!'

Mother and I exchanged glances, and her sweet look was a joy to see. There was a trace of a tear in her eye.

Vanessa, on whose wrist the fat hand rested with a sort of lingering caress, bent down and pressed her lips upon it, and a murmur of pleased appreciation of the gracious action ran through the crowd. One old lady near me exclaimed, 'Isn't she a dear, Maria?'

The other prizes were then delivered, and the stewards proceeded to marshal the cars for the final circuit and return to the riding-school. On this occasion Britannia was to head the procession; but, to our surprise, she did not at once take her place. Returning to the dais, with her trident in her hand, she again bowed low, and, with a smile all her own, said to the mayoress, 'May Britannia offer to take you on board?'

'Eh, what?' said the old lady, half-bewildered and half-pleased.

Vanessa stretched a hand across the table and took the mayoress's, saying, with her open, irresistible look, 'Come; it will please the mayor's people.' Then she looked to the mayor, and the mayoress made a mute appeal to him for orders. He gave a good Yorkshire guffaw. 'You'll take good care of the old woman, won't ye?' and the thing was settled, and the two ill-assorted figures were descending from the dais.

Vanessa ordered Tommy to her rock behind, and handing the mayoress into the front seat, took her place beside that lady, and, grasping the spokes of the ship's wheel, steered the car round the amphitheatre, amid vociferous cheers, the little Admiral giving the orders as before. Tommy with the trident was a sight to behold, as he held it up in a mock-heroic attitude. The old lady's expression was a curious blend of nervousness and pleasure, Vanessa looking round to her every now and again, giving encouragement with her own bewitching glance.

When we reached the riding-school—to which we had the entrée as the marquis's guests—we were just in time to see Vanessa lift the little Admiral from her perch and hold her up to the mayoress to be kissed, and to hear the mayoress say, 'I would like to kiss you, if I may,' and to see Vanessa bend down her face while the old lady clasped her in her arms. Then she turned and saw mother and me standing by, and came across to mother and took her hand in both of her own, saying, 'How good of you! How good, not to have told her!'

Mother returned the hand-clasp, and said, smiling, 'Of course I did not; but it would have been just the same if I had, the moment she knew that you were disabused and were kindly inclined to her. Hers is a true nobility of character.'

The little woman leaned forward and whispered, 'I may be a very foolish old woman, but I am not blind exactly. She will soon have nobility of name as well as of disposition. Yes, I am sure she will.' She smiled and we smiled, and just then Vanessa came up, having doffed her robes, appearing in a perfectly cut, simple coat and cape, with the three-cornered hat. She drove the mayoress home in the car, with no remains of Britannia's panoply except the upright wheel, which could not be altered on the spot, and, as she told me afterwards, met the cream of the bourgeoisie at afternoon-tea, and had 'a delightful time,' which I knew meant giving pleasure and doing what can be done in the odd moments of life to brighten the life of others.

'Vanessa,' I said, 'in these days of titled mayors, are you already taking lessons in mayoress's duties?'

She blushed and laughed. 'Are you so sure as all that?' she said, taking my face in her hands.

'I told you so before. I said I thought I knew; now I do know.'

(To be continued.)

THE SANTA FÉ TRAIL

WHAT was probably the oldest route in the New World to be travelled by men was the Santa Fé Trail, as it still is called. Although not dating as far back as some of the Roman and other ancient highways of Europe, it was used by the traveller and explorer as early as the sixteenth century, and was probably a route over which the Indians of this part of America journeyed long before the first white man followed it.

There are no pavements, no walls, no ditches along the Santa Fé Trail. To the European it might not seem a roadway, but over it have gone thousands of trains of wagons bearing home-seekers, miners, and other adventurers from the country about the

Mississippi River, bound to the south-west. Many a wanderer has made the journey on horse or pony, and not a few have tried to make the long, weary trip on foot, though the majority of these have fallen by the way, victims to the hardship and suffering or to the hostile savages that in the earlier days often attacked the travellers to rob or perhaps to murder them. No, the Santa Fé is not marked by walls, nor has it a floor of stone like the Roman and other highways which traverse parts of Great Britain and the Continent; but for hundreds of miles one can follow it without losing one's way because of the bones which whiten the ground. Scattered over desert and prairie, in themselves they tell a tale of the past, for they are the remains of not only animals but men, even women and children. Where the country round about has been settled and civilisation has come, the victims of the savage tribes and famine and disease have had a Christian burial; but in the uninhabited country, through which much of the trail passes, the bones of oxen, horses, mules, and human beings are still bleaching in the sun. Some of them have been there over a century.

The trail stretches away from the banks of the Missouri River to the old Spanish town of Santa Fé in New Mexico, from which it takes its name. Since Coronado the Spanish explorer was guided over it by the Indians in 1541, parts of the route have been changed, but only for short distances, and the main 'road'—if it may be called such—extends through the valleys and plains of Kansas into the state of Colorado, where it reaches the great wall formed by the Rocky Mountains; then, turning southward, it follows this wall into New Mexico, going through a pass in the mountains to Santa Fé, a distance of seven hundred and seventy-five miles from the starting-point. Originally the trail led up the Arkansas River valley, where it turned south-westward. Later a shorter route was taken across the Cimarron desert. This route was without water for sixty miles; but time was the object, and it was used by the more venturesome. In this section, at the present time, there are no railroads and consequently few settlers, and so the prairie is in its primeval state. Here is the Grand Prairie of the Spanish period; and now, after the lapse of a generation since it was used, the trail is well defined, except rarely where it has been broken by the plough, all the way from the Arkansas to the Cimarron rivers. It is here that so much of the way is marked by the skeletons of those who have fallen, but on the smooth, hard surface time has also preserved even the marks of the vehicle-wheels.

Crossing the plains of south-western Kansas, the traveller comes to a broad and well-defined highway of ancient use. It is enclosed within wire fences, and is no longer used; but it is plain that it was made by hoofs and wheels. Four wagon-tracks run parallel in a width of one hundred feet, disclosing the ruts worn by the wheels, the paths of the oxen that drew the wagons, and the little ridges between. Straight as the bird flies it traverses the plains. From the very edge of the north-eastern skyline it may be traced with the naked eye, so light and dry is the atmosphere, and it is followed with the same distinctness in its course towards the south-west until it disappears over the rim of the horizon. Over this trail, or long sections of it, have travelled since Coronado's march in 1541 four races of men—the Indians, the Spanish, the French, the Americans. Relics still found on the prairie mark the successive stages: the flint arrow-heads of the early Indians and the steel tomahawk of later use, the Spanish pointed spur of the seventeenth century, a sword of French manufacture, and a quantity of grape-shot. The latter possibly was the contribution of American artillerymen returning from the Mexican war.

Farther west, in Kansas and Colorado, the country is a desert like the Sahara; but here again the way over which the pioneer white men toiled to reach the El Dorado which they thought lay west of the Rocky Mountains is all too plainly marked. Truly, the journey was fraught with danger and hardship, for the distance was long and the region traversed unknown, barren, and uncivilised. Many perished from thirst and exposure, and many more were killed by Indians, or, straying from the caravan, left to die of starvation upon the plains. In later years the dangers were lessened by the establishment of military posts; but these could not afford perfect security, and until 1870, when the Indians were captured and placed on reservations, life on the trail was not safe.

It was the custom to 'outfit'—get food and other supplies—at the town at the eastern end of the trail, the wagons travelling singly from there to the Cottonwood River in Kansas, where they would wait in camp for the others to come and form a train or caravan for the rest of the journey; for west of the Cottonwood the Indians lay in wait, and for their common safety the pioneers journeyed in companies. Sometimes there were two hundred men in one company. The wagons were of the same types as were used in the settlement of the states east of the Mississippi. Each was drawn by eight mules or oxen, and sometimes by horses. A wagon's capacity was five thousand pounds, and, except when crossing the streams, one team of eight animals easily pulled it. The wagons were canvas-covered, and they moved only about fifteen or twenty miles a day. They travelled four wagons abreast for better protection from surprise by Indians. The company, besides the wagon-men, included horsemen, whose duty it was to kill buffalo and antelope, for there was no other fresh meat along the route. Some parts of the country abounded with these beasts, and the chase was an exciting diversion from the monotony of a day's travel.

Far different was the march of Coronado along the route in the search for gold. This expedition marched by a circuitous route from the city of

Mexico to the western bank of the Missouri River, near where now stands the city of St Joseph, Missouri. In all, he journeyed three thousand two hundred and thirty miles to a province which the Indians call Quivira. In his journal he wrote: 'The province of Quivira is nine hundred and fifty leagues from Mexico. The place I have reached is in the fortieth degree of latitude. The earth is the best possible for all kinds of productions of Spain; for, while it is very strong and black, it is very well watered by brooks, springs, and rivers. I found prunes [wild plums] like those of Spain, some of which are black; also some excellent grapes and mulberries.' Quivira was a fertile part of Kansas. In an earlier entry he says he travelled 'mighty plains and sandy heaths, smooth and wearisome, and bare of woods.' In another he writes the first authentic account of the buffalo, or bison, saying: 'All the way the plains are as full of crook-backed oxen as the Mountain Serena in Spain is of sheep.'

Centuries elapsed after Coronado's expedition before other white men ventured over any part of the trail. It was not until 1822, following the end of the Spanish dominion in Mexico and its northern provinces, that the trail became an established and beaten path of commerce; but so far back as 1763, when the province of Louisiana was a French possession, French traders from the Upper Mississippi region established a store where now is the site of Pueblo, Colorado. Prior to the enterprise of the French traders in 1763, eight of their countrymen from the Upper Mississippi settlements, in 1739, made the journey to Santa Fé, returning home the following year. What the mission, if any, of these adventurers was is not recorded. In 1720 the Spanish Government sent into the country a military force, which was destroyed by the Missouri Indians, a powerful and resentful tribe. In 1599 Don Juan de Onate, the conqueror of New Mexico, made an expedition into the 'Kansas region.'

Thus, long before the Santa Fé became a route for the trader and home-seeker white men had ventured upon it. Lieutenant Pike, an American naval officer and explorer, who discovered Pike's Peak in the Rocky Mountains, first mapped out the trail for the white-topped wagon-trains, and for many years goods were carried across the continent from east to west on it, while gold and silver were slowly hauled from the mines to the country east of the Mississippi, for it was the only route across the Great Plains. The first party of traders to journey over it were a little band of men who went to Santa Fé in search of horses and mules. They were nearly a year in going and returning.

For nearly fifty years the trains of wagons crossed and recrossed, bearing over a million pounds' worth of merchandise yearly. These were the caravans of the New World. But at last came the railroad-builders, who made a way of steel, and gradually the 'freighters' abandoned the trail, along which stretches one of the great American transcontinental railroads, partly named after the route it follows. And so this famous path of commerce passed from its usefulness. But, although unused, abandoned, and almost forgotten, it still marks the solitude of the plains. The wagon-ruts may be grass-grown, but they are still distinct; the roadside bears the scars of camp-fires long since quenched by the snows and rains of a third of a century; even evidences of the caches of the early voyageurs of the plains remain; but the towns which were founded and the settlements which grew and thrived upon the caravan traffic have disappeared. All the busy commerce of the plains is gone; but here and there pastures remain, and succeeding the Indian and the bison have come the peaceful American and his herds of domestic cattle.

THE BLACK FLAG.

CHAPTER II.

FOUR bells in the middle watch had struck on board H.M. gunboat *Merlin*, as under shortened sail and quarter-pressure steam she slowly forged ahead up-Channel on her return from a three years' cruise in the Mediterranean. On her larboard-bow the towering form of Portland Bill loomed through the murky darkness, and daylight would see her safely moored off Spithead. At least, so thought every one on board.

The lights had been freshly trimmed on bow and quarter. The lookout at each cathead had been changed, and the watch below in their hammocks were peacefully dreaming of the happy reunion which the morrow was to bring. Visions of mothers, wives, or sweethearts crowded with welcoming hands and beaming smiles around the canvas couches of the slumbering sea-dogs. On deck the watch collected in little groups, some under the lee of the masts, others under the shelter of the bridge or top-gallant forecastle, and spun yarns of past adventures or revelled in the anticipation of coming joys. Aloft, the rising gale piped through the straining cordage, and the closely reefed topsail bellied out as if it would burst from the bolt-ropes. The night was intensely dark, but every now and then the moon would burst through some rift in the piled-up masses of clouds, flooding for a brief moment the weird, wild scene with her silvery light.

It was Ned Trunnion's lookout, and he and his

messmate, young Maurice Kemp, who was keeping him company, were snugly ensconced in the hammock netting on the port-bow. Ned was a fine, weather-beaten tar of thirty-five, who had been at sea all his life, and had seen active service in every part of the world. His messmate was quite a youngster, and nothing gave him greater pleasure than to keep lookout with Ned Trunnion, and listen to some of the thrilling stories he loved so well to narrate.

'It's going to be a rough four hours for the morning watch, I'm afraid, Ned,' remarked the youngster.

'Ay, lad, it be,' replied his companion. 'I fear it's going to be a rough four hours for both watches if the wind veers round a couple or three points more to nor'ards, as it threatens to do now. This is an ugly part o' the Channel, and Portland Race isn't the safest place for a craft to be wi' a stiff nor'-easter blowing in her teeth.'

'Is this a dangerous part of the coast, then, Ned?' inquired young Kemp.

'Ay,' replied the elder sailor. 'I know every yard on it, and I'd rather be waterlogged in the Bay o' Biscay than beat about off here wi' Portland Bill or the Chesil Bank for a lee-shore. There's a few rocks over there, look ye, that wi' a wind from the nor'-east would shred the iron plates o' the *Merlin* into pieces no larger than a lady's hairpin;' and he pointed in the direction of the reef where the old wreck lay stranded.

A few moments of silence ensued, during which Ned was closely scanning the faint outlines of the distant coast. 'Umph!' he at length ejaculated; 'and there's "Rattling Rock" over there, up which my old shipmate Dick Darrell tried to climb, and got stuck when he was more'n three-parts up; we had to draw him up wi' a rope from the top, or he would have stopped there till life's last "eight bells" had been rung. Poor Dick! he's over there on the isle now, perhaps in a worse plight than when he was stuck on the face o' the "Rattling Rock," or when the sharks nearly had him when the cap'in's cutter capsized at the mouth o' the Gambia.' And soft-hearted Ned Trunnion heaved a sympathetic sigh.

'What happened to him, Ned?' asked his companion, in the hope of hearing one of Ned's interesting reminiscences.

'That which might happen to any man,' replied Ned. 'Dick had a quick temper, and was too fond o' the purser's grog. He was allus getting into the black-list, though he was as good a sailor as ever handled a reef-point. Our present commander—he wor then only second luff—had taken a spite against Dick, and wor allus a-making him "toe the line." One day in Malta—it's near seven years or so now—Dick had been ashore on leave, and returned on board three sheets in the wind. The second luff spied him as he lumbered over the gangway singing:

> The ship that goes, and the wind that blows,
> And the lass that loves a sailor.

Poor Dick was wheeled to the quarter-deck, and the luff started to call him all sorts of unparliamentary names, and ordered the master-at-arms to confine him in irons in the fore-cockpit. The devil must have got into Dick at that moment, for, seizing an iron marlinespike which lay handy, he dealt his tormentor a terrible blow wi' it over the head that felled him like an ox. The result was a court-martial, and poor Dick was sentenced to penal servitude for life. I afterwards heard that he had been sent over yonder to the convict-prison on Portland Isle.'

Just then the moon broke through a rift in the clouds, and young Kemp's eyes suddenly rested on an object in the water, which caused him to utter a sharp cry. 'Look, Ned! look! What's that?' and he pointed to where a dark mass with something white lashed to it rose on the crest of a wave only a few yards from the ship.

Ned's quick eye likewise caught sight of it, and he exclaimed, 'Good gracious, lad, it's a raft with a man lashed to it!' Then the sailor's instinct rising within him, he shouted, 'Man on a raft on the port-bow!'

All was at once in a state of commotion on board the *Merlin*. The sailors metaphorically cut the threads of their respective yarns and rushed to the ship's side. The officer in charge satisfied himself by actual observation. A boat was lowered, and though the wind was strong and the sea running high, the raft was soon alongside the pinnace, the lashings cut, and the body—for it appeared nothing more than a body—quickly transferred to the deck of the gunboat.

By this time the doctor had arrived on the scene; and as the apparently lifeless form was hoisted over the gangway, Ned Trunnion, who was holding a deck-lantern to enable the doctor to examine if life was quite extinct or not, uttered an exclamation of mingled fear and surprise, and almost let the lantern fall from his grasp. The shirt and breeches which this poor waif of the sea had on were covered with the broad arrow, and the features, though pinched and ghastly from cold and privation, were the well-remembered features of the man whose history he had but now been relating—of his old messmate, Dick Darrell.

'Poor wretch!' said the doctor, taking in all the facts at a glance; 'I'm not sure but it would be more merciful to let him die. Take him below.' The order was immediately obeyed, and restoratives applied, and when Dick opened his eyes it was to see bending over him the rough, weather-stained, but kindly face of his old shipmate, Ned Trunnion.

. . . . . .

'All hands on deck to take in sail!'

The boatswain's voice, loud and resonant as a steam fog-horn, startled the sleepers from their dreams of home and friends. Overhead on deck

were heard the sounds of hurrying feet, and the short, sharp words of command, uttered in a voice which the resuscitated convict below remembered only too well. It was the voice of Commander Oliphant, who had come on deck, roused by the noise made by the lowering and rehoisting of the pinnace. He was every inch a sailor, somewhat of a martinet; but the red scar that ran half-way down his forehead had taught him to be just, and now no officer in the service bore a higher reputation for fairness and impartiality in the treatment of his crew. That red scar had been caused by the hand of the man who lay below, and who by this time knew that he was again at the mercy of his old enemy.

Presently Ned Trunnion was called away to take his place in the fore-top, and a marine was deputed to keep guard over the castaway. The gale had by this time increased to something like a storm, and the ship pitched and rolled heavily in the high cross-sea that was running. Every stitch of canvas was taken in, with the exception of a close-reefed fore-staysail, to steady her head and keep it to the wind. The huge engine laboured and throbbed like the breaking heart of some defeated giant. Louder and louder raved the storm in all its fateful fury. Closer and closer the doomed vessel hugged the treacherous lee-shore that stretched out its jagged, saw-like ridges seaward, like the tentacles of some monstrous octopus. Over her decks the great green waves rushed in liquid avalanches, sweeping everything into the hell of waters that seethed around her.

Soon one of the heavy guns broke loose from its lashings, and went crashing first against the fore-mast and then through the bulwarks and over her side into the sea. The mast quickly followed, and for a moment the vessel heeled over on her side as if about to capsize. Terror proved too much for the marine's sense of duty, and, leaving his charge to look after his own safety, he hurriedly made his way on deck. His example was followed by as many of the sick as could leave their hammocks, and Dick was left alone, with only one companion, a curly-headed boy of sixteen, who had been wounded in the attack on Alexandria and had lost a leg. The convict's first impulse was to rush on deck like the rest, thinking only of his own safety; but the pleading voice of the maimed boy restrained him. He was still weak and stiff from his long immersion in the water, but his splendid vitality enabled him to rally from an experience that would have killed any one with a less wire-woven constitution.

'Don't be afraid, my lad,' he said in kindly tones, and gently patted the white and wasted cheek. 'I'll not leave you, even if the worst comes to the worst. In the meantime, however, you'll be safer here than on deck. I'll just run up and see how matters stand there, and come back to you again.'

So saying, he made his way up the companion-ladder and on to the forecastle-deck. The mast and the cordage were being cut away rapidly, and, freed from their weight, the vessel righted herself again. But she was now completely at the mercy of the elements, and it was only a question of a few moments for the end to come.

'Hold on for your lives!' shouted the captain, as a great white-topped wall of water came rushing up at the *Merlin's* stern. Instinctively every one obeyed; and in an instant the deluge had swept over the decks, like the besom of destruction, men, spars, boats, everything and every one who could not cling on with the desperation of despair. The bridge had been carried away, and with it the captain. Dick, who had clutched hold of the fore-castle-windlass, caught sight of his ancient enemy as he was swirled, still clinging to a part of the bridge, over the starboard-bow. Quick as lightning he darted to the vessel's side, and, hanging on to a broken stanchion, waited for her to rise out of the trough of the wave. She did so; and at the same instant the broken part of the submerged bridge, the rail of which had got entangled in the fore-chains, rose also, the captain still clinging to it. To stretch out over the yawning chasm to grasp the drowning man by the collar of his coat and drag him on board was the work of a moment; and then captain and convict were face to face.

. . . . . .

The gray dawn broke over the heaving waste of waters, lighting up a scene as woeful as mortal eye ever gazed upon. The gallant *Merlin* was a total wreck. She had struck, and thirty men and boys, all that were left of a crew of fifty, were clinging to the stumps of her broken masts. The nearest lifeboat-station was eight miles away, and long ere relief could come the *Merlin* would be in pieces. On the rocks ashore the fisherfolk were making frantic efforts to effect a communication with the wreck, but all to no purpose.

'Is there a man left,' shouted the captain, 'who has courage enough and devotion enough to make the attempt to swim ashore with a line? My arm is broken, or I'd try it myself, though it is almost certain death.'

Every one looked from the place where he clung to the dark, towering cliffs that frowned in front, and at the white, tossing, tumbling maelstrom that lay between. The strongest swimmer could scarcely battle with that terrible under-suction, and, if he could, the cruel waves would dash him to pieces amongst those spike-like rocks.

Every one looked, but no one essayed an answer. At last a man who with one hand clung to the broken mast, while with the other he supported the half-dead form of a curly-headed lad—a man wearing a uniform that did not belong to the Queen's navy, and which was stamped with the hideous badge that told rather of the Queen's prison—this man, while all else remained silent, raised his voice and spoke.

'Captain, I will make the attempt. My life has been hitherto worthless to myself and useless to the world; its sacrifice will be no loss to its owner, and may save that of some better man. I only make one condition; and that is, if I succeed, this youngster shall be the first soul sent ashore.'

A hearty cheer greeted these words, and the desired promise was readily given. A line was procured, one end of which the daring criminal tied round his waist, while the other was made fast to a stout inch manilla hawser. Taking a strong splinter of wood between his teeth, he waited till a great roller came coursing shoreward, flung himself into it as it broke over the ship, and was carried on its crest a hundred yards towards the shore. Then he disappeared, drawn back by the terrible undertow.

But Dick was experienced in surf-swimming, and the piece of splintered wood which he carried between his teeth served a useful purpose. As soon as the roller broke and dashed him down against the rocks, he would whip the piece of wood from his mouth and jamb it down among the interstices of the rocks, holding on till the receding wave would leave him. Then, bruised and bleeding, he would struggle over their jagged points till he heard the roar of another wave behind him. Again would he wedge his splinter into the chinks and crannies of the soft limestone rocks, and lie like a limpet till it had passed over him.

At last, with the assistance of the people on shore, he lay, battered and bleeding but alive, on the beach, above and out of the reach of the waves. While the womenfolk dressed his wounds and administered restoratives, the men quickly dragged ashore and fixed the hawser. A cradle was speedily extemporised, and in less than two hours every man left of the *Merlin's* crew was saved; Frank Vincent, the wounded boy, being the first to be sent ashore.

Dick recovered. He received a free pardon and a reward for his bravery, and afterwards entered the service of his once enemy but now firm friend, Admiral Sir Jasper Oliphant.

On Sundays, in the quaint old church at Castle Oliphant, accompanied by his comely young wife, the sister of Frank Vincent, Dick Darrell, in his sonorous voice, might be heard singing the *Te Deum*:

> We praise Thee, O God!
> We acknowledge Thee to be the Lord.

As for Warder Gunter, he had to pay the full penalty of Darrell's evasion, was reduced to the lowest grade, deprived of all prospects of promotion, and subjected to a severe monetary fine. He became more morose, more malignant in his hatred against the men under his charge, and was finally killed by a miserable wretch whom his cruelty had driven to madness. Of him it might truly have been said that 'the tender mercies of the wicked are cruel,' and that 'whatsoever a man soweth, that shall he also reap.'

THE END.

THE MONTH: SCIENCE AND ARTS.

REACTION IN ARTISTIC HOUSE DECORATION.

FOR some considerable time past a brilliant, glossy white has been in most extensive vogue for the decoration of the house. Its recommendatory features were that it gave the rooms a lighter, brighter, and cooler appearance, was easy to clean, and consequently more hygienic. Certainly these advantages have been obtained, and to a certain extent nothing can compare with the *tout ensemble* of a pure, spotless white. But the very glossiness is inartistic, harsh, somewhat commercial and inexpensive in appearance, more especially when the materials employed are of doubtful quality and the application is crude as the result of hurried, cheap labour. Taken altogether, it cannot compare with the 'matte' appearance of the flatted enamel which is so extensively used in French decoration. That beautiful, characteristic, velvety, egg-shell enamel is highly artistic, restful to the eye, round, soft, yet solid in appearance. The charm of the high-class French decoration of this character has always been the subject of great admiration, and it would have been more extensively employed had it not been so expensive. The French work is the outcome of great labour and pains on the part of the artist, which is obviously impossible except in those rare instances where cost is a secondary consideration. Recent experiments on the part of our colour chemists and manufacturers have, however, resulted in the perfection of white flatted enamel, the 'Dodo,' which, though not requiring elaborate care in its application, produces an effect very similar to the French enamel, the surface being beautifully soft and smooth in appearance. The material is made from pure zinc white, so that there is no possibility of that ugly discoloration which attends the use of spurious substances that maintain their characteristics for only a short while; it possesses great flowing power, so that it finds its own level surface without any signs of those disconcerting ridges or brush-marks frequently observable; has great covering capacity; and will not crack or blister. If a soft tint should be preferred to a dead white, it can be easily obtained to any required gradation of tone without forfeiting any of the soft, velvety characteristics. At the same time, it is quite as hygienic as its glossy brother, being capable of ready cleaning by soap and water without any danger of rubbing off. It dries quickly

and becomes very hard. Moreover, it is inexpensive and can be applied upon any material—upon iron-work as readily as woodwork, upon walls as efficiently as upon stone.

AN INGENIOUS NIGHT READING-GLASS.

Who has not experienced the exasperation of waking up in the middle of the night, and, wishing to ascertain the time, of fumbling about in the darkness for the elusive matches to illuminate the watch or clock dial; or, should electric light be available, has not been dazzled by the sudden emergence from the darkness into brilliant light? An ingenious inventor has overcome this troublesome possibility in a very ingenious manner by the design of what he describes as a 'night eye,' or glass, which enables one to read the time or print in the darkness. The luminosity, which is a purplish glow, is not produced by phosphorus or a luminous combustible medium of any description, but by a chemical radio-active action. It is essentially intended for use in the darkness when the eyes are in their night condition. All that is necessary is to hold the luminous material near a light for some ten seconds before retiring, so as to set up the chemical radio-active action. Then it will glow steadily all night. It will be seen that such a system is capable of application to a variety of purposes, more especially as it is so simple and absolutely safe from all points of view, and will last for many years.

A LADIES' HAT-HOLDER.

The prevailing tendency towards large dimensions on the part of my lady's headgear presents innumerable difficulties in regard to its safe and economic accommodation in cloak-rooms of theatres and other public buildings, not to take into consideration the perplexity of housing it securely at home in bulky boxes. To hang it from a hat-peg upon orthodox lines is well-nigh impossible, at least without serious likelihood of damaging or deranging the trimming. An inventor has, however, endeavoured to meet the situation by ingenious means, in the shape of a nickel tube about four inches in length by half an inch in diameter, from the top of which projects a small, wire-meshed hemisphere. Up and down this tube slides a counterweight attached to a thin chain, the opposite end of which carries a corresponding wire-meshed hemisphere, so that when the two halves come together a perfect ball is formed. All that has to be done is to pull out the sliding section of the ball, withdraw the hat-pin from one side of the crown, and pass it through the meshing of the ball, and then through the opposite side of the crown again, the hat thus being freely suspended and in such a manner that the trimmings are not touched in any way. To detach the hat the pin has only to be withdrawn from the meshed ball, when the latter falls back into a closed position by means of its counterweight. The utilisation of such a device as this should successfully solve one of the most perplexing difficulties confronting cloak-room attendants, and do away with the present methods, which are often provocative of much complaint through a hat being crushed.

SELF-WINDING CLOCKS.

Considerable stir was recently made by the announcement of the perfection of a clock that would go for one thousand days with a single winding. At first sight this appears a remarkable horological achievement, but as a matter of fact there are clocks on the market which do not require any winding at all—that is, in the ordinary sense of the word—and will go for years without attention. These timepieces are electrically driven, and can be connected to the ordinary house-lighting system; or should such not be available, four-volt batteries are in every way as serviceable. The winding mechanism is very ingenious, and successfully guards against the possibility of overwinding or straining the mechanism by this operation, which is the general cause of timepieces stopping or becoming deranged. There is a small motor carried in the clock which is automatic in its action. When the clock runs down the current is switched on and the spring rewound up to a certain predetermined limit, when the current is switched off, this cycle of operations being repeated continuously and without any attention whatever. Even breakdowns in the electrical supply are provided against. Such contingencies, though now reduced to the minimum, are unavoidable even in the best-regulated electric generating works. When the current is drawn from the house-lighting system it first winds an auxiliary spring before winding up the clock-spring proper. Should an accident occur to the supply, this reserve spring is brought into action, and it is sufficient to drive the clock for forty-eight hours, which in the majority of cases is ample to tide over repair of a breakdown. With a battery system such a provision is unnecessary. The consumption of electrical energy is insignificant, a unit of energy, representing from fourpence to sixpence, being sufficient for a period of about ten years. The automatic winding system is distinctly advantageous, for it serves to keep the timepiece regulated to a very precise degree, and spring fatigue is not experienced. The system is applicable to small clocks with a dial of some three inches designed for the mantelpiece as efficiently as for clocks having a dial measuring several feet across.

IMPORTANT DEVELOPMENT IN MOTOR-BOAT DESIGN.

The craze for speed in boats propelled by petrol or other explosion engines has brought about a remarkable development in the design of such craft which will probably be far-reaching in its results. Hitherto the general practice has been to crowd heavy, high-powered motors into as light and frail a boat as possible—mere egg-shells, in fact—and many have been the fiascos attending the racing of such freaks. Sir John I. Thornycroft, F.R.S., how-

ever, thought that the true solution of speed lay in the alteration of the design of the hull, and to determine this point carried out a series of elaborate experiments with small models following the lines of skimmers or hydroplanes. These proved highly valuable and aroused considerable attention in motor-boat and shipbuilding circles. He followed up these investigations with a full-sized motor-boat upon the lines of the model which gave the most promising results, and the preliminary trials with this craft have served to substantiate the points emphasised in the trials with the model. Above the water-line the boat does not differ materially in its appearance from the general craft of this type, except that it is whale-backed and somewhat broad, but beneath the water-line there is a very wide divergence from existing practice. Under the keel, at the prow, is a vertical fin plate carrying at right angles a horizontal plane. As the speed of the boat increases the prow rises, until at last, when a speed of twenty miles per hour is gained, the keel lifts clear of the water, being supported in front only by the plane which skims or glides along the surface of the water, while the stern, which is of special design, drops. In this manner the boat skims over the water with but little resistance from the latter, throwing only a little spray and scarcely any wash. The higher the speed the more steadily the boat rides, but in choppy water a quick, seesaw motion is observed, this being attributed to the extraordinary position of the centre of gravity. The speeds so far obtained, upwards of thirty miles per hour, have been marvellous, and could not be anywhere approached by a craft of the orthodox style with engines of the same power. Evidently we are on the dawn of a new era in motor-boat design, at least so far as racing vessels are concerned. In fact, if the speed were carried to a certain point, such a vessel would leave the water altogether and travel through the air.

A SPECIALIST IN GLOVES.

It is curious, and at the same time indicative of enterprise, to discover scattered here and there throughout the country specialists in certain phases of manufacture, the necessity of which does not at first sight appear. Among these is one who makes the design and manufacture of gloves for special purposes a prime study. When it is recollected that there are numerous occupations in which working with the naked hand or with the fingers protected by the usual type of glove is very injurious to health, or even impossible, the opportunities in this direction may be appreciated. And the demands upon such a specialist are as difficult as they are varied. For instance, the danger arising from the continued handling of the X-rays is provocative of dermatitis, the terrible effects of which have recently been brought home to the man in the street. Yet this specialist has succeeded in evolving a covering for the hand which extends complete protection to the digits. He has also evolved other coverings of a similar character for protecting the workman engaged in the handling of arsenic and other poisons, and as a precaution against anthrax while working with wool or hair, in which this insidious germ preferably lurks. Those fond of horse-riding and driving fully realise the difficulties of holding a steed in pouring rain, when the reins and gloves become as slippery as ice, and render gripping no easy task. Such will appreciate the benefit of a special glove that has been evolved. The glove-surface of the inside of the thumb and first finger, as well as the lower part of the third finger, is provided with a patent slip-in arrangement comprising a fine cord-netting, strong and durable. On a wet day the more slippery the reins become the tighter is the grip that can be obtained, and at the same time the leather fabric is given a very appreciably greater length of life. In fact, no matter for what a glove may be required, it can by this close observance of little details be provided, and will secure completely the protection desired.

CONVERTING NATURAL GAS INTO ALCOHOL.

An American industrial chemist has, according to a recent patent, evolved a process of converting natural gas into liquid alcohol, which should prove of some importance to those countries possessing abundance of this natural supply, for which some more remunerative industrial exploitation is sought. He points out that natural gas contains on the average 96 per cent. of methane, and this is transformed into alcohol by the action of limited portions of oxygen or air in the presence of a heat-absorbing fluid, such as steam, which prevents complete combustion. At the same time it keeps the temperature below the decomposing point of alcohol, the oxidation being induced and maintained by passing the gaseous ingredients through electrically heated gauze. The result is a direct conversion of the gas into alcohols and dehydrogenated alcohols, those which are known as wood alcohol (aldehyde of methane alcohol—i.e. formaldehyde). Consequently the product is a mixture of methyl alcohol and formaldehyde, but the latter can be easily separated. He points out that if the combustion is properly regulated and controlled, five thousand cubic feet of gas will produce approximately fifty gallons of alcohol. In the United States, where natural gas is readily obtainable at from twopence-halfpenny to fivepence per thousand feet, to produce a gallon of alcohol would entail an outlay of one farthing to one halfpenny for the raw material. The commercial practicability of such a process is obviously vitally dependent upon the cost of production.

METAL SHELVES FOR LIBRARIES.

During the past few years the employment of metal for shelves has undergone extensive development in connection with public libraries, not only on account of its greater protection against fire, but owing to its more economical qualities. There has been recently a still further develop-

ment, and one which is applicable to offices and warehouses as readily as to libraries. In this instance the shelves are made adjustable, and the arrangement lends itself to use in a variety of forms. It can be used in the centre of a room, transported from one part to the other, or placed against the wall with equal facility. It is light, absolutely indestructible, economical in occupation of space, and capable of indefinite extension. Moreover, it is built upon the interchangeable system, which appreciably improves its value. Another important feature is that a whole shelf with its contents can be removed bodily without interfering with or disturbing the rest. For this latter reason it has aroused attention in connection with offices and warehouses.

A NEW BY-PRODUCT.

Two French chemists have evolved a process which is now being exploited for the commercial production of a useful corn by-product. It is generically named 'Maisine,' and its perfection means that the albuminous portions of corn can be turned to valuable account. These investigators ascertained that corn-flour contains a gluten very closely allied to that of wheat, but differing from the latter inasmuch as it is soluble in alcohol, especially in amylic alcohol. Dissolved in alcohol and acetone solutions, the product thus produced, after evaporation, is a transparent, plastic substance. It can be combined with celluloid in varying proportions—20 to 75 per cent.—thereby lowering the cost and combustibility of this material. If the proportion exceeds 20 per cent., the resultant celluloid can be heated for three minutes to 155 degrees Centigrade without showing decomposition. Moreover, it can be associated with other substances with equal success, is available for food, and, like caseine, by combination with alkalies can be converted into glue and sizing substances. In the preparation of maisine the corn-flour is first dried, and all fatty matters removed by benzine. The corn-flour is then exhausted, and the resultant precipitate is filtered and dried. Maisine is yielded in a proportion of 13 per cent. from the corn-flour in this manner. Works have been established in France, and the material is being manufactured upon an industrial scale.

SEA-COW OIL AND BACON.

Apparently a new fishing industry has sprung up in Australasia in the hunting of the sea-cow—that curious, human-looking denizen of the deep, the appearance of which no doubt suggested the mermaid of tradition—for its oil and flesh are considered valuable prizes. The dugong, to quote its correct name, is mammalian, gregarious, and herbivorous, feeding on the rank grass and marine shrubs growing plentifully on the mud-banks and coral shores of North Queensland, which is its favourite haunt. The oil is worth from ten shillings per gallon upwards, and is stated to be of excellent medicinal value, especially for rheumatism; while its flesh, cured and salted, is a first-rate nutritious edible, especially for consumptives, owing to its heavy oil content, which renders it an excellent substitute for cod-liver oil. The sea-cow is caught with a net measuring one hundred and twenty yards in length and twelve feet wide, of two feet mesh, set, like the ordinary fishing-net, in the neighbourhood haunted by the mammal. The net is supported at either end by a heavy, wide plank, and by a plugged oil-drum in the centre. It is spread at night, and the sea-cow becoming entangled in its meshes is drowned. In the morning the fisherman can readily detect if he is in luck's way, since the white stomach of the trapped mammal floats high above the water. The prize is towed ashore, skinned—for the back sheathing is thick and hard in texture, rendering it useful for many purposes—the best sections of the flesh cut out, smoked, and salted, while the remainder is boiled down for the extraction of the oil. In the case of well-grown males, the value of the catch is further enhanced by the ivory of the two tusks, which run up to six inches in length by one inch in diameter. The equipment for the fishery is somewhat elaborate and costly, the net alone representing about forty pounds, while, in addition, there has to be retained a fleet of boats, as well as boiling and curing huts on shore. It is probably on account of the extent of this initial outlay that the fishery has not been extensively developed, but in view of the marketable value of the products, the dugong-fishery should be a new and promising Australian industry.

'MOTORING TO-DAY'—A CORRECTION.

Sir J. H. A. Macdonald requests us to express his regret that in an article on 'Motoring To-day' in *Chambers's* for June he stated that the Town-Clerk of Shrewsbury had not replied to letters written to him, as he is now informed that the letters were not received by the Town-Clerk.

AMERICAN EXCAVATION IN EGYPT.

In recent years Egypt—especially the valley of the Nile—has attracted unusual attention from Americans, because it has been included to such an extent in the routes for tourists from the United States. It is an interesting fact that American archæologists, also others interested in the excavation of antiquities, have taken part in this work more and more either through the donation of money to carry it out or personally going into the field. In a number of instances they have co-operated with such organisations as the Egyptian Exploration Fund, and it may be said that their work has been heartily appreciated. It is needless to say that the Department of Antiquities connected with the Egyptian Government has general charge of the excavations. It is under the direction of the noted savant M. Maspero, who has so long been an authority on this subject. In fact, the department is practically under French and German supervision. To secure permission to make

excavations it is necessary to have authority from this department. Some of the Americans who have taken an interest in the work have expressed the opinion that the present system of getting permission is too restricted, and that a broader policy should be shown by the authorities. For instance, it is the usual custom for an excavator not only to contribute one-half of the objects he secures to the museum at Cairo, but to allow them to be selected by the authorities of the Department of Antiquities. It has been asserted that they sometimes reserve the most valuable parts of the collection, which prevents museums elsewhere from obtaining the results of excavators from these countries. A feeling prevails in the United States that the work might be made more international in scope, since some of the individual projects have had such important results. An illustration of this fact is the discovery of the tomb of Queen Thiy in 1907, which was among the most valuable discoveries in the history of the excavation. The success was due almost entirely to the enterprise and liberality of Mr Theodore M. Davis, an American enthusiast in Egyptian archæology. Up to the time Mr Davis began excavations it had been impossible thoroughly to explore this region through lack of funds. At his own expense he had an electric light plant installed, so that work could be carried on night and day if desired. He paid for a corps of labourers, and employed noted experts in excavation. It is admitted that only by this method could the discovery have been made, and if others donated funds as liberally much greater results would be obtained from the Nile Valley than are now secured.

SULPHATE OF AMMONIA FROM PEAT.

Probably there is no question that has so extensively occupied the mind of the chemist and the inventor as the commercial exploitation of the vast deposits of peat abounding on the surface of the globe. The objects of their investigations have varied from the production of fuel to obtaining chemical compounds for animal foodstuffs or other commodities. Success, however, has only been moderately achieved. The latest project, and one which incidentally appears to be assured of practical success, is the manufacture of sulphate of ammonia. This chemical compound, which has extremely high fertilising value, has been principally obtained heretofore as a by-product in gas and coke production, and the utilisation of a special process for the production of this article marks an important development in applied science. The invention has passed through the experimental stage, and a huge plant capable of turning out some five thousand tons of sulphate of ammonia per annum has been erected upon an Irish peat-bog, the exploiters having acquired some six square miles of the raw material. The value of the invention lies in the fact that peat containing as much as 75 per cent. of water can be used, and that distillation is effected by moist combustion. A special type of furnace has been evolved, and combustion is carried out by means of a blast of air charged with water at a regulated temperature. The resultant gases contain paraffin-tars, acetic acid, and ammonia, each of which is highly valuable. The ammonia-gas is conducted to an acid-tower, where, on its meeting a stream of hot sulphuric acid, sulphate of ammonia is formed. In the preliminary experiments it was found that five tons of the fertiliser could be extracted from one hundred tons of peat, exclusive of the other by-products, which in themselves are valuable. The process is remarkably novel, and, being economical, can be developed upon commercial lines with complete success, a ton of the sulphate of ammonia costing about six pounds to produce, while its market value is about twelve pounds, giving a gross profit of 100 per cent. Furthermore, owing to the remarkable fertilising value of this compound, the demand is far in excess of the supply; and, as this demand is increasing, the possibility of the product depreciating in its marketable value is very remote.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

NOCTURNE.

Out on the bar, the sea, with voice incessant,
Sings to the night above it stretching wide—
Throbbing with stars, but shorn of her young crescent—
The triumph-song of the returning tide.

The tide returns, but the still, narrow river
Flows to its meeting, dim, remote, and cool,
Holding faint starshine; brighter stars aquiver,
On its white beaches, sow each sandy pool.

Light which is yet not light is all around us,
Darkness that is not darkness fills the air;
In the soft, moonless gray all things that bound us
Are blurred and blended, magical and fair.

Only behind us lights are redly burning
On the long bridge, in tremulous lines below
Their rays reflected; and our path, in turning,
Before us shows the hillside lamps aglow.

Oh, summer night and distant tide-voice calling!
Your softness and your sounding fills my heart,
Making a dream for other nights' recalling,
When Memory holds the Past's dim gates apart.

CLARA SINGER POYNTER.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
2*nd*. For its return in case of ineligibility postage-stamps should accompany every manuscript.
3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.
4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE TUTOR OF TYNDRACH.

By H. HALYBURTON ROSS, Author of *A Romance of Ord*, &c.

IN FIVE CHAPTERS.—CHAPTER I.

THE gentle trickle of the burn over its pebbly bed, the soft, fresh balm of the mountain air on her face, the luxurious ease of the couch of heather on which she lay, all had a soothing effect on Ann Graham. She was half-asleep, her eyes closed, the black hair loosened about her head, her arms stretched out, displaying the supple grace of her young figure, when a voice behind her made her start into a sitting posture.

As she opened her eyes the strong daylight dazzled her for a moment, while the abrupt return to consciousness perplexed her mind.

The man's figure before her seemed part of a dream, but the question, repeated for a second time, convinced her: 'Can you tell me how far it is to Inchie?'

There is a matter-of-fact sound about all such inquiries as to time and distance that discourages illusions. Ann rose agilely to her feet and faced the stranger.

'About a mile,' she said; 'that is, to the village. Were you going there?' Her eyes studied him disinterestedly as she was speaking.

He was struck by the contrast between their vivid blue and the almost coal-black hair waving on her forehead. There was a fine irregularity about her features, too, that interested him; and he forgave the freckles for the clear, healthy pallor of the skin beneath.

'My ultimate destination is the manse,' he said.

Ann caught her breath in surprise.

'You live there?' he surmised quickly.

She nodded. 'I have lived there all my life. The minister is my uncle.'

The coincidence evidently did not strike him as extraordinary. When one has had a certain experience of life it is not the coincidences that surprise, but the scarcity of them.

'It is the minister I want to see,' he said. 'My name is Selwyn. I am with Lord Maudsley at Tyndrach, as tutor to his sons. He is writing a book about this district—the legends, history, superstitions, &c.; and, hearing that your uncle was a great authority on local lore, he sent me over to try to glean what help I could from him.'

Ann smiled. 'Yes, my uncle can tell you everything,' she said with the assurance of perfect faith. 'If you come now we shall be just in time for tea.' She glanced round for the hat she had discarded as she spoke, and seeing it lying at some distance on the heather, made a dive for it, and thrust it carelessly on to her head.

While she was doing so Selwyn noticed that there was a modest pearl ring on the third finger of her left hand, and a vague curiosity as to the type of man who had appropriated this girl with the vivid eyes and the strong, sweet face made itself felt within him.

'Are you really going to show me the way?' he said, smiling involuntarily at her unself-conscious behaviour.

'Yes, of course. I can take you by a short cut, and it is time for me to be going home,' she said in her most business-like tone, but smiling at him with frank good-comradeship nevertheless.

He prepared to accompany her, congratulating himself inwardly on the prospect of her companionship. There was something delightfully fresh and stimulating about her personality, yet withal a suggestion of deeper possibilities hitherto unawakened. The man who married her would find himself faced with them some day, he reflected cynically. How would the discovery affect their mutual lives?

The path Ann chose was little more than a sheep-track through the heather, and led steeply downwards, so that it was impossible for them to walk abreast. But Selwyn was content to wait until a more propitious mode of progress presented itself. An exclamation of delight escaped his lips

 [*All Rights Reserved.*]

as the first glimpse of Loch Inchie burst on their view.

'That is the road down there,' said Ann, half-turning to point to a narrow ribbon of white winding by the loch-shore, 'and those are the glebe-fields on the other side. You can't see the manse—it is hidden by the trees; but we will go across the fields; it is the shortest way.'

The manse cows were being driven in for their milking as the pair entered through the white gate into the glebe. The barefooted urchin at their heels stared curiously at the stranger by Ann's side as they passed.

'Jock's wondering where you came from,' she said, turning to her companion with frank amusement; but the expression of half-conscious interest and admiration in the tutor's eyes made her flush and avert her head quickly.

'He thinks I am some genius of the mountains,' said Mr Selwyn in his low, languid voice.

Ann realised suddenly that she was sorry the walk was so nearly at an end. Little had been said by either of them during the course of it, yet the novelty of the association with a stranger, and especially one of the type of Mr Selwyn, had lent it a peculiar charm.

They entered the house by a side-door and made straight for the dining-room. Tea was spread out on the table, and the minister was seated at one side, a book propped against the sugar-basin in front of him.

'Uncle Robert, this is Mr Selwyn,' said Ann, coming into the sombre room like a whirlwind. 'He has walked over from Tyndrach to see you.'

The minister started up from his place with a bewildered air. Visitors were few and far between at Inchie, and the treatise on *Ossian* in which he had just been immersed still held sway over his mind. But a few words from the tutor as to the real object of his mission soon brought him back to the present. His delight at finding an audience for his pet hobby was unbounded. For the first quarter of an hour he completely absorbed his guest, while Ann bustled to and fro making fresh tea and attending to the tutor's material wants.

'So his lordship is going to write a book?' said the old man at last, leaning back in his chair and surveying Selwyn quizzically over his glasses. 'I am thinking, sir, it will be you who will write it, and he who will sign his name.'

Selwyn hurriedly disclaimed the suggestion.

'Eh, but Malcolm would have been interested to meet you!' went on his host, turning significantly to Ann as he spoke.

The tutor, too, glanced at the girl, remembering his former curiosity as to the identity of her lover, and wondering if this could be he. But she only nodded her head in agreement.

'Malcolm's my nephew,' the old man continued in explanation. 'A minister too; his parish is near Golspie—a lonely part, but it is his first call. We are expecting him down to-morrow.'

So, perchance, Ann had gone up on the hillside that afternoon to dream about her lover's coming, reflected Selwyn cynically.

'I've only one grudge against him,' continued the minister—'that he is going to take away my niece here. We've put off the evil day as long as possible; but it's natural young people should be impatient.'

There was no mistaking the consternation on Ann's face now. 'Oh uncle, you know I'm not impatient!' she exclaimed hotly. 'I don't want to leave you at all, or Inchie. Malcolm knows that. I tell him so every time he comes.'

'Hoots, lassie, don't fly out like that!' said the minister with a sly glance at his guest. 'We'll say it's Malcolm, if you like. There's been a plaintive note about his letters lately. I don't blame him for wanting companionship.'

Ann pushed back her chair abruptly, and rose to her feet. 'I'm going into the garden,' she said.

Selwyn opened the door for her, but she carefully avoided his eyes.

'We'll follow you later, after we've finished our talk,' called the minister after her, still smiling.

The manse garden sloped to the loch. It was surrounded by high walls covered with ancient fruit-trees, and everything planted within its precincts seemed to grow and flourish miraculously.

By the time Ann had wandered twice up and down her favourite herbaceous walk she had begun to ask herself the reason for her sudden ebullition of feeling. Marriage with her cousin had long been an established fact in her calculations. The possibility of any other future had never even suggested itself to her. Her affections were equally divided between her uncle and her cousin, and marriage simply meant for her the passing from the guardianship of the one to the other.

These two men had up to this time been the only *dramatis personæ* in her life, and it was natural that she should have fallen in with their conclusions. But this evening for the first time she seemed to see the situation through the eyes of another—the quiet, self-possessed stranger who had walked suddenly into her life on the breezy hillside, bringing with him a whole world of hitherto undreamed-of possibilities.

What would he think of the future she contemplated, of the man who was to be her husband? She had an unwelcome connotation of certain attributes of her lover as these questions framed themselves in her mind—an habitual clumsiness of movement, a want of finish and control, a lack of reserve and strength—that offered a striking contrast to the subtle air of connoisseurship and experience that were the tutor's predominating characteristics. The next moment she was reproaching herself for her disloyalty.

Malcolm loved her—second at least to himself; of that she needed no proof. The making of a

home for her had been his first object ever since he set out on his career. If he had an undue opinion of his own powers and capabilities, she had always hitherto believed that his confidence was well founded. Of the stranger she knew nothing except that he had brought a new element into her life, and one, too, of discord.

'Ann! Ann!' The minister was calling her.

She turned back up the path she was traversing.

The two men had just entered the little door at the top of the garden, and were coming towards her.

She took in every detail of their appearance as they approached; her uncle's familiar figure, in its rusty black, the stooped shoulders, the shrunken face overgrown with gray whiskers, the kindly, preoccupied eyes behind their glasses; and beside him, cool and inscrutable, the stranger. At this distance he appeared almost boyish, with his slight figure and pale, smooth face; but on closer inspection Ann knew there were tell-tale lines about his eyes and round his lips that betrayed the maturity of the man. There was an indescribable something in his air, too, that inspired her with confidence—a sense of accumulated wisdom and knowledge of the world that made even her uncle, old as he was, appear simple and unsophisticated.

'I have ordered the gig, and am going to drive Mr Selwyn back part of the way,' called the minister as they approached. 'He has promised to walk over to service on Sunday and take dinner with us. I want him and Malcolm to meet.'

Ann felt the colour mount into her face. She knew the tutor's eyes were on her face, and knew too that he must inevitably gauge the secret of her discomfiture. Yet why should she object to a meeting between the two? She was about to force herself into a cordial confirmation of the invitation, when Selwyn's quiet voice interposed.

'I said if I could manage it, sir,' he said, turning to the minister with his easy smile. 'My time is not my own, you see. If I do not come you will understand that I have been prevented.'

Ann's heart sank as she listened. So he had truly interpreted her silence! A quick shame seized her; all the affection and loyalty she had ever felt towards her cousin rose up to reproach her.

'Do try to come!' she cried earnestly, her blue eyes fixed pleadingly, almost authoritatively, on his face. 'We shall be so disappointed if you do not manage it!'

'I will do my best,' he returned gravely. 'It will be my last chance of a conversation with your uncle. I am going to London next week.'

'To London!' echoed Ann quietly.

'I'm sorry to hear it,' put in the minister. 'But you'll be coming again to these parts?'

The tutor smiled curiously. 'Who knows?' he said with a light shrug. Then he held out his hand to Ann. '*Au revoir*, Miss Graham. Perhaps you will take me for a row on your beautiful loch on Sunday—if I come?'

'Yes,' said Ann, smiling back into his face, 'I will—if you come.'

(*To be continued.*)

ABOUT TEA AND COFFEE.

So great a part is played to-day by tea and coffee in the social life of most people that it is hard to realise that it is only within quite recent times that these beverages have taken the place they now hold. Though both were introduced into this country between two and three centuries ago, it is within the memory of men and women who still object to be reckoned 'old' when tea was looked upon as essentially a luxury. By the working classes it was indulged in only on high days and holidays, and used sparingly even by others higher in the social scale. The chief reason for this was, of course, its cost. If it is difficult to know how the place of these beverages was filled in those earlier times, it is harder still to imagine that they will ever be displaced. Indeed at present the tendency is all the other way, and the growth in consumption of both tea and coffee—whichever happens to be the national preference—is everywhere quite marked. Looked at broadly, this fact is one which may be viewed with entire satisfaction, though to many there is not wanting an element of regret.

It is not easy to find a definition of 'food' which will satisfy every one; but, as liquid of some sort is a necessity in the animal economy, anything which can fill the place without entailing prejudicial effects may fairly claim a kindly consideration. That tea and coffee have not only claimed that consideration but have received a favourable verdict goes without saying. That verdict, however, has not been absolutely unanimous, and both have constantly to defend themselves against the aspersions of a small but active minority. This opposition has an easy case when their fight is against tea as a constant and, very nearly, sole article of diet. The devotees have the teapot always on the hob, with the result that the tea is stewed, not infused; and thus, in addition to using it to an extent it is not intended to be used, they drink the decoction prepared in the most hurtful way. But as an accompaniment to solid food, or simply as a beverage when one is tired, what better or more delightful could be desired? And there is the added satisfaction of knowing that the stimulant is obtained without any after reaction. Whether, therefore, as an adjunct to the serious meal or for the delicate sipping of

the drawing-room or the tea-room balcony, there is no beverage which can compare with it.

Much of the hostility which does exist arises from the ignorance or forgetfulness of the fact that there are teas *and* teas. We may get broadly at the difference by recalling to mind the two conflicting 'schools' in the matter of infusion. 'Never infuse longer than three minutes,' say the followers of the one. 'A three minutes' infusion was never heard of in the olden days,' retort the others, and then proceed to recommend fifteen or twenty minutes. Both are right, for, as we have just said, there are teas *and* teas. Two stories recur to us which will illustrate this point, and both have the merit of being true. An eminent medical man quite unintentionally made an experiment one evening. Some friends were being entertained, and at eight o'clock tea and coffee were served. At eleven o'clock, after the guests had left, his wife, with that curiosity inherited from our common mother, expressed a wish to try the tea. It had been standing infusing under a tea-cosy for three hours. Each had a cup; and the verdict of both was that they had never tasted anything like it—it was simply splendid! The other story is that of a commercial traveller who, in passing a certain order to his firm, advised them that it was useless to send *fine* tea, as all the people in the place to which it was going drank whisky and smoked Irish roll. Something was wanted which would grip their throats! If the good doctor and his lady had tried their experiment with the tea which *could* have been sent to such instructions, the verdict might again have been that they had never tasted anything like it—but they would have taken good care never to taste it again.

When people complain that they cannot take tea without after ill-effects, it simply means in nine cases out of ten—perhaps in ninety-nine cases out of a hundred—that they do not know this broad distinction we have just made, or, knowing it, have failed to act upon their knowledge in the purchase of their tea. Those who suffer from dyspepsia need not fear tea if they intelligently select it; and those equally with delicate palates, who therefore can appreciate flavour, have not yet known the full pleasure of tea-drinking if they have been content with the plain or harsh sorts which are to be had in such abundance. Of course those who deliberately prefer the latter should undoubtedly hold by the short infusion. Perhaps for them a certain teapot which has been on the market for some years will have some interest. Its leading feature is that it can stand in two positions, and by putting it in the second the water is completely withdrawn from the leaves and the infusion is consequently checked. Teas that require such treatment, however, are not to be mentioned in the same breath with the delicately flavoured, high-grown Indian teas or the choice, mild China teas.

Another supposed trump card which the adherents of the short infusion school are never tired of playing is that of tannin, and the larger quantity extracted from tea the longer the infusion continues. They are quite right as to the fact. We remember, however, a conversation between a well-known chemist and an equally well-known tea-dealer. The former was telling of some experiments he had been trying with the object of eliminating tannin from tea. 'What are you worrying yourself about tannin for?' asked the dealer. 'Doesn't the milk or cream neutralise it?' 'Of course it does,' said the chemist. 'I never thought of it.' And so tannin does not need to worry any one who drinks a good quality of tea and uses milk or cream. Some, however, do not use either, and what has just been said may induce them to do so now.

Is milk or cream, it may be asked, the better? We would certainly say milk if the tea is really fine, for milk does not hide or smother the flavour as cream does. In the case of some teas cream is certainly desirable, for the less of the flavour of the tea one feels the better!

It is noteworthy how, from the point of view of economy, really fine teas of the style indicated are an advantage. The longer infusion needed to extract their flavour and aroma calls for the use of actually less tea to secure a reasonable average strength of liquor. There is a danger by using too much of making the tea so strong as to give the impression of 'bitterness.' Then this same class of tea is better with milk than cream; and the town dwellers with mental visions of their dairy bills can see the advantage without further emphasis.

Another matter connected with the making of tea worthy of special mention is the teapot itself. Should it be of earthenware or metal? There is no doubt that on the tea-table a silver pot, with the service in keeping, is very attractive; but from the strictly practical point of view the humbler earthenware has the advantage. It should be of good quality and internally well glazed. Whenever the slightest flaw in this respect makes itself evident the pot should be discarded, as the tea is then an infusion of tea and clay. In one of the states of America it is, we believe, a legal offence to serve food in hotels and like places on earthenware which has become cracked. The object is quite a laudable one, though it might have been supposed that the objections of the patrons of these establishments would have secured the same result. Another point to be attended to is the absolute cleanness of the inside of the pot. How many of the ladies who read this can put their hand inside their teapots or have a brush that can sweep round every point of its inner surface? We remember a little experience told by a gentleman. His tea, day after day, had a most unpleasant taste. He puzzled himself as to what could be the cause. He at last lifted the teapot-lid, and, after smelling without getting a clue, he suddenly swept his finger round the inside, and the point came out black. His landlady had, doubtless, been rinsing out the pot

with hot water but had not been *cleaning* it, so that it had got badly 'furred.' Is it necessary to say that in cleaning the inside of a tea or coffee pot no soap or other such material must be used? An even more striking instance of what *can* happen is afforded by an experience of another gentleman. He too was having difficulty not only with the tea but with the teapot. The tea was bad and the pot was pouring badly. A friend chanced to call at tea-time, and, seeing the trouble, concluded that something had got into the spout. Careful examination revealed the fact that a piece of lead-pencil was sticking in it. At last the obstruction was extracted and found to be from an inch to two inches long. How it came there no one could tell. Perhaps it had been used to clear a previous block, and, slipping from the fingers of the operator, it had been allowed to remain!

The objection to metal is simply that there is a danger of giving the tea what is known as a 'metallic' taste. If, too, the pot is electroplated, the plating in course of time wears through with disastrous results. An example of this came some time ago to our knowledge, and the fact that in this case it was a coffee-pot does not affect the moral. A lady complained bitterly to her merchant of the coffee he was supplying. Nothing could be wrong with the making—she attended to that herself. The next morning the coffee was as bad as, perhaps worse than, ever. Calling a cab, she took coffee-pot and coffee to the dealer to let him see the wretched stuff for himself. It certainly was bad enough; the liquor was positively green. However, a fresh infusion in another pot was made on the premises from the coffee the lady had brought with her, with results entirely satisfactory. The coffee-pot itself was then examined, and with the discovery that the plating was much worn the mystery was solved.

Yet another point may be mentioned—the water. Its character is of infinite variety, some more, some less, suitable for tea; but at least we can see that it is freshly drawn, boiled on a brisk fire, and poured into the pot immediately it boils. It is no mere sense of the poetic beauty of the phrase that makes the Chinese say that the water should be taken from 'the rippling brook,' but rather their knowledge of the virtue of thorough aeration.

There are several causes, it will thus be evident, apart from bad tea which can give rise to legitimate dissatisfaction; but these are completely under the control of the individual user, and one or other may be suspected if anything goes wrong. For the rest, the old doggerel has at least sound sense, and its advice is commended to all whom it concerns:

> The kettle must boil,
> The teapot be hot,
> Or a cup of good tea
> Can never be got.

It might prove an interesting inquiry how it has come to pass that one nation has given tea and another coffee a leading place in its dietary. In our own country we consume over six pounds per head per annum of tea and barely three-quarters of a pound of coffee. In Holland and the United States the consumption of coffee is some eighteen and a half pounds and eleven pounds respectively, and tea in neither case one and a half pounds—in the United States, indeed, little over one and a quarter pounds. It is difficult to account for the very low place coffee takes with ourselves, unless it is due to the supposed extra trouble of making it and the undoubted extra cost, especially if one is to use real—that is, pure—coffee. For while the average price of a good coffee may be taken at one shilling and sixpence or one shilling and eightpence against, say, two shillings for tea, the larger quantity needed of the former for the same measure of liquor makes it distinctly more expensive. Another consideration which tends to discourage its use is the fact that once it is roasted, and, even more emphatically, once it is ground, it steadily deteriorates in quality, while tea retains its freshness and flavour for many months if kept in a close canister. This means that coffee must be bought where one can depend on getting it freshly roasted and ground—preferably roasted only, leaving the grinding to be done at home as required. Even then the purchases must be small and frequent—and how lazy people have become when this proves a burden not easy to be borne! After all, coffee is well worth some trouble, and lovers of the fragrant berry would fain see its use increase.

In this country we have nothing to fear on the score of quality, for, in spite of our limited consumption, the finest coffee grown comes to these shores. Why the Continent has got such a name for coffee it has always puzzled us to know. As a rule it is served stronger and blacker there than here. With us the emphasis is laid on the flavour, and it is held that the high roast which obtains abroad is *over*-roast, which tends to destroy the flavour. If, however, it is blackness of liquor and not brownness that is wanted, there should be no difficulty in meeting individual tastes—at any rate in the larger towns, where coffee roasting is to be seen every day in shop windows or is evidenced by the fragrant smell which meets one's nostrils in walking along the streets.

One advantage we certainly have over some other countries, and that is that the only adulteration allowed is chicory—a harmless and in some respects a beneficial article. It is used to give strength and thickness to the liquor, and also to cheapen the price. On the Continent and in the United States coffee is faked in numberless ways and to an extent which has only become publicly known through recent revelations. Some of the so-called French coffees sold here suggest a doubt as to whether the makers are aware of any distinction between coffee and chicory, so large a proportion of the latter obtains in them.

The latest claimant for public favour is a coffee freed from caffeine. It is quite a genuine coffee, and not to be thought of as a 'fake.' To read, however, of the terrible evils resulting from the

presence of caffeine, one wonders how any regular coffee-drinker can possibly survive. We fear these evils must be greatly exaggerated for advertising purposes; and we scarcely think that the new coffee will win many converts among the regular users of the standard article. It lacks a something—it may be simply quality—which the other has. On the other hand, it may secure a quite new clientele, just as cocoa has so successfully done.

We have hinted that the supposed trouble in making coffee accounts partly for its limited use. The making, however, is really as simple as that of tea. There are many elaborate machines, it is true, but their chief value is as table decorations. Coffee can be made as well in an earthenware jug as in the costliest and most elaborate *cafetière*, and the former has the advantage of being easily kept clean. How much good coffee is spoiled by a cloth strainer not being absolutely sweet or a metal part having got rusted it would be hard to tell. With the earthenware jug, on the other hand, every part is seen and easily got at, and it would be through almost unthinkable carelessness if anything went wrong in this respect. The day of coffee may still be to come in this country, though we think it unlikely that it will ever rival tea in popularity.

VANESSA.

A MOTOR IDYLL.

By Sir J. H. A. MACDONALD, K.C.B., LL.D.

CHAPTER X.

WE were all engaged to dine at Oldsborough that night. Vanessa came from her room dressed in the simplest style, and with no jewellery but the diamond hoop, which shone upon her arm. I had never seen her before as she looked that evening when we were driving to the castle. Her gaze was inexpressibly far away, except that, when now and again her eyes and mine met, the curve and dimple of a smile would flit over lip and cheek for a moment.

It was not a large party. Dear little Mrs De Burgh was there, and was overwhelmed with congratulations on her tiny Admiral, who had been sent home laden with gifts which Vanessa and the mayoress, and even Tommy, had showered upon her after stopping at the town's bazaar. The marquis took my mother to dinner. He was alternately grave and jerkily gay, and mother seemed to manage the occasion with all her own gentle tact. Vanessa had fallen to a Guardsman, an old army comrade of our host, a keen sportsman and motorist, so their conversation was lively, although the look I had seen on her face did not come out altogether. I fell to a youthful cousin of the marquis, who had apparently not seen food for days, so eager was he in appetite, and, being somewhat bashful, caused conversation to lag, for which I was not sorry, as I was observing my doves with all a matchmaker's eagerness.

It was a lovely evening, and after dinner the long open windows tempted the ladies out on to the terrace. Vanessa and I found ourselves—*of course* by accident—separated from the rest, in two wicker chairs under the spreading branches of a great tree. We did not speak, but I held her hand, and little pressures said all we had to say.

When the gentlemen came out, which they did not delay long to do, the marquis came across—with what I could see was an affectation of leisureliness—to where we were seated. But the affectation lasted only until then, for, turning to Vanessa, he said, 'Come down the walk here. There is a lovely view in the twilight.' His tone was that of one who intended to be the master for the moment, whatever might be his fate later; at least, so it struck me.

She said not a word, rose slowly, and then said inquiringly, 'This way?' turning her hand towards the path. He inclined his head gently, and she went forward. He turned a glance towards me, and, seeing me lolling without a suggestion of a move, he said, 'You will forgive us?'

I could not help feeling a little happy malice, and shook my head, laughing, my lips forming the word 'Never.' Our eyes met, and he understood me, and in a moment passed from my sight. I closed my eyes, and my lips murmured a word that spoke of longing desire for these two whose fate I knew was about to be sealed for ever.

I sat in my secluded corner for about a quarter of an hour in happy anticipation, with just that tinge of uncertainty which tones all human hopes until realisation comes. I fell into reverie, and my artist's mind drew pictures of a future that seemed to me now to be my deepest interest in life.

I was brought back by a voice, her voice, silvery and sweet, 'Are you there, Mitey?'

In a moment I was on my feet and running down the path. As I ran I saw nothing, but was suddenly pulled up by the words, 'Here, darling!' and, turning sharply, I found myself in front of a great drooping ash, through the branches of which I saw the two standing facing me, her hand drooping over his shoulder, and his clasping it.

With a rush I went through the branches and stood in front of them. She brought down her hand, still holding his, and gently made him move a step forward. I held out my hand, and he held

out his; but, giving a little laugh, she moved his hand aside and said quietly, 'No, no; this is my dear sister.'

It was impossible to mistake her meaning, so there was nothing else for it. He leaned forward and I presented to him my cheek. He kissed me, saying, 'You have been a sister to me too, I know.'

It was so like Vanessa—always unselfishly eager to bring others into her happiness! I fell upon her with the ravenousness of a wild beast, and kissed her again and again, a great tear running down my cheek.

'I am glad, Mitey darling, that you are the first to know,' said Vanessa; and, turning to her lover, she said archly, 'What next, oh king?'

After conferring, we all agreed that no public announcement should be made that night, as the guests' carriages were all at the door, and it might make it awkward for them to appear to go away abruptly after such an announcement, and still more awkward for them to decide when to go if they did not go at once.

'Vanessa,' I said, 'go in and join mother, and I will bring this man in after a few minutes.'

When we came in I found mother and Vanessa on the sofa together, and mother looked at me with a glance which said plainly, 'I understand,' and rose to go.

The marquis accompanied us to the door, and assiduously helped mother and me with our cloaks, leaving Vanessa to be aided by Uncle Goodman, after she had carefully wrapped him up in his greatcoat. And so we passed out and entered the carriage.

We were a strangely silent party on the way back, and somehow I felt sure that the dear old man's thoughts were running parallel with ours, for once he leaned across and laid his hand on Vanessa's, she putting her other hand over his and returning the caress, while her eyes went down, and the tell-tale blood mantled over the sweet face, as he said, 'What a day, child! What a day!'

When we reached home I hurried mother away, so as to leave the dear old man to mount the stair on Vanessa's arm; and once, glancing back, I saw them on the landing, she with her head bowed down, and he with his hand upon it and his eyes looking upwards. I took mother into the sitting-room, thinking Vanessa would follow us when she had left the uncle at his room in charge of the faithful Stocks. But she did not come. I was just about to tell mother what had happened, when she said quietly, 'You need not tell me. I saw it in her eyes when she slipped in through the window. She came to me on the sofa, and spoke no word; but the joy of a new life was shining in the sweet face, and I knew, and I felt that she was certain of it, for when she was able to speak all she said was, "Dear Mrs Bellair," and she stopped as if there was no need for more words. In reply I only smiled a query smile, and she gave an almost imperceptible nod in answer, but it was quite enough.'

'Mother,' I said, 'I am almost too happy for words,' as I led her to her room. On reaching the door we found the lights turned on, and Vanessa standing on the hearthrug. She simply flew at mother and clasped the latter tightly in her arms, and there the two remained motionless for ever so long, until I came forward and laughingly pulled them asunder, saying, 'Do you want me to be jealous of you both at once?'

What a woman's chat we had that night, until mother suddenly assumed her hen-with-the-chickens tone, and ordered us off to bed—an order which we obeyed in the letter but not in the spirit, as Vanessa and I lay down together until we had had our talk out—that talk which no one can understand except the girls themselves, in which there are rapid changes of phase from little-child prattle and caresses to discussions on dress, wild opinions about persons, and lovingly expressed serious thoughts about present and future—full of confidences such as men never exchange.

'Vanessa,' I said, as I kissed her good-night and left her, 'this is your real spring; enjoy it, darling, for you can never have another. You may have a glorious summer and a golden autumn; but the bloom of spring is now, and only now. May your joy in it be unbounded!'

'Mitey,' she said, with her last kiss, 'you used to call me your angel. I know you are mine.'

And Mitey went to her room with a great rejoicing in her heart.

(To be continued.)

THE ROMANCE OF THE INCANDESCENT GAS-MANTLE.

By Frederick A. Talbot.

THE Atlantic greyhound was bowling along merrily at twenty-five and something knots per hour. It was the last lap on the homeward run to Liverpool, and with pent-up enthusiasm, the excited passengers were leaning over the taffrail straining their eyes to catch in the fading twilight a glimpse of the first link with home—the Fastnet Light off the south-western corner of Ireland.

Presently a cry of 'There it is!' rang out, and across the horizon majestically swept a narrow spoke of white light which, although the daylight had not yet departed, was of striking brilliancy. As the steamer swept hurriedly onwards the beams became longer and more intense, and it was not

long before the lantern itself was descried on the skyline. When the beam came face to face with the observer on the deck, even at that great distance, the seven hundred and fifty thousand candle-power ray momentarily blinded one.

The intense brilliancy of the light, which was given full effect by the clearness of the atmosphere, inevitably provoked a discussion as to the origin of that penetrating beam. 'Electricity' was the general reply, for it seemed impossible that any other type of illuminant could be capable of shedding a flash of such searching power, possible of observation at twenty or more miles distant. Consequently, when the writer advanced the statement that it was gas generated from oil, in conjunction with the unpretentious incandescent burner and mantle, his remark was received with incredulity.

Yet such is the case. The new Fastnet Light, raised two or three years back beside that which had done satisfactory service so many years at this outpost of the British Isles, probably marks the crowning triumph of Baron Auer von Welsbach's remarkable invention. When the illuminant for the new structure came to be considered, vaporised oil in conjunction with the incandescent mantle proved to possess such overwhelming advantages from every point of view—maintenance, simplicity of control, definiteness, intensity, brilliant whiteness of light emitted, immunity from breakdown, and economy—that it was installed. To-day it is doubtful whether any other illuminant can offer such favourable all-round conditions, a fact testified by the numerous applications of this system of lighting to lighthouse engineering.

It is a moot point whether the eminent Austrian investigator, even when influenced by the inventor's natural feelings of superiority in the product of his brain, ever conceived such possibilities. True, it must be conceded that the results have been attained with the assistance of others in devising new subsidiary appliances for operation with the light-shedding medium to secure the desired effect; but fundamentally success rests with the mantle.

At the time the outcome of Baron von Welsbach's experiments was made known gas-lighting appeared to be doomed. The incandescent electric light had forced its way into popular favour, and beside it the old-fashioned gas-jet, consuming six or more feet of vapour per hour, and throwing a murky light of only two or three candle-power, appeared but like that of the farthing dip.

The advent of the mantle created a sensation second only to that of harnessing the lightning for lighting our dwellings and streets. The gas consumption was cut down by 50 per cent., and the lighting efficiency increased tenfold or more. Gas-lighting received a new lease of life, and many of those who had heralded the electric light with such unbounded enthusiasm reverted to their old love.

That was only twenty years ago. In that short span gas illumination has entered so extensively into our complex social and industrial life that we almost wonder how the old gas-flare could have been tolerated a quarter of a century ago. Demand for a new invention has probably never equalled that which ensued for this epoch-making mantle. But as with every new invention, the original device possessed many disadvantages, the most obvious of which was its extreme fragility, and scientific investigation was concentrated upon the elimination of these inherent defects. To-day, as a result of prolonged and ceaseless experiment, it has been found possible to produce a mantle which with normal care is in every way adapted to the rigours of everyday usage, and does not require that careful nursing which was vital to its existence when first introduced.

What is the secret of this remarkable revolution in lighting efficiency? It appears incredible that a thin gauze cone when placed over a gas-jet should be capable of changing the yellowish, dismal flare into a brilliant, searching, steady white light of one hundred candle-power or so! The secret of this remarkable result is entirely due to the presence of two rare minerals, thorium and cerium. Baron Auer von Welsbach found that if a cotton cone was soaked in a nitrate solution composed of ninety-nine parts of thorium and one part of cerium, and subsequently placed in a hot flame so as to burn out all impurities, converting the whole fabric into oxides of the above-mentioned two rare minerals, an intense, powerful light, which is now so familiar, was emitted when the material was raised to a high state of incandescence over a Bunsen burner.

The thorium used in the process is among the most valuable minerals known, and is worth in its raw state about eighty pounds per ton. It is found only in one part of the world—that is, in sufficient quantities to render its exploitation worth while. On the outskirts of an insignificant little village in Brazil runs a river which cuts its way to the Atlantic through banks of peculiar sand. Geologically, this sand is built up in strata, and it is the dark layers that are so eagerly excavated by the Indians, for with the sand is mingled the grains of thorium — the secret of light. This raw material has to be submitted to continuous concentrating operations before it is ready for use. The cotton foundation of the mantle is in the form of gauze or very fine web-bing, which is finally burnt away, leaving only an oxide skeleton crowning the burner.

When first introduced the mantle was only applicable to a vertical position. One serious disadvantage was soon detected. This was the large area of shadow thrown by the burner, reducing lighting efficiency by 33 per cent. The advocates of electric lighting were not slow to take advantage of this point by emphasising the fact that owing to their system of suspending the lamp no shadow could possibly be thrown upon those areas where light was particularly required.

But inventors were spurred to further effort.

If the mantle could only be inverted, all the claims of the opposing system of illumination would vanish into air, since it was not disputed that gas-lighting had been rendered more economical and more efficient by means of the mantle than its electric rival. The task involved considerable pioneer effort, as in the new field the mantle was deprived of its vertical support. By attaching the fringe of the mantle to a ring which was gripped in position on the burner, however, the inverted form was ingeniously obtained, and when it was used in this manner the disconcerting area of shadow incidental to application of the ordinary upright type was completely removed.

As is inevitable with such revolutionary inventions, as the system developed and the demand for this method of lighting became extended a host of unscrupulous manufacturers set to work to flood the market with the article upon the lapse of the patent. Prices were cut unmercifully, and in a short time it was quite possible to obtain a mantle for the humble penny. These products were of a deplorable character. They were deficient in life, and only served to accentuate the prevailing drawbacks of the first-class article. The result was that a wave of distrust was experienced, and the invention came in for considerable undeserved obloquy. The gas companies of the country, however, commendably circumvented this development by offering to supply and keep incandescent burners in repair and efficiency for a nominal sum. In this manner the humble gas-consumer was guided into realising that the best is cheapest, and was afforded the self-same facilities in the efficient and economical lighting of his home as those more fortunately blessed with this world's goods. The result is that there is scarcely a home in these islands to-day where the welcome rays of the incandescent gaslight are not to be found, and the industry is one of the most extensive and flourishing in the world, millions of mantles being manufactured annually in this country alone for the home-market.

One salient feature in the history of the incandescent mantle has been the activity of scientific investigation. Improvement has followed improvement with startling rapidity. In the early types the burning-off of the collodion (which acts as a protector to the fabric while in transit), after the mantle was placed in position on the burner, converted the whole into a fragile ash-skeleton. But the very act of incineration set up disintegration owing to the explosion caused by combustion destroying some of the fine fibres of the fabric and impairing the solidity of the oxides. The severity of this destruction may be easily realised by examining a photo-micrograph of a section of a burned-off mantle.

Some seven years ago another experimenter, Plaisetty, discovered that the nitrates of thorium and cerium could be converted into their oxides by chemical agency instead of combustion. He selected artificial silk as his material; and, although it proved a serviceable medium, it was found that the oxidising process set up considerable shrinkage in the mantle. He thereupon attempted to repeat the process upon a fabric of natural cellulose, but this proved an insurmountable obstacle to him. At this juncture Mr Thomas Terrell, the eminent King's Counsel, who had been prosecuting research in the same field of applied chemistry, ascertained the conditions under which the object for which Plaisetty was striving could be accomplished.

This was a most important discovery, and marked the dawn of a new era in the history of the incandescent mantle. Not only was enhanced structural strength attained, but increased lighting efficiency. The mantle was of a more homogeneous nature, and the oxide fibres composing the fabric were of perfectly smooth form and uniform solidity throughout.

In 1903 another equally radical improvement was effected. The mantles which had hitherto been made were of a rigid, hard character. By continuing his experiments Mr Terrell succeeded in evolving the first soft mantle—that which is in common use to-day with inverted burners. To achieve this end he found it was necessary that the oxides should exist in the fabric before burning-off occurred, and not be produced as a result of this incinerating operation; also, that the proportion of cellulose in the fabric should be reduced to the minimum, so that it could be more easily burned off, without giving rise to an undue quantity of smoke. By this system of denitration prior to burning-off, the mantle is rendered extremely pliable. Such a mantle is capable of submission to rougher usage than the ordinary types. As is well known in the case of the latter, after the collodion has been consumed the mantle cannot be removed easily, as the slightest shock or vibration will promote collapse of the delicate cone of oxides. On the other hand, the Plaisetty mantle can be handled with comparative impunity within considerable limits. This is especially the case with those made according to the subsequent patent of 1906, in which Mr Terrell completed the process for making the soft mantle. In this latest development, the stocking is formed and shaped to give the necessary size when finished, and so treated as to facilitate the combustion of the cellulose.

The outcome of this last step was the possibility of proving that the maximum lighting efficiency could be obtained from mantles of all kinds of unconventional shapes and sizes, whereas in the rigid, hard mantle it was necessary to adhere to certain standardised proportions. Moreover, it solved the question of transit and storage. The earlier mantles required to be carefully packed and handled, and occupied considerable space. The latest Plaisetty-Terrell product can be folded concertina fashion, packed within a small, flat box, and is not so sensitive to vibration. The advantages of such a device are obvious, since it is requisite from time to time to submit the

burner to a thorough cleansing to remove all dust and other foreign particles which obstruct the air and gas passages.

One factor in connection with incandescent gas-lighting which has not received the attention from scientific hands that it deserves is the burner itself, since upon the design and construction of this integral part depends the economy and efficiency of the system to a very pronounced extent. It is to the mantle what the carburettor is to the petrol-motor. Were the quality of the gas supplied throughout the kingdom of a uniform quality it would be possible to standardise the burner, but as a matter of fact considerable fluctuation exists in the quality of the gas in different localities. In one place, for instance, it is rich in the illuminating constituents, and can consequently admit of a larger proportion of air being mixed therewith, while in another area less air is required. Therefore, although the light emitted may appear satisfactory in every way, it is not to be concluded that the efficiency and economy of the illuminant cannot be increased by air-adjustment. Many burners at present on the market possess no recommendation beyond smart appearance and cheapness, and these should be studiously avoided, for not only are they lacking in strength and gifted with a short life, but they attract dirt, which is highly inimical to light-efficiency and economy of gas consumption, and are of crude, unscientific design. The remarkable improvement which has been made in burners is strikingly demonstrated in the experience gained with the Pharos burner. This is a rationally designed fitting, very sensitive and precise in its action without being complicated. Non-corrosive materials in the vital parts are used, and the gas-regulator can be adjusted to the fiftieth part of an inch, with dead centralisation of the needle, while the air-regulators are positive in their action and proof against the intrusion of dust and fluff. Precisely what influence a properly designed burner exercises upon the ultimate results is significantly shown by the fact that it has been found possible to raise the lighting efficiency from twenty to over thirty-nine candle-power per cubic foot of gas, which enables a single burner to emit a light of nearly one hundred and sixty candle-power—a result which has not yet been paralleled.

Remarkable though the results have been in the application of the incandescent gas-mantle to ordinary coal-gas lighting, its effects are far more revolutionary in regard to other gaseous vapours. It has enabled many light and inexpensive hydrocarbons which were formerly unavailable to be used. Prior to its advent these 'air-gases,' as they are termed, were a source of constant danger. The proportion of hydrocarbon to air had to be so high to yield the requisite luminosity that there was always danger of explosion, and, in fact, the system practically fell into desuetude owing to the frequent occurrence of such catastrophes and the strong competition offered by acetylene. To-day the position is reversed. The extreme simplicity of air-gas generation, the insignificance of cost of the gas, and its non-explosive character are driving acetylene from the field. Moreover, the advent of the mantle has solved one of the most perplexing problems confronting the resident in isolated rural districts where public main supplies of coal-gas are unavailable and resort has perforce to be made to oil illumination.

This development has resulted in a wide range of air-gas systems being placed on the market. Though they differ considerably in point of detail, fundamentally the principle is the same. The favourite medium is petrol in its various grades of density. The petrol is volatilised and passed to a small collapsible holder from which the supply to the house is drawn. Explosion is quite out of the question, since in the most perfect of these systems —which, by the way, is a British invention—the proportion of gas to air is reduced to as low as 2 per cent. Such a mixture is far too deficient in gas to ignite or explode even in the event of a leak. The fact that a house may have its individual gas-generating plant, which can be stowed in an area measuring only two or three feet square, and be operated by any member of the family in perfect safety, renders this an ideal scheme of artificial lighting, having the further advantage of giving at a much cheaper cost a light equal in every respect to that obtained from coal-gas. In this country such a development is of very recent date; while, on the other hand, on the Continent, owing to the cheapness of denatured alcohol, and in the United States, where illimitable supplies of the requisite volatile oils are easily available, it has come into much more extensive vogue. Indeed, many instances could be mentioned where, although the gas-mains are laid outside the door, the householder prefers his own generating system. Thereby he is entirely independent, can resist the demands of extortionate or captious supply companies and municipal bodies, and achieve the same end so far as lighting, heating, and cooking are concerned at a third of the cost. The initial outlay is the only deterrent; but here again the cost of a complete plant has now been reduced to a trifling figure, while the modern tendency to rental-purchase is stimulating this young industry. Many large houses in this country have installed such systems and found them an excellent and satisfactory investment.

Again, the incandescent gas-mantle has done much to revolutionise the use of the lamp. There is a very extensive public who, from situation, force of circumstances, or prejudice, prefer the lamp to any other system of artificial lighting. Certainly it is mobile—that is to say, it can be carried from room to room as desired, and be placed in any part of an apartment for convenience. But with the ordinary paraffin-lamp a constant source of danger exists; and as the absolutely safe lamp has yet to be invented, extreme care must always be exercised in its manipulation. Yet petrol has been satisfactorily pressed into service even in this field in a

variety of forms. In some the volatile oil is stored in the receptacle in precisely the same manner as the paraffin, while in others it is carried in an absorbent medium, so that no free liquid is present in the lamp. The latter certainly has the element of perfect safety, as in the event of its being upset or broken no liquid can escape and perhaps be ignited. In the majority of cases, however, the first-named method is practised, the container being made of a stout, non-corrosive metal. The burner is warmed, and, the petrol or alcohol becoming vaporised by the heat, the gas is lighted in the usual manner, the heat supplied for vaporising the petrol being maintained the whole time the light is burning. One word of warning is requisite concerning the use of such lamps, however. The reservoir being metallic, the heat is naturally radiated downwards from the burner, and the upper part of the container in many cases becomes very heated. This sets up extensive volatilisation of the contents, which, unable to flow through the burner in greater volume than the regulation of the feed permits, accumulate within the reservoir, so that great pressure is exerted upon the wall of the container. If the lamp be of cheap manufacture this pressure becomes sufficient to burst the container, with the result that an explosion ensues. Obviously, therefore, such a system is inapplicable to cheap lamps—that is, if the factor of safety is to be duly studied. In one type of lamp the reservoir is fitted with a safety-plug, which, being of softer metal than that of which the reservoir is made, is the first to yield to the pressure of the gas when it rises above a predetermined degree. In this particular phase of activity there is considerable scope for inventive effort, especially in the direction of insulating the burner from the reservoir of the lamp, so that vaporisation of the petrol may only ensue as desired, and in the precise quantities, and that no possibility of back-pressure may result in the reservoir. One important point that has to be kept ever in view when using petrol is its searching character. All joints must be perfectly and tightly made, otherwise the liquid will force its way to the exterior and become a source of menace. The penetrating effect of this medium is only too well known to motorists, as well as the dangers arising therefrom.

In the utilisation of petrol-gas the United States is far ahead of this country. In fact, in rural districts it constitutes the only available source of lighting. It is not remarkable, therefore, that American inventors should have devoted considerable attention to this problem, which has been materially facilitated by the incandescent mantle. The use of petrol-lighted lamps is universal throughout that continent, and the best product in this line—one that has stood the test of time—has recently invaded this country, and from the many excellent points it possesses is assured of success. Already it has been extensively adopted in outlying districts for lighting not only private residences but country streets, public buildings of various descriptions, and churches. This system is the acme of simplicity. The petrol is carried in a metallic reservoir which is placed above the burner so that the feed thereto is entirely by gravity pressure. The lamp is started up by means of a small methylated lamp which heats the burner. The petrol flowing downwards from the reservoir passes through a filtering medium to the burner, where, coming into contact with the heat, it volatilises, and, passing through the gas-jet, becomes mingled with its requisite proportion of air, the mixture flowing to the burner, where it is ignited in the usual manner. By this means one can obtain a brilliant light of approximately one hundred candle-power at a cost of less than a farthing per hour, taking the price of petrol at fifteenpence per gallon, which is a liberal average. Where the raw material can be procured cheaper the cost of the light is proportionately lower; but even on the first-named basis a light of one hundred candle-power at a farthing per hour compares very favourably with that procurable with coal-gas.

In this particular system the dangers attending the radiation of heat do not occur as in the ordinary hand-lamp, since, instead of the liquid being stored in a reservoir within two or three inches of the flame, it has to travel through some eighteen inches of feed-pipe, all heat radiation from the burner being absorbed long before that distance is traversed; while the reservoir itself is placed well beyond the range of heat radiation from the mantle, so that it cannot become heated.

Such are a few of the results that were made possible by the invention of the incandescent gas-mantle. Before its perfection the use of vapour-mediums other than coal-gas was impossible, except at great risk. But what of the future? It is obvious that the mantle will become still more popular, and that gas-lighting, far from being in decadence, is assured of a much greater era of prosperity. But it will experience the keenest rivalry from the volatile oils. Yet the mantle, despite the past twenty years' use and ceaseless improvement, is far from perfect. It possesses one salient defect. The cellulose foundation is a supreme source of weakness. Breaking at the head, splitting, collapsing under shock, have not yet been entirely eliminated in either the vertical or inverted types, though in the latter they have been reduced to the minimum.

It would seem that the future of the mantle lies in the discovery of some material which can take the place of cotton or ramie. Already one substitute has been placed on the market which, though in its infancy, possesses many points of excellence and every sign of extensive application. The evolution of the unbreakable mantle is one of the most promising achievements in scientific research and invention.

MONEY WAITING OWNERS.

IT is a healthy sign surely when we learn that over a million pounds sterling is lying waiting until the rightful owners come along. This would seem to show that Britain is indeed that wealthy country the poor foreign immigrant has been led to believe. To be exact, the total sum of dormant funds under the care of the Paymaster of the Royal Courts of Justice is one million one hundred thousand pounds. But this money is distributed over three thousand four hundred separate accounts. One-half, however, do not exceed one hundred and fifty pounds in value, so that there are quite a number of fairly sizeable sums to be picked up. All are over fifty pounds.

Very curious are many of the accounts as entered in the official books. Old titles, now never heard, crop up now and again. Take, for example, the ledger entry dated 1758, a claim in which the Duke of Chandos is one of the two parties interested; evidently not important, or it would not have remained untouched.

There is another account of the eighteenth century which has not been dealt with since 1790. The two rival owners were the Duke of York and the Duke of Newcastle. How does it come about that a sum of money has been left for nearly a hundred and twenty years? Doubtless their graces' chamberlains did not consider the matter worth troubling about. And so the Treasury has the money invested, probably for all time.

Another case which excites comment is that of Lord Le Despencer. In 1809 his lordship sold his Lincolnshire estates. There was a sum of money paid into court then; a century has elapsed, and still there is no owner.

Singular, however, is it to find that there is freehold land in the very heart of London the owners or part-owners of which are unknown. Yet in 1835 land with buildings in Great Swan Alley near Coleman Street, and in Great Bell Alley and White's Alley, was placed under the jurisdiction of the Supreme Court. The only entry in the books is worded: 'The unknown person or persons interested in the freehold estate and inheritance of that piece or parcel of ground, with the messuage or tenement thereon erected, and its appurtenances.' Some person must at this moment be a property-holder in London city and know it not. Whoever was the proprietor has relations alive, even though many degrees removed in cousinship. This is not on the same footing as the cash snugly invested by the guardians of Chancery for Edward Wix, 'who is absent beyond the seas.' It is not surprising in this island of circumscribed dimensions that divers accounts are summarily docketed with the name of the person and the fact that he is beyond the seas.

Why should a sum of money lie since 1803 in name of the Right Hon. Earl Grosvenor? And why should Baron Alvanley and Baron Kinnaird, or their descendants, not settle their little differences and take out that money which the Paymaster has been bothered with since 1839? One can understand the dubiety that may exist about a sum lodged in Chancery in 1836, 'Slave Compensation Account.' Perhaps the parties were diffident in appearing in public as claimants. Then, again, in 1824 a New Providence sea-captain picked up some derelict property, and brought it into the port of Nassau, where it was sold 'for the benefit of the rightful owner when appearing.' That is honesty of the best copper-bottomed and A1 at Lloyd's hall-mark. Does all the derelict property that is washed ashore on the Orkneys or the Achil coast come under the auctioneer's hammer in order that the value may be transmitted to the British Treasury?

Some accounts are painful in their brevity. 'Mary King, a lunatic.' That is the sole record of money deposited in 1742. How many more centuries will that remembrance of a clouded life be allowed to stand? An item—to use a business term—happily rare is 'The Account of ——, a Felon.' Here again the relations may—the sum being a small one—not have considered it advisable to recall that page in their pedigree.

Rather quaint is the account indexed in four words, 'Hilton, Henry, an Infant.' This was in 1867! And a plebeian touch is given to the books of Chancery by the entry, 'The Ten Hogsheads Account.' What was in the hogsheads? Did the owner suddenly evolve a distaste for wine, and under the incentive of his blue ribbon turn his back upon the ten exiles?

To revert to aristocratic nomenclature, there are several entries referring to the Duke of Bolton. His grace in the latter part of the eighteenth century appears to have had creditors, and likewise appears to have become somewhat involved in his accounts. We are afraid after all these years the money in dispute will be eventually a Chancery heirloom. Away back in 1741 a sum was deposited, and not dealt with. The parties were Lord Montjoy and the Duchess of Buckinghamshire; and in 1819 Lord Monson and the Earl of Essex had a question relative to personal estate. Chancery still awaits the solution.

Seamen are a wandering race, and the money deposited in 1813 for certain men belonging to His Majesty's ships *Decade* and *Argonaut* is almost sure to remain in the Paymaster's coffers. Various entries refer to unclaimed dividends. This evidently argues a lack of industry in the search for the investor or his nearest relations. In most cases, however, the companies have been wound up. For example, in the early days of railways various abortive enterprises figure in the Chancery lists.

The Croydon, Merstham, and Godstone Iron Railway Company was dissolved in 1841 by special Act, and unclaimed dividends repose peacefully in the Royal Courts of Justice.

Among the accounts which excite a mild feeling of wonder is that of James Browne's Trust in 1854. This trust was created for keeping in order the tomb of James Browne. But how the Treasury annexed the money is somewhat difficult to understand, unless the tomb had been in an ancient churchyard which in course of time became improved out of existence. There is an imposing sound about the title of an entry of money taken under the paternal care of the Chancery officials the year before the battle of Waterloo. It reads, 'The Master and Wardens of the Company of the Merchant Venturers of the City of Bristol.' On the other hand, the 'legacy of nineteen guineas to Martha Underdown,' in 1868, makes one seek to probe the reason why nineteen and not twenty was the amount of the legacy, and also why it should have been swallowed up in the capacious maw of Chancery.

Memories not of the most pleasant are aroused by the account in the Probate and Divorce Court—a sum deposited for some Court purpose and docketed, 'Not dealt with.' The names are 'O'Shea *v.* O'Shea and Parnell.' Of course the Admiralty has money in hand, accounts dating as far back as 1863; and there is the ship *Canada*, also the *M'Gregor Laird* and other old-time vessels—prize-money for some men of the navy.

It is noticed in glancing over the lists of persons who have the doubtful privilege of being recorded in the ponderous Chancery tomes that some very quaint names appear. There is Casamajor, Chipchose, Chetle, Chew, and Clagett. One account is Christmas *v.* Chalcraft, another Crake *v.* Goldswain; Sarah Ings is plain and brief; there is a foreign savour about Knierim *v.* Schmauss; Bathsheba Penny has a Puritan accent; Prole *v.* Soady is distinctive; equally so is Snape *v.* Sermon, likewise Still *v.* Hoste and Wilkin *v.* Snell. A novelist seeking for the archaic would discover good material in the Treasury archives. There is a Friday—reminiscent of *Robinson Crusoe*—the entry is dated 1820; and a Thoday. Alliteration is provided by Tookerman and Tootal. If a writer of fiction introduced these names for a hypothetical firm the editor would convict him of too robust an imagination. Trickey, Tolle, and Trigge would make an excellent catch-phrase to test the insobriety of a tottering individual; or Wimpenny, Wintle, and Whitlie.

Building speculations evidently led to litigation in the eighteenth century just as in this present advanced twentieth, for there was a dispute in 1741 recorded as Huggins *v.* York Buildings Company. The litigants saw the sum at issue carefully entrusted to the care of the then Chief of Chancery; and it has remained safe and secure ever since. In some cases there even appears to be a dubiety in the Courts of Justice records as to when money came under its jurisdiction. Take, for instance, the entry, 'Jones *v.* Lloyd, in Master Thomas Bennet's Office;' the date is given as 'Before 1726.' How long before? we wonder. It is annotated as 'Not dealt with,' and the date of the order directing the transaction is mentioned as Act 12 George I. Before we quit this engrossing subject it may be asked why an account should remain on the books since 1855—one in which a small legacy is left to the Archbishop of Canterbury 'in aid of the funds for the religious instruction of persons employed in the lead and coal mines of this country.' A somewhat sarcastic touch is to be understood by the English critic in the bare three-words account indexed as 'Macpherson *v.* Money.' That was in 1824, and the money is still in safe custody. 'The Kingston Plate Account' is the title of a ledger entry, the parties being the Earl of Kingston *v.* Viscount Lorton; but as more than a quarter of a century has elapsed since the last transaction the account has no immediate possibility of being closed. One of the legatees of Sir Manasseh Massey Lopes, who died in 1851, has never come forward to claim her legacy, and apparently her relations have never known anything about this little windfall.

An instance of long remembrance of an attentive helper is seen in the will of an old lady who died about 1867. Money is now lying in Chancery to pay a legacy devised as follows: 'The legacy of fifteen pounds bequeathed to the apothecary, Newry, Ireland, who attended the testatrix whilst she was in Newry in 1809.' Evidently in the fifty odd years that had elapsed since the patient sought and appreciated skilled advice there had been no person left to remember the lady's visit to the apothecary, especially as she did not seem to have had the forethought to note down his name. This lady also left a legacy of twenty pounds to 'Mr Poole, miniature painter, Newry, Ireland.' That sum is also snugly reposing in Chancery. And while on the subject of legacies, we may mention that a surgeon of His Majesty's ship *Pompee* left three sums of fifty pounds each; these have never been claimed, and in 1860 were entrusted to the Treasury.

Yes, the list of dormant funds in Court is pleasant reading of an evening for all except the unhappy wight whose name appears duly indexed. For it is easier depositing money in Chancery than it is getting money out—much easier. The proving of heirship is not so quickly done as rolling off a log; and the Paymaster of the Royal Courts of Justice has a mind not readily open to conviction.

FARMING IN ALBERTA.

By P. B. Gregson.

FEW people outside the vast new province of Alberta, in the north-west of Canada, have even an approximate idea of its area and internal economy. In extent of territory this province stretches for a distance of eight hundred miles from north to south, where it borders the United States—that is, as far as from London to Rome—and has a breadth equal to that of France, and barely half a million inhabitants; and of one hundred million acres of cultivable land only 1 per cent. has yet been brought under cultivation. Settlers are pouring in, chiefly from the United States; and these American immigrants really make the best settlers, for they bring with them experience of farming under analogous conditions, as well as ready cash, farm equipment, machinery, and horses. There is no danger of the north-west becoming Americanised, for the Canadian is an enthusiast in his loyalty to the Crown. To take the 24th of May as an instance—this date is in Canada a national holiday; stores are closed and the Union-jack flies everywhere on public as well as private buildings. This intense loyalty is the dominating Canadian sentiment, and it can *never* be Americanised. In addition to the American settler, there is a constant leaven from the eastern provinces of Canada and from the British Isles and Europe. The Scandinavian settler comes well educated, is law-abiding, honest, and hard-working, and equally with the American takes a keen interest in civic and national affairs. As an instance of the cosmopolitan character of the settlers, it may be mentioned that in one small village in Alberta, with a population of two hundred, there are over twenty nationalities, all abiding in concord.

The Government of Alberta, seated at Edmonton, is exceedingly paternal. The Department of Agriculture has established creameries in every desirable district throughout the province. It supplies to every farmer who makes application a set of scales at wholesale price to weigh the milk as drawn from the cow, and to show him the difference between a poor and a good milch cow. It appoints officials to go round among the farmers to instruct them in the method of producing the best cream by separating-machines, and it takes that cream to the nearest creamery, churns it there, makes the butter, finds the market, and pays the cash proceeds monthly to the farmer, less a slight percentage for operating expenses. The price paid to the farmer has for three years in succession averaged twenty-three and a third cents per pound. As milk differs in quality, the Government supplies the collector of the cream with test bottles, so that he may test and label, in the presence of the farmer, each supply of cream received from him. Through the creameries, also, the Government will receive and fatten and find a market for fowls and also for eggs, and at certain periods of the year experts go through the province giving free instruction in all these matters.

The Department of Agriculture devotes attention also to the grain-growing farmer. For his welfare it has appointed experts having knowledge of the characteristics of weeds, who have districts over which to travel and inspect the fields, and are known as Government weed-inspectors. Their duties are to instruct the farmer, free of cost, how to recognise weeds, and to show him the best method of eradicating them. Their powers are autocratic, backed up by a special ordinance enabling them to enforce its provisions. The necessity for such inspection will be apparent when it is stated that in a rich virgin soil like that of the north-west prairie noxious weeds, if allowed to survive, will often smother out entire fields of growing grain. The average settler is ignorant of the nature of many of the most noxious weeds, and with the incoming of settlers from all parts of the world many weed-seeds new to Alberta are introduced either in the fodder brought in with the cattle or even through uncleaned grain supplied for seeding. Among the most persistent and destructive of weeds thus introduced are the Canada thistle (*Cnicus canadensis*) and the stink (or French) weed (*Thlaspe arvense*). This latter weed will crop three times a year, and the writer, in his capacity as weed-inspector, has had on several occasions to direct the settlers to plough under entire fields of growing grain in order to eradicate such weeds and have a clean farm for the following year. So important does the department consider this drastic treatment to be that the ordinance, in the event of the refusal by the settler to obey, empowers the weed-inspector himself to employ men, horses, and ploughs to do the work. In certain districts in the older provinces farms have become quite unsaleable through being overrun with noxious weeds. No farm or farmyard is left uninspected, and the office of weed-inspector is no enviable one. On one occasion, owing to the absence during inspection of a settler whose farm was infested with stink-weed, the writer had to return at two o'clock in the morning, rouse up the farmer, and make him dress and come out to receive instruction. On another, a bridge over a creek having been washed away by heavy rains, the writer had to divest himself of his clothing and cross the swollen creek to inspect the farm on the other side. It is the duty of the inspector to report to the department the condition of every farm inspected, so that the Government may keep note every year of the care taken in farming or otherwise by every settler. The powers of the inspector extend to inspection of every public and private road,

and of the road-beds of the railways, for often weed-seeds are shaken from the cars, and, spreading, overrun the adjacent farms.

There are also experimental farms conducted by the Government, where particular kinds of grain or fruit are tested, and the results are published in pamphlet form and distributed gratis to every farmer.

The Department of Public Works takes in hand the roads throughout the province. Every two miles a main road is laid out running due north and south; and roads crossing these, running due east and west, are laid out every mile. At each crossing a post is erected about a foot or two high, stating its location. Every settler is required to assist for two days in each year with teams, ploughs, and labour in the construction and repairing of the road running past his farm, or to pay a tax sufficient to cover the cost of hiring such work. For every six miles square of district an overseer is appointed and a board of councillors elected, whose duty it is to see that each settler duly performs his allotted work or pays the tax, and to report annually to the department as to the progress and efficiency of the roads, together with the number of new bridges and culverts constructed. These roads, being absolutely straight, sometimes run through swamps and forest, and necessitate the adoption of a system of the kind described. The roads are uniformly sixty-six feet in width. There are no stones, and to prevent mud-holes (which are sometimes, on roads inefficiently constructed and during the June rains, seemingly bottomless) the roads are well graded to the centre.

A public school is erected every six miles or so throughout the greater portion of the province. These schools are supported by money grants from the Department of Education, supplemented by light taxes; and twice a year an inspector of schools visits each school and inquires into the proficiency of the pupils and examines the sanitary arrangements. His report, together with a detailed statement of the way in which the Government grant has been applied, is forwarded to the department, and thus a record is kept, so that the efficiency of the teaching in any school throughout the province can always be ascertained by any settler.

Alberta is essentially a mixed farming country, more especially the central portion of the province, where the farmers have cattle, hogs, sheep, poultry, and dairy produce, besides their grain. Table vegetables grow to an enormous size, and all small fruits (such as raspberries, strawberries, currants, gooseberries, saskatoons, cranberries, &c.) grow in profusion in the wild state. As to the grain, the central portion of the province has become famous for its superior quality of oats; and while thirty-four pounds is the standard weight for a bushel of oats in Canada, the Dominion grain-inspector for Alberta states that 85 per cent. of the oats examined by him weighed over forty-two pounds to the bushel. The southern portion of the province is equally famous for its winter wheat. It is sown about the middle of August, and has a growth of about four inches before the winter. This holds the snow, and the wheat is harvested early in the following August, long before there is any danger of frost. Where this wheat has been sown in properly prepared land there has never been a failure. So successful is the cultivation of winter wheat in Southern Alberta that land cannot be prepared fast enough. The acreage sown to winter wheat has more than doubled itself each year for a number of years. Turkey-red wheat from Kansas has been introduced, and grows such a superior sample in Southern Alberta that it is now being shipped back to Kansas for seed. It has also been grown successfully, within the writer's knowledge, in Northern Alberta for eight years in succession, and has succeeded fully four hundred miles north-west of Edmonton; and last year at Cardston, north of Calgary, a farmer had a yield of winter wheat of sixty-two bushels per acre.

Coal underlies practically the greater part of Alberta, the seams of some beds outcropping forty feet in thickness. At all mines provision is made by the Government to supply settlers with coal at cost at the bed. Coal can usually be obtained for one dollar per ton in this way.

Enough, perhaps, has been already said in descriptive pamphlets as to the many opportunities presented to the settler in Alberta. This province is, in the writer's opinion, the place above all others which gives the settler a chance to climb.

CELESTIAL SMUGGLERS.

IN all countries the evasion of fiscal obligations is considered no wrong, and 'passing the Customs' is generally regarded as a tax upon personal rights; so much is this the case that those who render unto Cæsar that which is Cæsar's generally do so to escape a worse evil, and seldom from any moral conviction as to what is right and what is wrong. In this one respect, at least, East and West may be said to have met; for in no country in the world has the art of smuggling reached a higher standard than in China, and in no part of China have smugglers become so daring or so ingenious as in the famous Canton Delta, whose innumerable and intricate waterways spread their welcome arms to shield wrongdoers and embarrass pursuit.

John Chinaman is a born gambler, and as often

as not stakes his acuteness against lawful authority merely for the love of play. He reckons that if he 'gets through' some four times out of five his account will show a balance on the right side, and he will thus have a small profit, combined with the excitement of the game. That this is the spirit of many is a proved fact, as the same men have been caught red-handed again and again, and the mere fact of their persisting indicates that there is both money to be made and recreation to be found in the practice.

The heavy duty on opium and the comparative ease with which it can be secreted naturally places it in the front rank of desirable contraband, and many a ball of the seductive drug has found its way into Canton from that acknowledged base and happy hunting-ground of criminals, the British free port of Hong-kong, without His Imperial Majesty Kuang Hsü being a cent the richer. Many are the methods adopted and the precautions taken by these nimble evaders of the law. Floats and sinks, the outcome of the most fertile imagination and the most careful study, are the most frequent means used, and at a given signal from the shore the whole consignment is dropped overboard from one of the palatial river steamers running between Canton and Hong-kong, to be eventually picked up at a convenient time by receivers on land. On one occasion a handsome cat with kittens was noticed on board one of these steamers, and after a time it was remarked that the latter did not appear to grow any larger. An inquisitive Custom-House officer in Canton found upon examination that they were all dummies filled with opium, and it was recalled that this lucrative imposition had been going on for weeks. Again, the Canton Customs night-patrol going the rounds of the crowded harbour took shelter one night from a violent summer squall under the huge paddle-sponsons of a well-known river steamer. 'Is that you?' inquired a voice from above in Chinese. 'Yes,' replied the Customs officer, with quick perception. 'Then, catch,' answered the mysterious interlocutor, passing down half-a-dozen balls of opium, the share of which meant much prize-money for the lucky gig's crew. The smuggler was, of course, waiting for a confederate whom the Customs officer unwittingly forestalled. On another occasion the Inspector-General of Customs, Sir Robert Hart himself, was visiting Canton, and in the evening at dinner was obliged to apologise to his hostess. 'You must excuse my costume,' he said, 'for the Customs have seized my boxes.' It was indeed true, as one of his Chinese servants, never suspecting that the Inspector-General's personal effects would be disturbed, formed a syndicate with some enterprising friends, and half-filled one of the trunks in his charge with contraband. Salt, that daily necessity of life, being a Government monopoly in China, is subject to official regulations which add to its cost and lessen its quality. The duty indirectly paid on this article may be styled the income-tax of China, since all must use this everywhere indispensable commodity. Salt, therefore, naturally comes within the scope of the contrabandist, and smuggled salt, by reason of its cheapness, commands a ready sale. It differs from opium, however, inasmuch as its bulk renders concealment difficult and landing it at its destination risky. The majority of salt-smugglers are, therefore, the Chinese crews of the carrying-vessels, working in conjunction with accomplices ashore. It is as often as not concealed amongst the bunker coal, and kept there until a favourable opportunity for landing presents itself. At one of the river ports, some years back, the crime of salt-running assumed such startling dimensions that extraordinary precautions to put a stop to it were introduced, which proved efficacious for a time. Later, however, it was noticed that sampans, or small boats, manned by those unhappy outcasts, lepers, were becoming more numerous, and it was soon discovered that they were engaged to land the salt, as it was perhaps not unreasonably assumed that Customs officers, however zealous, would at least respect the inviolability of these fatal craft, and it was not until the aid of the local magistrate was invoked that these adjunctive smugglers were forbidden the port.

TWILIGHT ON THE HEIGHTS.

When falls the gloaming faint and dim,
And the sunset splendours die,
And the pale young moon like a silver rim
Lies low in the star-set sky;
When the autumn wind sighs softly down,
And the sleeping woods are still,
And the curlew's cry from the hillside brown
Breaks the croon of the lonely rill,
The smoke-wreath curls from the homely hearth
In a slow-ascending spire,
And the wayworn step of the toiler of earth
Seeks rest by the evening fire.

Then high on the heights remote from men
Lone wends my wand'ring way,
'Mid the bosky dells of the slumb'ring glen
Where the Spirit of Peace holds sway;
No echoing note from the world below
With its lust and its greed and its gold,
But the hills and the heavens and the sunset glow
And the beauties of life untold.
Then soars the soul to a higher plane,
And breathes in a purer air,
And the visions of youth glow bright again,
And faith sees all things fair.

Oh, golden gleam in the cloudening sky,
Sweet, sweet are thy ling'ring rays:
As Fancy's glow on the hill-tops high
Sheds light on the dark'ning days.
And down from the heights with steps untired
Once more to the world of strife,
With the heart refreshed and the soul inspired
To bear the great burden of life.

ILLUSTRIOUS LITERARY SCOTSMEN IN LONDON.

By E. Beresford Chancellor.

AT a moment when various members of the Government as well as the Leader of the Opposition—to say nothing of many other great officers of the Crown—hail from the Land o' Cakes, as the Scottish national poet terms it, it might well be doubted if a dozen papers the length of this one would be sufficient to deal with the subject of illustrious Scotsmen in London, especially when we remember how many great men in the past have descended from beyond the Tweed upon the southern portion of the kingdom, and, with that singleness of aim and tenacity of purpose for which they are famous, have made their names illustrious on the banks of the Thames.

The subject is indeed far too vast to be handled in a few pages, even were one to limit one's self to such baid details as the *Dictionary of National Biography*, for example, gives us; and I will therefore confine myself to saying here only a few words about some of the more notable literary men whose names are known all over the world, but who were destined, though Scotsmen born, to pass much of their time, and in some instances to do their best work, in England, and whose feet trod the stones of London while their hearts were often in the streets of the Northern Athens.

Of these, one of the most famous was James Thomson, the sweet poet of the seasons and their change, who, when he came to London in 1725, lived for a time in lodgings in Whitehall, between Cragg's or Craig's Court and Great Scotland Yard. Till about twenty years since an old, round-fronted house still stood which many authorities regarded as the actual abode of the poet, and here, on the first floor, he is said to have written a portion of his *Summer*. Other parts of the poem were composed when he was fulfilling the uncongenial post of tutor to a school in Little Tower Street, Eastcheap, kept by one Watts; and we find him writing to his friend Aaron Hill, on May 24, 1726, to announce the fact. Next door to this academy was the Ship Tavern, and if we know anything of Thomson we may be sure that he was no stranger to its portals. But these resting-places were his only while Fortune kept back her smiles; later, when prosperity came to him, he turned like the wise men westward, and we find him subsequently in Bond Street, where he lodged over a milliner's, and where, according to Mrs Piozzi, he seldom rose early enough to see the sun do more than glisten on the opposite windows of the street. About this time he was receiving subscriptions for his *Seasons* at the Smyrna Coffee-House, in Pall Mall, while we learn that the letter he wrote to Speaker Compton soliciting his patronage for the second edition of *Winter* was dated from Long's Coffee-House, in Queen Square (now Queen Anne's Gate), Westminster. Later he flitted to 'ambrosial Richmond,' and there he lies buried in the parish church, where a simple tablet perpetuates his amiable memory, as does an elaborate monument in the Poets' Corner of the Abbey.

Thomson died in 1748, and ten years later another notable Scotsman, David Hume, came to lodge in Lisle Street, Leicester Square. He remained there but a little time; and later, during the years 1767 to 1769, while Under-Secretary for State, he resided in a house in Park Place, St James's Street, what time he was a member of Brooks's and a person of social importance.

But a more popular writer than Hume had shed lustre on the west end of the town thirty years earlier, for in 1739 Tobias Smollett—who describes the incident in that autobiographical novel, *Roderick Random*—came to London and lived for a time in no less a thoroughfare than Downing Street, where he took over the practice of John Douglas, as he tells Barclay in a letter dated May 1744, and tried to make a living as a surgeon without much success.

Two years later we trace him to humble lodgings at the east end of Curzon Street; and it was probably about this time that he frequented a small tavern, the 'Golden Ball,' at the corner of Cockspur Street, where, as Dr Carlyle in his autobiography records, he and his friends used to partake 'of a frugal supper and a little punch,

 [*All Rights Reserved.*]

as the finances of none of the company were in very good order.'

Having married in 1747, Smollett took a larger house, and apparently lived beyond his means; but in the following year *Roderick Random* appeared, being published by Osbourne in Gray's Inn Lane, and an 'ampler day' dawned for the novelist. Two years later he went to live at Chelsea. The residence he took was known as Monmouth House, and stood near Upper Cheyne Row. The fact is interesting in view of Carlyle's later home close by, and should make this quarter of the town a particularly interesting one to the countrymen of these two great men. As was usual with him, Smollett introduced both the house and his manner of living into one of his novels, in this case *Humphrey Clinker*, which, together with *Launcelot Greaves* and *Count Fathom*, was written here. He was a regular frequenter of the 'Swan' and Don Saltero's Coffee-House, in the vicinity, and was visited at Monmouth House by such notable contemporaries as Johnson and Goldsmith, Sterne and Garrick.

But a still pleasanter reminiscence of Smollett is the fact that every Sunday he kept open house for his more 'unfortunate brothers of the quill,' and here a substantial meal awaited them, and a hearty welcome. When Carlyle came to live close by he mentions this in a letter dated 1834. 'We could shoot a gun into Smollett's old house' (at this very time getting pulled down), he says, 'where he wrote *Count Fathom*, and was wont to dine a company of hungry authors.' In 1767 Smollett left England in broken health, never to return, although he was still to write *The Adventures of an Atom* and *Humphrey Clinker*.

When Johnson—whom, by-the-bye, Smollett was the first apparently to call the Great Cham of Literature, in a letter to John Wilkes, dated 1759—came to visit him at Monmouth House it is not improbable that Boswell was more than once of the company, for he had come to London in 1760, and was introduced to Johnson in 1763, four years before Smollett left England. Boswell's connection with London is so extensive and peculiar that nothing less than an article devoted to the subject could do it adequate justice. There never was, with the possible exception of Charles Lamb, such a Londoner as Johnson; and wherever Johnson went there was Boswell almost invariably to be found. The first meeting between these inseparable companions, as they afterwards became, was in the bookshop of Tom Davies, at No. 8 Russell Street, Covent Garden, and most of us know Bozzy's account of the circumstance. At this time he was lodging in Downing Street, which thus, when we remember Smollett's association with the street and that of so many notable Scotsmen since, seems to be particularly connected with the northern kingdom, and a very proper objective for Scotsmen.

Two months after the famous meeting of Johnson and Boswell in Russell Street, the latter moved to 'the bottom of Inner Temple Lane,' where Johnson was at that time living, in order to be near 'the great lexicographer.' Unfortunately, rebuilding has obliterated the actual residences; but Boswell's was in Farrer's Buildings and Johnson's at No. 1 Inner Temple Lane, opposite, now known as Johnson's Buildings. Here he received his new friend 'very courteously,' although the latter had to confess that 'his apartment and furniture and morning dress were sufficiently uncouth.'

If Boswell thought to keep pace with the Doctor's continual flittings he must have been hard put to it, for two years afterwards the latter had moved to Johnson's Court, Fleet Street, and was again to change to Bolt Court in 1776. It seems probable that Boswell, although never faltering in his devotion, craved for a residence in a more fashionable part of the town; but it was not till 1768 that he had made up his mind to move to Half-Moon Street, Piccadilly. Not long did he stay here, however, for in the following year we find him in Old Bond Street. The former lodging was at a 'Mr Russell's, upholsterer;' and writing from here to Temple on May 14, 1768, he complacently remarks: 'I am really the great man now. I have had David Hume in the forenoon and Mr Johnson in the afternoon of the same day, visiting me. Sir John Pringle, Dr Franklin, and some more company dined with me to-day; and Mr Johnson and General Oglethorpe one day, Mr Garrick alone another. . . . I give admirable dinners and good claret.'

Change of address made no difference to Boswell's hospitality, and it was in his new lodgings in Bond Street, on October 16, 1769, that he gave the famous dinner to Johnson and Reynolds, Garrick and Goldsmith, in which he appeared in the 'bloom-coloured coat' which had been made for him by John Filley, and which must have filled poor Goldsmith with envy.

Three years later Boswell made another change, this time to Conduit Street; and it was here, on the occasion of a visit, that Johnson gave voice to the *obiter dictum* that 'nobody can write the Life of a man but those who have eat and drunk and lived in social intercourse with him;' a qualification which Boswell certainly possessed.

The neighbouring Grafton Street is also connected with the greatest of biographers, for it was here that, attired in his Corsican dress and with a letter from Paoli in his hand, he was introduced to the great Earl of Chatham; while when Paoli came to London, and lodged in South Audley Street, Boswell was not only frequently his guest, but also stayed in the house, and was on one occasion so ill here that Johnson brought Reynolds to cheer him up.

After the death of Johnson, and while engaged on the Life of his friend, Boswell was living in Queen Anne Street, Cavendish Square, of which, writing to his daughter in 1788, he says that it is in 'quite a genteel neighbourhood.' But he was to change yet again; and his death took place at No. 47 Great Portland Street, in 1795. The

street has been enlarged and renumbered; but the actual house he lived in was, we are told, on 'the east side, the seventh from the corner of Marylebone Street, towards Langham Street, then Queen Anne Street.'

Considering the number of Boswell's London residences, it is appropriate to find that one at least of them has been indicated by one of the London County Council's tablets, and it seems a wise choice that the house so marked should be that in Great Queen Street where he wrote the work with which his fame is indissolubly connected.

But the most illustrious of all Scotsmen who have paced the streets of London, the one whose beautiful nature and indomitable will under undeserved misfortune will appeal to many, even more than his incomparable literary work, was the Wizard of the North, the great and noble Sir Walter Scott. His sojourns here were short and fitful, but what occasions for merriment they were; how all the world vied in doing honour to the great man; how simply he accepted the homage showered on him! Nothing, I think, proves so well the splendid character of the man as the innocent pleasure he gave and received on these visits. His great nature was as unaffected by adulation and praise as is the summit of some giant mountain by the sunbeams that play around it. Whether he was, to use his own words, 'telling a parcel of old tales or reciting a pack of ballads to lovely young girls and gaping matrons,' or listening to the thunders of applause that greeted the Prince Regent's toast of the 'Author of *Waverley*' at Carlton House, his was always the same simple and beautiful nature, unmoved by prosperity, as it was subsequently to be unafraid in the presence of ruin and disaster.

In 1803, which marks the period of one of his earliest visits to London, he writes to Ballantyne from 15 Piccadilly West, then the residence of his friend Dumergues. This house was later called 96 Piccadilly, and in 1887 was demolished, and a club, the Junior Travellers', erected on its site. The novelist generally made this his headquarters until Mr Lockhart went to live at 24 Sussex Place, where he, of course, often stayed with him during his visits to London. But other places in London are connected with his great memory. Thus in 1826 he was lodging at No. 25 Pall Mall, and here on October 23 of that year, as he writes in his diary, 'Sam Rogers and Moore breakfasted, and we were very merry fellows.' At Rogers's famous house in St James's Place he was (as where was he not?) a frequent and welcome guest; and the diaries of men like Moore and Crabb Robinson and others contain many references to those symposia in which the Author of *Waverley* was the most prominent of the party, and the most genial and amusing.

Few things, I think, are sadder than to compare those days of prosperity and pleasure with those later ones, when, broken in health, though indomitable in will, Sir Walter came to London and stayed at various hotels—the Waterloo in Jermyn Street, Long's in Old Bond Street, and, last of all, the St James's in Jermyn Street. Peter Cunningham, in describing Scott's last visit here, on his way back from Italy as a dying man, says: 'London memoranda delights in remembering the universal feeling of sympathy exhibited by all (and there were many) who stood to see the great novelist and poet carried from the hotel to his carriage on the afternoon of the 7th of July 1832. Many were eager to see so great a man; but all mere curiosity seemed to cease when they saw the vacant eye and prostrate figure of the illustrious poet. There was not a covered head, and the writer believes—from what he could see—hardly a dry eye on the occasion.' It is almost as pathetic as that last scene of all, when, as Lockhart writes: 'It was a beautiful day, so warm that every window was wide open, and so perfectly still that the sound of all others most delicious to his ear—the gentle ripple of the Tweed over its pebbles—was distinctly audible as we knelt around the bed, and his eldest son kissed and closed his eyes.'

Another Scottish poet, whose stirring verses are far less read nowadays than they should be, also made London his home occasionally, and indeed was married, in 1803, in St Margaret's, Westminster—Thomas Campbell.

For no less than seventeen years after this event he resided on Peak Hill at Sydenham; but in 1820 he settled in the Metropolis on being appointed editor of the *New Monthly Magazine*. At this time he lodged in Margaret Street, Cavendish Square, but a little later took 10 (now 18) Upper Seymour Street, Portman Square. Here he remained till 1828, when the death of his wife so affected him that he gave up the house and went to live a lonely life in chambers at 61 Lincoln's Inn Fields. After this a succession of lodgings—No. 1 Middle Scotland Yard, 42 Eaton Street (Pimlico), 18 Old Cavendish Street, York Chambers (St James's Street), and others—were occupied, until 1840, when he took No. 8 Victoria Square, just off the Buckingham Palace Road, which remains still a curious little backwater amidst the streaming streets of London, as it was in his day. This was Campbell's last residence in London, and while here he was looked after by his niece Mary Campbell, and here he was visited by, amongst others, Rogers and Moore, Milman and Beattie.

Let me give an amusing little anecdote, as told by the last-named, *à propos* of this house. When he was abroad Campbell asked Beattie to go to Victoria Square and get some money, which was 'in a press in his bedroom.' The press, says the Doctor, 'was opened without difficulty, for it appeared doubtful whether it had been locked. The contents . . . were carefully examined, but no money was discovered. . . . In shutting the press doors, however, the point of a red embroidered slipper—I shall never forget it—stood in the way. Taking it out in my hand to push it back, it felt hard, and on looking

nearer I saw it was stuffed full of white paper matches, such as are used to light candles. One of these, out of mere curiosity, was unrolled—for it was twisted like a whipcord—and to our surprise and delight turned out to be a ten-pound Bank of England note. . . . And at last, when both slippers had been fairly stripped of their precious lining, we found that the product in genuine bank-notes amounted to upwards of three hundred pounds.'

On his final departure for the Continent—he died at Boulogne—Campbell sold the bulk of his library, and he was wont to tell how the grocer to whom he disposed of the less valuable works—including, I presume, some of his own productions—'was a more insolent critic than the second-hand booksellers. . . . The duodecimos were quite at a discount.' 'But here,' said the vendor of butter, handling the folios, 'are some real good books.' 'Yes,' replied the poet, 'most pious books.' 'Yes, indeed,' rejoined the man of cheese; 'one leaf of them will wrap up a whole pound of raisins!' To such base uses may the learned Barrow and the judicious Hooker come!

VANESSA.

CHAPTER XI.

I FIND this in my diary:

'Two months have passed, and all is in preparation at Larkhall for the wedding. Presents are pouring in, and Vanessa and I are deep in study of silks and lace, and forms of hats and toques, and those countless little things that tell of coming bridal. One thing I find—that it is easy to fix on what she shall buy of the things of beauty that are spread before us when we go shopping in town, or the garments in which the graceful shopgirl moves about in the saloon for us to criticise. Given the right colours and the right texture, the arrangements of form matter little. Vanessa's figure is one of those the graceful lines of which will show through anything. Each costume seems more ravishing than the last. But ruthlessly she rejects everything that suggests frippery. Simplicity is the dominant note of all her choice; at which her Mitey rejoices, for although Vanessa seems not to know it, there never was a woman in the world of whom the words were more true, "when unadorned adorned the most." Of course there are occasions when simplicity would be affectation, when the unadorned would suggest a desire to be conspicuous; but I know that the choice of the day for rich laces and diamonds and pearly ropes may safely be left to a taste which is unerring.'

Perhaps there is no greater social pleasure to a girl—particularly as it can happen but seldom in her life—to be a bride's 'best friend' in the choice of the pretty things which go to make up the trousseau of one beloved and beautiful. I know that I revelled in it, and looking back at my diary reminds me how I tingled with pleasure when my lovely model murmured, as she stood in a soft flowing robe which I had finally designed, after many a sketch had been made only to be torn up, 'Mitey, you are wonderful!' I could only say, 'Dearest, I know where the inspiration comes from,' and bid her look into her own eyes in the great cheval before which she stood.

But I was also to receive a pleasure, and a flattering one, from outside. One morning a letter arrived for me, which said:

'DEAR MISS,—We, the tenants of the noble Marquis of Oldsborough, have had a meeting about making of a present to the noble marquis on the aspicious occasion of his entering into holy matrimony. It was told to us by the marquis's gentleman that marchioness to be's lady's-maid had told him that you, miss, had made a statute of her future ladyship as Brittania the Pride of the Ocean, as she appeared so splendid at the splendid show we had here when she carried off the prize his lordship gave. We would say here, if it is not taking a liberty, you being a friend of Miss King's, that it is he, the marquis, as is a-carrying off of the first prize now.

'With a unanimous vote we have declared that if you will be so kind, we would esteem that you did us a high honour if you would say that we might ask you to permit us to have the statute done in silver to present to the happy pair, as our gift to show our love to our noble landlord and to his lady, who we hopes will long adorn his ancestral hall.

'It is a great liberty we take, but hoping you will not think it too great a liberty, as we all, on thinking of it over, do consider that we could not think of anything that would be a more worthy thing than your statute. We have not seen it, but we are told from Miss King's young lady that it is just her very moral, so it must be real good, and so we do humbly ask that you will be so kind, and we will all be very grateful, and we will hope that you will receive our humble request favourably, and not say nay if you can see your way to say yea.—In name of the committee, I am, dear miss, yours most respectfully, EBENEZER MOULDWORTHY.

'*N.B.*—And would you please keep this a secret, as the committee think it will be best to be a surprise?—E. M.'

'How long did that piece of composition take of the worthy Mr Mouldworthy's time, I wonder?' said I to myself after I had laboured through it. Needless to say, my response was 'yea,' and on a

certain day in town I said to Vanessa, 'Have you and I ever had a secret between us?'

To which she responded with an emphatic 'Never!'

'Well, then,' I said, 'we are going to have one now; so, there, you must let me go out by myself for half-an-hour.'

'Well, then,' she replied, laughing and mimicking me, 'Mitey is a reptile. I shall not fix what reptile until I know the mystery.'

I kissed her and was gone, and in ten minutes was in the silversmith's shop. On presenting my card, the youth who took it disappeared through a glazed doorway, and there came bustling forth a bald gentleman hung with long white whiskers, bland and obsequious. 'I do hope, madam,' he said, 'that our work will please you. We have felt honoured in being entrusted with such an exquisite piece of art as your model;' and he fumbled at his gold-rimmed pince-nez.

The statuette was indeed a great success, and he told me that his patrons, to whom he showed it, were loud in their praises, and assigned it to more than one R.A., so Mitey felt quite conceited. When it arrived at Larkhall it made a splendid centre-piece for the crowd of beautiful presents that were ranged under the circular dome of the great conservatory.

The marquis, who had come down to his hunting-box to stay there until the wedding, came over to see the presents, and I found him in the conservatory gazing at the silver presentment of his love as he had done when first he saw my clay model. He took my hand, and we stood quiet for a minute. Then he said, 'Mitey, I little thought anything could be more beautiful than your clay when I first saw it, but you have found more in her since.'

'Yes,' I said. 'Neither you nor I thought it possible; but the little god with the bow can touch with a perfection all his own what seemed already matchless. Dear Cecil, I am so glad!'

My voice broke, and he drew me to him and kissed my cheek, saying, 'I had no sister till she gave you to me; now I know what sisterly love is.'

At this moment Vanessa came behind us, and put an arm round each. 'What! tears?' she said.

'Yes; but tears of joy,' I murmured, and, turning, I fled.

Vanessa would have no one for chief bride's-maid but me, and there were only two others, little Mary De Burgh and a granddaughter of Mrs Marsden's, the old lady being intensely gratified by this kind thought. Vanessa said that a crowd of bride's-maids was a mistake, and she had few young friends in England. But among her friends she numbered two of her fellow-nurses at the hospital, and these she insisted on having at the wedding. She also invited Mrs Saxilby and her husband the mayor, saying that it was hardly fair to expect them to come so far; but she would be delighted if they could. The reply was that they would willingly travel a much longer journey; the mayoress saying to me on her arrival, pointing to her head, 'Coals of fire, my dear; coals of fire!'

Another party that was invited consisted of Constable Sturgis and his wife and children, Vanessa supplying Mrs Sturgis with a dress and the children with charming frocks for the occasion.

At last the day came. How delightful it was to see my darling come up to the altar-rail on the arm of dear Uncle Goodman, and to see him give her away as if she were his own daughter! And later, in the vestry, after signing the register, there came a look of almost heavenly sweetness into the rugged old face as she, parting her veil, pressed a loving child's kiss upon his lips.

It was a glorious afternoon when the marquis's great car came up to the door to carry off the bride. But it did not come up alone. Each of the local Automobile Clubs was represented by a string of cars, and the marquis's own club had sent a deputation of three cars to represent them on the occasion. Thus does the power-carriage enlarge the range of social amenities to a degree unknown till now. It was delightful to see the long, serpentine line of seventy cars take its sinuous course down the avenue. I rode first with Tommy in Vanessa's own car, mother sitting in the tonneau. On reaching the road we increased our speed, and after running a few miles the procession stopped at a place where two roads formed a fork, the cars running up the road that skirted the side of a hill overlooking the other road, which ran along the base. We all got down and lined the bank between the two roads. How we women waved our handkerchiefs and how the men cheered as the happy pair drove past us, Vanessa like a queen, smiling and kissing her hand with infinite grace, and he keeping fast to his steering, with only an occasional wave of his hand! The road was strewn with shoes. All admitted that Uncle Goodman made the best shot, his slipper lying at the bride's feet, who, seeing he had thrown it, picked it up, and, turning round to him, kissed it. Just then the marquis let the car go, and she bounded away like a greyhound freed from the leash.

Poor Mitey's eyes were so clouded by tears that the car and its precious freight were too soon lost to sight.

Mother took both my hands in hers and said very quietly, 'Mary, there never was a truer word than yours when you said that there was no one like Vanessa.'

THE END.

HALLEY'S COMET.

By Alexander W. Roberts, D.Sc., Lovedale.

ONE has stood by the harbour-heads of a very busy port and watched for the incoming mail from some remote land. It was two months ago, perhaps, since it sailed from out those very harbour-heads; and voyaging on and on over an apparently limitless sea, it at length reached its distant destination. Then it returned again, as homing swallows do; and now, full of certainty and expectation, a group of men gather to watch for the first dark streak on the far-distant horizon that will tell of its approach. As one watches and waits one is impressed by the marvellous assurance and skill that has guided the iron hull, the insensate iron hull, over desolate waters, to its desired haven, with an accuracy of direction and a certainty as to time rarely in error.

It is with similar feelings that one watches and waits for the return of Halley's comet in 1910.

Seventy-five years ago it sped out on its great journey, on its distant, far-stretching circuit round the sun, on its vast round of nearly ten thousand million miles. Every seventy-five or seventy-six years this remarkable body completes this stupendous orbit, an orbit shaped for all the world like a straight banana or a torpedo. One end of this oval track lies beyond the outermost planet, three thousand million miles away; the other lies within the earth's circle, at a distance of only sixty million miles from the sun. Thus during the greater part of its elongated orbit, during at least seventy-three years out of the seventy-six, it is invisible to even the most powerful telescopes.

During this invisible stage it is describing that portion of its journey remote from the earth, away out on the confines of the solar system. When, however, it is passing over that part of its path which lies nearest to the sun, it approaches the earth sufficiently near to become visible in our skies.

We will better understand the peculiar movements of Halley's comet if we consider the cycle just being completed, or, to take our first figure, the out and home voyage now so nearly ended that astronomers are all agog to catch its first appearance as it sweeps round between sun and earth.

Its last appearance in our skies was in 1835 and 1836, when Sir John Herschel observed it at the Cape. In 1835 it was a fairly conspicuous object in the sky, especially in the southern sky, though it was not so striking as previous appearances led astronomers to expect. Its maximum brightness was reached in October of 1835.

After October it began rapidly to decrease in brightness, becoming invisible even to the most powerful telescopes after May 1836. But although it vanished from the sight of men, heading out into the vast ocean of space from which it came, its onward path was known with as great accuracy as sailors know the way of a ship over the trackless deep. And thus every lap of its stupendous orbit, ten thousand million miles in circuit, as we have noticed, has been mapped out with the utmost care and with the most certain assurance. Unseen for seventy-three years, it is yet as surely seen by those who make this branch of astronomy their care as if it shone nightly and brightly in our midnight sky.

The invisible bonds of law have it in their inexorable hold, and from out the confining boundage of that unbreakable leash it can never, never pass. It is not a question if it may: it must. The law of gravitation sets down for it, in the uncharted spaces of night, a definite path, and along that road it must travel, ever circling round its sovran lord the sun in certain definite orbits.

We have said that Halley's comet was last seen in May 1836. It had passed but a few months before through its perihelion, or nearest approach to the sun, and was moving swiftly, yet with an ever-decreasing speed, away from its central ruling force. In the early days of 1837 its enormous velocity—a million miles a day—had carried it out as far as the orbit of Jupiter, and by the close of 1838 it was crossing under Saturn's track.

Outwards, ever outwards, is its way! By 1844 it has reached the orbit of Uranus, and fifteen years later it is out in the chill spaces where Neptune, the outermost of the planets, swings through its solar round of one hundred and sixty-five years. And then, as if repentant of its headlong flight away from the sun, it begins to turn sunwards in its course.

We have likened the flight of Halley's comet to the out and home voyage of a great mail-steamer. To use again this figure, after 1860 the comet swung slowly and steadily round in its orbit, just as a liner wears round at sea and heads again for its home port.

In 1872 the return journey of Halley's comet began. By 1884 it was again over the confines of Neptune's orbit. When this present century dawned it had reached Uranus's path. Two years ago, with a velocity every day, every moment, growing greater, it swept within the line of Saturn's march. At the commencement of this year, 1909, Jupiter's orbit was crossed.

In June it was five hundred million miles distant from us, but speeding onwards towards us at the rate of over a million miles a day. In August or September it should be near enough to our earth to be picked up by some of the giant telescopes that are in the possession of not a few of our observatories. And thus no small emulation is being

witnessed between those observatories, endowed with powerful instruments, as to which of them will be the first to pick up the returning voyager from far-distant shores. Indeed, the search has already begun, chiefly by means of photography, it being thought that this auxiliary to science may make visible objects fainter than the eye can see.

It is more than probable that during the northern winter months only the larger telescopes will reveal the returning voyager, far-travelled for two generations of men; but in March 1910 it should be visible to moderate telescopes, if not indistinctly seen as a faint, hazy star by the naked eye.

It will reach its nearest approach to the sun the first week in May 1910, and during that month and June it ought to be an object of conspicuous brightness in southern skies. Unfortunately the long summer nights of northern lands will interfere sadly with observations in Europe and America.

It is thus possible that the brightest phase of the comet will not be seen by northern observers, unless they travel southwards as Sir John Herschel did in 1834, for after June 1910 the comet will again set out on its outward voyage, and pass practically through the same cycle as it did in the years 1835–1910.

In 1911 it will disappear into the night of far distances, not to emerge again till the year 1986, when the most of those who read this article will have ceased caring about comets.

There are few more interesting chapters in the fine story of astronomical research and discovery than that which tells the tale of the tracing back through the long centuries of the successive appearances of this remarkable comet. Already, chiefly through the assiduous labours of a group of oriental and classical scholars, we can trace its movements sunward and outward, sunward and outward, for nigh three thousand years.

This is surely notability enough and nobility enough to make it a subject of interest to not a few. It is the greatest among comets not only because of the spaciousness of its movements but because of its historical associations.

Some of its appearances are of unique interest. On the Bayeux tapestry there is a famous picture of the comet which appeared in 1066, and which Duke William of Normandy regarded as a sign from heaven that he was to conquer England.

Indeed, it gave him no small heartening, and thus this 'strange star with a tail' may indirectly be said to have influenced the destinies of England. At any rate it spread dismay and gloom over Saxon England. The comet depicted on the Bayeux tapestry, and which William regarded as a herald of victory, was none other than Halley's comet.

Again in 1456 we have its return connected with an important historical event. In that year John Hunyady was defending Belgrade against the oncoming Turks. As the comet appeared in the sky the two armies were so frightened that they ceased fighting. Unfortunately Constantinople had already fallen, or the history of Eastern Europe might have been changed.

There are not a few appearances of 'fearful stars' recorded in Roman story, some of which can with certainty be stated to be simply the return of Halley's comet. Especially is this the case with the comet which appeared in the year 11 B.C. Indeed, so regular is the appearance about every seventy-six years of a comet that one wonders how the philosophers and thinkers of ancient times did not trace a connection between them all, as they certainly did in the case of eclipses. Very possibly the fear which such strange visitors caused in the minds of most, learned or unlearned, may have led the wise men of past days to leave comets severely alone. William the Conqueror was a thousand years before his day when he announced that a comet such as was then shining in the sky 'was only seen when a kingdom wanted a king.' As a rule they were held to presage famine, wars, disasters, and especially heralded the death of kings:

When beggars die there are no comets seen,
The heavens themselves blaze forth the death of princes.

It is to Edmund Halley, the contemporary and personal friend of Newton, that we are indebted for lifting comets from the region of superstition into the calmer area of pure science. At the instigation of Newton, who hated numerical calculations, he undertook a thorough investigation into their movements, and into the laws which controlled them. He especially inquired into the movements of the great comet of 1682, a comet which he himself had very laboriously observed. After a most profound investigation, he came to the conclusion that it was circling round the earth in an orbit that took seventy-six years to fulfil.

His next step was to ascertain if there were any previous appearances of this comet. On searching records he found that a bright comet had been observed in the year 1607, and another in 1531, and yet another in 1456—the Belgrade comet already referred to. A mind so penetrating as Halley's soon discerned the great importance of this discovery. With a steadfast assurance of the certitude of his conclusions, he predicted that it would again appear in 1758, adding quaintly: 'Wherefore if it should return according to our prediction, impartial posterity will not refuse to acknowledge that this was first discovered by an Englishman.'

It was seen for the first time on 25th December 1758 by a German amateur astronomer, long after Halley was laid to rest, and an 'impartial posterity' all over the world has acknowledged the greatness of his discovery by for ever associating his name with that of the comet his genius has made so important.

This prediction by Halley broke down for ever the popular fear of comets, although no doubt, even to-day, the strangeness and suddenness of their appearance startles and awes all beholders.

Men never grow accustomed to Nature in her singular moods; thus eclipses, though predicted centuries beforehand, never fail to inspire men with fear and dread.

It was the appearance in 1682 of this remarkable comet that led Halley to his notable prediction that the same comet would appear again in the year 1758. It returned at the predicted time. We have already spoken of the next return, that of 1835. Thus the forthcoming appearance in 1910 will be the third since Halley determined its path through space, the eleventh since that which ushered in the Norman Conquest, and the twenty-fifth since the remarkable appearance in 11 B.C.

One is tempted to dwell for a moment on a consideration of the vast changes in history this rare visitor has witnessed. For a few months it looks down on our earth, then sweeps away again into the remote spaces of our system. Each successive return it shines down on a changed world. During the time it has been completing its year whole nations have been swept away, new lands discovered, society transformed. Since its last appearance in 1835 the Victorian Age has dawned, culminated, and set. A new Africa, a new Germany, a new America, a new Japan, have arisen in the world's day. The conditions of travel, of commerce, of government, have all been greatly changed.

Mountains and stars always seem to speak to one of the eternal flux of events, of the unrest that ever broods over the habitations of men.

But to revert to the more immediate circumstances of Halley's comet, there are one or two very interesting questions connected with its return, as indeed with the return of all comets. One of these questions is the constitution of such bodies. What is a comet? The usually accepted view is that it is a cloud of meteors at a very high temperature and giving forth electrical or chemical exhalations which appear as the tail.

Thus the nucleus, or brightest part of a comet, would be the more densely aggregated portions of the cloud, and the tail, matter in a very finely divided state; just as in this southern land one sees in dust-storms the powdered sand rise in fan-shaped forms high into the air, and remain there often for days.

While the nucleus shines with its own light, the tail shines partly by borrowed light. There is, also, in the peculiar diaphanous glow emitted by the tail, evidence of a similar quality of light that we find in electrical discharges in a high vacuum.

And here we come to the crux of the whole problem of comets. Why should the tail always be blown *away from* the sun. At a first understanding of the matter it would seem a very reasonable condition of things that as the comet tears along its path the tail should swing out after it, just as a trail of smoke follows in the wake of an ocean steamer. But the tail sometimes follows and sometimes precedes the comet. When it is making straight for the sun, the tail sweeps out behind; when it is heading away from the sun, the tail goes in front of it, as if some violent storm were blowing the tail along the comet's path.

It is evident that the disturbing force lies, therefore, in the sun, for the tail is always, it matters not in what position the comet is, pointed directly away from the sun. Two explanations are offered.

One is that the waves of light from the sun, bombarding the almost infinitesimal dust which forms the tail, drives it along in the direction in which they, the light-waves, are travelling. There are grave mathematical objections to this theory.

The other view, and the sounder, is that, besides waves of light, electrical rays are also propagated outwards from the sun, and these acting on the finely divided matter of the comet produce a tail. It is hoped that the very recent developments in cometary astronomy may enable students of this special branch of science to arrive at some certainty on the matter when Halley's comet does appear.

Another important question, still uncertain, is whether comets grow less bright each successive return. It is evident that if they are composed of myriads of small meteoric bodies, they will tend to shed off some of the outlying swarm, and thus in the long lapse of ages the largest comet would become attenuated, while all along its path would lie the débris of its ruined greatness. Further, the expulsive force which seems to be constantly at work in the ethereal fabric of a comet must sooner or later work its death.

In proof of this it is held that at each recurring period Halley's comet is becoming a less conspicuous object in the sky. The forthcoming appearance will give us the fourth return since careful observation and accurate drawings have been made of the comet, and so within a year astronomers should be able to make some declaration on this important question—a question which is intimately related with the evolution of the whole solar system.

A fact in support of the theory that comets are simply an aggregation, a shoal of meteors, is that on three or four occasions when a comet passed near the earth there were brilliant meteoric showers. Indeed, there are those who hold that comets and meteors are 'sib' to one another, that the latter are simply the remnants of some comet that in the course of ages has become disintegrated and its denser portion, or nucleus, scattered all along its path.

A third problem is connected with the variable movement, resulting in a variable period, of this and other comets. Thus there are seventy-six years between the 1682 return and the 1758 return, seventy-seven years between the 1758 return and the 1835 return, seventy-five years between the 1835 return and the 1910 forthcoming appearance. Why should the comet sometimes take seventy-five years to go round its orbit, and at other times seventy-seven and even seventy-eight years? We begin our explanation of this apparent anomaly by saying that if there were no other bodies in the universe but a central sun, and Halley's comet

circling round it, then each returning cycle would be like all those that had gone before, the same in period, rate, size, and every other element of motion. Each orbit, also, would be of the same shape and size as all its fellows, so that if we took the 1835–1910 orbit and placed it over the 1682–1758 orbit they would exactly correspond.

But the sun and the comet are not alone in space. There are other bodies in the sky. There is the Earth, Mars, Jupiter, Saturn, and all the other planets, and these are constantly tugging at the comet, now pulling it this way, now that, so that no two orbits are alike in shape, and no two periods are of the same duration. Sometimes because of hindrances on the way it takes seventy-eight years to return; at other times it is pushed along incontinently and its round is seventy-five years. Soon after it left the neighbourhood of the sun in 1835, Jupiter's great bulk swung across its path. The giant planet threw its grapnel-lines into its tenuous substance, dragging it back on its course, and thus making it return sooner by a year than it would have done had no Jupiter loomed up out of the stellar abysses.

All this is carefully allowed for by computers. They know the exact pull that every planet exerts, and they allow for it.

Now it is said that there are still undiscovered planets far outside the orbit of Neptune. If this be so they will show their presence by perturbing and changing the orbits of such comets as return to earth again at recurring periods. No heavenly body can conceal its influence. It influences every other orb that draws near to it, with results which can be measured and interpreted.

Enough has been said to indicate the interest that attaches to the coming appearance of Halley's comet. There are the many historical associations connected with it. There is, also, the possible beauty of the phenomenon; but as to this one must venture a word of caution, for it is just possible that the comet may be hastening now swiftly to its doom. Once disintegration begins to take place in bodies of this nature the end is near. Then there are the many interesting problems connected with comets which make the forthcoming appearance in 1910 of Halley's comet a matter of extreme importance to scientific men.

THE TUTOR OF TYNDRACH.

CHAPTER II.

THE Reverend Malcolm Turner's first anxiety on his arrival at Inchie manse the following day was to secure a private interview with his cousin. As a rule, Ann provided such opportunities unthinkingly. It seemed natural to her that Malcolm should want to usurp a certain portion of her time on his periodical visits, and she yielded herself to his requirements philosophically.

But to-day it was different. She had an unaccountable shrinking from finding herself alone with him, and managed to evade all occasions for *tête-à-tête* until the afternoon. Then an imperative demand from him that she should accompany him on a walk left her no choice but to obey. He was turning instinctively towards the hillside as they were about to start, but Ann demurred. She would rather keep to the road to-day, she said. It was too hot for climbing.

In reality, she felt an absurd disinclination to go with Malcolm over the route she had traversed the previous afternoon with Mr Selwyn. Somehow, the path seemed sacred to the memory of the episode of which the tutor had been the hero.

With easy tolerance, Malcolm yielded to her whim. In such trifling matters a woman might well be allowed to have her way, so that the larger and greater issues were left to masculine jurisdiction.

He had come to Inchie this time fully determined on an early settlement of his marriage. He was tired of his loneliness in the great, desolate Highland parish, where the sheep and cattle so far outnumbered the human beings that comprised his congregation, and Ann's presence in his home would give him just the companionship he desired.

The girl realised intuitively what his object was, and it was her dread of it that had been partly responsible for her avoidance of him. How could she stave off the crisis? With what excuse was she to meet his plea? Her uncle's loneliness seemed the only tangible reason for delay she had to offer, and that, she knew, would be easily overcome by an appeal to the old man himself. There was no way out of it but by flat refusal, and her opposition was as yet too vague and unrealised to lead her to such an extreme step.

She had an uncomfortable, trapped feeling as they started together down the road; but, fortunately for her peace of mind, Malcolm had a good deal of egotistic steam to let off before coming to the subject in hand, and for the first part of the walk his talk was exclusively of himself and his own doings in Golspie. His stories for the most part redounded to his own credit, and gave Ann a somewhat highly coloured view of his popularity and the general success of his pastoral ministrations. But she was too well accustomed to this self-congratulatory tone from him to be oppressed by it, and indeed did her best to encourage his reminiscences.

They had turned their faces homeward before he introduced the real object of his visit. Ann listened

to his proposals in silence. Put into bald words, the prospect of her impending marriage seemed even more distasteful than it had done in thought. She was shocked herself by the sense of aversion with which it filled her. Up till yesterday she had been conscious of no such sensation. There had been a philosophical quality in her anticipations which she had mistaken for the usual happy acceptance. What had happened to change suddenly her whole outlook?

She took a quick glance at Malcolm as he walked beside her. For the first time she seemed to see him with the eyes of a stranger. The cousinly affection that had hitherto blinded her to his imperfections no longer had power to cast a glamour over him. All the weakness and faultiness of his physiognomy seemed to have become glaringly apparent to her in a moment—the projecting mouth with the moustache clipped along the upper lip, the cleft chin, the roughly moulded features, the dank hair worn so long as to come over the clerical collar. With a quick impulse, partly of shame, partly of disillusionment, Ann averted her eyes; but Malcolm was happily oblivious of her scrutiny. He was slashing with his stick at the wayside grasses as he spoke, concerned only with the unfolding of his programme for the future, in which in a few moments, when his eloquence was exhausted, Ann would gladly acquiesce.

'It is time you had a proper sphere, Nan,' he concluded, turning to her at last and laying his hand with a possessive gesture on her shoulder. 'You are a woman now, and as my wife you will have a position and authority you can never have in uncle's house.'

Ann made a slight movement to dislodge his hand, but it remained firm.

For some moments they walked on side by side in silence.

'I couldn't leave Uncle Robert alone all winter, Malcolm,' said Ann dispassionately at last. 'It would be better for us to be married next spring, and then he would be accustomed to his loneliness before the winter.'

Malcolm gave one of his boisterous laughs as she finished speaking, dropping his hand at the same time.

'As if it made any difference to uncle whether he is lonely in winter or summer!' he declared contemptuously. 'Besides, what of me?' drawing a step nearer her as he spoke, and dropping his voice to a more lover-like key.

She walked steadily on. 'Oh, you don't count,' she said with a little, forced laugh. 'And, really, I don't know why you are bothering about it to-day, Malcolm,' she continued hurriedly, fearful of a further demonstration of affection. 'I would much rather you waited till nearer the time.'

Malcolm made an impatient cut at a sweet-brier by the roadside.

'But this is June, and if we are to be married in autumn you will have to be thinking about getting your things ready,' he declaimed authoritatively. 'I have spoken to Uncle Robert, and he is quite willing to part with you; in fact, the thing is settled,' closing his mouth obstinately as he concluded.

Ann made a quick gesture of rebellion. His last words were not calculated to bring her to a conciliatory frame of mind.

'It can't be settled without my consent,' she affirmed in a low voice, gazing straight before her as she spoke, an indignant light in her blue eyes.

Malcolm glanced at her incredulously. Was this the Ann he had known—the sweet girl-comrade who, ever since his boyhood's days, it had been his delight alternately to humour and control; the one being on earth whose fate and future seemed to be entirely in his hands? What had come to her? It must be that she was spoiled; her uncle was overindulging her, yielding to her whims and fancies too much. All the more urgent need for a speedy marriage.

'I think there is hardly any necessity to remind me of that, Ann,' he said, drawing himself apart and speaking in a tone of dignified reproof. 'If you don't care enough for me to marry me in the autumn you don't care enough to marry me at all. But I'm not even going to think of such a thing,' with a lift of his head. 'We have been lovers too long, dear. You know how much your happiness means to me.'

He made no attempt to draw nearer to her or emphasise his confession by any demonstration of affection, and Ann felt a miserable sense of reproach as he was speaking. He was plainly bitterly hurt by what she had said, and now that she began to reflect upon it her attitude did seem childish and unreasonable. She had had no thought of putting her marriage off altogether. What she had stipulated for was a postponement of her decision, and she was still determined on that.

'Don't let us say any more about it to-day,' she pleaded in a low voice. 'Wait till to-morrow evening.'

Malcolm caught eagerly at the new penitence in her tone.

'Yes, very well, Nan,' he agreed. 'We'll think about nothing but enjoying ourselves and having a good time; though there's that tutor fellow coming to-morrow—worse luck!' he concluded with a grimace.

Ann's face grew suddenly crimson at the allusion. Something in his tone, too, jarred upon her and roused her resentment.

'It is very unlikely that Mr Selwyn will come,' she replied coldly.

'Well, I'm sure nobody wants him,' said Malcolm. 'To hear Uncle Robert talk you'd think he was some distinguished man instead of just a sort of second-rate schoolmaster. Why, I might have been nothing but a tutor myself now if I hadn't been so determined to get into a profes-

sion,' he concluded with a little laugh of self-satisfaction.

Ann controlled herself with difficulty. A second-rate schoolmaster! And he, Malcolm, daring to talk as if he was the tutor's superior! Yet she knew that any defence of Mr Selwyn on her part would simply arouse her cousin's jealousy and add to the complications she foresaw on the morrow. Besides, was it necessary? Could a man like Mr Selwyn suffer from the belittling comments of such a one as Malcolm? She knew instinctively that he would prefer them to be passed over in silence, so she said nothing; and Malcolm, tiring soon of his criticisms of another, reverted once again to the more congenial topic of his own personality.

But before Ann slept that night she was to hear more of the subject she had thrust from her so distastefully in the afternoon.

After supper Malcolm strolled out into the garden to smoke, leaving his uncle and cousin alone in the lamplit parlour.

Ann, who had fully expected to be asked to accompany him, was secretly relieved at her escape. Her resentment against him for his disparagement of the tutor was still strong, and she felt that, under the circumstances, they were better apart.

In a moment or two her uncle would retire into his room, and she would be free to follow her own inclinations.

She rose from the table with a murmured excuse about seeing whether the lamp in the study was lit, when the minister signed to her to be seated again.

'Malcolm and I have been talking about the future, Ann,' he began, pushing the plates and knives before him in a nervous way as he spoke.

Ann's heart sank. She knew now why she had been let off the solitary *tête-à-tête* in the garden.

'And he tells me that you are making an obstacle of my loneliness. I realise the goodness of your motive, my dear child; but yet it is hardly fair to me—it places me in the wrong. My only wish is to clear the way for you young people, not to be made an obstacle of. You would be much happier as a married woman, Ann, and I should be content in your happiness.'

Something hot and impatient was rising up in Ann as she listened. She felt it coming nearer and nearer to the surface; in another moment she must speak. She pushed back her chair and stood up suddenly.

The minister followed her impulsive action with surprise, gazing wonderingly up at her over his glasses. The lamp with its china shade was between them; the light struck full on Ann's face, revealing the gleam of intense feeling in her blue eyes.

'Oh uncle, it isn't that that was my excuse!' she cried tumultuously. 'It is that I feel that I don't love Malcolm enough to marry him. I have only just found it out.'

Partly to her relief, partly to her chagrin, her uncle received her outburst with a laugh of gentle amusement, which acted like a cold douche upon her heroics.

'Hoots, lassie!' he said, waving her down into her chair again. 'Why, he's part of you. Think what it would mean if he were to be suddenly taken out of your life. You've belonged to one another almost from the cradle, and it's that that's led you astray. It's the woman in you clamouring for romance; but with some the romance begins after marriage, and it will be so with you and Malcolm. You've been brother and sister so long that neither of you quite realises what the true love-making will be like. Why, if I were to be taken to-morrow whom would you turn to for protection but to Malcolm? Wanting him you would be lonely indeed. And he's a good lad, and he loves you dearly, dearly.'

Ann sat very silent and subdued. She had to acknowledge the truth of his arguments. Long years of use and wont rose up in opposition to the rebellion of a day. Malcolm the sharer of her childish joys and sorrows! Malcolm the companion and friend of maturer years! Malcolm guide and protector to be of her future life! She knew how dear he was to her uncle; she had even sometimes felt a pang of jealousy for the truth that he was first in the old man's affections. But Malcolm's mother had been the minister's best-loved sister, and she lived again for him in the young man's person. Surely her uncle was a good judge. He had perfect trust and confidence in Malcolm; he believed in his talents, in his powers, in the future that lay before him.

Somebody was tapping at the window from the darkness without. As Ann turned quickly she saw the red gleam of Malcolm's pipe.

'Come out, Ann—it's beautiful,' he called.

'Yes, go. There, he wants you,' echoed the minister, smiling across into her still doubtful face as she hesitated.

She rose and moved slowly across the room. Fate seemed to have her in its toils; but on its side were justice and duty and tradition. What was one wild, foolish fancy against such a cumulative force?

At the door she turned. Her uncle's gaze had followed her. Some expression of wistful uncertainty on his face made her hasten impulsively back to his side. She stooped and put her arms round his neck and kissed him.

'God bless you, child!' he said.

'Nan, Nan!' called Malcolm's voice from the outer door, where he was waiting for her.

Ann went quickly through the hall towards him.

'I was lonely without you, Nan,' he said in a low voice as she reached his side.

She slipped her hand into his for answer. He grasped it tightly. 'I'll marry you in the autumn, Malcolm, if you like,' she said.

(To be continued.)

THE LION IN AFRICA.

By H. A. Bryden.

A GOOD many years since, a writer on South Africa remarked flippantly that the lion was retiring from business. More than two decades have passed, yet the lion has by no means finally retreated even from South Africa; in many other parts of the Dark Continent his presence is, of course, constantly in evidence. In this paper I propose to show what originally were the limits of the noblest of the *felidæ* in Africa, to trace briefly the story of his ejection from the more settled regions, and to show where at the present time he makes his lair and carries on his predatory operations.

In ancient times the lion had naturally a far wider distribution than at present; within the early historic period he was abundant in south-east Europe, he roamed over all Africa from the Mediterranean to the Cape peninsula, and was known throughout much of India and other parts of tropical Asia. At the present day the range of the animal in Asia may be very quickly defined. The lion is still to be found here and there in Mesopotamia, on the western flank of the Zagros range; a few are believed to survive in Persia, south of Shiraz; while in India the great cat has been so harried and shot that it is now to be found only in the Gir Forest of the southern portion of the Kathiawar peninsula.

It is astonishing, when one remembers how scarce the lion has become in Asia, that, despite the fact that in Africa during uncounted ages the hand of every man has been against it, this animal still roams pretty much at will over the whole country from southern Algeria to the northern border of the Transvaal. Even in the days of the Pharaohs these creatures were probably not common in Lower Egypt, although Amenemhat I. has triumphantly recorded the fact that he hunted the lion and brought back the crocodile a prisoner. The Roman emperors procured most of the lions displayed in the arena from Mauretania and the Nubian desert.

In modern times the sportsman passing through Egypt cannot expect to come up with the lion until he reaches the White Nile and the Bahr-el-Ghazal country. Eastward, in Abyssinia, lions are still fairly numerous, and the full-dress of a notable of that country includes the skin of one of these formidable beasts. Eastward of Abyssinia, again, in Somaliland, lions are to be found in some plenty. From the Soudan, southward, lions are to be met with all over Africa until Zululand is reached. In that territory they still exist, although in the more settled regions of the adjacent colony of Natal they have been exterminated these forty years. The last lion slain in Natal is believed to have been one shot by the late General Sir John Bissett in the year 1865.

Fifty or sixty years ago, in the days of the celebrated French lion-hunter Jules Gerard, lions were found much nearer the sea in Algeria than they now are. A few are still reported in the southern portion of that dependency; but modern civilisation and modern rifles have driven the king of beasts from most of his ancient domains in this portion of North Africa. Tunis is, we believe, now almost devoid of lions; in Tripoli few or none are to be found; while in Morocco, except in the extreme south of the region of Sus and the country below Tafilet, they are seldom heard of. But from Senegal, no great way south of Morocco, the lion's habitat may be traced southward through the continent as far as Damaraland and Namaqualand in German South-West Africa. All through Central Africa the grim beast is more or less abundant, his numbers depending chiefly on the presence of the game from which he derives his sustenance.

The favourite food of the lion may be stated in the following order: zebra, buffalo, all kinds of antelopes, cattle, sheep, goats, horses, and asses. Where game is plentiful, the lion will, as a rule, leave domesticated animals pretty much alone. When game becomes scarce he betakes himself to the kraals of natives, and helps himself nightly to such food as he can pick up. Where an old lion or lioness becomes so decrepit and worn-out as to be unable to catch and kill its own food from herds of game, the beast will hang about native kraals; and, finding that the dreaded foe, man, is usually a much easier prey than had been imagined, these animals take readily to human food, and become man-eaters.

As a rule, lions are more numerous and thrive better in the higher and healthier parts of Africa than in the moist, flat, low-lying, equatorial regions of the west coast. The highest altitude of which I have record of a lion being shot is at Punda Milia, British East Africa, where, at an elevation of six thousand two hundred feet, one of these animals was secured by Major Powell Cotton in 1902. Four thousand feet is a common altitude for lions; and in the earlier days of South African hunting vast numbers of these animals were shot at this height on the karroos of Cape Colony, the plains of the Orange Free State, and the high veldt of the Transvaal. On the high plateaux of East Africa, also, where game abounds, lions have been and still are very numerous.

In South Africa especially, that wonderful home and nursery of the many kinds of game on which lions delight to feed, these carnivora have, until quite recent times, been extraordinarily abundant. When the Dutch took possession of the Cape in 1652, and built a fort there, lions were as numerous as they were daring. In the quaint chronicles of the old Cape commanders, preserved in the archives

at Capetown, occurs the following entry for January 23, 1653: 'This night it appeared as if the lions would take the fort by storm.' In the same year Governor Van Riebeek encountered a lion in his own garden! It took a long time in the days of flintlock guns and a sparse population to eject the lion from his ancient kingdom south of the Orange River—something like a couple of hundred years.

The Boers of the eighteenth century, with their cumbrous and often unreliable flintlocks, although they steadily thinned down the lions as they trekked inland and carved out their farms from the wild veldt, not seldom suffered grievous losses from these dangerous foes. In 1773 Thunberg, the Swedish traveller and scientist, speaks of Jacobus Botha, then a man of eighty-one years of age, who had been one of the most successful elephant-hunters of his time. This Botha, who was, I believe, an ancestor of General Botha of the present day, had had his hunting career cut short at the age of forty in an encounter with two lions. One of these he shot; the other mauled him to such an extent that he could never again handle a musket. Another Boer of that period, in an encounter with one of these beasts, had his hand so terribly mutilated as to be useless. With extraordinary courage, he placed the wounded member on a block, laid an axe on it, and ordered his Hottentot to sever it from his arm with the blow of a club. Strange to relate, the man actually made a good recovery from this heroic treatment. In 1890 an almost similar accident happened to a settler in Mashonaland, who, going to the door of his hut on a dark night, had his hand seized and frightfully lacerated by a lion. In this case blood-poisoning set in, and the wound proved fatal. In the Sneeuwberg Mountains, behind Graaff Reinet, about the middle of the eighteenth century, a widowed Dutch woman named Wagenaar, who had gone forth to scare a lion from her cattle, was seized by the ferocious beast, which tore off one of her arms and crushed her skull in. After this the brute killed and devoured a Hottentot maid who had gone to her mistress's aid. The woman's children, who had witnessed this shocking spectacle, dug themselves out through the mud floor, under the back wall of the house, and thence sought refuge at the nearest farm. These are but a few of the numberless mischances and fatalities which the early Cape settlers suffered in their encounters with lions.

At the beginning of the nineteenth century, when the British finally took possession of the Cape, lions were still plentiful and very daring in many parts of the country south of the Orange. Even up to the year 1850 the last of them had not been expelled from the northern portion of Cape Colony. The latest record I have of a lion near the Orange River is dated so recently as 1893. In November of that year two lions followed and attacked some oxen while they were drinking in that river on the northern bank, not many miles west of Upington. The lion was killed; the lioness was wounded, but made her escape. In the Orange River Colony lions have vanished, but in the Transvaal warfare upon the lion has not yet been finally brought to a close. Here and there, in the wilder portions of the northern and eastern part of that colony, these carnivora still exist. A lion was killed at Springs, near Johannesburg, so lately as 1897; and another was reported in 1898 near Heidelberg, south of Johannesburg.

In Rhodesia, north and south of the Zambesi, North Bechuanaland, Ngamiland, Damaraland, the fringes of the Kalahari Desert, Ovampoland, and other parts of German South-West Africa, and in the Portuguese territory of Angola, lions are still pretty numerous, as, indeed, they are on the other side of the continent, in Portuguese East Africa. In German East Africa, where game is abundant, these carnivora are almost as plentiful as they still are in the adjacent country of British East Africa. Thus, in spite of the fact that man has made war upon the lion from time immemorial, and that during the last fifty years all Africa has become known to us, the animal still maintains its ground over a very large proportion of the continent.

Why has the lion obtained from the earliest times so great a pre-eminence among beasts in the estimation of mankind? The reply, briefly put, may be as follows: because of his strength, his ferocity, his splendid grace, and the position he has always secured and maintained for himself among all other beasts of Africa. With the exception of the elephant and rhinoceros, which, by reason of their bulk and the thickness of their hide, he is not able to overcome, the lion stands without a rival among animals of the Dark Continent. To the beasts of the field he is a terror by night and day. Even to man, armed with the most wonderful and deadly of weapons yet devised, he is still almost as formidable an opponent as ever. An encounter with a lion still means that, in spite of the odds of wonderful arms of precision and of human skill and courage in his favour, a hunter can never know until the grim beast is stretched dead at his feet whether himself or his opponent shall be the conqueror.

All the long and distinguished line of British hunters in Africa speak of the animal in high terms of respect. Mr F. C. Selous, who has shot thirty-one lions with his own rifle, and has probably had more to do with these beasts than any man living, speaks of them with the very greatest respect. He says: 'If pursued or wounded, they may be expected to charge, and, *cæteris paribus*, I have found in my experience that a far larger proportion of them do charge than of any other animal in South Africa with which I am acquainted; and as their powers of concealing themselves and their quickness and agility in attack are far greater than in the elephant, buffalo, or rhinoceros, I pronounce them to be more dangerous animals to meddle with than any of these.' A hungry lion on a dark night is the most daring and dangerous beast in Africa.

Jan Viljoen, one of the greatest of the old school of Boer elephant-hunters, once said with truth: 'A hungry lion is a true devil, and fears nothing in this world.' On the contrary, a lion that is not hungry will sometimes refuse the most tempting opportunities. I once rode with a hunting-friend and a native lad seventy miles from a water-pit in the Kalahari to the Lake River, Ngamiland. We were going ahead of our wagons, riding one horse and leading a spare one each. There was no fuel handy to make a fire; and, after eating some food and tying up our horses close to us, we lay down in our blankets and fell asleep. Next morning, on waking, we found the spoor of a lion which had been prowling round us as we slept, within fifty paces, and yet never attacked either horse or man. On the following night this same lion killed an ox from a native kraal hard by. Lions, like individuals among mankind, vary, of course, a good deal in character, and some are doubtless less courageous and less aggressive than others.

In East Africa lions are often met with in large troops. Mr F. J. Jackson once came across twenty-three together near Machakos. Mr Neumann has seen a party of fifteen north-east of Mount Kenia, and other sportsmen, among them Major Powell Cotton, have also seen these animals together in considerable numbers. A Hungarian sportsman, Count D'Harnoncourt, actually killed a few years since in East Africa no less than six lions out of a troop—a very remarkable achievement. Mr Selous has shot three lions in a day with his own rifle; but Count D'Harnoncourt's feat is, I believe, a record which will probably stand undefeated in Africa.

When the lion is about to charge he throws his tail in the air, holding it erect and stiff as a bar of steel. This he may do twice or thrice, after which he instantly charges with a hoarse, grunting roar. It may be doubted whether the charge of an angry elephant, coming down at close quarters at high speed, and accompanied by the furious screaming which these pachyderms raise when infuriated, is a greater trial to the nerves even of a cool and courageous hunter than the lion's assault in the open. A heavy bullet will, however, often turn both elephant and lion at quite close quarters, and the lion, being a thin-skinned animal and possessing much less tenacity of life than the tough antelopes of Africa, is, if hit in a vital place, not difficult to kill. Even on horseback the hunter is by no means safe at close quarters, the lion's speed for a short distance being greater than that of a galloping horse. Mr Selous, who has shot most of his lions on foot, has been several times hard put to it to get away on his horse; and Mr Baldwin, in the year 1860, while riding up to a lion he had shot at, had an extraordinarily narrow escape when the lion charged at him. 'My horse is a fast one,' he says, 'and has run down the gemsbok, one of the fleetest of the antelopes; but the way the lion ran him was terrific. In an instant I was at my best pace, leaning forward, rowels deep into my horse's flanks, looking back over my left shoulder, over a hard, flat galloping ground. On came the lion, two strides to my one. I never saw anything like it, and never want to do so again. To turn in the saddle and shoot darted across my mind when he was within three strides of me; but on second thoughts I gave a violent jerk on the near rein, and a savage dig at the same time with the off heel armed with a desperate rowel, just in the nick of time, as the old mannikin bounded by me, grazing my right shoulder with his, and all but unhorsing me; but I managed to right myself by clinging to the near stirrup-leather.' Notwithstanding this fierce ordeal, the hunter turned, and with a couple more shots killed the brute that had so nearly made an end of him.

Occasional lions are met with which, even in broad daylight, will attack and, if possible, slay every human being with whom they may come in contact. This is, I think, much more often the case where the beasts live in purely native territory and have not been much accustomed to firearms. Where native raids and wars have resulted in the exposure of large numbers of corpses about the country, these animals grow very bold and seem to lose their natural instinct of respect for mankind. When Sebituane, founder of the Barotse kingdom, swept across Bechuanaland in the first quarter of last century, his warriors massacred thousands of natives in their course. Moffat and other travellers of this time found the unfortunate Bechuanas sleeping in huts erected among the branches of trees and on raised platforms, to which the lions had driven them. One of these trees contained no less than seventeen conical huts.

Natives in savage Africa have at times extraordinary encounters with lions. Years ago, before Zululand was conquered and became British, a Zulu hunting in thick bush came suddenly upon a full-grown lion, with not a yard between them. It was a terrible moment; if the man had moved hand or foot the lion would have seized him. The Zulu was, however, a cool-headed fellow, and, although armed with some assagais, stood stock-still, moving not a muscle. For a couple of long minutes the brute watched him, then moved off, turning its head every now and again to make sure that no attempt was being made upon it. In this case the man never raised his eyes from the ground. Before going very far the same lion met another native, who raised his spear to defend himself. At him the lion instantly sprang and inflicted such wounds that the unfortunate Zulu died within half-an-hour. On another occasion a Zulu traversing the bush-veldt in search of game, and armed with a single-barrelled gun, found himself suddenly in the midst of a family party of six lions—a lion, a younger male, a lioness, and three cubs, the latter about the size of cats. One of the cubs instantly ran up to him, as if to a playmate, and the lioness, furious with anxiety, rushed up, and, as the man afterwards said, fairly danced round him. The Zulu, with iron nerve, remained perfectly quiet and moved not even an

eyelid. As he said, 'It was a hundred to one that I did not kill the mother; and if I had, the other two would soon have avenged her.' After a minute of the most terrible suspense, the whole party of lions, seeing that the man attempted no harm, retired into the bush and left him to congratulate himself upon his wonderful escape.

Here is another encounter of a different kind, related by Major Powell Cotton in his recent book of travel, *In Unknown Africa*. An Elgeyo boy was suddenly confronted at close quarters by a fine, black-maned lion, which opened its jaws and drew back its lips in an ugly snarl. 'The boy promptly fired a poisoned arrow into its open mouth, and, while the lion was trying to cough it out, ran for his life.' In a short time the beast was dead, and the lad returned and took the scalp, in the hopes of trading it to the Masai. A still more wonderful native adventure with a lion is vouched for by two unimpeachable witnesses, Oswell and Livingstone. At Mabotse, in Bechuanaland, some women were hoeing in the fields, and a young man was chatting to them. A lioness suddenly sprang upon him and was carrying him off, when one of the young women ran after her, and, catching her by the tail, was dragged for some little distance. 'Hampered with the man in her mouth and the woman behind her,' says Oswell, 'she slackened her pace, whereupon her opponent straddled over her back and hit her over the head with a heavy, short-handled hoe.' Strange to relate, the lioness dropped her prey and slunk away into cover. The plucky woman who accomplished this rescue was the wife of the man attacked. But, after all, it is very seldom indeed that the lion will submit to such liberties.

It has, of course, long since been clearly proved, notwithstanding the assertions of the old Boer hunters and of natives to the contrary, that one species, and one only, of this animal is found in Africa. The Asiatic lion is of identically the same species as its congener of Africa. Many variations in colour exist, but it is a fact that black-maned and yellow-maned lion-cubs are constantly produced in the same litter. In the feral state lions as a rule carry far less ample manes than do menagerie specimens. Nevertheless, wild-bred animals having fine manes are occasionally shot; and, especially in Somaliland, English hunters, such as General Paget, Lord Wolverton, Lord Delamere, and others, have been exceedingly fortunate in shooting lions with ample and very beautiful manes. One of the handsomest lions ever seen in captivity was shown at the Zoological Gardens some years since. This animal came from Senegal, and was of a bright and wonderfully rich yellow hue. In Africa, in the wild state, lions seem to breed less freely than in captivity, seldom producing more than three cubs at a birth. In captivity from four to six cubs are often born. From teething and other troubles only a small percentage of wild lion-cubs survive to maturity. Probably this is a provision of nature; for it is certain that if all lion-cubs were healthy and reached adolescence the dread of this beast would be far more widespread and its butcher's bill much more terrible than they are at present.

Rifles are now so perfect and so destructive that it is difficult to suppose that much more deadly arms of precision than those we now use can be invented. I have shown that, notwithstanding the odds against him, the lion in Africa still roams over an immense extent of country. He yields slowly to civilisation, it is true; but in the wilder and more remote parts of the continent his reign is still practically unchallenged. It took, as I have shown, two hundred years to drive the animal north of the Orange River. South of the Zambesi the last lion may perchance have disappeared within the next thirty or forty years. In many other parts of Africa it may be safely anticipated that the roar of the lion will be heard for at least another hundred years; in some places possibly two hundred years may be nearer the mark. The lion, in truth, dies hard. His destruction is only accomplished by sportsmen of great courage and determination, men who are experts in the use of the rifle and whose eyes and nerves may be depended upon in the last extremity of danger. Even with such as these, the lion is not always the loser; and, to the end of his career in Africa, this animal must always remain the noblest and most dangerous quarry to be hunted by adventurous mankind.

THE VIRTUES OF COMMON SALT.

By F. N. Burn, Rangoon.

IN *Chambers's Journal* of August 24, 1901, appeared a paragraph under the above heading, noticing a work by Mr Gümpel on *The Prevention of Epidemic Zymotic Diseases in India and the Tropics* by the use of salt solutions. In conclusion it is stated that this remedy, whilst having the advantage of being cheap and easy of application, 'may not suit every constitution.' I have read recently that both in Russia and Calcutta cholera cases have been effectively treated by salt applications. I have myself in the past seven or eight years found the advantage of putting a little salt in all the water I drink. I also put a little salt with sugar and milk in every cup of tea, coffee, or cocoa I use. I have been a resident in the tropics for over forty years, and except for a sprained ankle have not had occasion to call in a doctor or to take any medicine in the last thirty years. I may say I am not a total abstainer,

though very nearly one. I believe every one's health in the tropics would be very much better if he used more salt. Until I did I suffered occasionally from headaches, and often had a bad taste in my mouth on waking in the morning. I never have a headache or a bad taste now. I find the benefit of drinking a tumbler of cold water with a little salt in it every morning on rising at about 5 A.M., before my bath or cup of cocoa, which I usually take between 5.30 and 6 A.M. The fact that salt has been successfully used in hospitals in Calcutta and in Russia in cholera cases should lead medical men to try this system of taking salt in solution in water before cholera breaks out. Wherever a regiment is quartered in India, if officers and men would double their salt consumption in times of sickness I am sure the advantage of doing so would soon be generally recognised. If a diagnosis could be taken of all cholera or plague cases amongst natives, I believe it would be generally found that the bowels of patients were generally constipated for four or five days before they were attacked. I was travelling with my brother in Siam very many years ago with a considerable following of Burmese and Indians. We put up at Bangkok in a large rest-house, of which there used to be several along the banks of the Menam. The place was substantially built of teak on posts about six feet above the ground, and after it had been washed and a portion curtained off for our use was fairly comfortable. We stayed in it for about three weeks. Two Burmese followers were seized with cholera, and died there during our stay. I did not then know anything of the virtues of salt, and did not take more than the ordinary quantity. There were no other cholera cases either in the rest-house or in the vicinity that we heard of, and the theory of immediate evacuation now generally followed in plague and cholera cases was not adopted. We stayed on until our business was finished, and had no more cases. Medical science has not as yet proved very effective in the prevention of either plague or cholera. Cleanliness and rat-destruction are no doubt useful as preventives; but both are difficult to enforce, and religious prejudices against taking life often interfere with rat-killing. In many places in Burma where the municipalities pay a reward for dead rats thousands are killed. But, on the other hand, where rat-traps are set by municipal servants, pious Buddhists think it a work of merit to release the rats caught before the early collection of traps takes place. The Government does something towards reducing fevers by selling quinine cheap through the post-offices and the agency of headmen. My own experience in the districts of both Indians and Burmese is that constipation is the source of fevers and other diseases, and that until you eradicate this quinine or other remedies are not of much avail. If people could be induced to try the easy and cheap method of taking a little common salt with the water they drink they would in the generality of cases find it a remedy for constipation, and they would seldom require other medicine. How many millions of money must be spent in pills and other remedies quite uselessly, when every one has the cheap salt remedy at hand and can try it without going to a chemist or a doctor!

A SPRING DAY IN SARK.

Loveliest of lovely islands,
Fair queen of flowering ways,
Of gorse and grass grown highlands,
And shadowy shoreless bays;
Of hidden caves sonorous
With sounds of refluent seas,
Of winds that swell the chorus
To wave-born melodies;

We saw thee first enshrouded
In mists of driving rain,
A vision, dimmed and clouded,
Now seen, now sought in vain;
Till, through the gloom, a slender
Bright shaft of sunlight clove,
And smote to sudden splendour
Thy waves that stormed and strove.

No dream was e'er beholden
So fair as thou art fair,
In garments green and golden
Woven of the light and air,
That cloud as waters darkle
When skies are overcast,
That flash and flame and sparkle
When clouds have overpassed.

Beset with tides and races
Thy rock-bound ramparts rise,
And bear the shining spaces
Wherein thy kingdom lies,
High raised o'er black abysses
Within whose deeps profound
The mad sea boils and hisses
In whirls of foam and sound.

O'er cliff and promontory,
O'er crag and crumbling ledge,
The gorse's golden glory
Flames to the outmost edge;
And all thy woods are ringing
With voices of the spring—
The throstle's joyous singing,
The leaves' low whispering.

His lips are hushed for ever,
His song for ever stilled,
That with its mighty river
Of passionate music filled
The listening lands;* he praised thee
As none could praise but he,
To deathless glory raised thee
And thrilled the world with thee.†

Thou dream of swift surprises,
Alas, no skill is ours
To limn thy hues and guises
That change with changing hours!
Unworthy we to sing thee
Whose words are rude and worn,
We have but love to bring thee—
Our love of wonder born.

P. J. H.-G.

MINUTE MINUTES OF THE HOUSE OF LORDS.

By F. Bayford Harrison.

THE Journals and Minutes of the House of Lords, the accumulation of centuries, are both voluminous and curious. Taking only the early years of William and Mary, we have a number of large octavos consisting each of some five hundred pages, and affording plenty of literary browsing. Certainly the fare is mostly very dry; only here and there occurs a patch of pleasant verdure. The great national questions which occupied the kingdom and the Parliament are for serious history, not for the magazine sketch, and yet some of even the most minute of the Minutes throw sidelights on the manners and customs of our ancestors, and are not without interest for us.

The Minutes preserved in manuscript are often very quaint; the clerk whose business it was to jot them down as occasion arose expressed himself simply, and sometimes with a certain child-like charm. Some of these parliamentary proceedings never attained to the dignity of print; they are embedded in more important matters, and when dug out they are 'neither rich nor rare,' only curious. Such was an absurd little Order made on the 10th of January 1690, during a very solemn debate as to whether peers should be tried for all offences by their peers; the decision was that they should be so tried for political offences, but for murder and felony in the same way as commoners. In the midst of this important discussion, involving laws and lives, there was made a singularly trivial Order: that no lord should 'go to the fire' without special leave of the House. Their lordships were concerned with a question involving the beheading or hanging of members of their august body, and they interrupted the proceedings to forbid undue roasting of fingers and toes. Perhaps the chillier peers crowded round the burning logs and left the Lord Chancellor to freeze on his Woolsack; perhaps when they so gathered together they indulged in unseemly gossip; at all events, the quaint Order was made and appears in the Minutes.

Another Order which is only found in the manuscript Minutes prohibited the peers' footmen from lying on the tables in the painted chamber; which reminds us that in those days armed servants attended their masters in the streets of London; and the demand, 'Who goes home?' made nightly in the House of Commons, was instituted to ensure companions and safety for the Speaker on his homeward route after dark.

We find, under date 16th of April 1689, that the Lords' Committee of Privileges had a very grave matter to decide. Under the Stuart kings—perhaps under the Tudor monarchs—peers had been in the habit of putting on their hats when the king put on his. When present at plays the king and the lords sat in the cockpit; if the king remained covered, so did they; if he took off his hat, they doffed theirs. The same rule held good in the Chapel Royal; the Bishop of Winchester gave evidence that Charles I. used, by putting on his hat in the chapel, to give permission to their lordships to put on theirs; presumably this was done as they came out from divine service. When they walked in the Mall and when they played tennis a like custom was observed. The outcome of this serious debate is not recorded. About the same time arose a discussion concerning New Year's gifts, and whether they should be reciprocal between the king and the peers. The Earl of Winchelsea said that when they were called in Parliament they might take a deer upon sounding a horn, and they were to have his venison; the king used to give wine, 'and that is taken off; the custom is run out.' Apparently the sovereign had been in the habit of supplying the materials of a meal to those peers whom he summoned to his infrequent Parliaments; but the custom was 'run out.' Nothing more is recorded; as our latter-day reporters would say, 'the subject then dropped.' Many a debate in the Upper House came to a like timely end; but, trivial as they were, and with no results, they were not too minute for the Minutes.

A proposal was made about this time to take

 [*All Rights Reserved.*]

away all privilege from peers who neglected to attend the House during a whole session. It was suggested that there should be inflicted a fine of one hundred pounds for each lay lord, and for each bishop fifty pounds, who so transgressed; the bishop was to be let off with a small fine because he might have duties outside the House. The subsequent proceedings need interest us no more; in fact, there were none. In 1691 the Duke of Norfolk petitioned the House in the matter of marshalling the funerals of William Painter, of one Gardner, one Hammond, a girl named Denn, and a widow named Cann—the Christian names are not given. The premier duke held that his privilege as Earl Marshal had been invaded. There is 'no further entry of proceedings.'

The lords have always been great sticklers for privilege; *scandalum magnatum* was a much more heinous offence than libel on a commoner. It was a dangerous thing to lay a hand on a rowdy and ill-conducted peer. We find a Minute written by the Clerk of the House of Lords, and couched in naïve language:

'The Sergeant of Guard was called in and asked to give an account of the matter. He said that Lord Grey and his brother came to the playhouse, and the sentry stopped him and told him he must take a ticket; and he went down and came back again presently, and threw a guinea to the fellow and went on again. *Mr Yelverton* (called in)--I saw this sergeant take my lord by the shoulder and push him. *The Sergeant* says he did not strike his lordship. *Robert* (*or John*) *Phinney*—I cannot say it was the sergeant. The musketeers struck at one. *The Sergeant*—I was pushed behind. *John Pegue*—I did not know who struck my lord. They withdraw. Then the two box-keepers were called in and sworn, the sergeant being present.'

They went at it hammer and tongs, for the point in dispute was a momentous one—a peer's privilege for himself and his servants on the one hand, and on the other the respect due to the king's guard. The House finally ordered the sergeant and a soldier to be sent to the Gatehouse, and made a decree that for the future no soldiers should guard the playhouse. The plays had been suspended, but were now resumed; and the soldiers were shortly afterwards released, on petition.

More serious questions of privilege are constantly recorded in the Minutes. In the year 1690 three such questions were concerning charges of murder; two of them still have a certain historical interest. The Earl of Lincoln was a man of such enormous bulk that he everywhere attracted public attention, even in church, for he was quite unable to kneel. He was walking one autumn day in the streets of Kensington, then a rural village, attended by his servant. A boy named Anthony Webb stared rudely at the obese nobleman, and perhaps made jeering gestures, though we are not told that he made any remarks. Lord Lincoln bade his servant beat the boy, which he did. Nothing more happened until the following February, when the boy died. A coroner's jury found that death was in consequence of the assault. Now, this verdict meant that Lord Lincoln and his servant must be put on their trial for murder; a post-mortem examination was demanded, and it was then found that young Webb had died of 'a consumption.' The subject of privilege came in as a question whether the earl should be tried by his peers or by an ordinary jury; but the question never required to be thrashed out.

Another and much more famous case was that of Lord Mohun, who with Captain Hill was accused of murdering Mountford the actor. Hill was one of the multitudinous admirers of the charming actress Mrs Bracegirdle, but fancied that he was rejected because of her preference for Mountford. His jealousy was so excessive that he swore to stab his rival; and Mohun swore to stand by his friend. The story is well known. Hill ran the actor through the body and fled. Mohun was seized, and tried by his peers. There was really no doubt of his guilt, and no defence offered; but the peers, by sixty-nine votes to fourteen, acquitted him. Had it not been for his privilege he would have been tried like a commoner and hanged at Tyburn.

Such a defeat of justice could not be brought about in these days. And many of the Minutes reveal a state of affairs which now is impossible. Thus, on the 7th of November 1689 the 'irregularities' in the courts of law were inquired into. It was stated that the Keeper of the King's Bench Prison on the first day of every term made oath that all his prisoners were within the Rules of the Court, although some of them were out of the kingdom. So the keeper habitually committed perjury. Incidentally we learn that the Marshalsea contained eighty-four beds, that the sheets for them cost annually one hundred and nine pounds fourteen shillings, and that the nurses were paid one hundred and twenty-four pounds sixteen shillings. Ale was charged threepence a quart (wine measure), and brandy eight shillings a gallon. The marshal received over five thousand pounds a year, not including action-money, gratuities, and bribes. In considering these figures we must bear in mind that provisions were very much cheaper and money much more valuable in those days than now. The Marshalsea was, in fact, an augean stable which only a Hercules or a Dickens would attempt to sweep clean. The abuses and 'undue practices' revealed in these Minutes are almost incredible.

The Court of Ludlow, a provincial tribunal, was the scene of shameful abuses. It was not a Court of Ludlow for which a Milton would compose a masque, but a Court of Barony or of Law 'of the Marches of Wales.' The judges appear to have been quite irresponsible, and there were no juries. Grievances were many; the court was not useful either to the king or to the people, and it cost the Crown three thousand pounds a year. Examples of abuses are cited. Bromley, a maltster in Shrewsbury, had to pay a debt of fifteen shillings; his

costs amounted to five pounds. There was no appeal to Westminster Hall. The clerks copied 'usually half the sheet, six words in a line.' So the costs were heaped up. James Probert swore that he was sued for a trespass of six sheep; the court found damages one penny for each sheep; the judge assessed the costs at three pounds, and other charges came to four pounds more! A noticeable point in this matter is that the first monster petition ever presented to Parliament was for the abolition of the iniquitous Court of Ludlow; it was signed by nearly eighteen thousand persons resident in various parts of Wales.

Venal corruption was rampant everywhere, and there is a curious little Minute in which the name of Mr Samuel Pepys appears. Richard Gibson stated that he 'had been for twenty years a clerk in the Navy Office, and had not been advanced according to his standing,' or as men with shorter service had been. No doubt he had a real grievance; therefore, to compensate him, Mr Samuel Pepys promised him the purser's place in the *St George*, which he was to fill in his own person, and which was worth four hundred pounds a year in war-time and eighty pounds a year in peace-time. But one King, 'in consideration of four hundred pounds, for which he gave bonds, got him to have the post transferred to him, and always said that the transaction had been profitable to him.' This was, of course, a neat little 'job;' and Mr Samuel Pepys seems to have winked at it.

We are not in these days accustomed to hear of 'jobs' among Government officials, nor to find our rulers paying their private debts out of the national taxes. But things went very badly under the Stuart kings. In 1689 there was still owing a sum of twenty thousand pounds for the purchase-money of Audley End, bought by Charles II. The 'Merrie Monarch' had covenanted to give fifty thousand pounds to the Earl of Suffolk for the property; but at his death only thirty thousand pounds had been paid. When, in the year 1689, there was a proposal to abolish hearth-money, the late earl's son, the Hon. Henry Howard, came forward with a petition. The twenty thousand pounds still owing to his father's estate had been secured on hearth-money; and he had counted on it as a provision for his younger children, of whom this Henry Howard was one. A Mr Brett also sued for two thousand pounds due to him on the same security. Some of us are old enough to remember the window-tax, which laid an embargo on light and air. The hearth-tax restricted the warmth of a house. It remains to be added that William III. had to pay these two debts incurred by Charles II.

The impecunious Charles had died a Catholic; William was a Protestant. At this time there was a rush of French Protestants desiring to be naturalised Englishmen. The Revocation of the Edict of Nantes had driven large numbers of such persons into more liberal countries. The only matter of lasting interest in the list of them in the Minutes is that amongst others was a David Garric, son of Peter and Madalena Garric of Montpellier; it is believed that he became the grandfather of the great actor.

While Protestants from France were made welcome in England, very hard measure was dealt out to Roman Catholics. They, even when good citizens, were not allowed within the precincts of the House of Lords. Thomas Burdet was summoned to give evidence before the House of Commons. Lord Lovelace was told that there was a papist present; the fiery peer asked the intruder how he had the impudence to be there, and ordered him into the custody of Black Rod. After a detention of eight days, and having presented a petition, Burdet was released. Parliament lived in perpetual dread of a second Gunpowder Plot even in this year 1690. On the 20th of November Lord Carmarthen received an anonymous letter warning him that such a conspiracy appeared to be on foot. The vaults and cellars under the House of Lords were immediately searched, as they still are every year before the opening of a new session. To call a man a papist was to hang him—almost; he must be an adherent of the Stuarts, and therefore a sworn foe to King William. One Aisley, said to be a priest, was in custody, not accused of any crime except his creed; and there was no proof against him of any misdemeanour. His account of himself was that he had been a Roman Catholic for more than six years; that he was not a priest, and had never said that he was; and that he lived 'at Malta in Italy.' His luggage was searched, and 'nothing beyond five guineas being found in it,' the money was restored to its owner and he was set free. This gentleman is no more heard of. 'Malta in Italy' was a safer place of residence for him than liberal England.

Mixed marriages were not easy to accomplish; the difficulties were not then, as they are now, raised by the Church of Rome, but by the civil authorities of England, and sometimes by the parents and guardians of the would-be contracting parties. Cox, a Protestant, wanted to marry Winifred Middleton, the daughter of a papist; the matter came before the House of Lords. It was sworn that Cox, impetuous lover, 'made several outrages' on the house of the lady's father, that he bought a ring, and that he stupefied her with chocolate for eight or ten hours! Middleton was designing to carry his daughter off beyond seas to a convent. Whether Cox obtained his bride, or whether Middleton immured his daughter, is not revealed by these Minutes.

Many another romance clothes the dry bones of parliamentary records. Clandestine marriages often gave their lordships considerable trouble. The supposed heir to a dukedom was the hero of a curious story. There was a certain M. Foubert who kept an 'academy' in the Haymarket, and bequeathed his name to Foubert's Passage and Court. In his academy various 'genteel arts' were

taught, and young gentlemen of rank availed themselves of his instructions. One such youth was Christopher Monk, said to be the heir of the Duke of Albemarle, who had recently died in Jamaica. Kit Monk was thirteen years of age. In Lime Street lived a pastrycook named Hungerford, who had a wife and a daughter Sarah. The maiden was married at St Pancras Church to young Monk, *her* mother personating *his* mother, and giving the necessary consent. He reached his fourteenth birthday without having openly renounced the marriage; but some six years later he endeavoured to do so, alleging that he was under the influence of drink when he contracted it; he probably suggested that he had been drugged, though not with chocolate as was Miss Middleton. What came of the quarrel between Christopher Monk and Sarah Hungerford does not appear from the Minutes; but we know that there was a Duke of Albemarle, and that he was not succeeded in the title by Christopher Monk. Two or three attempts were made to pass a Bill to render fraudulent such marriages as the one in question, as indeed they were already; but all these measures fell through at that time.

Another tale of an illegal marriage of a minor came before the peers. In this story the heroine is more interesting than the hero. Mistress (Miss) Mary Wharton was on her way to her aunt's house when her coach was stopped by three men; they knocked down the coachman, and the girl was forcibly taken by Sir John Johnston to the house of one Watson, a coachman in Westminster. Here lodgings and supper had been provided for her; also witnesses and a wedding-ring. The Rev. William Clewer, D.D., was summoned. He did not ask to see a license; but he thought the young lady was more than willing. The ring was too big; but she refused to change it, saying that it was unlucky to change. 'There was no force used.' Mary Wharton was sixteen and an heiress, and the bridegroom was a Captain Campbell. Apparently the marriage was held to be good, for no one wished to annul it; but Sir John Johnston was hanged at Tyburn for his share in the abduction. The king refused to pardon him unless the lady's friends desired him to do so. They made no sign, and the romance had a most tragic ending. A Bill to prevent or to dissolve such marriages was introduced but not passed; it was said that such a measure would be 'attended with very grave inconveniences, and might hinder many younger brothers from making their fortunes'—by running away with heiresses!

On the 25th of October 1689 an Order was made to prevent stoppages in the streets, King Street, Westminster, being then, as it has been in much later years, one of the most congested thoroughfares in London. John Bayly, drayman to William Green, 'being stopped by a constable and two beadles from coming into King Street, on Wednesday last between 11 and 12 A.M., said that he would go through, and abused them; he called the beadle that stopped him a rogue; and another drayman standing by said if he knew the beadle he would have a touch with him at quarterstaff; the drayman asked the beadle's name, for his master would spend a hundred pounds to vindicate his servant.' Such a vulgar street-row was hardly worthy the attention of the grave and right reverend seigniors temporal and spiritual; but locomotion both in town and country was a matter calling for improvement, as we see when a peer excuses himself from attending a call of the House and from paying a fine of a hundred pounds on the ground that he was one hundred miles from London, and the journey to town would occupy four days.

THE TUTOR OF TYNDRACH.

CHAPTER III.

A NIGHT'S reflection had no power to alter Ann's mood. When the Sabbath broke she was still submissive—not with the old unthinking resignation of days gone by, but with a sort of dazed quiescence that dared not allow of thought.

The minister's calm, irresistible arguments the preceding evening seemed like the voice of her whole past speaking against the wild, wayward emotion of a moment; and Ann was by nature conservative. The old dominion was very strong, and Malcolm was of the essence of it.

He, noting her chastened air, congratulated himself on the reassertion of his influence. Among the many cut-and-dried principles he treasured were some very stringent ideas as to the place of women in the world, and especially their subjection to their husbands. Ann's vagaries yesterday had caused him a temporary uneasiness, but her later penitence reassured him. Once married, he would be able to assert his control without difficulty. She was little more than a child after all.

They walked together across the glebe fields to church, with the harsh, clanging bell as an accompaniment to their talk.

Malcolm had on his Sunday mood. How well Ann knew it! The air of distance and gravity he seemed to assume with his silk hat! She need fear no love-making from him on the Sabbath. It was as if he believed the day was made for him and he for it. He would not even condescend to remark the becoming tint of the simple lilac dress she wore, though his eyes approved it unconsciously. But the glances of admiration cast on her by the loafers in the kirkyard as she passed through with her lover

would have assured Ann if her mirror had not already told her she was looking her best.

She had taken especial pains with her appearance that morning; not, as she conscientiously believed, with the desire of attracting admiration from any particular person, but because there was a difficult part before her, and she required all the confidence and assurance she could command to carry it through.

The question as to whether Mr Selwyn would or would not adhere to his intention of walking over to service had been the uppermost thought in her mind all morning, and she had half-unconsciously postponed the final facing of her future till the ordeal of a second meeting with him was over.

At breakfast she had listened to her uncle's pleasurable anticipations of the young man's visit with a feeling almost of dismay. She told herself that she dreaded the prospect, that she would fain he did not come, that she never wanted to see him again.

Yet, perversely, when Malcolm, leaning towards her as the service was about to commence, whispered in a triumphant aside, 'He hasn't come after all, you see,' a strange sinking of disappointment mingled with her relief.

Her own glance had wandered round the varnished pews several times in vain since their entry; but now the minister was in the pulpit and had given out the number of the psalm, and there was plainly an end to hope.

She realised suddenly in that moment that she would have liked Mr Selwyn to see her in her pretty dress, that some of the trouble and pains she had taken with her appearance that morning had been expended in the hope of his approval; and just as she had reached this humiliating reflection she glanced up and found him looking at her from an empty pew across the aisle.

His face was grave, but there was a smile of recognition in his eyes that deepened as the quick flush mounted her face at sight of him.

For the moment Ann forgot everything but the pleasure of his near proximity. All that had intervened since their last meeting was temporarily wiped out—her rebellion, her heroic resolutions, her penitence. Then, as if he was suddenly reminded of the presence of her companion, Mr Selwyn's eyes passed on to her cousin by her side. One glance he cast at him, and quickly averted his head. But Ann felt that in that glance he had taken Malcolm's measure and hers too. A bitter pride made her include herself in the estimate. She had reverted suddenly to the old mood of the morning. In a few months Malcolm would be her husband. It was her duty to desire no recognition apart from him.

For the remainder of the service the tutor appeared oblivious of their presence, absorbed in the act of worship in which he was taking part. His inscrutable profile was turned to the pair; not so much as a side-glance did he vouchsafe them.

Ann schooled herself to dismiss him from her thoughts; but the loud singing of Malcolm by her side seemed to make the quiet figure across the aisle more significant, more obtrusive, by contrast.

A sort of impotent anger at her own weakness assailed her. She would be loyal—she would! Malcolm was to be her husband.

It was in this spirit she effected the introduction between the two men in the churchyard at the close of the service. There was an almost defiant note in her voice as she said her lover's name; and Selwyn, quick to assign its cause, responded by a show of cordiality towards the young man he was very far from feeling. Malcolm's behaviour made it still more difficult for him to sustain the rôle. There was an assumption of patronage and familiarity in his manner that made the tutor long to inflict some snub upon him; but consideration for Ann's feelings withheld him.

'My uncle will be delighted that you managed to escape from your pupils after all,' Malcolm said by way of greeting, after they had been talking for a few moments. 'I could never have put up with a teacher's life myself.'

A smile, difficult of interpretation, appeared in Mr Selwyn's eyes as he listened. He was gazing straight past the other at a belt of fir-trees on the other side of the kirkyard wall.

'Yes, it is a hard lot!' he acknowledged prosaically at last. 'But beggars mustn't be choosers.'

'I think we had better walk on,' intervened Ann with grave dignity. 'There is a kirk-session meeting after service to-day. My uncle will be late.'

If Selwyn's admiration for her had needed a stimulus he would have found it in the way in which she conducted herself in the trying position in which he, by his own selfishness, had placed her.

The embarrassment she had betrayed that first evening upon hearing of his proposed visit had shown him plainly in what light she regarded her cousin, though he had not pictured him quite such a barbarian as Malcolm was proving. Yet the wish to see her again had conquered, and here he was in answer to it. Not that he was seriously in love with Ann. In a few days he would be effectually removed from her influence by distance, and it was a sort of cowardly confidence in the arbitrament of fate that had tempted him to gratify his desire for another sight of the girl.

The thought of her had haunted him persistently since their last meeting—her freshness and vitality, the dawning beauty of face and figure, the unawakened possibilities of her womanhood. But already he was angry with himself for his weakness in yielding to the temptation. He pictured her tied for life to the uncouth specimen of manhood walking on her other side, and the idea maddened him. He saw clearly enough how the situation had arisen. There was no need for any biographical details to throw light upon the story, nor did he believe for an instant that Ann was in love with

her cousin. She was a victim of circumstance, that was all; and no doubt her perverted sense of duty would impel her to carry through the sacrifice to the end.

Well, it was not for him to interfere. He had no alternative to offer her; and if he had, he was too much a man of honour to propose it. Marriage was not for him, so he had always told himself, partly because he had such a high standard of womanly perfection, and had hitherto not been successful in meeting his ideal, and partly because fate had endowed him with a short purse and an insatiable desire for the best things of life. But of one thing he was determined: he would manage to secure a short time alone with the girl that afternoon. Surely he deserved some reward for his tolerance towards her cousin.

Accordingly, at dinner, he reminded her of her promise to take him out on the lake.

To his surprise, she acceded at once; then, as if suddenly reminded of some unexpressed obligation, turned quickly to her cousin.

'Will you care to come, Malcolm?'

Selwyn held his breath for the answer.

But the opportunity for asserting his importance was too tempting for Malcolm to resist. 'No; I have enough of the water on Sunday at Golspie,' he said.—'I have to take service every Sunday afternoon on the other side of Loch Garnock,' turning to the tutor as he spoke.—'But there's nothing to prevent you from taking Mr Selwyn out for a short row,' he went on, addressing his permission this time direct to Ann herself.

She accepted it silently.

'And when you come back I'll have those notes ready for you,' chimed in the minister.

Selwyn laughed. He was more pleased than he would have cared to acknowledge at his easy victory.

Dinner over, the pair made their way down through the manse garden to the little landing-place where the boat was tethered.

Malcolm accompanied them. His proprietary airs and the many unnecessary directions he gave Ann before starting filled Selwyn with disgust. But he restrained himself for the promised pleasure of the girl's society. A dread that at the last moment her lover might change his mind and offer to accompany them possessed him. He was secretly a little surprised at the young man's magnanimity in allowing Ann to go with him alone, but assured himself ironically in explanation that a poor tutor was no rival for a minister of the Established Church of Scotland.

'I suppose you can row, Selwyn?' were Malcolm's parting words as he pushed off the boat.

Ann was already at the oars, and Selwyn waited till they were a few lengths from the shore before muttering an affirmative. All the pride of the old Blue was up in arms within him. The next moment the humour of the thing struck him, and he gave a little laugh.

'Tea at four,' came Malcolm's rude Doric across the water.

'What are you laughing at?' queried Ann, in a low voice, of her companion as she bent to the oars. There was a light of antagonism in her blue eyes.

Selwyn straightened himself, grave as a church in a minute. 'A foolish idea that struck me,' he said. 'I assure you it isn't worth repeating.'

Ann said no more, but her face had grown cold. It was a bad beginning to their *tête-à-tête*, and Selwyn reproached himself for his thoughtlessness. Yet he had confidence in his own power to make amends. For some moments he offered no attempt at conversation. Lying idly in the stern, he watched the girl as with strong, regular strokes she pulled the boat along. The exertion had brought out a fine glow on her face; her eyes had a curious light of mystery, their blue depths veiled by the dark lashes. She was gazing straight past him at some point on the receding shore, yet there was nothing self-conscious in her avoidance of his glance. She was plainly engrossed by the task in hand.

'I am glad I came over to-day,' said Selwyn at last, gazing round him with a satisfied sigh at the deep, calm water on every side, made dark with the reflection of tree and mountain. The hush of the Sabbath stillness could almost be felt—it was so intense as to be audible. 'I was in two minds about it. I thought you were not pleased with the idea,' he went on, as Ann offered no reply.

'No, I was not at first,' she allowed quietly, a flush stealing into her face. 'But now I am glad.' She did not cease rowing as she spoke, nor did she let her eyes rest on him.

'Ah, that is right,' said Selwyn in a tone of approbation. 'I don't suppose I shall be in this part of the world again,' he went on after a pause. 'I am going to give up my much-despised tutoring and become a sort of auxiliary drudge at the Foreign Office. Besides, even if I should happen to return, you will not be here. I hear you are to be married in the autumn.' His eyes were on her face now.

'Who told you?' said Ann quietly, still avoiding his glance.

'Your cousin,' replied Selwyn. Why had he not said fiancé? he wondered, but could assign no satisfactory reason.

'Yes, we are going to be married,' she affirmed deliberately.

'May I offer you my very best wishes for your happiness?' he said.

She nodded, letting her eyes meet his suddenly, then as quickly averting them. 'Thank you very much,' she said, and began rowing more quickly.

He stood up all at once, and leaning forward, laid his hands on the oars. 'You are tiring yourself,' he said. 'Let me row.'

There was something masterful in his tone that forced her to obey, yet she did not yield at once.

'You are sure you can?' she said, laughing up into his face.

'I rowed in the Eight at Oxford five years ago,

he said with a grim little smile as he settled himself down in the place she had vacated.

Ann drew in her breath. Now she understood the reason of his laugh. What a snub this would have been for Malcolm, and he had spared him out of consideration for her feelings!

'Tell me about the race,' she said, with suppressed eagerness. 'I have often read descriptions of it, but I have never met any one who has taken part in it.'

So he began in a desultory way to picture for her stray incidents of the great struggle. But by degrees some magic quality in her interest inspired him, and he forgot his present surroundings. Glorious memories of the past crowded thick upon him. He laid down the oars, letting the boat drift where it would, while he poured forth a dramatic word-picture of the historic event.

'And you won?' said Ann at length, drawing in her breath as he paused, her eyes aglow with the triumph of the victor.

'Oxford won,' he corrected her quietly, and took to the oars again.

'Thank you for telling me,' said Ann very low. 'I shall remember always.'

He leant towards her. 'Thank you for inspiring me,' he said, half-laughing. 'I don't suppose I could have described the thing to any one else.' There was actually a note of shame in his voice.

'But you did it—you won the race!' she cried. 'That is what counts in everything—the doing things. Any one can tell about them.'

Selwyn watched her earnestly as she spoke. Here was a revelation of the woman-soul he had dimly guessed at. Then a cynical smile curved his lips. 'I am afraid all my achievements have not been on a par with the boat-race,' he said. 'As far as other things go, I have done nothing.'

'But you will,' said Ann, undaunted, her eyes intensely blue. 'You have the will.'

'And lack only the inspiration,' he muttered.

He half-glanced at her as he spoke, but she was gazing sideways down in the deep water and appeared not to have heard the remark.

'Ten minutes to four,' said Selwyn, jerking his watch suddenly out of his pocket. 'What will your cousin say if we are late?' and he began rowing energetically.

(To be continued.)

THE SPANISH BEGGAR.

By JOHN D. LECKIE.

THERE is no country where poverty is absolutely non-existent, nor where beggars are entirely absent; and Spain is no exception to the rule. Yet mendicancy is by no means so general in the Peninsula as one might be apt to judge from the descriptions of travellers (for the most part transient) who have visited the country. The fact is, the British traveller in Spain, and in many other countries as well, is looked on as fair game for the beggar and all those who live parasitically on the rich. The English tourists who visit Spain are generally of the wealthier class; in fact, among the lower classes every Anglo-Saxon is looked on as a sort of millionaire. It is not to be wondered at, therefore, that they should be specially subject to the importunities of beggars, and that these should sometimes appear to be unduly numerous; all the more so when it is remembered that there is no Poor-Law, such as we know it, in Spain, and that the indigent are as a rule wholly dependent on private charity, and to the credit of the Spaniard be it said, this source of assistance is generally ample to meet all cases of want.

Although the lower classes in Spain live in a very frugal manner, often in a way that would excite the contempt of the British manual labourer, there is probably much less real want and destitution among them than is to be found among the same class in our own country. If no Poor-Law existed in Britain it is safe to say that the number of beggars here would be quite as great as is the case in the Peninsula. To say that 'Spain and beggars are synonymous,' as one writer rather ungrammatically puts it, seems to the writer somewhat of an exaggeration.

There is no part of Spain which is more overrun by the British tourist than the Canary Islands. Owing to their delightful climate, and the fact that they are largely patronised by wealthy tourists of all nations, these islands might be looked on as a paradise for the tramp, the loafer, and the beggar, yet they are by no means unduly infested with the mendicant fraternity. It is true, the traveller on his arrival at any little country village is frequently pestered by a crowd of mendicants soliciting coppers; but these almost invariably consist of ragged urchins and not adults—spoilt children, in fact, who have been corrupted by the tourist and his habit of throwing about his small change wholesale.

It will be noticed that we have alluded to the Canary Islands as a part of Spain, and not as a Spanish colony, as they are often considered to be. As a matter of fact, the Canaries form an integral part of Spain, of which they constitute a separate province, and they stand in the same relation to that country that the Channel Islands do to England. In fact, the parallel, geographical and historical, between the two groups of islands is very striking.

We have a vivid recollection of a blind Spanish

beggar who used to take his post at the entrance of a church, a favourite stand for the southern mendicant. His face was deeply pitted with the marks of smallpox, to which he doubtless owed his affliction, and there could be no doubt as to the genuineness of his case. He was accompanied by his daughter, a bright little girl about eight years old, who solicited passers-by for 'a copper for father.' The child was poorly but neatly dressed, and had an engaging manner, which would move a heart of stone. So far from being importunate, she never directed her appeals to any one in particular, but only in a general way to the passing crowd. The group was a sympathetic one and typical of the Spanish beggar. And if that little beggar-girl had been elegantly dressed and set down in a drawing-room full of ladies and gentlemen she would have been perfectly at her ease, and there would have been nothing in her manners to show that she had not occupied such a position all her life. For among Spaniards that natural courtesy which we suppose to be the hall-mark only of the upper classes is the natural heritage of the very lowest. Even the beggar who throws his ragged cloak about his shoulders does so with the grace and dignity of a grandee, and expects to be, and is, treated with courtesy by all ranks.

We have said that the favourite stand for a Spanish beggar is at the church door. As Catholic churches are never closed, and there is a constant stream of worshippers, the mendicant seldom fails to reap a rich harvest. Nor are 'tips' wanting, for he sometimes acts as a go-between in love affairs, and forms a medium of communication for receiving and forwarding Cupid's missives. Spanish girls of good family are never seen in public unless chaperoned or accompanied by near relatives; but it is easy to slip a *billet-doux* into the beggar's hand as the maiden wends her way with downcast eyes towards the church door, and the humble supplicant thus becomes a medium of preordained clandestine correspondence for a lovelorn couple.

We have never seen a Spaniard treat a beggar hastily; he is seldom turned away without a small dole; or, if alms are refused, the refusal is made courteously, with an 'Excuse me, brother,' or some similar phrase. Accustomed as we are to the number of impostors and drunkards to be found among our own great army of mendicants, this toleration may seem excessive; but the Spanish beggar is a creature of an entirely different order, and excites the sympathy even of the foreigner. We have more than once seen an English beggar turn with a volley of foul imprecations on a passer-by who had rejected his solicitation for precuniary assistance. The Spanish beggar is rarely an impostor, and still more rarely a drunkard. The charitably inclined have therefore some guarantee that their alms are not bestowed on the undeserving. Every country has its shiftless element—its 'unemployables,' as they are termed by the Salvation Army—and so has Spain; but these unemployables seldom owe their downfall to any inherent vice, but suffer from some physical or mental infirmity for which they cannot be held personally responsible.

In Spain the writer did not see much of the professional tramp. In England the casual ward of the workhouse is the general resort of this class, but in Spain such an institution does not exist. Such wayfarers, however, can generally obtain a free but modest repast at the convents, which abound in Spain; for though there is no Poor-Law in the Peninsula, the Church in a certain sense acts as the almoner of the poor. These free meals are patronised by the impecunious of all classes, even the broken-down gentleman who is to be found here as elsewhere. Many men eminent in Spanish history and literature have been glad to avail themselves of these free convent meals. It was at the Franciscan convent of La Rabida that Columbus once stopped to solicit a meal for himself and his son. The guardian or superior was so struck by the grandeur of his views that he detained him as a guest, and gave him a letter of introduction to the confessor of Queen Isabella. The interview which resulted ultimately led to the conversion of the Spanish monarchs to his views and to the epoch-making discovery of America. Although the convents which were suppressed in Spain about the year 1835 have since been re-established, the custom of distributing free rations of soup and bread is not now so general among them as formerly. In some cases, however, relief is granted by the municipalities.

There was a period when the so-called *picaresque* novels (Spanish *picaro*, a rogue), recounting the adventures of vagrants and beggars, were popular in Spain. This was especially the case during the time of Cervantes, who himself, in his *Novelas Ejemplares*—the English meaning of which is not 'Exemplary Novels,' but 'Stories with a Moral'—has left some sketches of this nature. Six years before the first publication of *Don Quixote* there appeared *Guzman de Alfarache*, by Aleman, perhaps the most famous of the *picaresque* novels, which is said to have gone through twenty-six editions in six years, a remarkable record for that time. It is perhaps, however, inferior to its contemporary work *El Lazarillo de Tormes* ('The Little Beggar of Tormes'), by Mendoza, which is believed to have inspired Le Sage when writing *Gil Blas*. It would seem not improbable that the popularity of these 'vagabond' novels gave to Cervantes the idea of writing the immortal *Don Quixote*, which was intended as a burlesque on the knight-errant literature of the *Amadis de Gaul* type, then so much in vogue.

We remember reading in one of these *picaresque* novels the advice given by an old beggar to a young apprentice in the craft. He particularly enjoined on him the necessity of wearing clothes which were patched in many places, and always with cloth of a different colour from the original, for the beggar's patches are his best advertisement. At the same

time, the beggar's clothes, though patched, should be clean, for a loathsome exterior does not attract sympathy. Doubtless the clothing of some of these ancient beggars, like Artemus Ward's boots, had been patched until none of the original material was left in them.

Although the Spaniard has a lenient side for the beggar, he is not unmindful of his failings. He remembers that excessive generosity to a beggar makes the latter presumptuous. The dole, when given, is generally small; the one-centimo copper piece—about one-twelfth of a penny—seems to exist for the sole purpose of being given to the mendicant fraternity. Neither should the charitably disposed be too liberal in their hospitality in such cases. There is a Spanish proverb, 'Let a beggar sleep in your barn and he will make himself your heir.' This reminds us of the case of the American tramp whom a farmer found surreptitiously sleeping in his barn, and summarily ejected. As the wanderer edged his way towards the gate, he got rid of a parting shot as follows: 'Here I have been sleeping six days in your barn, eating your apples and drinking your cider, and yet you treat me as a mere stranger without any claim on your hospitality.'

In the various countries of Spanish America (including also Brazil) mendicancy is not so noticeable. We do not remember to have been struck by the number of beggars in any of these countries, except in the city of Mexico, and that was more than twenty years ago. In other cities of the Mexican Republic, such as Puebla and Vera Cruz, they were by no means plentiful.

In South America the beggar is generally conspicuous by his absence. During a residence of fifteen years in that part of the world we do not remember to have been accosted by able-bodied vagrants more than half-a-dozen times. Two of these were Anglo-Saxons, and we regret to say that neither of them seemed to be deserving objects of charity.

Owing to the demand for labour and the ease with which a living can be made in the southern continent, the absence of mendicants is not to be wondered at. Still, there is always a contingent of aged, blind, crippled, or otherwise infirm persons, mainly dependent on voluntary private charity.

In South American countries one day in the week is generally set apart for the beggars. In Rio de Janeiro, Saturday is the beggars' day, when they make a regular round of the principal business houses and are rarely refused a small coin. The writer was formerly connected with a large insurance company in Rio, and every Saturday the porter would sit at a table, with a pile of copper coin, at the street door. Although a copper coin was never refused to any beggar who solicited alms, the total amount thus disbursed would not amount to more than two or three shillings a week. We have often admired the patience with which these doles were invariably disbursed, and it was equally gratifying to note that this wholesale liberality was seldom abused by the recipients.

MACALLISTER'S BIG BLUFF.

By ROBERT M. MACDONALD, Author of *The Great White Chief*, &c.

A GROUP of men stood on the bank of a mountain torrent in the far interior of British New Guinea. Intersecting the waterway a cleared line had been cut, which stretched away through the heart of dense primeval forests on the one side and until lost among the ridges on the other. Along the middle of this passage, planted on all the higher or most prominent positions, were a number of red-painted poles, and it was their presence which had brought the men to a halt. They marked the eighth parallel of south latitude, the boundary between British and German New Guinea, over which an armed force from any side or a prospecting-party from the British territory dared not pass. And the men were fully armed, and were also a prospecting-party, British to the backbone.

'Well, boys,' said Doc, 'it seems to me we are as far as we can go, unless'—— He paused and looked at the nearest pole. 'We were just coming on to something good, too,' he added reflectively. 'I wouldn't mind betting that the mother-lode of that osmiridium we've been tracing lies in that rocky range about six or seven miles ahead.'

'Well, darn it all! let's go and see,' cried Bunyip Bill. 'Who can stop us?'

'A German patrol, if it comes along,' answered Macallister quietly. 'You know the law about armed forces crossin' the boundary.'

'Hang the law!' cried Fat Jack. 'If we leave our guns at home the natives will have us for dinner before sundown.'

'We'll leave no guns at home,' Big Sam growled. 'We'll need them if we fall in with the Germans.'

'Even without weapons we are forbidden to cross that line,' went on Macallister. 'Germany does not allow the white man to come into her territory although only to search for mineral treasure. You see, his influence is bad on the poor, harmless natives.'

'But don't the Germans come into British country?' demanded Cunnamulla Charlie. 'I reckon that law should work both ways.'

'Come on, mates. What are we waiting for?' cried Canadian Pete. 'Darn the Germans!'

'If you are skeered about walking up the river

past these poles, Macallister,' laughed Damper Dave, 'I'll show you how to get out of that trouble.' He walked up to the nearest pole and straightway proceeded to cut it down with an axe. It soon fell into the stream with a crash, and the reckless prospectors laughed.

'Come on now, Mac,' one cried. 'You can shut your eyes an' you'll not see the fallen pole.'

'I never thought Macallister would be so darned skeered o' gettin' into trouble, boys,' commented Fat Jack, as Macallister still hesitated.

'You'll never learn sense, Fat Jack,' the big Scot replied. 'Now, cuttin' that pole was a vera injudicious act, although only what I might have expected Damper Dave to do. However, it's no' the gettin' into trouble that worries me, it's the gettin' out again with such an unreasonin' crowd o' helpless fellows like you to handle. You should really try to think sometimes, lads. It's grand exercise for the brain'——

'Oh, dry up, Mac!' interrupted Doc. 'What is all this speech leading up to? You surely never thought that we would turn back because a red-painted pole stood in our way? Dave did his best to make it easy for that conscience of yours by cutting it down. Come along; we'll never see the German patrol.'

'I was goin' to say, Doc, if ye hadna stopped me,' observed Macallister, 'that sometimes a wee bit thought is a good thing. Now, as a result o' my summin' up o' this most iniquitous law-breakin' situation, I see that it would have been much more satisfactory to us if we had not cut down that boundary-post. We might have left that to nature, and kindled a fire on the windward side o' it. Fire doesna respect German boundary-posts, and might even have burned a lot o' them if our carrier-boys were o' a playful disposition at the time.'

'You blamed old fraud, Mac!' cried big Sam. 'Why in thunder didn't you say that before? Of course a fire is the best business, for how can we see posts that have been burned down, an' how could we know we were in German territory if we didn't see the boundary-line?'

'I would also point out to you that if a German patrol came along the line they would see the chips lyin' where that pole has been cut, and it is just possible that their natives might be able to trace us up the river.'

'By Bunyip Bill's ghost! we'll soon make that right,' cried Damper Dave, proceeding to gather up the chips. 'Come on, you unreasonable boundary-jumpers, an' give a hand.'

The men gave their assistance willingly, and the 'boys,' or native carriers, were also called up to assist nature in bringing about a conflagration. The 'boys' were more or less civilised coastal natives, who gave their services as carriers to the white gold-seekers for the handsome remuneration of one shilling per day. Usually they were worth their wages, even although their employers had nothing to carry, for the fierce cannibalistic tribes of the interior dearly loved their coastal brethren—roasted, and it was often only when a carrier was missed in the morning that the prospectors knew they were in the vicinity of some big village.

The boundary-posts, as far as could conveniently be seen from the river-bank, were soon destroyed, and then the party moved on as happy and careless as children out for a holiday. And it seemed as if they were on the trail of a valuable deposit of osmiridium, for the farther they moved up the stream the richer became the sands in that highly priced compound.

At length they entered a gorge through which the river had cut its way; and, finding a ledge near the mouth, they pitched their camp on it, and soon had their fires blazing and the billies boiling, the 'boys' kindling a ring of smoke round the camp with the fronds of nettle and sandalwood-scrub to drive away the ubiquitous and persistent mosquitoes and other festively inclined pests.

After supper the men lit their pipes and made their prospective sleeping-places as comfortable as possible by clearing away the snakes and other creatures who held a prior claim to the ledge.

'It is darned funny!' remarked Fat Jack, in reflective tones, as he threw a burning log at a crocodile which had come from the depths of the pool to investigate the reason of the appetising smell emanating from burning fat. He paused abstractedly as the saurian sank from view, and Damper Dave asked, 'What is funny, Jack—the croc's curiosity, or its hunger?'

'Maybe he's thinking of what Macallister will look like if we're caught,' put in Big Sam.

'I don't think Macallister will be the funniest of this crowd should that happen,' said Doc. 'But where is he? He was here a few minutes ago.'

'I was thinkin' it was darned funny how that damper I baked to-night should have such a fine flavour when I put nothin' in it,' Fat Jack went on.

'You had currants in it, Jack,' reminded Cunnamulla Charlie.

'Nary a currant. I forgot we had any.'

'Then what were these little black things scattered all through the damper?' asked Bunyip Bill.

'I reckon they must have been ants or native bees,' answered Jack. 'They tasted mighty good anyhow, but how they got in I don't know.'

'Oh you darned baking-powder cook!' Big Sam roared, 'you've gone an' baked your damper on top of a nest of bees. Oh boys! I feel as if I were pegging out.' Sam looked very ill, but all his comrades suddenly felt the same way, and close investigation proved that Fat Jack really had pounded his floury concoction above a tiny hole in the rocky ledge in which the strange, fly-like creatures known as native bees had made their home.

'I don't see what you fellows have got to complain of,' grumbled the cook. 'I don't think a

German bee tastes different from those down in the Yodda Valley, an' you got plenty of them in everything you ate when camped down there.'

His words ended abruptly, for a tree-stump hurled at him with considerable force by Big Sam struck him in the stomach, and he sat down. While he was searching in his extensive vocabulary for some words with which he might effectually express his feelings concerning too particular prospectors, Macallister dropped down on the ledge from an outjutting rock above. In his hand he held a piece of stone, and from the nonchalance of his demeanour it was evident to the men that he had discovered something of importance. He walked up to the fire, and examined his piece of rock by its light, then he handed it to Doc and fumbled for his pipe.

'What is it, Mac? What have you struck?' cried most of the men in chorus, forgetting their squeamishness for the moment.

'Only the seam o' osmiridium which shed all the stuff we've been tracin' in the creek,' he replied lugubriously, 'and I can see that the map o' this part o' the world will have to be altered over the matter if it makes any claim to be up to date.'

'Only a seam of osmiridium!' exclaimed all; and Canadian Pete added, 'Why, you old law-keeping sinner, don't you know osmiridium is worth over eighty pounds an ounce?'

'Ay, fine,' Macallister answered. 'But this seam is in German country in the meantime, and'——

'Hang the Germans!' growled Big Sam. 'Let 's see the stuff.'

'And I was going to say,' continued Mac, 'that if we mean to work it, it would add to our peace o' mind if a new boundary were made causin' this camp to be in British territory. The seam runs through the face o' this rock above us, and probably extends right through this gorge.'

'Mac,' said Doc, 'take what steps you like to ease that conscience of yours, and we'll all help you to any reasonable extent. This is the real stuff, though, and I for one don't intend to leave this place without a good supply of it, unless the Germans come along and drive us away with an army against which we cannot hope to contend. Our fortunes are here, and here we 'll stay.'

'You can just bet we will,' chuckled Big Sam. 'An' if the darned Germans come along we'll eat them.'

Macallister made no answer.

But Sam's speech was too much for Fat Jack. 'Eat them!' he sniffed. 'You are a funny lot to eat Germans, when you can't even make a feed of a damper that has got some native bees in it without feeling bad.'

Few heard the scornful remarks, however; all had clambered up the rocks with improvised torches to see the wonderful lode of osmiridium. It was not much to look at. The rocks were of the usual iron-stained, metamorphic variety, and apparently volcanic agencies had materially assisted the creek in making a passage through them. A long, straight black line, not unlike a mark which might have been made with a charcoal pencil, ran through them diagonally, and this black streak was the lode.

'Jumpin' beans!' was Cunnamulla Charlie's comment, 'that stuff looks just like the part you write with in a lead-pencil, an' it isn't any bigger.'

'But it doesn't need much to make an ounce,' Doc observed, 'and we can easily blast out a drive in the foot-wall and leave the seam as a roof until we have undermined as much as we want at a time.'

'Or the Germans come,' said Macallister quietly.

'We'll chance their coming,' Doc laughed; 'and then we 'll leave the matter in your hands, Mac.'

It was too dark to see, but some of the men had the impression that Mac smiled. At any rate, they were not the kind to worry over trouble before it came, and soon after the camp was asleep, except for the 'boys' at their own fire. They had caught a large, fat iguana, and had not yet finished feasting.

In the morning all hands set to work extracting the precious metallic compound, and when night fell they were well pleased with the result of their day's operations. Next day they continued blasting out the rock, and on the third day Macallister ceased work early in the afternoon and went up the gorge on exploration bent, and also to see if perchance he might be able to shoot something for the camp-larder. He was late in returning, but was well stocked when he did reach camp; and next morning he set out again, taking some of the most intelligent 'boys' with him, and some tools.

The men had now forgotten the trifling fact that they were in German country, but it was brought home to them rather suddenly that afternoon. Just as all had ceased work, and swung down to the ledge on which the camp was situated, a clattering of rifles at the entrance of the gorge startled them; and, looking up, they beheld an army composed of about a dozen Germans and some hundred trained and armed native policemen. The rifles were levelled at the camp occupants, and the 'boys' which belonged thereto immediately set up a most dismal howling, which continued until Fat Jack broke his frying-pan over the head of the chief offender.

The Germans advanced, grimly silent, and the prospectors watched them interestedly, wondering vaguely where Macallister was, and why he was not in camp when required.

'Vat are you doing here?' sternly demanded the German captain as his men surrounded the camp.

'Fishing,' answered Doc laconically, feeling in his pocket for a cigar—a sure sign that he was preparing for trouble.

'You are British. You have broken the peace between the two nations in coming here. Vill you surrender ant gif your word you vill come quiet?'

'Where to?' Doc asked. 'You haven't got a spare cigar about you, I suppose?'

'To Astrolabe, vere you vill be dealt with according to the Cherman law.'

'But we are not interested in the German law,' answered Doc, 'although some of us have a great respect for it. What are you doing here yourself?'

'I am the commander of the boundary patrol, sir. It has been reported at headquarters that you British prospectors do not recognise the boundary, and I haf gome to make them respect the flag of Chermany.' The German spoke slowly, but his English was nearly perfect.

'That's very good of you,' chimed in Fat Jack. 'Where did you pick up those black Germans you've got with you?'

'These are inhabitants of this island who are in his Imperial Majesty's service. But do you surrender?'

'No,' replied Doc; 'but I would like a cigar. Ah, thank you; now we can talk better.'

The lieutenant of the party had handed his cigar-case to Doc without a word.

'Do you mean to say that you will resist my men?' cried the German captain. 'Surely you are not so foolish. It vill just mean bloodshed.'

'That may be,' returned Doc, puffing vigorously at his cigar; 'but it will be your fault. Do you think that Britons, whether home-born or colonial, will submit to be taken prisoners by some niggers and a handful of Germans? No, sir; we'll defend ourselves if you force us to do so.'

'I'll blow the third button off his coat when you say the word, Doc,' cried Big Sam from behind a large boulder.

'An' I'll puncture the other fellow's gas-bag,' cried Canadian Pete, also from a hidden position.

'Look here, Kaiser,' put in Fat Jack, 'you're quite right about the bloodshed. We fellows don't like the idea of shooting your crowd; you can't help being Germans, so I move that we toss up to see who'll clear out.'

'No, we won't,' shouted Cunnamulla Charlie. 'We're not going away until we take down all the seam we cut under to-day.'

'Shut up, you darned, all-fired idiot!' retorted Fat Jack. 'I know how to toss.'

'I'll tell you a better plan,' suggested Bunyip Bill. 'Put out your best man, an' I'll fight him. Both parties can stand by the result.'

'No, no,' cried the German, waving back his lieutenant, who seemed as if he would have liked to accept Bunyip Bill's challenge. 'Duty cannot be trifled with. In the name of the Kaiser I call upon you people to lay down your arms.'

'And in the name o' the nearest British warden I call upon you people to drop your rifles,' called out another voice.

And at that moment Macallister appeared coming down the gorge. 'We dinna use the poor, over-worked King's name as a charm when we've got Sandy MacTavish as a Resident Magistrate so near,' he added half-apologetically; 'but I'll guarantee that Sandy will give you a fair trial all the same, and no' press heavily for extreme measures.'

'What do you mean?' demanded the lieutenant; the captain seemed to be too much overcome with rage or surprise to speak.

But Doc spoke, and Macallister's comrades all made comment. Their words were tersely expressive of delight at Macallister's appearance in time to take a hand in the game; for, despite the opinions they sometimes vented concerning his most wonderful conscience, they knew that when a crisis was reached Macallister ceased to be troubled with any such encumbrance. At least, they thought so.

'This is your funeral now, Mac,' Doc said with a laugh. 'Allow me to introduce you to the German patrol. I needn't reverse the method of introduction, because you can see who and what they are; but they may not have heard of the one and only Macallister.'

'You just sit down, Doc, and keep Bunyip Bill from makin' a fool o' himself,' spoke Mac, with a most solemn countenance. 'I'll vera soon find out what these foreigners mean by comin' armed into his Britannic Majesty's possessions and causin' disturbances.' He glared ferociously at the German captain, and Fat Jack ejaculated softly, 'Great Manchester! Hear him, boys!'

'Vat dat you say?' spluttered the officer, while his lieutenant laughed as if greatly amused. 'I am von Cherman, and I catch you people here in Cherman country. You are our prisoners.'

'Hold on, Mr Berlin, or whatever your name is,' Macallister interrupted. 'Do you happen to know where you are at this moment?'

'We are six or seven miles on this side of the boundary,' answered the captain, restraining his temper with an effort.

'Then how dare you come that distance across the line with an armed force?' thundered Macallister. 'It is equal to an act o' war, and—and—— What's amusin' you, Big Sam? Do you see anythin' funny in bein' insulted, and havin' our country's laws broken by a party o' German raiders?'

'It's the toothache, Mac. I always screw my face up that way when I have toothache,' wailed Sam. 'I'm not laughing. Oh!'

'Go ahead, Mac,' cried Fat Jack. 'You walk into the Germans for their darned cheek, and we'll stop Big Sam's toothache mighty suddenly.'

Several of the men advanced with various mining implements in their hands to give Sam relief, but he loudly protested that the pain had gone before any drastic measures had been taken; and Macallister again worked up an appearance of righteous indignation against the Germans.

'You would actually dare to threaten a camp o' honest prospectors with a band o' black German niggers!' he cried. 'My man, I'm thinkin' this is a vera serious business, and if you dinna apologise on the spot I'll no' say what the outcome may be.'

'An' make him sing "God Save the King" when you are at it, Mac,' chimed in Bunyip Bill. 'I reckon we're entitled to some kind o' compensation for having our nerves shocked by his niggers.'

'But this is German country,' cried the victim of

Macallister's wrath, turning appealingly to his officers. 'It is you who have an act of war committed.'

His chief lieutenant, however, shook his head doubtfully, and spoke a few words in German, which seemed to affect the officer in command greatly.

Then Macallister began again. 'My poor, misguided freend,' he said pityingly, 'I see now how you have made such a vera grievous error. You really think you are on your own side o' the boundary-line and that we are where we have no right to be. Now, I'll just prove to you that you've made a mistake. What is the position o' the boundary-line?'

'The eighth parallel south,' answered the lieutenant, smiling, before his chief could speak.

'Exactly,' agreed Mac, picking up Doc's sextant, which was reposing at that moment on top of one of the 'boys'' discarded bundles. 'Then see for yourself what side o' the eighth you are on just now.' He pushed the instrument into the leader's hands, and pointed to the setting sun.

'Mac,' whispered Doc, 'he can't take an observation just now. The sun is too far down.'

'And do you think I want him to take our position?' Macallister replied. 'If he can, we're done.'

The officer took the sextant gingerly, and at once a gleam of seraphic joy illumined Mac's features. Doc also became greatly interested, but the face of the usually smiling lieutenant had suddenly grown stolid and expressionless. The German captain was looking through the instrument at the fast-sinking sun, just visible above a shoulder of Mount Scratchley.

'Now you can see which side o' the eighth parallel you are on,' Macallister said. 'Adjust that mirror, and you'll find the figures will come nearly even.'

'That is so,' muttered the German sadly. A great fear had come over him.

'And a vera simple calculation,' went on the audacious one, 'will make it plain to you that we are at this moment seven miles and three-quarters distant from the boundary, as you can see for yoursel'.'

'That is so,' repeated the surprised officer helplessly. 'But the marked posts! We were on the north side of them this morning, and did not cross the line.'

'At least you didna notice yoursel's crossin',' corrected Mac consolingly. 'But I'm vera much surprised that a man o' your knowledge o' New Guinea didna take into account that a bush-fire or maybe some wild natives might have destroyed them.'

'Oh, dry up now, Mac!' Doc interrupted. 'The captain is sorry for his mistake, and we'll say no more about the matter.'

'I'm o' a forgivin' disposition mysel',' Macallister replied, 'and I was thinkin' that we might ask them to stay to dinner with us.—We havena much in the way o' luxuries, of course,' he added, turning to the captain; 'but what we have'——

'No, no, gentlemen,' cried the captain. 'Do me one favour more. I dare not stay on this side of the division. Seven and three-quarter miles is not a great distance to walk on a clear night, as this will be, so do come with us north to the boundary-line and have dinner with us. We are well supplied with good things.'

'Snakes an' centipedes an' niggers!' ejaculated Big Sam. 'He's scored on Macallister after all.'

'We can't very well leave the camp,' Doc was beginning, when Macallister broke in, 'We'll have much pleasure in comin' with you,' he said. 'We can leave our "boys" to watch camp.'

'Then let us get away now,' cried the German. 'Mein Gott! I had forgotten that you fellows are still covered with our rifles.—Ground arms, men; and you, Schwebert, find a way through this gorge northwards.'

The youthful lieutenant stepped out to obey, and Macallister walked by his side to show him the easiest passages. For some time they proceeded in silence; but as they emerged from the cañon into the moonlight the officer turned to Macallister and said, 'It's a good thing you didn't hand me that sextant, Mac. I might have looked through it the right way.'

'Ay,' grunted Mac, 'you are a vera sagacious fellow; but the last time we met you were an Irishman, and your name wasna Schwebert.'

'Oh, a name is nothing. I'm in the German service here because it pays well, and there's plenty of fun. But, tell me, Mac, what will you do when we travel the seven odd miles and find no boundary?'

'Man, you're no' half as sagacious as I thought, after all. There are the boundary-posts stretchin' across in front—at least, some o' them.'

'Great Dublin!'

'They're no seven and a half miles distant, as they should have been, but I'm no answerable for the mistakes o' boundary surveyors.'

'Then you didn't bluff the captain, Mac; and we really are in British territory?'

Macallister grinned. 'It took somebody the better part o' yesterday and to-day to make these posts and put them there,' he said; 'but I'm inclined to think that a bush-fire will destroy them before the next visit o' the German patrol. I've somehow got the impression, too, that half-a-dozen new ones will grow up again in a line about eight and a half miles down south.'

And so it came to pass; but Macallister and Doc are fully determined that another fire will yet take place, for their osmiridium fetched eighty-one pounds per ounce, and the seam still remains.

A SUCCESSFUL SCHEME FOR THE UNEMPLOYED.

By S. BARING-GOULD.

IN front of the Government offices in Munich is a bronze statue of Benjamin Thompson, Graf von Rumford. In the National Museum is his portrait in colours, showing him as a man with strongly marked features, a firm mouth, and clear blue eyes.

If you ask almost any inhabitant of Munich who he was, you will receive the answer that he was an Englishman who did away with beggary and unemployment, and gave to the city 'the English Garden;' and, except by the few, this is all that is remembered of a man who did more for Bavaria and for Munich than any other man.

That he was an Englishman is only so far true. Born at Woburn in Massachusetts in 1753, before the Declaration of Independence, he was a subject of the British Crown. Moreover, as he grew to man's estate and the rebellion broke out, all his sympathies lay with the mother country, and he was unable to see that the States were justified in going to war over their grievances.

He was the son of a small farmer, and he lost his father when he was aged but one year. His mother married again, another farmer named Josias Pierce; and this man and Benjamin's grandparents took care that the boy should receive a competent education. As he showed no inclination for agriculture, he was placed at the age of thirteen with a shopkeeper at Salem. Already he had displayed interest in science, and had blown himself up in an attempt to invent a new kind of firework. He bore the scars on face, hands, and breast to his dying day.

In 1769 he went into another business in Boston, and pursued his studies in physics, and above all in the properties of heat. He then learned French, and attended lectures at the Harvard College; and during the four years that he was in Boston he acquired a good deal of knowledge that served him well in after-life.

He then settled at Rumford, in New Hampshire, a place that has since altered its name to Concord, and there he married the only daughter of the Church of England rector, named Walker. As Walker was related to Governor Wentworth, Benjamin Thompson received an introduction to him, and being at once recognised as an able and energetic young man, was appointed major in the provincial regiment of New Hampshire. But when the troubles began and it became clear that the States were determined to go to war with Great Britain, Thompson got into trouble, first through harbouring a couple of deserters, and afterwards on account of his well-known and frankly expressed disapproval of the rupture. He ran the risk of being lynched; he was arrested, had to fly for his life from place to place, and had finally to take refuge on an English vessel, the frigate *Scarborough*, on which he remained till March 24, 1776, when Washington compelled the British troops to leave Boston.

He was then sent to bear the unwelcome tidings to London. The messenger conveying bad news is not usually well received; but it was otherwise with Thompson, whose loyalty was admired, and whose direct and manly bearing gained general respect. He was taken into the Colonial Office, where his abilities were speedily recognised, and in 1780 he was appointed under-secretary to Lord George Germaine, Secretary of State for America. The royal army seemed to be smitten with every kind of misfortune, and Thompson, in his position as under-secretary, saw clearly the incompetence of the conductors of the war. It was his office to see to the transports, the armament, the recruiting of the forces, and to the victualling.

In February 1782 Lord George Germaine, before his resignation, obtained for Thompson the appointment of lieutenant-colonel in the British army; and then he quitted the office of Secretary of State for America along with his chief, in 1782, after six years' service. Throughout this period he had pursued his scientific studies, and in 1779 had become a member of the Royal Society.

In command of a regiment of dragoons he was now sent to Charlestown, where he was engaged several times with the American troops, and in 1783 he took part in the defence of Jamaica, which was threatened by the combined fleets of France and Spain. Peace was signed soon after at Versailles, 3rd September 1783, between England and the United States of North America, and Thompson returned to England.

His political and personal hopes had received a heavy blow. He was thirty years old, a colonel, and he saw his only prospect of advancement in the field. No wars were then in progress save one between Austria and Turkey. He resolved on offering his services to the Emperor. In order to carry his purpose into execution, he besought leave of absence from George III.; and receiving a warm recommendation from the Bavarian ambassador, Count Hastang, he left England in September 1783.

On his way to Vienna he passed through Strasburg, where was stationed Duke Maximilian Joseph of Zweibrücken, with his regiment. Thompson appeared on the parade-ground on his horse and in uniform as an English officer, and attracted attention. He was led before the Duke, who received him very courteously, and questioned him relative to the American war, in the presence, as it happened, of some French officers who had been

engaged in America on the side of the enemy. The readiness with which Thompson answered, the clear and graphic account he was able to give of the actions in which he had been engaged, so impressed the Prince that he gave him recommendations to his uncle the Elector of Bavaria, as Thompson would pass through Munich on his way to Vienna.

Carl Theodor was the Elector who had united the Rhenish Palatinate with Bavaria. He was not himself an able man, but he had the faculty of recognising ability in others, and at once he saw that Thompson was the man he wanted to bring order into the confusion that reigned in all branches of the executive in Bavaria. He pressed him to remain at Munich, and assured him of his support if he would introduce measures of reform. Thompson hurried back to London and laid the proposal before the King. George III. at once consented, and knighted him.

Sir Benjamin Thompson now returned, receiving the half-pay of an English colonel, in the spring of 1784, and entered the service of the Elector, who made him colonel of a cavalry regiment and his aide-de-camp. Although at Court and in all the high society of Munich only French was spoken, Thompson set diligently to work to learn German, and acquired it sufficiently in a short while to make himself understood. In 1785 Carl Theodor appointed him his Chamberlain, and in 1787 Privy Councillor. It was not according to custom that a mere English knight should receive a decoration in aristocratic Bavaria, so the Elector induced the King of Poland to confer on Thompson the two orders of St Stanislaus and of the White Eagle, after which he was considered qualified to receive the Bavarian orders of St Hubert and St George.

The condition of the army was deplorable. It was not only subjected to pedantic and antiquated routine of no earthly advantage, but it was wholly inefficient. The Minister of War, Count Wilderbusch, had directed all his efforts to the reduction of the cost of the army; the discipline was bad, and it was neither well armed nor well fed or clothed, and was thoroughly unpopular as a profession. The state of affairs was so deplorable that the Elector required Thompson to investigate into its condition and to suggest remedies. This he did, and sent in his report on February 7, 1788. Carl Theodor at once raised him to the rank of major-general and appointed him Minister of War. Thompson had now a free hand to carry out his reforms. His great aim was to make of every soldier a patriotic citizen, and of every citizen a possible soldier. He did away with a host of abuses; he raised the soldier's pay, had him well clothed, well housed, and well fed, and allowed him as much liberty as was consistent with discipline. He had fresh and good blood introduced so as to improve the quality of the horses, both for the army and for the farmer. He started factories for munitions of war on the most modern principles, established military schools for the officers, and induced the Elector to plant schools everywhere throughout the Bavarian Electorate and the Palatinate for the compulsory education of every child.

There was a wide tract of desolate land, rubble and marsh, along the Isar's bank, wholly profitless and impracticable for agricultural purposes. At Thompson's desire some five miles of it was secured for the town, drained, laid out, planted, and transformed into what is now the beautiful English Garden, perhaps the most extensive park possessed by any capital.

But it was not only waste and profitless land that this energetic man sought to reclaim. At that time Munich and the other towns of the Palatinate swarmed with beggars and men who either would not or could not work. Bavaria had for years been oppressed by Jesuits, and the people degraded by the multitudes of monastic establishments that encouraged idleness and mendicancy. Thompson was not strong enough to attack these, but he was resolved to put an end to the plague of unemployment which raged throughout the whole country. It was not that Thompson was a tender-hearted man, a philanthropist and humanitarian, but that he was a lover of order, and the disorder of the streets, the crimes incessantly committed by the professional beggars and idlers, vexed him to the soul. He evolved an extensive scheme whereby a net should be thrown over the whole country, and the unemployed and unemployable be swept together, and then disposed of so as to render most of them profitable members of society, and those who were incapable of work and really needed assistance should be relieved.

The Elector at this time possessed four cavalry regiments. They were distributed over the land, so that in every village there should be five or at the least three men, who were to patrol the country from one station to another; and nothing was to be exacted from the peasants but to house these men. Forage for the horses and food for the men would be paid for. The object of this measure was to ensure the arrest of every beggar and loafer in the land. He purposed to begin with the capital, and the example would be followed everywhere else. He had already organised a police for the poor, out of voluntary assistants. He had a committee consisting of a president, a member of the Council of War, of the Council of State, of the Ecclesiastical Council, and of the Chamber of Finances, a secretary, and a paymaster. Not one of these was to be paid. All felt that something must be done, and all were ready to lend willing assistance.

The town of Munich was divided into sixteen districts, and in each a charity committee was established, consisting of one chosen among the respectable burghers, a priest, a doctor, a surgeon, and an apothecary. These committees were appointed to look after the welfare of the deserving poor in their several districts, and all were in touch with the central committee.

For the relief of the needy Thompson relied on a contribution from the Elector and on pooling the charitable offerings of the citizens. But that was not all. In the Faubourg of Au, beyond the Isar, was a ruinous factory. Thompson bought it, rebuilt and enlarged it, and converted it into a workhouse supplied with all sorts of workshops for every kind of trade, and over the door was inscribed in large letters, 'No alms given here.'

When all was ready, on New Year's Day 1790, the officers of the three infantry regiments stationed in Munich took up their appointed positions in the streets to await further orders. Thompson had assembled in his own house the field-officers and the heads of the city magistracy, and desired their assistance in carrying into execution the plan he had devised. All promised help in effecting the arrest of every beggar and unemployed man loafing in the streets, and in distributing them—the strong and able to be sent to his workhouse, the helpless and really needy to be assisted with alms. He then left with the burgomaster, the field-officers, and a magistrate. He had not got half-a-dozen steps along the street before he met a beggar, a sturdy fellow, whining for charity. Thompson put his hand on the man's shoulder and said, 'From this hour there shall be no more begging in Munich.' He handed the beggar over to a sergeant, and he was marched off to the workhouse. This went on throughout the city. All were hustled together into the Town Hall and there sorted out—who were to go to the workhouse and who were to receive assistance in their homes. In the workhouse the inmates had warm quarters and warm food, and were promised pay for their work. And to work they were set. Those who would not were left without their meals. Thompson's scheme succeeded admirably. His workhouse provided the clothing for the Bavarian army, and in one year rendered a clear profit of ten thousand gulden, or about eight hundred and thirty pounds.

In a comparatively short time he had transformed a set of miserable social parasites into industrious and contented men. He himself was devoid of sentiment, and did not notice, what was observed by others, the eyes full of reverence and affection that were turned on him when he visited the institution. Once, and once only, was he stirred, as far as could be perceived, at an exhibition of gratitude and recognition of his work. He was lying dangerously ill in the city, when he heard a tramp of feet in measured tread go by in the street, and he raised himself in his bed to know what it meant. He was told that all his workers from the institution for the unemployed were going in procession to the Frauenkirche, the present cathedral, to pray for his recovery. His lip quivered, and he turned his face hastily to the wall. This was not the only occasion when the poor people whom he had rescued from a life of degradation showed their thankfulness. He was very ill in Naples; and when the news reached Munich, the inmates of the workhouse voluntarily devoted an hour a day to prayer to God that he might be restored.

In the same year, 1790, in which beggary was abolished in Munich, the Elector nominated Thompson to be lieutenant-general of an artillery regiment; and two years later, after the death of the Emperor Joseph, when he was regent, he raised Thompson to the rank of Count of the Holy Roman Empire, with the title of Rumford—a strange proceeding, to give a title to a place not in his own realm. Later on Rumford's daughter Sarah was created a countess in her own right.

In 1795 he went to London, and his postchaise was stopped near St Paul's and a portmanteau stolen that contained all his private papers, original notes, and scientific observations. This was a bitter distress to Rumford, and he suspected, quite unjustifiably, that the thieves were set to rob him by envious London scientific men.

In October 1796 he was back in Munich just eleven days before the flight of the Elector to Saxony, occasioned by the advance of the French army under Moreau. Before he left, the Elector appointed Rumford his plenipotentiary, with full powers to deal as circumstances required.

The battle of Friedberg resulted in driving the Austrians on Munich, where they found the gates closed upon them. Bavaria claimed to be neutral. Throughout the European war she acted a selfish and ignominious part. It was well known that the sympathies of the Elector and the people of Munich were with the French rather than with the Austrians, and the general in command of the latter threatened to bombard and lay the town in ashes if a single French soldier were admitted within the walls. Rumford thereupon, with the consent of the Minister of War, Moranisky, took command over the garrison of one thousand four hundred men, and by his firmness repressed all anti-Austrian action and brought the city through its menaced dangers unscathed.

The latter part of Rumford's life was spent in France, in failing health, and he died at his residence at Auteuil on August 21, 1814.

His scientific discoveries have been superseded, his inventions improved; but his great achievement of finding employment for the unemployed and clearing Munich of beggars has lasted to the present day. It is now a city without a beggar in it, and where scarce a man is to be found who has not work ready to his hand, and a hand ready to his work, for it is compulsory for all boys who are passing out of the seventh class of the primary schools to spend three years at one of the divisional continuation schools or a trade-school. A man without employment goes to an office for the unemployed, and employment is found for him. The population of Munich is five hundred and fifty thousand, and is growing by leaps and bounds, so that production is not in excess of demand. It is a city without slums, without beggary, and without the unemployed and the unemployable.

THE LETTERS OF JOHN STUART BLACKIE.

MR STODART WALKER has chosen a fit occasion for the publication of the letters of John Stuart Blackie, carefully preserved by a proud father and a discerning and devoted wife, which, in this the year of the centenary of the writer's birth, are published by the house of Blackwood, with which the guileless and optimistic Scot was connected for more than half a century.

Beginning in 1829, the letters range over the greater part of the Victorian era; a fair conception of the amount of country covered being afforded by the fact that they are early enough to have references to Coleridge and De Quincey, and late enough to include Robert Louis Stevenson and Mr Barrie.

The letters of an optimist always form delightful reading, and the optimism of John Stuart Blackie was such as even to gain the adjective 'tyrannical' which his nephew applies to it. Few men have been capable of seeing the best of things as Blackie invariably did. He was indeed, as Mr Stodart Walker says, the very apotheosis of the *plein-air* in life. To him, indeed, the world was an earthly paradise, and it is as such that we take the stage in his fascinating series of letters. 'The optimism,' says his editor, 'was no mere dress for the soul, it was not a blind acceptance of a faith he did not comprehend—a barred door and a comfortable fire, with a storm raging without; but a living fact in a living man.' John Stuart Blackie, indeed, carried his optimism so far as to find an apology for wasps! In an amusing letter written from Taymouth, where one of the ladies present, having been stung by a wasp, had indulged in certain pessimistic reflections, he wrote: 'Of course, when a wasp stings a fair lady on the face it is disagreeable and painful, and if, for the moment, she should conclude that a wasp exists only in the worst possible world, she might be pardoned as a woman, but to philosophy she could have no claim. In a rich and various world, wasps have just as good a right to exist as fair women; and as for their stings, they have as good right to them as women have to their beauty and their tongues.' The remarkable capacity of 'finding a kiss in every cross,' of taking the knife of suffering or of misfortune by the handle and not by the blade, and in this way using it to advantage, was a constant one throughout his unceasingly active days. The difficulties and circumstances of life he faced without fear. 'Difficulties are the true test of greatness. Cowards shrink from them, fools bungle them, wise men conquer them.' 'Prudence yields to circumstances, folly quarrels with it, pride defies it, wisdom uses it, genius controls it.' From the first page of his letters to the last we find such wisdom, a wisdom founded on activity and guided by truth and love. As a young man he wrote: 'The four things I want are (1) a great inspiration, (2) a great cause, (3) a great battle, (4) a great victory. Give me these four things, and then we shall preach our gospel of Rest, and build an altar of Repose, and kick every busy little devil out of the house because we are old and wish *to die quietly*.' Such was the foundation of the Blackie ideals, richly portrayed in these letters, and never ceasing to be the inspiration of his serene, brave, and guileless nature. John Stuart Blackie certainly took, as George Meredith said of him, 'the healthy estimate of life.' The influence of such a remarkable character must have been catholic, far-reaching; and it is interesting to quote what his oldest friend, Sir Theodore Martin, wrote of him on this count: 'It was impossible not to love him, not only for his fiery energy and determination to work out for good whatever power had been given him, but for the truly original purity of his nature. He was in truth the most pure-minded man I ever met, an Israelite without guile; and I have no doubt many of the best impulses of my nature are due to his influence upon me in the far-away days.' It was this whiteness of his nature that aroused the enthusiasm of such a judge of character as the Chevalier Bunsen, and earned for him the love and admiration of forceful men and gentle and noble women. The mainsprings of his life were a passion for truth and the gospel of love. 'I can live

 [*All Rights Reserved.*]

without health; I can live without creeds or churches, without Whig or Tory, without all that is supposed to distinguish a gentleman from a man; but two things I cannot live without—Truth and Love. The want of Truth blinds me, the want of Love freezes me, and I die.'

As can be easily imagined, the letters teem with little pen-portraits of men who are part of the rich heritage of the nineteenth century. In the first letter, written in 1829, we have this boy's impression of Professor John Wilson: 'Christopher North wears a large night-gown destitute of buttons, his beard seems of several days' growth, he has no neck-cloth, and sits at a table on which his snuff is spread and ready for use, unencumbered by any box or other enclosure.' The reminiscences of Carlyle are numerous and varied. From the first the Chelsea prophet was a kind and helpful friend to Blackie. 'There is no young literary man from whom more is to be expected,' wrote Carlyle; 'very fearless, very kindly, without ill-humour, and without guile.' We extract the following from one of Blackie's letters, written in 1845: 'Thomas Carlyle is really a notable monster, and to be respected for the many noble thoughts he has elaborated, and for the words of wisdom which he has flung abroad to bear divine fruit among foolish-hearted men; but I can't help thinking, face to face in a small parlour, he is rather terrible, and I fancy prophets are best exhibited in the pulpit or in the wilderness. A few grand moral instincts burn so intensely in the hearts of these men that they have no room for anything else; they rush out from their smoking sanctuary with a flaming sword in their hand, and whoever follows them not is a heretic. Scottish and English Universities, British House of Parliament, orthodox theologies, railroads, and free-trade were all shaken out and sifted under the category of sham; while Oliver Cromwell and his Ironsides, and the old Covenanters who sang psalms and handled pikes on Dunse Moor, were held up to admiration as the only heroes in this country for the last two hundred years.' Numerous also are his references to Browning, whom he loved as a brother. 'He was frank and free, and full of talk; altogether an agreeable, rational, intelligent, sound-headed and sound-hearted man, with no poetical or other nonsense about him; a manly, hard-hitting Englishman, as in his most effective work he certainly appears.' 'He is an active, soldier-like, direct man, a contrast to the meditative ponderosity of Tennyson. The power and attitude in each case is a perfect index to the movement of the poetry.' Of Tennyson we have a portrait written on a visit to Farringford in 1864: 'A certain slow heaviness of motion belongs essentially to his character, and contrasts strikingly with the alert quickness and sinewy energy of Kingsley; head Jovian, eye dark, pale face, black flowing locks like a Spanish ship-captain or a captain of Italian brigands—something not at all common, and not the least English.' While on a visit to Charles Kingsley, Blackie wrote: 'I helped him to drain a bottle of burgundy. He had been out fishing all day, and was glowing in face like a tropical copper sky. He was extremely agreeable all evening, and swung in a manilla-grass hammock, which stretched across his study, in a style of the most complete negligée. His brother Henry came in after dinner, and we all smoked and drank tea, and talked, and went early to bed.' There are innumerable little personal touches of this nature scattered amidst a crop of more fattening material—serious reflections on life and literature, religion and politics, art and artistry; but always presented in a graphic and fluent style, richly salted with metaphor and peppered with a never-failing humour.

Politicians meet us at every stage—reminiscences of Bismarck, of Lord John Russell and Gladstone and Disraeli, Salisbury and Arthur Balfour and Rosebery. Of Gladstone we read most pleasant descriptions of familiar encounters, more serious disquisitions on his strength and his failings; disagreeing with the great Liberal statesman frankly, freely, and often forcibly, he yet invariably finds some philosophical excuse for what he takes to be the failings of his opponent. 'Justice run mad,' he describes his Irish legislation; 'the slave of a noble idea,' converting him into what Napoleon would call 'an ideologist.' Blackie gives us many amusing pictures of his encounters with such pretentous Radicals as John Bright and Thorold Rogers. We are told that the former did not consider the British Constitution worth a purchase. Blackie seems to have been impressed with the wisdom of Disraeli and Salisbury—'a ticklish man to tackle' is a comment on the latter. As for Lord Randolph Churchill, we are told that he spends most of his time reading parliamentary blue-books and French novels. Rosebery, 'the wise young laird of Dalmeny' he loves and visits often.

Of ecclesiastics we read much—Chalmers and Guthrie, Manning and Newman, Norman Macleod and Dean Stanley. 'Guthrie is a real MAN;' but it is Norman Macleod who stands out of the picture as an easy first favourite. Here is an early pen-portrait: 'We had in our carriage a trump-card of a fellow, Norman Macleod of Glasgow, who kept us in a roar of laughter with a succession of the most admirable jokes and humorous stories. The very look of the man is a joy, so round, so full, so jovial, so clear, bright, healthy, and hilarious! I was quite prepared to fall in love with him by what I had previously known, and now fell right into his arms at once. What a good and pleasant thing is a jovial *man*, how transcendently good is a jovial *priest!*' From the day of their meeting, Macleod and Blackie were 'mystics.' On the death of the former the latter wrote: 'It is a blow to my soul to think that Scotland should thus have lost her noblest son struck down.'

Of scientific giants we read much—of Tyndall and Huxley, Faraday and Gregory, Simpson and

Murchison. With men of science Blackie seems to have got on swimmingly. Tyndall was a most intimate friend, and when he wrote to him and advised him seriously 'to study the Nineteenth Psalm and the Angel's Hymn in *Faust* as containing more wisdom than Huxley could educe from the intestines of any antediluvian rat,' Mr Stodart Walker is quite right in saying that both Tyndall and Huxley would understand what Blackie meant. As early as 1848 Blackie wrote of men of science: 'My impression has been very favourable. No doubt they will sometimes waste a great deal of power upon what appear to me very trifling and slippery subjects; but small things acquire importance by their being associated with great, and the metalled road of sane science is never made till there be first a great deal of groping in the dark and stumbling through bogs. I like, in the first place, the grand spirit of liberty, equality, and fraternity which prevails amongst men of science.'

Writing as we do so soon after the publication of these letters, it is difficult to decide on the question as to which aspect of John Stuart Blackie they most graphically convey. The general impression that is left on the reader's mind is one of an extraordinary activity, of a tremendous thoroughness in method, of a large tolerance, of a genial appreciation of his fellow-men; a hatred of sham, of narrowness, priggishness, pedantry, little Scotlandism, and of tinkering busybodies. Nothing is more inspiring than the manner and matter of his student days in Germany, of the exemplary manner in which he applied himself to his work, and of the sacredness with which he regarded the word Duty. The economies of his *Wandejahr* afford delightful reading, seconded only by the humour that pervades the whole atmosphere. Of the love-letters it is impossible to speak too highly. Here we have the man revealed in all his strength, determination, and nobility; and if it were for these letters alone, this volume must always remain as a noteworthy contribution to the literature of their time. The historical records of the letters are not few. The revolution in Italy, the struggles that led up to and followed the Disruption in Scotland, the fight for University Reform, the Crimean and the Franco-German wars, the Reform and Home Rule movements, all afford opportunities for the free play of Blackie's thoroughly alive pen.

The volume is indeed a rich mine for the reader with catholic sympathies, for all those who can see no contradiction in a high moral tone and a keen sense of rectitude with a bubbling humour and a capacity for a glorious joy in living. With a stage crammed with strong men and beautiful women, with those who have made their mark by the power of the spoken or written word, or simply by the force and beauty of their own personalities, we have presented an inspiring and entertaining series of *tableaux vivants* for which it would be difficult to find a modern comparison. For Blackie was no mere man of letters; he was a man of action, who learned throughout the craftsmanship of his days to comprehend thoroughly the creed of love and good-fellowship, and in his own words to 'flap his wings freely before the Lord.' Yet through it all Blackie is 'a bonny fighter.' Loving his opponent, he baptises his love with fire. It is indeed as a fighter that he appears most picturesque; there is a kind of Carlylean-Norman Macleod note in the ring of his steel: 'Oh wonderful, wonderful, wonderful! I hear that the Presbytery and the University of St Andrews have memorialised Government about ejecting Sir David Brewster from his principalship because of his church principles. Bravo! bravo! bravo! old Bigotry! Rise up again, thou stout gospel of petrified externalities! Ye high-flowing Moderates, scrape the sky with your reborn Pharisaism—Pharisaism of fashionable ecclesiastical coats with stamped parliamentary buttons to cover the nakedness of a skeleton. Cook, MacFarlane, Mearns, and the Aberdeen Moderates against Brewster, Fleming, Brown, and Blackie. Another throw for "modern martyrdom." Have at you, my boys! On, Stanley, on! to the charge, I say! On! if the lily-livered knaves have only the courage. On, I say, on! Hurrah!' In another battle, the fight for his wife, he wrote: 'I will not go to your father's house without being asked; but I will come in the month of May next year, and I will proclaim it loudly, from Largo Law, and from the West and East Lomond, and from all the hills in Fife, "In the name of God and of Nature and of Truth, give me my wife, and if you will not give her to me I will take her. . . . Meanwhile, my bird, being in a cage, sing nevertheless, and hop about, for thy deliverer comes. Be quiet, be cheerful, be self-possessed, avoid sadness—it is a great sin, it is *the* sin, and the mother of sin; it is faithlessness. It is the farmer's sin who fears Noah's deluge every summer, and yet the sun shines, and the heat works, and the corn is ripened, and the garners are full. Let nothing cloud you. Dance, and leap, and rejoice before the Lord! I say that sorrow is vanity and a lie, a phantom and nightmare; the only Reality is Joy. And if you cannot live and rejoice, then *die*. . . . Cumber not the happy earth with your supererogatory presence! Walk not a night-phantom hideous through the stable day! Follow each noble instinct of your heart! Be always busy, systematically, radically busy. Bend to love all things, condescend to hate nothing. Hate no man, but pity sinners, despise cowards, avoid knaves, work with the wise, and amuse yourself with fools.' This may be 'tyrannical optimism' with a vengeance, but it is more sappy than the dead-sea fruit of a negative pessimism with which the quasi-philosophers of a generation or two later attempted to decoy the healthy mind. We put down the volume with the feeling as if we had emerged from a garden where all the flowers spoke.

THE TUTOR OF TYNDRACH.

CHAPTER IV.

MALCOLM had arranged to leave Inchie by an early train on Monday morning. He was taking with him, as he believed, Ann's promise that she would marry him in the autumn. True, he had been somewhat disconcerted by her manner after Mr Selwyn's departure on Sunday evening, but attributed her want of responsiveness to the reaction consequent on her unusual exertions as hostess. The strain of entertaining a stranger for so long must naturally tell upon her, and especially one who was such a prig and coxcomb as the tutor.

He had not hesitated to express his opinions of their visitor to Ann after his departure, but she had offered no opposition to the verdict; plainly she, too, was a little disillusioned. Later in the evening he had introduced the subject of their marriage, and discussed in detail certain duties and obligations that would devolve upon Ann in their future life. To these, too, she had listened without comment; and at last, provoked by her want of interest, he had despatched her to bed to sleep off, as he said, the tiring effects of Mr Selwyn's visit.

But though Ann had made a thankful escape to her own room, it was not to sleep. She had sat up the best part of the night, preparing herself to face the consequences of the new resolution she had arrived at suddenly that afternoon. It was a complete reversal of her decision of the previous night; but something within her assured her that in this case the resolution was final. Under no circumstances could she ever become her cousin's wife. Marriage with him was an impossibility. Let the alternative be what it might—starvation even—she would choose it unhesitatingly. The whole question had suddenly assumed a vital importance; the unthinking, unrealising, period was past for ever. Not only her happiness, but her individuality—her very soul, as it were—depended upon the decision. Material benefits were nothing as compared with the loss of self-respect such a marriage would entail. It was not merely that she found she had not sufficient love for her cousin; she had made that discovery the previous night, and yet had reconciled herself to the idea of becoming his wife. Something far more momentous had intervened to shake her resolve—a sudden revelation of what marriage might mean, the true companionship to be derived therefrom, the greater possibilities she had never hitherto imagined.

But how to break it to Malcolm? She had purposely refrained from doing so that evening—not out of fear of the consequences, but because she felt that she required a quiet interval for preparation, that she might have all her forces marshalled, her arguments in readiness. He must be told before he took his departure the following morning. Her uncle, too, must know. The grieving of them both horrified her gentler susceptibilities, yet her determination was unshaken. It was as if the real quality of her nature had suddenly revealed itself—those deeper, stronger possibilities that Selwyn had vaguely guessed at, and that were hidden beneath the child-like character and the softer woman's nature.

It was a very pale Ann who descended to the breakfast-room the following morning. She was the first to appear, and half mechanically she busied herself with her usual occupations—making the tea and putting little finishing touches to the arrangement of the table. Then she crossed to the window and stood for some time watching the antics of a thrush pecking and coquetting over the lawn. The great cedar in the corner threw a shade across the grass, but beyond it the sun shone gaily on the bright flower-beds and mossy turf. How she loved it all, the dear, familiar scene she had looked out upon for so many years! Now it seemed as if she were taking farewell of it. Surely life could never be the same again after the rupture she was contemplating this morning!

At last she heard her cousin's door open on the landing above, his noisy step on the stair. She turned round from the window as he burst into the room and came straight across to where she was. There was an aggressive exuberance about Malcolm in his early morning mood that Ann always connected instinctively with the soapy polish on his face. Both were so admirable in what they indicated—contentment and cleanliness; yet somehow she found them irritating.

He stooped to kiss her, but she drew back.

'Malcolm, I must tell you,' she said, raising her eyes bravely to his, though her face was deathly pale, 'I cannot marry you.'

He gave an awkward, frustrated laugh, and turned away impatiently.

'At it again?' he muttered. 'Why, the day before yesterday you were all eagerness for us to be married in autumn. And now'— He shrugged his shoulders; then his face darkened. 'If you're so loath, put it off altogether,' he went on, turning to her again with rising anger.

'Yes, that is it; it must be put off altogether,' said Ann with the same deliberate calm.

The flush of anger faded from his face; an expression of blank incredulity succeeded it. He had not believed for a moment that she would take his suggestion seriously; it was meant rather as a threat. But something final and inevitable in her manner of speaking alarmed him.

'Ann, what do you mean?' he said.

She passed the blind-cord steadily through her fingers for a moment before replying.

'I mean that I don't love you enough,' she said at last, raising her truthful eyes to his face again. 'I can never be your wife. It would not be fair to you or to myself.'

He gave a harsh, grating laugh, twisting round on his heel as he did so.

'And when did you make this discovery?' he sneered. 'Was it in the boat yesterday?'

The taunt stung her. It was like a rude hand thrusting at some secret truth she would not allow even herself to contemplate.

'Well, I must say I thought more of you than that,' he went on before she had time to recover her presence of mind. 'To go silly about a fellow you've only seen twice, and who's never had a thought of you in his heart!'

Ann started forward. 'Hush! You daren't! It isn't true!' she cried. 'He has had nothing to do with this. I shall never see him again. I never want to; only, I—I'—— She broke off, turning back to the window again.

Malcolm watched her for some moments in silence. There was a bitter struggle going on within him between injured pride and self-love, and his real fear and anxiety of losing Ann altogether. Even now he could hardly believe that she was serious. He had looked on her with proprietary eyes for so many years that life without her seemed something strange and different and unthinkable. It was impossible that she could be wilfully rooting herself up out of his existence—daring the unknown future—she whom he had always looked upon as dependent for every plan and prospect on himself.

He almost hated her in that moment for the price she was making him pay for what had hitherto been a free and unquestioned right. Yet to lose her altogether for the sake of a few conciliatory words now, the temporary humbling of his pride? No, it was not to be thought of.

He stretched out his hands and laid them on her shoulders.

'Ann, Ann, give over this madness,' he pleaded in a voice half-tender, half-reproachful. 'I will forgive you and take you back.'

No words could have been more ill-suited to bring about the end he desired. With a vehement gesture, Ann shook herself free of his hands.

Forgiveness! Yes, that was the insufferable, intolerable condition to which she would have to submit all her life long, the subservience of an inferior, the misunderstanding and undervaluing of her whole nature.

'Never—never!' she cried tempestuously, turning round to him as she spoke. 'You can't take back what's never been yours. If you had ever really known me and understood me you couldn't talk about forgiveness. I am only just beginning to understand myself. If I married you I should starve—we would both starve—because I couldn't give you what you want any more than you could give me what I must have;' and without further pause she rushed past him towards the door.

It opened as she did so, and her uncle entered the room. He started back at sight of the tempestuous vision.

'Ann, Ann, what is this?' he said.

But she paid no heed to the question, only hastened by him.

'She's been bewitched, that's all,' said Malcolm's voice, harsh and strained, from the window—'bewitched by the tutor of Tyndrach.'

. . . . . .

Autumn was at hand; the feel of it was in the air—dank earth and decaying leaves, and a chill at eventide that drove folk indoors. The September sun still shone bravely at midday and illumined the fading hillsides with a sort of spurious brilliance. But the yellowing bracken would soon be dead-brown like the heather, and the grass was already hardly distinguishable from the granite.

For several mornings there had been a sprinkling of hoar-frost on the manse lawn, and the birds were beginning to show the eager, hungry look they have in winter. It only wanted a gale of wind to complete the transformation and tear the last remnants of summer from the face of the country.

Such a storm was coming! The first long, keen of the wind had been sounding in the manse chimneys all night; and when Ann looked out of her window in the morning the loch was churned up into snowy turbulence, and the leaves were scudding across the lawn or dancing round in mad circles to the tune of the blast.

Nearly two months had gone by since her emancipation from the bonds of Malcolm's tyranny; yet, despite the grave nature of the crisis, life was continuing on very much the same lines as it had done hitherto. The only difference seemed to be that now there was no break to look forward to in the future, and no letters from Malcolm to give an interest to the present.

He still corresponded regularly with her uncle; but she knew nothing of the contents of his letters—his name had not been mentioned between them since that morning. The minister's displeasure had been, and still was, a sore grief to Ann. She would fain have gone out into the world to escape from it, but he sternly set his face against any such step.

Perhaps there was a lingering hope in his heart that the difference might still be made up between them; that time would show Ann how foolish and mistaken she had been, and how necessary Malcolm really was to her happiness. If he could have seen into the girl's heart this hope would have disappeared at once. There had never been an instant's regret or uncertainty in her own mind about the step she had taken. Her only sorrow was for the pain and trouble she had thereby caused her uncle and Malcolm; her one hope, that in the future some opportunity would offer itself for making amends to them.

But latterly the minister had begun to have doubts of his cherished scheme from another point of view. There had been unmistakable hints in

Malcolm's letters of late of a means of consolation independent of his cousin's tractability or the reverse. Allusions to a certain Miss Edith Traquair, the daughter of a neighbouring minister, whose society appeared to afford considerable solace for his loneliness, were frequent in his correspondence. The minister, knowing the injury to his self-love that Ann's rejection had caused, and the obstinate nature of his pride, feared the worst. For some weeks past he had been preparing himself to hear of a new engagement; and, much as he dreaded the announcement, he felt it would be only what Ann deserved for her treatment of her cousin.

The problem as to whether he should give the girl a hint of what was coming had been perplexing him for some time, and he had finally decided on this morning of the storm to break the news to her.

By a strange coincidence there was a letter from Malcolm in the post-bag when he unlocked it, and a brown-paper parcel and letter to Ann, addressed to her in an unknown hand. He pushed them across to the girl before dealing with his own correspondence.

'What can that be, Ann?' he said, watching her over his spectacles as she scrutinised the post-mark.

Curiosity was not one of his failings, but the community of interest that bound them together made it impossible for them to have any secrets apart.

Ann shook her head. There was a puzzled, expectant look on her face and her fingers pulled eagerly at the wrappings as she unfolded the parcel. At last a gasp of astonishment and delight burst from her lips. The little leather case the parcel contained had revealed the most perfect bijou watch, encircled with a slender chain, fitting accessory for a woman of fashion, but for Ann an undreamed-of luxury.

'It can't be for me! It must be a mistake,' she cried, raising her eyes to her uncle's face.

'The letter will tell you,' he returned quietly. Already the name of the donor was clear to him.

Ann picked up the letter and opened it.

The minister, watching her intently over his spectacles from the other side of the table, saw the colour vanish from her face as she read.

'It's from Mr Selwyn, I suppose?' he offered at last, as she turned quickly to the end, and back again, and so on through the pages once more. 'A wedding gift. We told him you were to be married in the autumn.'

'Yes, it is a wedding gift,' said Ann with white lips. 'But—but—he's not Mr Selwyn any longer. His cousin, Lord Repton, died last month, and he has inherited the title. It's signed Repton.'

'Ah,' said the minister significantly, and paused. 'There was always just that something about him,' he went on after a moment. 'But it will have to go back,' in a sterner voice, indicating the leather case on the table as he spoke. 'You must write and tell him there will be no wedding at Inchie this autumn—or perhaps ever,' he broke off. Here was the opportunity he had been seeking of preparing Ann for the news about Malcolm, but somehow the task was more difficult than he had anticipated.

The girl's eyes were on his face—a curious eagerness and expectancy in their glance.

'I'm thinking, Ann,' he began again in a difficult, jerky voice—'I'm thinking that maybe Malcolm will marry some day. You see, he's lonely, and—well—he has suffered. You mustn't blame him, girl; you treated him ill. It is natural he should resent it.'

But Ann interrupted him quickly. 'Oh Uncle Robert, do you mean that Malcolm is in love with somebody else? Oh, how glad, how thankful I would be! You can't think what a difference it would make to me, especially'—— She broke off, glancing down instinctively at the letter before her.

Her reception of his news had a bewildering effect upon the minister. He stared back into her eager face for some moments in silence, as if trying to gauge the sincerity of her outburst.

'Then you could never have cared for him?' he pronounced gravely at last.

Almost mechanically he took up Malcolm's letter as he spoke, and opened it.

Ann watched him in silence and suspense while he read it. When he had done he laid it down again with a long-drawn sigh.

'Your cousin is to marry Miss Traquair next month,' he announced.

(To be continued.)

THE OLDEST BRIDGE AND CASTLE IN THE WORLD.

By Captain F. W. von Herbert.

'AND unto the angel of the church in Smyrna write: These things saith the first and the last, which was dead, and is alive; I know thy works, and tribulation, and poverty (but thou art rich), and I know the blasphemy of them which say they are Jews, and are not, but are the synagogue of Satan. Fear none of those things which thou shalt suffer: behold, the devil shall cast some of you into prison, that ye may be tried; and ye shall have tribulation ten days: be thou faithful unto death, and I will give thee a crown of life. He that hath an ear, let him hear what the Spirit saith unto the churches. He that overcometh shall not be hurt of the second death' (Rev. ii. 8–11).

There is hardly anything in the reading of my younger days which has left a more enduring impression on my memory than the awful age manifested in the shrivelled monkey which, a minute before, had been She of supernatural beauty and seemingly everlasting youth. It must be two decades ago that I was carried away by the breathless whirl of Rider Haggard's romance, and ever since then the sight of anything almost immeasurably old has given me a stunning sensation of the microscopic insignificance of the human life-period as compared to the life-period of man's works. As the horse and rider were to Carlyle a Revealed Force—that is, God revealed, for Force is that manifestation of God by which He is perceptible to our gross senses—so is to me an ancient work of human hands a Revealed Thought, and the only revelation possible of the thoughts of human beings who lived ages ago.

There is in Asia Minor a river which was called Meles three thousand years ago, and is called Meles to-day. It is not much of a river to look at, and its width at the spot of which I am writing is but forty feet of quietly flowing, shallow waters. But thirty centuries ago there lived and wrought on the banks of that river, within a stone's-throw of the place I wot of, the greatest poet the human race has so far produced—Homer, who, in the matchless beauty and the raging vitality of his verse, has rendered immortal men and women who but for him would have gone under, ages since, in the bottomless sea of the sum-total of human insignificance: Achilles, Ulysses, Hector, Helen of Troy, Andromache the loving, Penelope the ever-faithful.

Nowhere except in Asia Minor are to be found sites on which an inhabited town has stood uninterruptedly for thousands of years and stands so to-day. This was brought home to me once in the interior of the country, when I had pitched camp in a protected hollow close to one of those ancient cities (Konia), but shifted my quarters on the recommendation of a learned Moslem divine, who drew my attention to the fact that that hollow had served as cesspool for an unbroken stretch of at least five thousand years. Such awful age—four times the age of London—is brought home to the thinking traveller also in the great white city which lies on the bank of the river Meles, between it and the seaboard, for in that city, Smyrna, the age is writ in masonry. Edinburgh is counted an old town; but to Smyrna it is as the child is to the sexagenarian.

To enter Smyrna from the land side—that is, from the east—you have to cross the Meles to-day as in Homer's time, and the crossing is effected by a bridge. It is a crude stone structure of one simple arch. The pavement and the parapet are quite new—that is, new for that part of the world—having been built by the Turks only a century or two ago. Below that brand-new surface Byzantine and Roman builders left traces of their work—youthful masonry hardly fifteen centuries old; but the foundations, as well as some stone-slabs on the banks, date probably from Homer's time. Caravan Bridge, as it is called to-day, and was called thousands of years ago, has been in existence so long as there has been a Smyrna, and that city existed when Homer lived, and was then already aged. It was called Smyrna a thousand years before his day, so named after a legendary girl, and is so called to-day, except by its possessors, the Turks, who have corrupted the name to Izmir, and Giaour Izmir (meaning Infidel Smyrna) is its modern Moslem nickname.

When Saints Luke, John, and Paul came to Smyrna they came probably from Ephesus by the commodious road which Cæsar's soldiers and hirelings had laid out along the well-beaten track of the Greek colonisers. Thus they entered the town by Caravan Bridge; and we can imagine that from this bridge St John, later in Patmos, addressed in spirit the Church of Smyrna, for the actual edifice of which St Polycarp was first bishop and martyr was close on his left, the Roman city was before him, the quarter of the Jews farther to the left, where it stands to-day, and beyond the low roofs he saw the bay and the shipping.

'I know the blasphemy of them which say they are Jews, and are not, but are the synagogue of Satan. Fear none of these things which thou shalt suffer . . . ye shall have tribulation ten days.' In two particulars St John's prophecy has been fulfilled. 'The synagogue of Satan.' In secret, in a dark place unknown to Christian, Moslem, and Jew alike, that awful sect called by Europeans in the East 'devil-worshippers' practises its uncanny rites and holds its gruesome orgies to-day in Smyrna. So little is known of this people even among inquisitive persons on the spot, so fearful are the adherents of this perversion of faith of revelations to outsiders, so shunned are they to whom evil powers are credited, that the inquirer is pulled up at every step by the ignorance, real or assumed, of all whom he addresses. The headquarters of the sect are undoubtedly in Syria, somewhere in the Lebanon; but that a branch exists in Smyrna, that it is flourishing, that it practises its rites actively and constantly—this I have ascertained beyond the shadow of a doubt. And, to pile up the horrors, the meetings are said to take place in a vault under one of the walls erected by Timur the Mongol warrior king, into which wall he caused the heads of his victims to be built—Timur, one of the greatest manslayers in recorded history, compared to whom even Napoleon was a blundering 'prentice. That quarter of the town is well known to me. I have searched it thoroughly by night and by day, alone and in company of expert guides, occasionally at the risk of my life; but the exact spot I have not found. It is probably in a yard or garden behind the dwelling of an adherent. Thus I am unable to vouch for the existence at the present day of a remnant of Timur's ghastly building operations. Officialdom says that the last remains were destroyed about 1850, when the castle at the harbour entrance was pulled down, and a few years

later, when an old mole was demolished to make room for the quay. I met a Greek labourer, now eighty years old, who, employed in the harbour works, had with his own hands taken a hundred skulls out of the masonry.

'Ye shall have tribulation ten days.' When Timur conquered Smyrna in 1402 he caused thirty thousand of its inhabitants to be put to the sword. The operation is said to have lasted ten days, at the rate of three thousand persons a day. The thirty thousand heads were used as building material. The Mongol chief caused the harbour castle, built by the Knights of St John of Jerusalem, to be strengthened, a wall to be built across the inner harbour to prevent the Turks from attacking him by sea in his newly acquired stronghold, and various edifices to be erected within the destroyed town.

At the present time the approach to Smyrna from the land side is uninteresting and of sordid aspect. Let us presume that we are returning from an excursion to Mount Sipylus, one of the highest peaks in western Anatolia, which has played a part in Greek history so far back that history has a nebulous halo and is become mythology. We pass the old Moslem cemeteries, with their beautiful cypresses, the first burial-places of the Turks after their conquest of Smyrna, six hundred years old and still in use; then on our left the ugly railway station, on our right a quarter of ill repute (reeking with shame and dirt and vice, notorious throughout the Near East); then a huge khan (halting-place for caravans); and finally the bridge. In its centre we stop a moment and glance down to the banks, now frowzy and sordid; once, three thousand years ago, when Homer lived on this spot, pretty and peaceful, the appropriate setting to a poet's sedentary labours. The moment we have crossed the classic river we are in the Greek quarter of Smyrna, with its dirty crowds, its turbulent activity, its boisterous barter and exchange, its numberless mean little shops and booths and eating-houses, its vermin, its stench, its blatant vulgarity.

How different is the approach from the other side, from the west! For four hours our steamer glides between the fertile shores of the Bay of Smyrna, perhaps, barring that of Naples, the most beautiful bay in the world. The city, in the bend of the bay, is spread out like a theatre on the slopes of classic Mount Pagus, and it wears a hoary crown—the castellated ruins on the summit of the mount. White houses and flat roofs, slender Moslem minarets and ponderous Greek domes, cypresses, poplars, sycamores, and olives, are reflected in the serene blue waters of the tideless sea; and a forest of masts, belonging to many hundreds of quaintly rigged schooners and yawls from the Ægean Islands, veils the houses on the two miles long quay.

Naturally our first excursion inland is to the castle on Mount Pagus, as it must be of every European to whom history is a fascination. The ascent is more difficult than we imagined. When we have left behind the European quarter (the Rue Frank, with its traffic worthy of noonday Cheapside), the former Armenian quarter (with stately houses, now mostly occupied by wealthy Greeks and Levantines—since the massacre the Armenians prefer to live near the shipping), the tortuous slums of the poor Greeks, we come to a quarter of steep, narrow streets which seem to rise up into the skies, where passage after a rainfall is impossible. The houses have become hovels. Cretans and gipsies live here, and are of evil repute; the dogs are particularly vicious; but the motion of picking up a stone from the unpaved ground will send even the most ferocious mongrel away whining.

The last inhabited dwelling is a small fort, built of stones taken from the ruins. Here are two obsolete guns, which are fired as a signal to the fire-brigade when the lookout detects a conflagration in the city spread out below him: one shot for the European quarter, two for the Greek-Armenian quarter, and three for the Turkish and Jewish quarters, which latter lie far away to our right.

There is some more stiff climbing to be done on grassy slopes, and finally we stand among the ruins. The aspect from below gives no idea of the size of the castle. Its thorough exploration would be a matter of weeks. In Roman times the castle could and did easily hold a legion, four to five thousand men, with staff, offices, stores, baggage, and beasts.

When was this castle begun? In its walls we have the history of Smyrna, commencing above at comparatively modern—that is, Turkish—times, and ending below in the dim periods of legend and tradition. With the exception of the Turks, who never made any serious attempt to restore the stronghold, and of the Knights of St John, who failed to conquer it, each nation or tribe or invading army that held the city utilised also the castle, repaired it, added to it, built on the top of it.

There are a few remains of dilatory Turkish labours, perhaps four hundred years old; below them traces of Mongol work. But Timur held Smyrna only for a year, and not much could be done to so vast an edifice in so short a span. The immediate predecessors of the Turks, the Christian Crusaders (1097 A.D.) and the Moslem Seljuks (1094), left abundant traces of their handiwork. The latter were adepts in building, and the former marked their track with grim strongholds, many of which are in existence to-day. Then, as we recede in historical times, we find masonry of the great empire of the Khalifs of Bagdad, of the Byzantine period, of the Roman Empire, of the short-lived Seleucidan kingdom, a fragment of Alexander's world state, of the Macedonians under Alexander the Great, of the Persians under Darius, of the Lydians under Crœsus, the richest man of antiquity. We are now arrived at the year 550 B.C., and in the masonry records at about the present surface of the soil. So far as I have been able to ascertain, no systematic excavations have ever been made on Mount Pagus. But single enthusiasts have at various times dug into the soil; I myself have handled a

spade here, in the company of two Smyrniote friends, when the guardian's back was turned. This guardian is, or was two years ago, a retired infantry sergeant of many campaigns. Only two remarks this grave-faced, sun-scorched, taciturn warrior, tall and slim of figure, hawk-like of profile, made in my hearing: 'This is the entrance to hell,' pointing to a black hole in one of the interior walls; and 'Over yonder the Wandering Jew left his mark,' pointing to what looked like an arched gateway far down below in the town, amid a jungle of mean houses and tortuous alleys, plainly visible from this elevation. He dwells in a hut built by him close to the signal-guns, he has no kith or kin, his pension has not been paid for years, and his livelihood is the bounty of travellers and the charity of neighbours—this we learnt from the gunners.

That black hole—walled up by the Turks five hundred years ago, but reopened recently by the curiosity of explorers—leads to a complete system of underground passages, by means of which the castle on the hill and the city on the seashore were connected in Roman times. Its examination is at present impossible, for the stairs have long since crumbled away. One opening in the town was discovered when the railway station at Caravan Bridge was built, forty years ago; but the vaults were decrepit, the Greek workmen timid and superstitious, and the opening was bricked up. On its site stands a goods-shed. Popular tradition and the examination of old local records moved me to seek another opening beneath a modern dwelling-house in a turning off the Rue Frank. I interviewed the occupier, an educated Levantine, who is also the owner and was the original builder; but my first words caused him to start with terror, and he begged me, with every symptom of trembling fear and anxiety, never to mention that accursed passage. I have not learnt the reason of his fright.

Enough daylight is admitted by the hole in the wall to allow one standing on its dangerous threshold to examine the masonry, which seems to extend down into the bowels of the earth. Here the history of Smyrna prior to Crœsus is written in stone: Greeks of various kinds (Ionian, Eolian), Phœnicians (who were the first systematic colonisers of Asia Minor), Hittites (mentioned in the Old Testament); and below the very foundations laid by the original inhabitants (Carians or Lelegians) six thousand years or more ago. Sixty centuries! The inhabitants of the British Isles were half-beasts then. Two hundred generations have lived and died since then; every trace of those builders, in language, physiognomy, faith, and history, has disappeared; but their stones remain, and have served as foundations to the superimposed stones of twenty different nations, rising, flourishing, and decaying, one after the other.

If those grim castle walls could talk, what a tale of terror and torture, bloodshed and anguish, they would unfold! A cursory calculation, based upon the number of times Smyrna has been taken and lost, has shown to me that within those walls alone three to five hundred thousand human beings must have violently perished; within the city below four or five millions by the sword and as many again by earthquake and pestilence.

It is meet that in so old a town the legends—and Smyrna has hundreds of legends—should partake of the quality of age. Of such is the story of the Wandering Jew. In Christ's time there lived in Jerusalem a cobbler, whose two names commenced with *aleph*, *beth* (the *a*, *b* of the Hebrew alphabet)—so, at least, says the Anatolian version of the story. On His way to Calvary, carrying the cross, Christ rested on his doorstep, and he drove Him away with curses. Christ, turning on him, said, 'Thou hast forbidden Me to rest; thou shalt not rest.' Since then he is a homeless, curse-laden wanderer, and he cannot die. He was seen and spoken to in Germany several times, in the fifteenth, sixteenth, and seventeenth centuries, when the German savants reconstructed his name as Ahas Ber, afterwards corrupted to Ahasverus or Ahasuerus. Once in every hundred years he visits the sacred places of the East—Jerusalem, Bethlehem, the Lake of Galilee, Mount Carmel, Damascus, the Seven Churches of Asia (among them Ephesus and Smyrna). In each place he leaves on some wall or building that was in existence in his time his mark: the initials A. B. in three languages.

Descending from Mount Pagus, we go out of our way, and after an hour's search in a maze of alleys we find the arched gateway which we have seen from above. It is clearly Roman, dating probably from the last century before Christ. It forms part of the wall which surrounded the Roman city; and at each side of it a hundred yards stretch of this wall stands to-day, so thick that it has been hollowed out in several places, and the cavities are used as shops by Greek and Turkish petty traders and artificers.

A principal thoroughfare of the Roman city was called the Golden (Via Aurea). It is significant that an alley in the vicinity of the gateway bears the Turkish name Altun Sokak—that is, Golden Street—all the more significant as the majority of Smyrna streets have no names. The first (ephemeral) Turkish conquest of Smyrna took place in 1084, when the Roman city was still in existence.

We search for the Wandering Jew's mark. On a smooth corner-stone there are—rudely carved as if with a blunt chisel, perhaps sixty or eighty years ago—three sets of two single letters, one above the other: the Hebrew *aleph*, *beth*; the Greek *alpha*, *beta*; the Arabic *elif*, *bé*.

THE REVEALING OF THE DUKE.

By C. EDWARDES.

THE young Duke of Kelver joined the crowd in Bodstoke's Co-operative Hall. There was little likelihood that any one would recognise him; for, although he owned Bodstoke, five other small towns, and twenty-three villages, he had been abroad for the last four years. Indeed, he was in Nepaul when his father died and the vast inheritance settled upon him as simply as dew upon a flower.

He felt a strange curiosity about this demagogue Campion who was to address the Bodstoke Socialists in the hall.

'A dangerous man, your Grace,' Mr Milton, his estate agent, said of him that morning at the castle. 'The worst kind, because he has ability attached to his animosities and ignorance. A thorough fanatic. I have little doubt that he is subsidised by his party for the sake of the poison he disseminates.'

The young Duke smiled at his agent's phrases. 'Neatly put, Milton,' he said.

Pressed for more information, the agent said Campion had been one of the late Duke's body-servants at the castle, that the late Duke had kicked him out of the castle one day for gross disobedience, and that was the end of him so far as the family was concerned.

The young Duke had come home feeling rather ashamed of himself for his recent neglect of his responsibilities. About a hundred tin-lined cases of horned and other heads and pelts were all he had to show for those last four years. They didn't seem a lot to him now.

No one knew better than he that his late father had an atrocious temper. He was an autocrat to the finger-nails. Even his son hadn't been able to stand him. Hence, in a measure, his prolonged exile. The late Duke told him before he started that he might go even beyond the remotest of earth's continents if he pleased, on the understanding that he returned when it was necessary.

The young Duke also had a temper, but he had learnt to keep it bottled. Even camping for months above the snowline in the Hindu Koosh hadn't loosed the cork from the bottle. He had been greatly liked by most people out of England, from Governors-General to the lowliest of pack-carriers.

The Co-operative Hall was fairly filled when he arrived. He went in with a thin string of working-men. No one need have taken him for anything better or worse than a stalwart young mechanic of innate intelligence. His eyes were of a dreamy blue kind. You had to look closely to discover the power behind their agreeable mistiness. He was clean-shaven, and wore clothes out of which all the Bond Street nonsense had been knocked by ruthless exposure to weather.

Best of all for his present purpose, he had a favourite short brier pipe, and some tobacco in his pouch. After lazily adjusting himself between the elbows of his neighbours, he filled the pipe and begged the favour of a light.

'Good idea to allow smoking,' he said to the graybeard who gave him a match.

'Co-operative,' retorted the graybeard sententiously, '*means* smoking, young feller. The room's our own to do what we've a mind in. I should have thought you'd known that, if you're a Bodstoke man.'

'Yes, but I'm not,' said the Duke. 'I'm very interested, though.'

The graybeard scanned him over. It wanted five minutes to eight, and the platform still lacked population. Social amenities were in progress among the crowd, as well as drifts of tobacco-smoke, laughter, and a jar of voices.

'Office chap?' suggested the graybeard.

'I've been all sorts,' replied the Duke. 'But what about this man Campion?'

'Never heard him?' The graybeard seemed surprised. 'Never seen him land the aristocracy one in the eye? That's his special gift. I dunno where you hail from; but perhaps you know every blessed stick and stone for miles round here belongs to a ready-made young nob who never did an hour's work in his life. This hall what's ours we pay him a ground-rent for. He's a little twopenny god, you know, all because he's his father's son. Just come home, they say; and if so, and he meets him, Bobby Campion'll give him pepper. I'd be sorry for the young feller if Bobby had him up on that there platform.' The graybeard spat upon the floor. 'I would that,' he added.

'Now why, I wonder?' murmured the Duke.

'Why? Because his father, him that's dead, lifted his boot to him, and butted him down I don't know how many of his castle steps and stairs. You'll see he's got a limp on him still, if you've cute eyes. And all for why? "Here, you," says the old nob what's dead; "get on your knees to me and lace these 'ere boots, and be darned sharp about it!" Bobby hadn't knelt to nothing and nobody since he was a thinking chap, and he wasn't in any hurry to kneel to a man shaped like his own self, and no better anyway except by accident. But it was being spoke to like that that set his back up most, and I reckon the old Duke saw it in him. Howsumever that may be, he upped at him for daring to look as if he was a born independent. "What do you think you are?" screams the old josser. "A human being, same as your Grace," replies Bobby, with his own dander on the boil. "And I sha'n't lace your boots

unless you ask me in a way that fits in with my self-respect." How's that for spirit, young feller? Ah, here they come! The old nob shunted him out by the neck, and footballed him down the stairs like as if he was a dead dog. And he bore it, young feller, without hitting back, out of charity for the old nob's gray hairs. They took him home in a cart to his wife and kids; and he didn't even bring an action for damages, though the lawyers said he'd a hot case. Wouldn't demean himself, said he; but he'd chalk it up. That's when he began to sharpen his knife for the whole titled lot of 'em. He's the pale-faced one.'

'Another match, please,' said the young Duke. 'And thank you. So that's Campion?'

There was some clapping while the nine or ten platformers arranged themselves.

The young Duke was rather disappointed at Campion's appearance. He expected something rampant, with a mouth large enough to take a cricket-ball. He was prepared to be faintly amused by the man's aggressive exterior. But this was a slight, ten-stone, ordinary individual, with nothing striking about him. Yet stay; that wisp of black hair on his forehead, curved like a scimitar, gave him character. Yes; and when he laughed his teeth gleamed—not merrily, but as if he had a kind of hunger on him.

This was the man his father had kicked downstairs! The late Duke was enormous—sixteen stone—and gouty. The young Duke winced as his imagination recomposed the scene.

The chairman spoke a few words, with his fingertips joined in front of him. They were unimportant words. He was short and fat, and the young Duke only nodded when the loquacious graybeard said he was Jack Hewitt, manager of the No. 4 Branch of the Stores.

Then Campion stood up, and the room clapped its hands.

'Just one more match,' said the young Duke. 'I don't seem to get going.'

'Take the box,' said the graybeard; but the young Duke wouldn't think of it. He puffed at his pipe three or four times, and then out it went.

The subject of the address was 'Natural Right.' Campion started quietly, with easy hand-action. There was nothing new in his denunciations of persons of property, but the soft and musical purr of his voice was significant. He seemed to be smiling all the time. Even the young Duke, however, could see that it was only a surface smile. He called the landlords and plutocrats thieves, oppressors, and even murderers of the poor, without the least exertion. The young Duke began to understand that all he had said so far was ancient and accepted history with him and his audience.

The graybeard grunted 'That's so!' when Campion said that if 90 per cent. of England's rich men were hanged to-morrow morning they would get no more than their deserts.

'Either they or their fathers have taken the money out of your pockets, or mine, or our fathers', or kept what ought to have come into our pockets. They starved us of our chances, if not of bare bread. That's the plain logic of it.' And then all at once he turned and crashed his fist upon the table by his side.

'Take our own little big-bug!' he shouted. 'Now, just let's analyse his biography as man to man.'

'He's going to rub it into the young un what I told you about,' whispered the graybeard; and the young Duke nodded, and took the cold pipe from his mouth.

The speaker was very unfair to the young Duke. He said the latter was worthless and idle and wrapped up in his pleasures, and had no more sense of natural right than a wolf.

This brought on the crisis.

'I'd ask nothing better, my friends,' cried Campion, with glistening face (the room was hot), 'than to meet him and tell him what I think of him.'

The young Duke raised his hand. 'One moment!' he exclaimed; and very politely he requested the men in front to make way for him. 'I'm the chap he wants!' he explained. 'Oh, it's all right,' he said to an astonished one; and to another, 'I'm on your side much more than you think, if you'll excuse my saying so.'

The little chairman appealed for 'order,' and was evidently disquieted. A murmur had run through the room.

There was some pushing behind the Duke, whose pleasant smile greatly helped him to the front. 'May I come up?' he asked the chairman from the foot of the platform.

The chairman and Campion had exchanged words. With folded arms the latter had watched the young Duke's advance, his brows cut with wrinkles.

'Yes, it's him, sure enough,' he informed the chairman, who seemed then quite at a loss what to do.

'*I'm* coming,' said the Duke good-humouredly; and there he stood by the demagogue's side.

'I'm sorry, Mr Campion, to interrupt you'—— he began.

But he got no farther. Springing behind him, the demagogue lifted his boot into the small of the Duke's back and charged him off the platform. 'There you are!' he shouted maniacally afterwards. 'When Robert Campion says a thing he does it, duke or no duke. I've served him the same as his father served me; and you men who cry "Shame!" don't know what you're talking about. If he requires any more of it I'm ready!'

He folded his arms again and glared defiance at every one. No one spoke while the young Duke returned to the platform. There was much jostling to get to the front, but otherwise a silence that could be felt.

The young Duke had damaged his nose on a man's bald head, otherwise he was just as before. If anything, he was even braced by the assault. As a

hunter, he had fallen over precipices and been picked up smiling in spite of broken bones. It was scarcely a six-foot drop to the man's bald head.

Campion set himself squarely to the young Duke this second time, with his clenched fists stiffly by his hips; but the young Duke's first movement was for his pocket-handkerchief. His pipe came out with it and smashed on the floor. He picked up the bits, shrugged his shoulders as he viewed them in the palm of his hand, and slipped them into a side-pocket. Then he wiped the blood from his nose and again confronted the demagogue.

'On my honour as a man, Mr Campion,' he said, in the voice of one used to outdoor talking in all weathers, 'you're wrong if you think I suppose I'm born into the world only to have a good time. I'm not such a silly fool. I want you all to have a little patience. Ah, excuse me!'

His nose needed fresh attention. While he ministered to it he was impressed by the faces of the crowd. They numbered about two hundred, and positively not one of them seemed inimical to him. He saw ill-health and even want on some, staring disinterested wonder and downright goodwill on others. But there was nothing like the contempt and rage which had just now flashed in the demagogue's eyes.

And then he felt a little faint—not from loss of blood, nor yet shock, but from something better. Twice in Central Africa he had been the lord and master of hunting expeditions with scores of human beings dependent upon him, many of whom had died. Each time he had had horrible sick moments of remorse about those dead and dying ones. The same kind of emotion came to him now.

The chairman, who had felt unequal to his chair since the disturbance began, timidly ventured a suggestion.

'Shall we end the meeting?' he asked at random.

'Oh no,' said the young Duke, 'of course not.' He again faced the demagogue, whose nervous agitation was distressing to see. 'I won't interrupt things either. All I wish to do is to apologise to you, Mr Campion, for anything my father may have done in an unworthy moment. We all have them, you know. But—this nose of mine beats me. Good-night, gentlemen.'

He sprang the handkerchief to his face again. The 'Good-night, gentlemen,' was rather muffled. It carried pretty well, however, and the laugh in his eyes carried even farther.

As he jumped from the platform the crowd clapped. Ere he was out of the room the applause was as loud as Campion's own welcome half-an-hour ago.

He might have had honourable escort to the street if he had waited for it; but he took the stairs two and three at a time, and was down first. In the corridor below he met a policeman.

'Is the Duke of Kelver up there?' asked the man sharply.

'No,' said the young Duke; 'he's here. I'm the chap. Get along back. They'll do very well by themselves. Besides, I want you.'

The constable had his instincts like another. He saluted the Duke, and hoped he was not seriously hurt.

'Not hurt at all. There, listen to 'em! Come along.'

A youth had cried from the stairs, 'The Duke's a bit of all right!' and the Duke laughed as if he quite liked to hear his praises thus sung.

He took the constable by the arm, and they passed into the street. It was an unimportant street, without shops. The square lamp over the door, with the black letters 'Co-operative Hall' on the lamp, was at that hour its chief object of interest.

'Just tell me something about our friend Campion,' he said when they were on the pavement.

There was a side street three paces on; and, still master of his companion, the Duke steered him down that way.

The constable was not quite easy in his mind, but the young Duke's magnetic influences continued to work upon him. He had three worthy stripes on his arm, testifying to his intelligence; nevertheless, he did not readily grasp the Duke's point of view. He was more anxious to see the Duke safely to the Kelver Hotel.

But that wouldn't do at all.

'Where does he live? How does he live? He isn't level-headed, and men like that need to be looked after. I understand he's married. Where does he live, man?'

'Your Grace,' said the constable to this compound bombardment of questions, 'I'm afraid he's a bad lot at home. He lives in Park Street, No. 14.'

'Where's that? How far off?'

'About five minutes from here, your Grace.'

'Then take me there. And tell me all you know on the way.'

The constable's knowledge was not great. There was a deal of crying in No. 14 at times, he said, and Mrs Campion had the look of a hunted woman. The neighbours hadn't the same opinion of Campion as the men who listened to his tongue in places like the Co-operative Hall. Ah, yes! come to think of it, he had heard that several weeks' rent was owing. They might get turned out any day.

'He doesn't drink?' asked the Duke.

'No, sir,' replied the constable; and, yielding to facetiousness, he added, 'His spout 's of the dry kind. This is the street, your Grace, and here's No. 14.'

The young Duke gripped his arm. 'Good-night, officer, and thank you,' he said. 'Your name, please? Hannaway! Thanks. I'll remember. And you might go and tell my man to get the car ready. I'll be with him directly.'

He tapped gently at the door as the constable moved away. He tapped again, and then it opened a few inches, and a woman asked who he was.

'A friend of your husband's, if you are Mrs Campion,' said the Duke. The door opened wider. It let straight upon a poorly furnished parlour,

with a gas-jet in the middle of the room only just alight.

'Is anything the matter with him?' asked the woman anxiously.

'Oh no, no, no,' replied the young Duke with vigorous cheerfulness. 'Do let me in for a moment. There's no harm in telling you I'm the Duke of Kelver, I hope?'

Mrs Campion stepped back and turned up the gas; and the Duke entered without permission, and pushed the door behind him. He laid his cap on the table and wished to shake hands. But Mrs Campion didn't seem equal to the ordeal. She looked frightened. Her face was very white and thin, and there were dark curves under her eyes. She clasped her hands in front of her and bore herself like one used to blows and expecting another.

The Duke drew a deep breath. He noticed everything: the threadbare floorcloth, the worthless and scanty furniture, and, chief of all, the poor woman's open dread of him.

'I have only come to pay a debt long due to your husband, Mrs Campion,' he said. 'Please trust me. I haven't been in England a week, and until yesterday I didn't know about things. May I use your ink?'

An ink-bottle and a pen were on the mantelpiece. The Duke helped himself to them and drew a chair to the table. He was glad that he had a cheque-book with him; and, producing it, he opened it immediately.

'I don't know what he'd do to me if he found me here, Mrs Campion,' he said with a smile, resolutely forced, yet a fine specimen of its kind; 'but I'm going to chance it.'

'What are you going to do, sir?' whispered the woman.

'Let me do it first,' said he.

He dashed off an order to pay Robert Campion one thousand pounds, signed his name, and handed the wet slip to the demagogue's wife.

'There, Mrs Campion,' he said. 'I don't consider that it puts things right, but I do hope and pray he will take it as a sincere attempt from one generation to atone a little for the wrong done in a previous generation. And tell him this, Mrs Campion, that if he destroys it I'll double it. Tell him I'll come and do it to his face here if the cheque isn't cashed within the week. And tell him this also, that I shall think all the better of him if he's as much a Socialist this time to-morrow as he is to-night. But of course he will be. I oughtn't to have said that. I beg his—— Hello!'

The demagogue himself was in the room. The meeting at the Co-operative Hall had ended rather abruptly after the Duke's flight. He had come stealthily down the street, and stopped outside to listen until it seemed to him that he had heard enough. That wisp of hair divided his forehead like a black line.

'Robert!' cried his wife, rushing to him with the cheque.

His eyes were very wild when he entered, and they were still so when he turned them from the cheque towards the young Duke.

'This is rough luck!' whispered the young Duke, again forcing a smile. 'I hoped I'd get it all over long before you came home, Mr Campion. Er—I must make a bolt for it. I'm glad the table's between us, so far.'

It was graceful comedy, or the pretence of it, on the Duke's part. He was unquestionably anxious, however, to be off. More, he reached the door unobstructed. But he did not make his bolt quite so precipitately.

The demagogue had collapsed upon a chair and covered his face with his hands.

'Robert, thank him. It's noble of him!' whispered his wife.

It was this that made the young Duke pause. He returned, and at the risk of his life put his hand on the demagogue's shoulder.

'My dear fellow,' he said, in a tone that would have touched harder hearts than the demagogue's, 'we're not quits yet. Don't think that. Good-night, and believe me if I say, "God keep you both!" I'm one of the old-fashioned ones in some things, though folks wouldn't suppose it.'

He was gone the next moment.

OLD WORCESTER PORCELAIN.

By Francis B. Cooke.

ALTHOUGH to the lover of old china the wares of most of the early English factories possess certain features of academic interest, for sheer beauty the porcelain made at Worcester during the latter half of the eighteenth century is without a rival. In model, paste, glaze, and decoration, the productions of the old factory that stood on the bank of the Severn excelled those of all contemporary firms, and such pieces as have escaped the devastating hand of time are regarded by connoisseurs as triumphs of the ceramic art. Collectors vie with one another to secure specimens for their cabinets, and the value has appreciated to such an extent that fine examples of the best period (1768–83) are now worth a good deal more than their weight in gold.

The Worcester factory owed its inception to Dr John Wall, who, with one William Davis, an apothecary, formed a small company to start the business. Warmstry House, a large mansion near St Andrew's Church, was secured for a factory, and the manufacture of china commenced on a con-

siderable scale in 1751. The works were under the management of William Davis, who jealously guarded the secrets of manufacture, the principal output in the early days of the factory taking the form of articles for domestic use. The decoration at first employed was an imitation of the Chinese and Japanese ware that had long been imported into this country, and was for the most part painted in blue under the glaze.

The second and best period commenced in 1768, when three of the cleverest painters at the Chelsea factory were induced to transfer their services to the Worcester works. During the succeeding fifteen years the factory was at the zenith of its fame. Vases, tea, dinner, and dessert services, exquisitely decorated in enamel colours, became the predominant feature of the output, the purely decorative pieces surpassing in beauty and workmanship the best examples of Chelsea china. The favourite ground-colour was a rich mazarine-blue, which to the present day has never been surpassed. Other ground-colours employed with success were a turquoise-blue, a canary-yellow, a pea-green, and maroon. To these must be added the blue 'salmon-scale' ground so much prized by the twentieth-century collector, and a powdered blue somewhat similar in style to that of the Chinese. The pieces were decorated for the most part with flowers, exotic birds, figure-subjects, and landscapes exquisitely painted in white reserves or panels which were often in the shape of a fan. The best pieces of this period bear a fretted square mark in imitation of the Chinese, whilst others are marked with a script *W* or a crescent. Occasionally the square mark and the *W* are found in conjunction; and the latter, it is thought, indicates that the piece was inspected and passed by Dr Wall before leaving the works.

Another form of decoration that was brought to a high state of perfection at the Worcester factory was transfer-printing over the glaze. The colours usually employed for this purpose were black and puce, the copper plates used in the process being beautifully engraved. The most popular subjects were portraits of celebrities, landscapes, ruins, and homely illustrations such as 'a tea-party,' 'courtship,' 'swans,' 'the hunt,' &c. Sometimes only the outline was engraved, the remainder of the decoration being in enamel colours applied by hand. Large quantities of articles intended for everyday use, such as tea-services, plates, bowls, mugs, and, jugs, were printed in blue under the glaze, and, like everything else produced in the factory at that period, reached a high standard of excellence.

Dr Wall, the founder of the business, died in 1776, and seven years later the works passed into the hands of Mr Flight, who had acted as London agent for the firm. Under the new management the artistic decoration of the china began to deteriorate, and towards the end of the century a rococo style was adopted that afforded a complete contrast to the graceful simplicity of the early productions. The exquisitely painted flowers and exotic birds of the Wall period soon gave place to great coats-of-arms and classical subjects executed in somewhat stiff and laboured style, whilst a superabundance of burnished gilding helped to rob the pieces of their artistic merit. Early in the nineteenth century the Worcester works and most of the other factories existing at that time adopted a standard body of porcelain which effaced all individuality from the wares of the various firms, save only in such matters as marks and decoration. The Worcester factory is still in existence, under the style of the Worcester Royal Porcelain Company (Limited), and continues to enjoy a high reputation; but from the collector's point of view only the porcelain made during the second half of the eighteenth century ranks as 'old china.'

That Worcester porcelain of this period should be much coveted by connoisseurs is not altogether surprising, as for decorative purposes it cannot be surpassed. The rich ground-colours, the delightful creaminess of the paste, the beautiful glaze, and above all the soft, tender hue of the exquisitely painted birds and flowers fill the eye of an artist with a sense of perfect satisfaction. A Chippendale cabinet or glazed corner-cupboard stocked with old 'scale-blue' is to the connoisseur a thing of beauty and a joy for ever, whilst even a few pieces dotted about a room impart an air of refinement that nothing else can give it. Keen competition for the possession of specimens of early Worcester has of late years led to an extraordinary rise in its value, and fabulous prices have at times been realised in the salerooms. To mention just a few examples of high values: A pair of covered vases, eleven and a quarter inches high, with square mark, decorated with exotic birds on scale-blue ground, realised six hundred and thirty pounds; whilst two cups and saucers bearing a similar mark sold for ninety-one pounds. A pair of nine-inch jardinières of the Wall period, decorated with exotic birds and flowers in white reserves, were knocked down for two hundred and thirty-one pounds; and a pair of two-handled cups, scale-blue, with birds and insects, for ninety pounds six shillings. A tea-pot and tea-poy in similar taste changed hands at one hundred and eighty-nine pounds, and a bowl for one hundred and fifty-two pounds five shillings. These are high values indeed; but with old china, owing to breakage and the absorption by museums and collectors, growing scarcer every day, the price may be expected to advance still further, and the acquisition of old Worcester will soon be beyond the pale of all but the very wealthy.

As could only be expected, the great value of old Worcester has excited the cupidity of the unscrupulous, and the market has of late been flooded with forgeries. These counterfeits come over from the Continent at frequent intervals by the crateful. With the exception, perhaps, of Chelsea figures, there is no old English china so much copied as

Worcester of the Wall period, and the 'scale-blue' variety in particular, the reproduction, with its forged fretted square mark, being often sufficiently clever to trap many an inexperienced collector. These spurious pieces, however, will not for a moment take in a connoisseur who has studied the little peculiarities of paste and glaze that attach to the early wares of Worcester. He knows at a glance, or even if he had not the use of his eyes could tell by the feel, whether the piece he holds is the genuine product of an eighteenth-century factory or a spurious imitation from Germany or France made quite recently. 'How does he know?' it may be asked. Why, because the genuine article is fashioned of 'soft' paste, whilst that of the imitation is 'hard.' For the benefit of the uninitiated it must be explained that china manufactured in the eighteenth century was of two kinds—namely, 'hard' paste or true porcelain, and 'soft' paste or artificial china. When the industry was in its infancy in England the potters were striving to produce porcelain such as had long been imported from China and Japan. In this they were at first unsuccessful, as the natural elements of which true china is composed were not available; but as the result of experiment they evolved a counterfeit presentment infinitely more beautiful than the model they sought to imitate. This 'soft' paste was of a delightful creamy texture which absorbed the enamel colours used for decorative purposes, and imparted to them a delicacy that has never since been equalled. Hard paste china, or true procelain, was first made in this country at Plymouth in 1768 by William Cookworthy, who had discovered china clay in Cornwall, and was subsequently manufactured at Bristol and New Hall.

As a hybrid but mechanically perfect body was almost universally adopted in the early days of the nineteenth century, and has continued in use down to the present time, the manufacture of porcelain recognised by connoisseurs as 'old china' terminated about the end of the eighteenth century, although Swansea and Nantgarw continued to produce an exquisite soft paste until the year 1824. Now, Plymouth, Bristol, and New Hall were the only English factories that ever made true or hard paste porcelain; consequently all the wares that took shape at Worcester during the eighteenth century belong to the 'soft' paste or artificial variety. As artificial porcelain is no longer manufactured, the Continental forger has perforce to make shift with such materials as are in everyday use in his country, so that those counterfeits of old Worcester with which the market is flooded are invariably fashioned of hard-paste china. Therein lies the collector's safeguard, for if he can differentiate between hard and soft paste he will know instantly if the piece he is handling is what it purports to be or whether it is merely an impudent forgery.

If one could always repair to the curio-shop armed with a file or knife it would no doubt simplify matters, but dealers are apt to look askance at problematical customers who desire to experiment on their wares. If a file be applied to a piece of soft-paste china at a place that is free from glaze it will make a distinct cut, but if the article be of hard paste the tool will not leave a mark. In a similar manner, soft paste can be scratched with the point of a knife-blade, but hard porcelain will successfully resist the steel. The expert collector, however, needs no such extraneous assistance, as his fingers and eyes will tell him all that he wishes to know. To a practised touch the peculiar soapy feel of soft paste is unmistakable, whilst much may be learnt from glaze and decoration. With but few exceptions, a soft lead-glaze was used upon the old soft porcelain, and it is consequently pretty safe to assume that if the glaze be soft the body of the piece is of the soft variety of paste. A soft glaze is readily scratched with the point of a knife-blade, but it is usually quite easy to ascertain the nature of the glaze by less drastic methods. If the piece be held at an angle to an artificial light the glaze if soft will often display a number of minute scratches, the result of being rubbed with a rough cloth when washed; whilst the insides of tea-cups, if the glaze be very soft, not infrequently bear traces of the spoon. These soft glazes, moreover, were porous, and the enamel colours used for decorative purposes, although applied over the glaze, sank through into the paste, leaving the surface quite smooth and as shiny as the rest of the piece. If one examines a piece of old Worcester it will be noticed that the glaze covers the whole like a very thin glass on a miniature. On a piece of hard-paste china, such as Bristol, the glaze wears a cold, glittering aspect, and the surface of the enamel decoration is comparatively dull, and, standing up above the glaze, can be felt with the finger. Another peculiarity noticeable in soft-paste porcelain is that the underglaze ground-colours had a tendency to run, and to cover this defect it was customary to add a gilt border to the panels or reserves. In very early pieces this gilt border had a beautiful matt surface, but later on the gold was usually burnished. By such little distinctions the connoisseur is able to differentiate between 'soft' and 'hard' paste porcelain, but in order to locate the particular factory from which the piece emanated he must look farther. I have in my small collection an exquisite cup and saucer of the Dr Wall period, and perhaps a detailed description of it may be of service to the comparatively inexperienced collector.

Both cup and saucer are large in size, and the latter unusually deep. The exact measurements of the cup are: diameter three and five-eighth inches, and depth two and five-eighth inches; the saucer is five and seven-eighth inches in diameter by two inches deep, and each piece has a scalloped edge. The outside of the saucer is without decoration, and the inside of the cup is also plain white save for an exquisitely painted moss-rose with leaves on the bottom. The ground-decoration on

the outside of the cup and the inside of the saucer is of the much-prized salmon-scale pattern executed in a glorious mazarine-blue. The scaling is regular, and the scales themselves are of a very dark blue, having almost a blackish tinge. The upper portion of the cup widens in a graceful bulge, and the pieces are thin and perfectly modelled. Near the edge of both cup and saucer is a narrow band of blue, which, like the ground-colour, is under the glaze. On either side of the cup is a large panel, the two being separated by smaller ones, and near the rim are others still smaller. In all there are ten reserves, each of which is decorated with flowers. In the larger panels are bunches of flowers, and in the smaller ones a single blossom or a leaf. The flowers are beautifully painted, the outline being lightly pencilled in brown. The colours chiefly employed in the decoration are a brickish red, canary-yellow, purple-lavender, apple-green, and heliotrope, and the tint in each case is exquisitely soft and tender. That it is the work of a master-brush there can be no question, the roses and tulips in particular being lovely beyond compare. Around the panels are gilt scrolls, the gold having the rich matt surface only seen on the older pieces, and the edge of both cup and saucer is also gilt. That this scroll-work was applied for purposes other than decorative is evident on close examination. Here and there the gilding has failed to quite cover the irregular edge of the blue ground-colour, which, as in all old soft-paste china, has sunk into the body and shown a tendency to run.

The saucer has a round reserve in the centre, with a moss-rose similar to that on the bottom of the cup. There are also three large reserves and nine smaller ones; and although the colour-scheme is similar to that of the cup, different flowers are represented. The paste has a soft, creamy appearance, and the glaze covers the whole piece like a very thin sheet of glass. The enamel colours have almost entirely sunk into the glaze, leaving the surface smooth to the touch, and the same sheen is apparent over the decoration as is on the rest of the piece. Viewed under a magnifying-glass, the glaze has much the same appearance as the gum on a postage-stamp, although of course it is much whiter and more glossy. The saucer, alas! has a tiny piece chipped out of the rim, and the paste looks dry and lump-sugary. Although rather harder than that of some artificial porcelains, the paste is readily scratched with a file or the point of a knife-blade, as also is the glaze. Held to a strong artificial light, the pieces are beautifully translucent and have the cool, green tinge which is peculiar to old Worcester china. An examination of the bottom of either piece reveals another characteristic of the early productions of the factory—to wit, a shrinkage of glaze near the rim or foot upon which it stands. Both cup and saucer bear the fretted square mark in a dark shade of blue under the glaze, whilst the cup in addition has an italic *W* rather faintly pencilled.

It will be noticed that in describing this cup and saucer I have left the factory mark until the very end, and I would advise the collector to do likewise when scrutinising a piece of old china with a view to purchase. Factory marks are easily forged; and, as the majority of counterfeit pieces bear such marks, the latter should only be used to confirm an opinion already formed as the result of a careful study of paste, glaze, and decoration. Above all, the beginner should not attempt to pick up pieces of 'scale-blue' in curio-shops for a few shillings. A cup and saucer such as I have described are worth to-day about twelve pounds, or if decorated with exotic birds or insects thirty-five pounds. Had the decoration been in figure-subjects after Watteau they would have been worth anything from one hundred and fifty pounds to two hundred pounds. Every dealer knows the value of such china, and if pieces are offered for fewer shillings than they are worth in pounds it may be taken for granted that they are not genuine. Only the other day I saw in a shop a large covered vase, with blue-scale ground decorated with exotic birds, priced at seven pounds ten shillings. On examination it proved to be clumsily made of *hard* paste, the scales of the groundwork being irregular and too light in shade, whilst the enamel colours of the decoration were dull and stood up above the glaze. The paste was of a blue-white instead of wearing a creamy aspect, and the glaze hard and glittering. The painting of the birds was crude and stiff, and the colours lacked the softness of the genuine article. It purported to be old Worcester of the Dr Wall period, and although it bore the fretted square mark it was nothing but an impudent forgery, probably of German origin. Had it been genuine Worcester it would probably have realised close upon four hundred pounds in the saleroom.

MOONRISE.

BELOVED! when the autumn leaves lay sere,
And rising mists told of the passing year,
We talked together while the moon rose high
And chased the darkness from the brooding sky;
Heart touching heart, hand clasped in hand,
We watched the moonbeams bathe the weary land.

Another year: and, lo! 'tis summer's reign;
Now, from the land where there is no more pain.
You see the silver lamp *beneath* you lie,
While I look *upward* to the distant sky.
Hand wrenched from hand, heart torn from heart,
We watch the moon rise—but we watch apart.

Yet *not* apart! Shall not this crescent fair
Be to our souls a ready messenger?
Since at the hour of twilight you and I
Still mark her progress through the purple sky.
Heart speaks to heart, hand is near hand,
Though I watch here—you in the Better Land.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

A HAPPY heart may meet the winter with some contentedness, perhaps even with a touch of joy from exhilaration at the prospect of such cold as will brace the body and the nerves, and of sittings by the warm fireside in communion with chosen friends such as are not so readily obtainable in the circumstances of other seasons. But when a people is disturbed, when the times are not good, there are gloomy forebodings upon the severity of the season that is to come, and it sometimes seems that instinct, aided by trifling observations, tells in advance of unusually hard trials by weather that are on the way. Animals and birds have this instinct of future weather, and there is no plain reason why something of the same gift should not be granted indiscriminately to the human race. Many people do know by certain peculiar effects upon the muscular and nervous systems when sharp changes in the weather conditions are about to take place within a few hours, as, for example, the forewarnings that are given to them that there is 'thunder in the air.' The presentiment might be less definite, more a matter of simple instinct; but might not some in the same way be given to feel a season ahead when there are bad times in store, and the instinct might be confirmed by the signs of the birds, the blackthorns, and the other recognised tellers? One recalls how in the last weeks preceding that most fateful of winters when Napoleon took his army to Moscow, whence only a tattered remnant of it returned, there was a very common presentiment in France that the season would be one of most exceptional severity, as it proved to be. That winter was feared in advance as few others have ever been, and terribly were the fears justified. And now it has seemed in recent weeks that there is some general apprehensions that the trials of wind and wet and cold to which we shall shortly be submitted may be harder to bear than we have known them for some years past. There were certain signs made so early as the beginning of September. Evidence was accumulated to show that some abnormal circumstances were affecting the autumn migrations of our birds. Thus it was noticed that the church steeples and the telegraph lines of a town in southern France were covered with young swallows on their way to Africa a fortnight or three weeks earlier than their usual time, and it appeared that they would be so much in advance of the state of readiness of their natural food-supply at their destination. It was said also that about the same time a flock of fieldfares was observed in a ploughed field near London. This interesting little member of the thrush family spends its summer-time in Scandinavia and nests there, and generally comes over to us about the middle or the end of October, departing again in the spring when it has donned a new nuptial dress. At the first consideration it might not seem to be anything against the prospects of our season that the fieldfare should come to us a month or six weeks before its time, but it is not easy to show that this is anything in their favour. But it is perhaps of some significance that as you move about you hear the people here and there, who have noticed none of these signs and know nothing of them, murmur with some look of anxiety and an apprehensive quiver of the limbs that this will be a hard winter. Then we are told that there is not, as it were, any obligation upon the seasons to make any balance with each other, and that consequently it does not in the least follow that a cold, wet summer, such as we lately experienced, should be followed by a winter a little warmer and brighter than the average. Sternly refusing all the offers of optimism, the prophets will have it that the reverse is the case, and that a certain amount of sympathy seems to be maintained between the summer and the winter. If this is so, then our situation is assuredly an unfortunate one. The general circumstances of the times have no doubt tended to produce a gloomy feeling in the minds of people concerning many matters of the future. A very

 [*All Rights Reserved.*]

unusual state of things in politics, the aggression of Socialism, the questions of taxation, the high tension of international rivalries, the state of trade, the want of confidence in the country, and perhaps one might add the recent revelations concerning the extent to which overbuilding has been carried on in some large cities (having the likely effect of restricting building operations in the near future), all tend to create a state of nervousness, and to cause the public pulse to beat irregularly. A man of high business capacity and consequence, a shrewd judge of affairs and tendencies, lately declared that all his calculations and reasonings made it clear to him that the question of unemployment would be a harder and more sorrowful one to grapple with in this coming winter than any now living have known it to be. These are not cheerful contemplations; they are not appetising food for thought as one pulls the chair up to the fireside for the first time in the autumn. There may, however, be some small comfort in the idea that the rigours of winter have probably a less untoward effect upon the general health than they had in former times, thanks to modern means and systems. We are satisfied as to the best methods of combat against the cold and wet, and we may be thankful that we are not in the same case with Lord Chesterfield, who, writing to his son in the early days of 1766, complaining that he hardly remembered so severe a winter, and that it had occasioned much illness in London, added: 'I am sure it pinched my crazy carcass so much that about three weeks ago I was obliged to be let blood twice in four days; which I found afterwards was very necessary by the relief it gave to my head and to the rheumatic pains in my limbs, and from the execrable kind of blood which I lost.'

* * *

And with it all we are promised that there shall be a General Election in the middle of the winter, and this is an affair that in these days is in itself neither remunerative to the people nor a means of any such considerable entertainment as was once the case. It is indeed inevitable and well recognised that with the serious interference to trade most of the community must be losers in the pecuniary sense through the process of electing a new House of Commons; and while there may be a little pleasing sense of excitement during the early days, the monotony of it asserts itself in the second or third weeks, and the average reader of newspapers is relieved when at last the counties and the northmost islands are done with, and the printed sheet in the morning gives him some news of the outer world in place of columns of names and figures. The fact is that elections and electioneering in this present stage of constitutional history are such highly organised and such exactly regulated procedures, with so much stage-management from invisible party-headquarters, that there is no longer room for great displays of personal enterprise. The romance of electioneering has departed; there is now no sporting side to it. In the interests of the community this is no doubt just as it should be; but there will be some voters to deplore that 'the General' is not such an entertaining thing as it was in those excellent days before the ballot was established. It is now more than a hundred years since there took place in the county of York that most famous of all elections upon which half a million of money was squandered by the three candidates, Wilberforce, Lord Milton, and the Hon. H. Lascelles. The 'Austerlitz of electioneering' it was called. Wilberforce knew how to do those things, according to the circumstances of his time, for as a young man, only just of age, he successfully contested a seat for Hull at a cost to himself of between eight and nine thousand pounds. He said that according to old custom the single vote of a resident elector was rewarded with a donation of two guineas; four were paid for a plumper, and the expenses of a freeman's journey from London averaged ten pounds apiece. It was held that the letter of the law was not broken, as the money was not paid until the last day on which election petitions could be presented! In the case of the 'Austerlitz' of political warfare, the high sheriff decided at the hustings in favour of Lord Milton and the Hon. H. Lascelles—there were two seats; whereupon Wilberforce demanded a poll, and a public fund that was started to defray his expenses yielded sixty-four thousand pounds within a week. The poll was taken at thirteen booths in York Castle yard, and at first it went heavily against Wilberforce, whose opponents had secured every mode of conveyance in the locality, even (so it was said) to mourning-coaches. But during the fifteen days that the election proceeded voters were coming in all the time from the remote parts of the county to record their support for him. It was related in a letter from Hull that no carriages were to be procured there, but that boats were proceeding up the river heavily laden with voters, that farmers were lending their wagons, that even donkeys had the honour of carrying voters to York for Wilberforce, and that hundreds were proceeding on foot. Nothing since the days of the Revolution, said one observer, had presented to the world such a scene as this great county did during the period of this election. Repose or rest was unknown, except it was seen in a messenger asleep upon his post-horse or in his carriage. 'Every day the roads in every direction to and from every remote part of the county have been covered with vehicles loaded with voters; and barouches, curricles, gigs, flying wagons, and military cars with eight horses, crowded sometimes with forty voters, have been scouring the country, leaving not the slightest chance for the quiet traveller to urge his humble journey or find a chair at an inn to sit down upon.' Wilberforce was elected. Compare this with the sweet tranquillity which once upon a time used to characterise Mr

Labouchere's appeals to his constituents at Northampton, as piquantly described by himself. 'It is simplicity itself,' he said. 'I go down to Northampton and stay two days, making a speech and an apology. I say, "Gentlemen, I think you ought to elect a Tory this time;" but they elect me, and that ends the matter. Next day, before leaving the town, I apologise for having troubled them so much. "No, no!" they declare. "Yes, yes!" I reply, and, lighting a fresh cigarette, drive back to the station.'

* * *

With the bringing about of the present state of politics Lord Rosebery has clearly been concerned, and in a certain measure he came to be regarded as the man of the latter part of the parliamentary season. It goes without saying that there is no other man alive to-day a speech from whom on the political situation attracts more attention than does one by Lord Rosebery, and it would have been said that no other living statesman would command nearly so much attention were it not that there is still Mr Joseph Chamberlain to think of. It may be, of course, that the Rosebery orations are appreciated the more because of their scarcity, and possibly if they were made twice a week or nightly at Westminster, instead of something like triennially as at present, the people would regard them with that familiarity which soon would dull their liking for them. The position of this ex-Prime Minister is as curious as it is interesting. It might be difficult to justify it so easily as is done to-day if the party system in the State were so carefully ordered and exactly established as it was in the days before a Home Rule Bill was first introduced. But parties have fallen into a strange state of disarrangement since then, and so many issues of prime importance have been adopted upon which politicians have considered that they must separate from each other that it is now clearly difficult for one man to attach himself to any particular party and subscribe faithfully to all its tenets without some varying sacrifice of conscience. There is, then, something in the way of a general impression that there is less sincerity in high politics now than ever before; and in such circumstances it may not be difficult to justify the position of the independent free-lance who comes out to speak with authority on such pregnant occasions as seem to him to be suitable, albeit it may be objected that there is, after all, small value in such service when it is rendered so infrequently, and the faithful party-men are not unnaturally irritated at what they regard as the interferences of an irresponsible meddler who seeks to destroy the work of others yet will not work himself. The elder Pitt once wrote a letter in which he stated a case for himself in much the same way that Lord Rosebery would state his, and indeed has done. Said Pitt in 1764: 'As for my single self, I purpose to continue acting through life upon the best convictions I am able to form, and under the obligation of principles, not by the force of any particular bargains. . . . Whatever I think it my duty to oppose or promote I shall do it independent of the sentiments of others. . . . I have little thought of beginning the world again upon a new centre of union. . . . I have no disposition to quit the free condition of a man standing single and daring to appeal to his country at large upon the soundness of his principles and the rectitude of his conduct.' And for himself, Lord Rosebery once said on one noteworthy occasion that he believed there is a useful and uncoveted place in the commonwealth for one who, having held high office, and having no desire to hold it again, could speak his mind with entire independence. Probably at no time was there a better justification than at present for that voice which rises above party, and speaks to the distracted nation, harassed as hardly ever before in living memory by doubts and difficulties of the first magnitude, as its independent counsellor. He has been not inappropriately described as the Member for Britain. Some years ago a very celebrated journalist declared that the result of his study and analysis of the letters which were received daily at his office—that of a great London daily newspaper—convinced him that there was only one thing in English political life which really interested the public, and that was the political future of Lord Rosebery. It would now appear that that future is in a large measure determined, and that there is to be no further tenure of high office, nothing but occasional independent interference with this party or with that as the circumstances seem to call for it and the public ask for it; unless there should be some gigantic upheaval in the present party system resulting in a new arrangement with the sections more clearly separated. The times seem to be moving towards the establishment in some form of a middle-class and anti-Socialist party.

* * *

Quite one of the chief and most interesting books of the serious order published during the autumn season is that in which Mr Roger Ingpen has collected all the available letters of the poet Shelley. It is a work that should have been accomplished before now; but there is satisfaction to be found in the circumstance that the compiler has done his work very well; and though many of the letters have been published before, they are now carefully arranged, and the collection does include a large number to which publicity had not previously been given. One suspects that almost any well-done work dealing with this ill-fated genius of the beginning of the last century would be well received by the reading public, as in an age when convention counts for too much are most tales concerning self-willed people of note who cared nothing for convention or for public opinion. Shelley had lived a great deal in that short life of his which terminated by his being drowned before he was thirty years of age. Deeply interesting are these letters for the things that are said in them

and the views they give us of the writer; but they are not very remarkable after all for form of words, and any one who picks up this volume with the idea that here in prose he will see something of the magnificent, the inspired Shelley, as he is known in verse, must be disappointed. They merely tend to show that he was the born poet, and not much besides. It is a matter of common knowledge that in the earlier part of his manhood, when he had a not very considerable income and was constantly moving about from place to place, he was often in very straitened circumstances and resorted to various means of raising money through the medium of his friends and acquaintances. From his landlady at Lynmouth he borrowed thirty pounds, which it appears he did not pay back all at once; and then, again, his landlord at Tanyrallt was asked by him if he would very kindly help him to obtain a loan of twenty-five pounds. 'I shall know by your compliance with this request,' said the poet, 'whether the absence of friends is a cooler for friendship or not.' Shelley was grateful for the landlord's endeavour to obtain the money for him, and in a subsequent letter he said: 'I did not desire the request as a test of your goodness, and if I said so it was more the dictate of our extreme distress than any doubt I entertained of you. I have received a very dictatorial and unpleasant letter from Mr Bedwell, which I have answered in an unbending spirit. He is a friendly and well-meaning man; but I must not be treated as a schoolboy. I told him in my letter that I pay friendship with friendship, and money with money.' In another letter of about the same time Shelley tells an unknown correspondent that he has drawn upon him for the sum of thirty pounds; and 'I have to request,' he says, 'that you would not return it, as the consequences would be our being driven from our lodgings.' And though he once asked Horace Smith (of 'The Rejected Addresses') to lend him three hundred or four hundred pounds, he had to lament that that gentleman 'has lately declined to advance me six or seven napoleons for a musical instrument which I wished to buy for Jane at Paris; nor have I any other friend to whom I could apply.' However, there is nothing very new in the idea of a poet of any age being short of money; and, enthusiastic as we may be a hundred years after his time about the beauty of Shelley's verse, it is not at all certain that he would have found life much easier if he had lived in the present time. Only the other day did we hear of a most melancholy crisis in the affairs of a young poet and dramatist about whose talents and productions it was quite the fashion to rave in West End drawing-rooms a matter of four or five years ago. Some of Shelley's letters upon things observed and his philosophical thoughts are most interesting. 'I now understand,' he says, 'why the Greeks were such great poets; and, above all, I can account, it seems to me, for the harmony, the unity, the perfection, the uniform excellence of all their works of art. They lived in a perpetual commerce with external nature and nourished themselves upon the spirit of its forms. Their theatres were all open to the mountains, the sky; their columns, the ideal types of a sacred forest, with its roof of interwoven tracery, admitted the light and wind; the odours and the freshness of the country permeated the cities; their temples were mostly Apaithric, and the flying clouds, the stars in the deep sky were seen above. Oh, but for that series of wretched wars which terminated in the Roman conquest of the world; but for the Christian religion, which put the finishing-stroke on the ancient system; but for those changes which conducted Athens to its ruin—to what an eminence might not humanity have arrived!' His notes upon individualism which are contained in another letter may be read with peculiar interest. 'Rulers have called the private man,' he wrote, 'the property of the State, meaning generally by the State themselves; that the many have been immolated to the few, and have even believed that this was their highest distinction. These views cannot be too earnestly withstood. Nothing seems to one so needful as to give to the mind the consciousness—which Governments have done so much to suppress—of its own separate work. Let the individual feel that he is placed in the community not to part with his individuality or to become a tool. To me the progress of society consists in nothing more than in bringing out the individual, in giving him a consciousness of his own being, and in quickening him to strengthen and elevate the mind.'

THE TUTOR OF TYNDRACH.

CHAPTER V.

As soon as breakfast was over Ann escaped to her own room, the case containing Lord Repton's wedding gift hugged closely in her arms, his letter crushed in her hand.

So he had not forgotten her! Even amidst the brilliant fortune that had come to him he had remembered the humble episode in which she had taken part.

Lord Repton! How well the title suited him! previous conception of him—the air of quiet retire ment and exclusiveness that had characterised him and marked him out from all other men she had known! Now that Malcolm's happiness was assured she felt it was legitimate for her to indulge herself for a brief period with thoughts of this other man, the mere remembrance of whom had previously seemed an act of disloyalty.

But by degrees her reflections became tinged with sadness. A sense of partition assailed her. This elevation in rank was all very romantic and idyllic; but even as far as her thoughts of him were concerned it put him out of her reach altogether. In the future she would always have to picture him moving in some exalted sphere, with whose happenings she was utterly unacquainted. As long as he had been the tutor of Tyndrach there was a certain mutuality of interest between them. As Lord Repton he belonged to another world than hers.

Not that there was any hint of such a difference in his letter. On the contrary, its tone seemed to imply a closer intimacy between them than had existed even in her imagination. She drew it out of its envelope once more, her eyes dwelling earnestly on every word.

'Repton Royal, Berks.

'Dear Miss Graham,—Your marriage-day must be very near now. Will you accept the accompanying little gift in memory of our brief friendship, to which I owe so much?

'Our conversation on the lake that Sunday gave a fresh impetus to my life—just in the nick of time, too. As you will see from my signature, I have succeeded my cousin, Lord Repton, who died last month. The title brings a great burden of responsibility, but I have resolved to try to make something of my new opportunities. If I succeed I shall have you to thank.—Yours sincerely, Repton.'

Ann's eyes glowed as the full significance of the tribute came home to her. If nothing else good ever happened to her, these words from such a man would have made life worth living.

She would write at once and thank him for them, and for the wedding gift, which of course must be returned immediately.

Before settling down to her correspondence she opened the case and took another look at the costly little symbol of his remembrance. As she did so the true connection between the gift and the letter came home to her. Would he have written thus freely on any other occasion but her marriage? Would he even have allowed himself to think of her in the light of an inspiring influence unless he had also regarded the incident as closed—part of a past that could never be revived? He had permitted himself the indulgence of the retrospect, believing that for both of them a new life was commencing, a life which must inevitably lead them farther and farther apart.

What, then, would his feeling be when he heard of her broken engagement? Would there be a fear that he had committed himself in any way? The idea brought the hot colour surging to her face. No, not if she could help it. Her letter must contain no hint or acknowledgment of the precious tribute contained in his. Treasure it secretly as she might, no one must ever know—he least of all—the joy it had brought her.

It was an almost uncanny prescience that had led her to this conclusion, perhaps exaggerated, perhaps altogether without foundation. But Ann had matured from a child into a woman during these last months, and the worldly experience she lacked was made up for by sheer force of feeling. So, taking up her pen, she wrote as follows:

'Dear Lord Repton,—Many thanks for your beautiful present, which I am returning, as my engagement has been broken off.—Yours sincerely,

'Ann Graham.'

Rather different from the letter she would have written, but at all events her self-respect was preserved. Let him think her cold, ungrateful, unresponsive, if he would.

After that life became easier for both the inmates of the manse. Now that the ice was broken and Malcolm's name could be freely mentioned again, the barrier of constraint that had existed between them since his departure melted away.

Ann had written a warm letter of congratulation to her cousin, and received a chilling and distant reply from him, significantly extolling all those virtues and good qualities of his fiancée in which he had considered Ann lacking.

But, though she had read between the lines, the girl felt no resentment in consequence. She was only relieved and thankful that Malcolm had found some one who would be able to supply him with the amount of homage and veneration he seemed to think was his due, and hoped devoutly that no change of mind on Miss Traquair's part would rob him of his promised satisfaction.

In order to consolidate the engagement, she persuaded her uncle to invite Miss Traquair on a visit to Inchie, and in due course the invitation was accepted.

Ann was resolved to do all in her power to make the visit a happy one. It seemed to her tender conscience that she still owed her cousin a certain reparation, and would never rest content till she had fulfilled it.

Ten days or more had gone by since she had returned Lord Repton's present, and no further communication from him had reached her. Not that she had expected it. Her common-sense told her that the incident was closed; her pride forbade her to think of him except as a friend of the past, one who would never cross her path again. But the memory was something to be thankful for, and Ann never tried to discount the important part he had played in her life.

Miss Traquair's luggage was to arrive the day before she herself, and late in the afternoon Ann ordered out the gig to drive to the station and fetch it. She had allowed herself two hours for the long drive across the moors, but found when the railway gates came in view that she had almost half-an-hour to spare.

But she did not grudge the time. There was

always something of interest for her in the arrival and departure of trains, and the English express would be in, she knew, before the Highland train that was to bring Miss Traquair's luggage. Thrusting her hands deep into the pockets of her tweed coat, she walked briskly up and down the platform. It was a keen, cold evening, and the drive had chilled her. The little station was deserted, save for herself, an isolated speck of civilisation in the midst of the wide strath, connected only by those two mysterious parallel lines of rail with the great world.

Presently a ticking noise in the office warned her that the express was signalled, and almost automatically the old station-master and his one assistant appeared on the platform.

'I saw the gig, so I kenned you'd be here,' said the old man, accosting Ann with the familiarity of long acquaintance. 'You'll be waiting for the north train?'

'Yes, for luggage,' said Ann. 'Miss Traquair is coming to-morrow, you know.'

His face wrinkled up in an expression of contempt.

'Now, indeed, Duncan, she is very nice,' protested the girl, laughing. 'I have seen her photograph.'

'Hoots! dinna fash aboot a photo,' he returned caustically. 'Can a photo tell ye whether she has a pin-leg or a glass eye? Na, na; when I wants tae judge o' a wumman I comes near her and then I sees for mysel'. But, losh, here's the express! Stand back!' waving Ann authoritatively aside as the train appeared, smooth and snake-like, at the end of the long, straight vista of rails. The porter had seized the bell and was clanging it vociferously.

Ann felt a little thrill of excitement as she stepped obediently back a pace. There would probably be no passengers for Inchie; but she liked to watch the strange, huddled figures behind the windows of the compartments, with their rugs and their newspapers.

In another moment the train had pulled silently up. One solitary passenger alighted. Ann gave a gasp of surprise as she watched him stepping cool and unconcerned out of a first-class compartment, his rug over his arm. All the colour left her face. The world seemed to be swinging round; the very ground beneath her was rocking.

But now he had caught sight of her. 'You!' he said incredulously, almost rudely. Some of the colour had deserted his face too.

'You!' echoed Ann.

For some moments they stood transfixed, staring at each other—the girl, slight and boyish, with the blue cap matching the colour of her eyes thrust carelessly on to her raven hair; the man in his long travelling-coat, with his thin, lined face, and the curious mingling of pleasure and vexation in his eyes.

Lord Repton was the first to recover himself.

'Forgive my abominable rudeness,' he said. 'Just for a moment I wondered whether you could have come down to meet me'— He broke off with a laugh. 'Such fortunate coincidences don't often come in my way, you see.'

Ann drew back haughtily.

'I was waiting for the Highland train,' she said. 'I have come to fetch some luggage.'

'Luggage? That reminds me,' he returned with a laugh, 'I have a bag somewhere,' glancing about him as he spoke.

The porter was coming towards him with a large kit-bag on his shoulder. He signed to him to deposit it on the platform.

'May I wait with you for the other train?' he said, turning quickly to Ann.

'If you like,' she replied in a cold, lifeless tone, though her heart was beating wildly at the prospect.

The train had disappeared by this time, and they were alone in the little station. Instinctively Ann turned and began pacing up and down. Lord Repton fell into step beside her.

'So your engagement was broken off?' he began at last. 'I confess I was not surprised. But I wish you had kept my little remembrance. It was meant more as a memento of our friendship than as a wedding gift. The wedding only gave me the opportunity I sought.'

'You are very kind,' said Ann, still in the same calm, cold voice; 'but I could not have kept it.'

'And my letter? I hope you did not consider that very presumptuous,' he went on.

Ann drew in her breath sharply. She could feel the letter crumple against her heart as she did so.

'No,' she replied and stopped. She could not trust herself to tell him what the letter had meant to her.

'You see, you took no notice of anything I had said when you wrote,' he went on hurriedly. 'I felt horribly snubbed.'

Again Ann drew in her breath. It was becoming more and more difficult not to speak, yet her pride withheld her.

'I am keeping you,' she said suddenly, turning to him. 'Why should you wait?'

He closed his lips resolutely.

'I am waiting to please myself and because there is nothing to take me away.'

Ann accepted his last words literally.

'No; no carriage has come for you,' she said. 'But I can give you a lift; the gig is here.'

He interrupted her with a laugh, partly of amusement, partly of vexation.

'I did not mean that there was nothing to take me away in the material sense,' he said, 'though that is true too. I was trusting to good fortune to get a lift; failing that, I meant to walk to the village.'

'To the village!' echoed Ann in genuine amazement.

'Yes, the village,' he returned grimly. 'Perhaps you can direct me to a room. If you will search the heart of my mystery, I have come north to

consult with your uncle about more local lore for the book.'

Ann's eyes were shining with pleasure as she turned to him.

'So you haven't forgotten?' she said. 'I thought—I thought when'—— and she broke off in confusion.

'When I was elevated to the peerage I would forget all my old friends,' he concluded for her. 'Well, you were wrong. You will be astonished some day to find out how incorrect your estimate of my character was—some day. Why not now? Ann, Ann'—bringing her to a standstill as he spoke—'it is you who have brought me back. I wanted to see my future in you.'

The clear northern twilight seemed to have got into Ann's eyes as she gazed back at him, so vividly blue and brilliant were they.

'That is my real reason for coming, Ann,' he went on rapidly, tenderly. 'The book was an excuse. It is you I want.'

THE END.

PIONEERS OF THE MODERN SUFFRAGETTE.

By T. H. S. Escott.

To have seen in the flesh the seventeenth-century forerunner of our latter-day Suffragettes may sound an impossibility, but may—after a fashion presently to be shown—be claimed as the actual experience of the present writer. It happened in this way. At a country-house gathering some years ago, during a spell of exceptionally bad weather, a clever and vivacious young lady suggested relieving the monotony of long imprisonment indoors by what she called 'a game of living portraits.' From the old walls on every side there looked down upon the company the painted figures of former masters and mistresses of the house in which we were staying. The idea now started was for members of the party to dress themselves up as nearly as possible like the more famous among the originals depicted by early English and foreign masters on the canvases for which the place was famous. It remained for the particular guest from whom the suggestion had come to reproduce in her own person our host's most distinguished ancestress.

Having withdrawn to arrange her get-up, she presently reappeared in a gorgeous habit of the late Tudor or the early Stuart period. Her face, in form inclining, as it did, to square rather than oval, naturally adapted itself to the shape of the dress she had donned: a bodice square, rather high cut, scorning anything in the nature of gentle curves, sat with rectangular closeness upon her shoulders and round her waist. Almost square, too, seemed the head-dress, mounted with a straight row of pearls, beneath which the hair, disposed in a series of tight little curls, formed a sort of frame for a face whose natural features, strongly marked, had been artistically screwed up into an expression comically suggestive of the grimmest feminine determination. The costume and manner, it had been thought, would generally proclaim the picture of which the human imitation was attempted. If not, the living portrait might help the company to a good guess by speaking a few words in character.

'Ladies all,' said the figure, addressing an imaginary audience of seventeenth-century peeresses, 'you know my motto hath always been "Maintain your loyalty and uphold your rights." I put it to you whether that loyalty requireth me to resign my prerogative of nominating a member for my borough of Appleby to the king or to his sheriff. Known also it is to every one that the most ancient custom of this realm hath ever been to see no difference between the sexes, so long as the manor-holder, man or woman, did provide men and arms for the king's wars. This have I never failed to do. Moreover, my trusty sword in my weak woman's hand held my castles against the usurper Cromwell, in the service of the prince who, then in exile, is seated to-day on his father's throne. When, however, king's court officer or king's sheriff would rob me of my share in nominating a proper person to the High Court of Parliament, I will surrender to no threats that which, by right of birth, is mine. Herein I shape my conduct by the royal pattern itself; for, before my time, between the years 1553 and 1558, was it first declared by statute that, in respect of authority, it mattereth not whether the royal majesty be incorporate in king or queen.'

Some of us who heard this little piece of closely woven and clearly spoken argument may have dipped into the family papers in our host's muniment-room, or have read them in the reports of the Historical Manuscripts Commission. At any rate, no one who had seen the portrait now embodied in living form, and pungently articulate before us, could any longer doubt the speaker to be the British Hippolyta of her epoch, and so the earliest progenitress of Parliament's petticoated invaders. In real life the lady now referred to was Anne Clifford (1590–1676), Countess of Pembroke, Dorset, and Montgomery. This exemplar and prototype for all time of matronly or maidenly self-assertiveness, besides founding the Women's Rights movement, caused power and wealth to flow towards those of her blood and name. By the marriages into various noble families which she arranged for her daughters, she secured for her House a social and political connection scarcely less far-

stretching and powerful than that which matches of a like character had already gained for the medieval Nevilles. Petticoated champions of the 'suppressed sex' who may have lived and fought before this consummate countess are scarcely more than names. All one knows about them is that they were free women of high degree—peeresses, sometimes of the temporal and sometimes of the spiritual sort. Anne Clifford, however, had found out enough about the lives to profit from the examples of more or less masterful English women belonging to a still earlier age. The earliest precursor of the Bodichons, Boucheretts, and Beckers of a later age, she might also have made herself the first of feminine pamphleteers. As it was, she left behind her some memoranda concerning the women's emancipation movement which she originated. These jottings are likely to remain unpublished. I have been permitted to read them in manuscript. They contain in outline suggestions for a history of the gradual progress of the sex from servitude to independence. To confirm and extend this advance seemed to the great countess the special mission of the Anglo-Saxon race.

Britain's Roman conquerors, she writes, recognised the duty of protecting women; they performed it by absorbing the weaker sex in the stronger. 'For myself,' she adds, 'I desire but to regain for my order the powers and privileges which our ancestral free women, the abbesses and peeresses of this realm, held without challenge from 871–1485. Then came the Reformation; women ceased to be educated, and politically began to be feeble. Till they once more acquire learning they will in vain try to strengthen themselves for liberty. That they may do this is the task I bequeath to those leaders of my sex who may come after me.'

When Anne Clifford died, in 1676, the next championess of the cause she had made her own was still a child. Mary Astell carried on the work precisely from the point where Anne Clifford had left it, and upon lines she had indicated. This little excursion into ancient history is necessary because it was not Mary Astell's new educational organisation for her sex that chiefly promoted the real object she had at heart. Her common-sense, ready wit, and sound judgment for the first time in modern history caused men so intellectually distinguished as Atterbury and Swift seriously to notice the subject. Nothing came of her plans for giving her sex a better equipment of literary learning and mental discipline. Born out of due time, she engaged in an enterprise which formed a presage of what a later generation was to see. She tried, in fact, by rather more than a century and a half to anticipate the Girtons or the Somervilles or the Lady Margaret Halls of the Victorian era. Mary Astell's project of educational reform for her sex was set forth in the essentially modern *Serious Proposal to Ladies.*

Without difference of station or age, she invited her countrywomen to co-operate with her in 'expelling the cloud of ignorance in which custom has involved us. Let us, therefore, furnish our minds with solid and useful knowledge, so that the souls of women may no longer be the only unadorned and neglected things.' Then, passing to details, she admonished her sisters against the essentially feminine vice of 'skimming.' Good books, she added—and such were alone worth notice—must be understood and digested. Miss Astell may have had a prophetic vision of twentieth-century ladies as senior classics and senior wranglers; at least she speaks regretfully of the days when Plato, Aristotle, and others, in the original Greek, were the ornaments of boudoirs.

'To her is due whatever degree of sense may have appeared in the family, or whatever wealth is likely to remain in it.' So Thomas Fitzmaurice, first Earl of Kerry, and afterwards first Earl of Shelburne, is represented as saying of his wife. This was Anne Petty, daughter of the accomplished man of science and statistics, Sir William Petty, and maternal granddaughter of the Parliamentary General Sir Hardress Waller. The work done and the views ventilated by the ladies who lived between William III. and George III. show that the feminine education-reformers of our own day have been less original than is sometimes supposed. It remained for the future Lady Shelburne to insist upon carrying out the undertaking in regard to which Mary Astell had shown herself in advance of her age. There was no sentimental or Quakeress allegation of grievance on the part of those who acted as the pioneers of the feminine emancipation movement. Anne Petty's championship mainly formed an appeal to the common-sense of her sex. 'You want,' she said to her followers, 'a share of those privileges or rights now monopolised by men. Well, then, your first duty is, in respect of attainments and usefulness to the body politic, to demonstrate your equality with men; and I will show you how.'

Nothing could have been more business-like than the object-lesson taught by this social Amazon. Anne Petty was known by her family as a born accountant and arithmetician. She had always shown herself a ready-reckoner who could not only tell off-hand the aggregate cost of maintaining a household for a week, a month, a year; but who knew to a nicety the expense represented by every member of it per day, or even per hour. 'These,' she said, 'are the acquirements worthy of our sex; and, believe me, they become a young woman of quality better than silks or ribbons; they will, as it has been put by my husband [then Earl of Kerry], keep her warmer than a d—d expensive manteau.'

Many franchise reforms had been introduced or drafted by Lord Shelburne's friend and chief, William Pitt. Some of these measures, if carried, might have developed into something not far short of universal suffrage. As a fact, Shelburne never

contemplated anything of the sort. Influenced by his wife, *née* Anne Petty, he may, like his successors in Conservative leadership, from Disraeli and Lord Salisbury to Mr Balfour, have denied the existence of any constitutional reason for politically disfranchising the payers of rates and taxes who happened to be women. Nor, as a fact, were they formally disfranchised by statute till the 1832 Reform Act bestowed the vote expressly not on persons but on men.

Some ten years before the 1832 legislation stimulated and politically organised the movement, the moral and spiritual forces which informed it were being generated in an upper room in West Central London. Here, at least once a week, were gathered together philosophers, politicians, publicists of both sexes, varying in their degrees of conviction, celebrity, enthusiasm, but united by a common resolution of finding new careers for women. At 142 Strand, the house of Mr and Mrs Chapman, was born not only the *Westminster Review*, but the Women's Rights movement as a modern socio-political cult. Here were forged the intellectual weapons which her nineteenth-century trainers in the feminine warfare first taught Hippolyta to use with effect.

Amongst the Strand company was a gentleman connected by ties of personal friendship, rather than of political sympathy, with its leading members. This was my friend the late Licenser of Plays, E. F. S. Pigott. Here, to quote Pigott's words, never before published, George Eliot, then Miss Evans, told the militant stateswomen, who really seemed ready to march on Westminster, first to establish their position by brain-power.

In the movement's earlier stages the arch-emancipators were drawn from the still obscure and feeble section grouped together in clubs and drawing-rooms as Liberals, Dissenters, Vegetarians, and other uncomfortable people. During the nineteenth century's first half, Hippolyta, in her designs on the Parliament House, found her natural allies in Richard Cobden, C. P. Villiers, in the staff, as in the rank and file, of the Free Trade army. Concerning the recognised lady-leaders of our time, known as they are to every newspaper reader, nothing need here be said. The eighteenth-century Mary Astell has already been described only as a little before her time in devising a complete intellectual equipment for her sex before the actual joining of the battle.

Some hundred and fifty years after its first promulgation, the Astell project was to be translated into fact by Mrs Emily Davies and Madame Bodichon, the real, if not always the most celebrated, founders of Girton College. In the tenth year of Girton's existence, Hippolyta, after a long course of snubbing by the smart society of her time, suddenly found herself its pet. Some of her literary sisters of the eighteenth century, such as Mrs Barbauld, Hannah More, Mrs Marcet, and Mrs Trimmer, had made themselves names honoured and popular in English households. The moral and improving authoress had done more than any of the political Amazons towards predisposing the ruling caste to a favourable consideration of the feminine demand for political equality. The peeresses, by their assaults under the Duchess of Queensberry on the Upper House in 1738, had triumphantly secured a gallery of their own; in doing so, they had made themselves fashionable heroines. The Suffragettes of our own time can thus claim that they did but modernise the aggressive tactics of the very grandest among the titled ladies who dominated the Georgian era. But then, as has been the case in our own time, no parade of force or noise of battle was to accompany the most real and lasting of the feminine victories.

Of those allies belonging to her own sex whom Hippolyta, since she has gone so furiously into politics, may perhaps be disposed to ignore or forget, something will presently be said. Here it may be noticed that the forces of which the purely political Hippolyta, in her latest development, is the product were first put into motion beneath a roof in South Kensington which has a better claim than any other to be considered the Primrose League's birthplace. Originally a strong Liberal and Gladstonian, the late Sir W. T. Marriott, having in the early eighties discovered women to be naturally Conservative, suggested turning this phenomenon to account for the good of the party then in opposition. In Lady Marriott's drawing-room was unfolded, by the master of the house, the cleverly devised appeal to the constitutional instinct and decorative taste of the ladies which has resulted in the Primrose League.

For the first time Hippolyta now learned the full extent of her real power. She could not only influence the votes at Westminster of those composing the legislature; she could make and unmake the Cabinets by which that legislature was controlled. Here was one of those surprises that make politics as amusing as bridge. At the same time other things had conspired to transfer the ladies' parliamentary championship from one party to the other. Mrs Lynn Linton the novelist had been from early days the late Marchioness of Salisbury's friend. Both these ladies had written pretty regularly for the *Saturday Review* under its first editor, John Douglas Cook. To the peeress, indeed, had been attributed an article much talked of at the time, 'The Girl of the Period.' It was, of course, from the pen of Mrs Lynn Linton, to be followed by 'The Shrieking Sisterhood' and other like compositions, in which she seemed to proclaim internecine war against the more publicly ambitious of her sex. In her more serious work, however, there were not wanting opinions and incidents that suggested deep, if quiet, sympathy with the true objects that she believed might animate some of the Amazons, even when they seemed to her a little too impetuously in evidence. Mrs Lynn Linton also occasionally met a shy, sedate, generally taciturn

little gentleman—no other, in fact, than Francis W. Newman, the Cardinal's brother.

Never did Hippolyta find in the opposite sex so indefatigable an advocate as the ex-Fellow of Balliol. He it really was who pulled the labouring oar in the feminine cause, who lectured, organised, agitated, while John Stuart Mill was writing on logic and political economy in his study. His acquaintance with Mrs Lynn Linton began, not, as has sometimes been said, at any literary or intellectual reunion in a London drawing-room, but in a chance-meeting on Clifton Downs. Newman's short-sight was of the kind that did not, as that variety of vision is sometimes supposed to do, make his eyes clearer and stronger with advancing years. He had made a false step rather dangerously near the St Vincent rocks. The lady who wrote 'The Girl of the Period' and 'The Shrieking Sisterhood' was standing near, and literally stretched out a helping hand.

The dialogues on the suppressed sex, their past, present, and future, that followed between the two really contained material for a treatise on the Women's Rights question. At any rate, the lady Saturday Reviewer received during the colloquies some misgivings as to the part she had thus far played with her pen. She did not, however, make any formal recantation of the language used by her about the pushfulness of the noisier among the political agitatresses of her time.

Mrs Linton, long before she became a friend of Lady Salisbury, had often met the great Lord Brougham. About him she had some capital stories, one so good that it may be told here. His first wife had been a Mrs Spalding; Mr Spalding's portrait always hung in the dining-room. 'My dear Jack,' Brougham was once overheard to address that picture, 'what reason I have to regret your sad loss!' Moreover, towards the close of her *Saturday Review* connection Mrs Lynn Linton made the acquaintance of Miss Becker, to whom, while yet personally ignorant of her, she had sometimes referred in uncomplimentary terms; she was, therefore, rather surprised to find so little of the harshly militant Amazon about this lady in real life. Instead, she saw a highly cultivated woman, full of the best and most delicate feminine susceptibilities, intelligently interested in art and science, as well as constantly giving to her belligerent sisters sound advice as neatly worded as could have been phrased by Mrs Lynn Linton herself. 'I have,' once said to me the authoress of 'The Girl of the Period,' 'spent this morning with Miss Becker, in her favourite haunt, Kew Gardens; she said many wise and clever things, but nothing which took my fancy more than her habitual advice to her politically-minded sisters to attend political meetings, and to listen to scientific discussions, not with any parliamentary afterthought, but because the hearing of opinions with which they might not agree would teach them a self-restraint that was the most wholesome of all political disciplines. Finally, Miss Becker warned her followers to qualify themselves for the vote by graduating, not in the school for scandal, but in that of culture.'

In the present writer's hearing, the good Lord Shaftesbury was once dwelling on the sacrifices made, on behalf of their poorer sisters, by Miss Jessie Boucherett and others who had helped, in 1859, to found the Society for Promoting the Employment of Women. Mrs Lynn Linton apparently then heard for the first time of this work, inquired into it, and found that the educational machinery it provided really enabled poor gentlewomen left without means, and without, of course, any professional training, to qualify themselves for some self-supporting avocation. Eventually, therefore, Mrs Lynn Linton, if never actually declaring for the political enfranchisement of her sex, ceased to oppose it with her ancient bitterness; not perhaps, because she thought it desirable in itself, but from the fact of its being inextricably interwoven with social movements for feminine amelioration in whose necessity she had come to believe. Miss Jessie Boucherett was only one among the several effectively unostentatious successors of Mary Astell and Anne Petty, not to mention the redoubtable Countess Anne Clifford herself. The latter-day Suffragettes have wanted something more startling than the beneficent enterprises which left Miss Boucherett and her friends no time for breaking the windows of disobliging Cabinet Ministers, for marshalling processions into Palace Yard, or for organising congratulatory demonstrations of welcome to Amazonian martyrs on their release from Holloway Jail.

Naturally, therefore, they have forgotten quiet workers like Miss Helen Blackburn, the former secretary of the Women's Suffrage Central Committee, as well as, until her death in 1903, the editor of the *Englishwoman's Review*, a periodical which might almost be regarded as embodying the whole feminine Magna Charta. Yet one who had a slight acquaintance with this lady, and who knew something of her work and methods, may be forgiven for the suggestion that even the twentieth-century Hippolyta is under some obligation to the wide mental grasp, the strong common-sense, the sound judgment, and the charm of a cultivated mind which were Miss Helen Blackburn's chief characteristics. The same kindly courtesy and consideration for all that marked Miss Blackburn were not less conspicuous in some of her colleagues, who shared her disbelief in the wisdom of the militant modes of self-advertisement which were then only just beginning to be known. The ladies now referred to include Miss Louisa Hubbard, who died in 1907, and who established the Union of Women Workers, first started the *Englishwoman's Year-Book*, and together with Lady Mary Fielding, established the Working Ladies' Guild.

To this tranquil but serviceable category belong

also two Edinburgh ladies, Miss Louisa and Miss Flora Stevenson, the former a chief promoter of the university education of women, as well as an improver of the nursing arrangements for the Edinburgh poor; while the latter is well remembered as a member of the Edinburgh School Board. Miss Sophia Jex Blake, M.D., took a leading part in the battle in academical circles which enabled women to study medicine at Edinburgh University and take degrees.

The opinion and experience of foreign countries have been described as anticipations of the verdict of our own posterity. What might result from woman suffrage, adopted in some indefinite future here, may be judged from what has followed its introduction on the American and European continents, as well as in our own colonies. Finland is the most important country now enjoying adult franchise independently of sex. There, as in several among the less important states in the American Union, the feminine vote has introduced many women to public office without appreciable consequences of any kind. In New Zealand great changes were expected from the innovation. There, too, both its friends and opponents admit that on parties or causes it has had no effect whatever beyond increasing the interest of women in public affairs. As to the ecclesiastical questions which the she-voter must, it was predicted, vitally influence, the Anglican, Roman Catholic, and Wesleyan ladies, so far from disagreeing with each other, have all recorded their suffrages on the same side. The temperance struggle, admittedly a close one in New Zealand, has not been affected in the five general elections which have taken place since the new voters polled. The constituencies now mentioned have, however, witnessed one noticeable incident. Religious heterodoxy has proved a very venial matter in the eyes of the antipodean suffragists; in a Presbyterian electorate a notorious and politically most distinguished freethinker recently secured a majority of women voters on the register, and a much larger majority of women at the poll.

THE MONTH: SCIENCE AND ARTS.

THE EDISON CONCRETE HOUSE.

CONSIDERABLE interest has been aroused recently in building circles by the practical experiments that have been made with the concrete constructional system devised by T. Alva Edison. Briefly described, this process secures the construction of a house from foundations to roof, including all walls, floors, roofs, mouldings, cornices, baths, and so forth, by means of a mould in much the same manner as the housewife devises attractive shapes in blanc-mange. Needless to say, the medium employed is concrete, but of a special character, the secret of the inventor. The *modus operandi* is to prepare the foundations first, and then upon this base, when it has thoroughly solidified, to erect the house complete up to the roof, with the iron sections of the moulds bolted firmly together. Upon the completion of this stage the house is a mass of iron, with the space between the two surfaces to constitute the various integral parts of the building. At the uppermost point a large distributing vessel is set up, from which the special concrete is permitted to flow, and in its gravitation it penetrates and fills up every interstice between the moulds. This concrete is more fluid than that generally employed, so that it may flow readily. Of course, in the pouring extreme care has to be taken to permit of the escape of air from the space between the metallic sheathing. When the concrete has been permitted to solidify and harden thoroughly the iron sections are removed, and, hey presto! there stands the monolithic building all complete, ready for habitation, only the doors and windows having to be fixed. Owing to the care with which the surfaces of the moulds are prepared and the tightness with which they fit together, the walls are left with a perfectly clean and smooth surface, requiring no further treatment, and those within the house can be tinted or papered immediately. It is stated that by this method a house can be erected in about fourteen days. The moulds are so made as to be readily and easily interchangeable. At first sight the idea certainly appears to open up many possibilities in house-construction; but a little reflection suffices to show that there are numerous inherent drawbacks. In the first place, the capital expenditure in regard to the moulds is a heavy item, although, once acquired, they can be used over and over again for successive houses. Then, again, the durability of the system has yet to be established. What is going to happen when the inevitable settlement of the whole structure takes place? Concrete is apt to crack and split in a most disconcerting manner. The idea of casting a house in one piece in much the same manner as the metal-worker casts his work is no new idea; but it has not yet entered the phase of commercial practicability, and the latest development of the American wizard would appear to retain the inherent disadvantages of similar experiments in the same direction. The system may be capable of extensive vogue in the country of its latest exploitation, where wooden dwellings predominate. Certainly reinforced concrete as a building material has made tremendous strides within the past few years; but apparently in the

Edison principle the assistance of the strengthening ironwork is dispensed with, and consequently the drawback of the system is more pronounced.

HOW TO REMOVE GREASE-STAINS.

Despite the most elaborate care accidents are unavoidable, and who has not suffered from the falling of a drop of oil or grease upon the clothes, disfiguring the immaculate attire? Its removal seems an easy matter, but invariably it is erroneously effected, and the result is that the last state is often worse than the first. In removing grease-stains a solvent such as benzine or petrol is essential, and indeed is generally used. Underneath the fabric is placed a piece of blotting-paper to absorb the foreign matter when the solvent is applied. It is in the method of applying the solvent that the mistake is invariably made. The application of the benzine immediately dissolves the grease, and the whole has a tendency to spread, so that complete removal of the eyesore is either extremely difficult or quite impossible. To effect a complete cure the solvent should be distributed in a ring round the stain. In the resultant spreading of the current the stain is attacked from all edges, and when dissolved is kept within the centre of the benzine circle, travelling directly through the fabric and being immediately absorbed by the blotting-paper. Of course, in the case of a large stain, after the ring of solvent is made a small quantity directly applied to the grease may be necessary. The result, however, is then just the same—the grease becomes instantly absorbed by the blotting-paper, and when the benzine evaporates no sign of the operation remains. The efficacy of this method is more strikingly shown when the stain occurs on a light-coloured or delicate fabric. A hard grease-stain, however, though removed by a solvent, should not be driven through the fabric, but directly absorbed by the blotting-paper from the face upon which it exists. To attempt to force it through the fabric only causes the threads of the material to absorb the grease, and in such a manner as to baffle all further efforts at elimination.

AN INGENIOUS FIELD-GATE.

Those who live, move, and have their being upon the land are fully cognisant of the drawbacks of the present type of gate. In a short time after it has been hung, the weight of the swinging section causes the gate to droop at the shutting end, so that it will not readily close, and indeed may require lifting in order to engage with the catch. Under these circumstances the gate becomes an endless source of worry and expense. Recently, however, these inherent disadvantages have been ingeniously overcome by a simple invention. In this device there is a top-rail which runs right through, and on the under side of the shutting-post is a small roller which runs on to a bracket on the shutting-post itself, thus taking up the whole weight of the gate when it is closed. The gate is secured by a spring-catch which passes through a slot in the rail and drops into a notch in the lower arm of the same bracket or staple. In the usual type of gate, moreover, the wet, penetrating the mortices, rots the woodwork, thereby accentuating the drooping tendency of the gate. In this new device there are no mortices or joints, so that when it is coated with some preservative such as solignum, decomposition of the wood is impossible, and it will last for years. In a hunting district or upon a large farm there is the additional advantage that it can be operated by a person on horseback. The lever of the spring-catch projects upwards sufficiently to enable the rider to lean over and open or shut the gate with ease, this avoidance of dismounting being a feature that cannot fail to be appreciated. On those farms abutting on a railway track, cattle losses through the stock straying on to the line and being cut up by passing trains, owing to a gate being difficult to shut and thus left unfastened, can be obviated.

RAT-DESTRUCTION BY ELECTRICITY.

Many and various have been the means of waging war against the rat, and the results have been equally diverse. There is, however, one positive means of bringing about their death, as 'accidents' have proved. This is by electrocution. From time to time an electric generating station has suffered a mysterious disruption, and careful investigation has shown that the rodent has been the cause of the breakdown by crawling into the mechanism and setting up a short circuit—which, however, has proved 'hard on the rat.' A Viennese engineer has now devoted this 'accident' demonstration to commercial account. Recently, before a number of interested delegates, he carried out a series of demonstrations at one of the German municipal electricity works with an 'electrocution-trap' he had conceived. The rat is an inquisitive and a gluttonous animal, and the engineer has turned these two failings on the parasite's part to advantage. He has conceived a trap comprising a network of wires, the bait being an electric lamp or an appetising morsel. In endeavouring to satisfy its curiosity or epicurean tastes the pest compasses its own death, for the instant it treads upon the live wires the circuit is completed and it is electrocuted. The device is so contrived that any number of rats may be caught in this manner; and although possibly they may not be killed instantaneously, yet once the circuit is completed they cannot escape, and in from fifty to sixty seconds they are reduced to lifelessness. The engineer has found that only a comparatively low power is requisite to bring about the desired end, and the invention is so contrived that it can be used with certain success in any rat-infested quarter where electric current is available. It constitutes an ideal system for vessels. Even should no electric supply system be obtainable, an accumulator-battery will bring about the same results. Moreover, by a simple arrangement, the fact that a rat or a number of the species have been caught can be notified to a

central point, a signal being transmitted either in the form of the warning ringing of a bell or by a glow-lamp. The most notable feature of the arrangement is that the strength of current which spells death to the rodent is harmless to human beings or to the usual domestic animals. Certainly the system is more hygienic than poisoning or virus expedients, and is more rapid and positive in its action.

TROPICAL MEDICINE RESEARCH IN THE SUDAN.

One of the most important tropical research institutions in the continent of Africa is that which was founded a few years ago at Khartoum through the generous munificence of Mr Henry S. Wellcome. This laboratory is one of the most extensive and best equipped in the world, and the work it has accomplished is of such a unique character that other nations frequently seek to profit by its achievements. The Sudan is the seat of many mysterious maladies which bring about certain death to the white man, as well as working havoc in the ranks of the natives and their cattle. Every plant and animal, whether fish, fowl, or reptile, harbours some strange parasite which is not encountered elsewhere. The objects of this laboratory are diversified and comprehensive; and, under the able superintendence of Dr Balfour, the country is slowly but surely being rendered habitable to the white man. One of the most notable works it has accomplished is the penetration of the hitherto untrodden Burun country lying between the Upper Nile and Abyssinia. This work was carried out by Dr MacTier Pirrie, then one of the most promising of our younger scientists. Owing to his high qualifications he was specially selected for the anthropological work of the laboratory, and his expeditions into the unknown Burun territory resulted in much valuable data being gleaned of these people—their life, habits, and history. Unfortunately, while still a young man, he fell a victim to his zeal; he contracted one of the mysterious and most fell diseases peculiar to the country, was prostrated, and, although sent home to Scotland in the vain hope of recruiting his health, succumbed to the attack before setting out fully the results of his travels. His notes and observations were, however, worked up by competent authorities, and shed much light upon a hitherto unknown subject. The observer spent many months among the various tribes of the territory he penetrated, and his skill and tact in handling the natives was warmly applauded by the Government authorities. His untimely demise, literally in harness, affords one of the saddest and most illuminating instances of the devotion of the scientist to his work, without which it would be impossible to 'roll back the map' upon such little-known continents as Africa. Probably the southern Sudan is a more hazardous country to the white man than the West Coast, and few territories open up such a vast field for tropical research. In order to move about the worst centre of such an inhospitable area a floating laboratory has been established, and therein the little band of scientists wander up and down the vast, intricate network of waterways in the country, studying the strange maladies and parasites, human, plant, and animal, upon the spot.

A HANDY LEVEL.

A decided acquisition to the pocket is an ingenious little contrivance that has been patented by an English inventor. It slides into the waistcoat-pocket, and at first sight resembles nothing so much as a pencil-case or a fold-up footrule. But it is much more; it is a perfectly designed and accurate little scientific instrument adaptable to many purposes. It can be used for levelling operations (while of course it does not presume to the precision of the usual instruments for such work, its accuracy is striking), for estimating the height of any object, the angle of a slope, the gradient of a drain, road, or roof, and as a substitute for the spirit-level. It can also be employed as a square, dividers, a protractor, or a rule. It is fitted with a three-inch scale divided into sixteenths of an inch and millimetres, and the reverse face is divided to the scale of Ordnance maps (25·344 inches to the mile) and a one-inch to the foot scale. Its accuracy may be checked, and if necessary adjusted. Being compact and easily slipped into the waistcoat-pocket, it affords an excellent scientific substitute for a number of instruments, and proves highly serviceable for such operations as are within its field of application. Often only an approximation in such work is desired, and with this handy instrument it can be obtained with a greater degree of accuracy than is afforded by any other similar means.

THE AUXETOPHONE.

Great interest was created recently at a London concert, where the volume and strength of a 'cello was increased by means of a novel attachment, the auxetophone, which has been invented by the Hon. C. A. Parsons, of steam-turbine fame. This device may be best described as a comb or multiple reed-valve of aluminium, which is hinged so that each tooth of the comb can vibrate closer to or farther from a corresponding slot opening in a little box to which compressed air is supplied at about five pounds pressure. The farther the teeth are from the slot-openings the greater the flow of air, and, *vice versâ*, the closer they are the less the flow. The valve thus controls the flow of air, and when it is caused to vibrate it sends corresponding sound-waves into the trumpet which is connected with the instrument. In the application of the device to the 'cello or any other stringed instrument the valve is connected by a rod of aluminium to the bridge of the instrument. Thus the valve is caused to vibrate in accordance with the characteristic tone of the instrument. The sound issuing from the trumpet, though in many

respects identical with that from the instrument itself, is at the same time richer in character and greater in volume. At the concert in question the increased volume of sound, without any harshness whatever, was distinctly pronounced, the tones being fuller and more penetrating, while every interpretation of the *maestro* was strikingly evidenced.

PRESSED STEEL BOOT-SOLES.

An invention which should be possible of extensive development has recently been placed on the market. This is the substitution of pressed steel for leather in the soles of footwear. Its present application is restricted to what might be termed the roughest phase of boot-life, but its success therein should lead to its utilisation in all types of foot-covering where protection from damp and capability of withstanding rough usage are essential. The fact that the boot is responsible for a large percentage of the ills to which flesh is heir has long been admitted, and it is somewhat curious, in face of this point, that some radical revolution in boot-soles has not been undertaken. Leather is an excellent damp-absorbing medium, and the danger lurks in the fact that although the surface of the sole may appear dry the internal substance is sodden. In this latest development the bottom of the boot and the points where all the hard wear is experienced are formed of a single piece of pressed steel, studded with adjustable steel rivets, and to this the upper is attached. At first sight such a contrivance might appear heavy and clumsy, but such is not the case. Again, the liability of metal to corrosion would seem a serious disadvantage. In this case, however, the steel used is a special light, thin, rust-resisting, seamless metal, which is practically indestructible. The toe is so protected that it cannot be kicked through. The sole is in one piece, shaped to the natural contour of the foot, so as to offer no restriction to free movement or pliability. The steel rivets are adjustable, and when worn can be taken out and replaced, so that the walking-face has always a grip even upon a slippery surface such as ice. The uppers are strengthened, and are riveted to the sole so as to secure a strong, sound connection. Within the boot is an inner sole of horsehair and felt which acts as a cushion to the foot, and gives a springy and comfortable feeling. For those engaged in outdoor work, such as mining-engineers, farmers, and surveyors, this boot forms an excellent foot-covering. It should be an easy matter to extend the idea for such purposes as mountaineering or golfing, while the difficulties in the way of its application to everyday service where strength and durability as well as complete protection from wet are desired should not be insuperable.

TEETH DECADENCE AND FOOD.

One of the most absorbing questions in scientific circles at the present moment is the care of the teeth and the investigation of the causes of dental decadence. It is not a discussion restricted to one country, but has become of international import, for the fact that the present generation is possessed of inferior teeth is generally admitted. In America, where the dentists have earned an excellent reputation for their skill in building up decrepit molars, it is now realised that the problem of preventing teeth from becoming loose, broken, or decayed in the gums is far more vital than that of patching up with gold or other amalgams after the damage has developed. In this country more than one of the leading authorities have emphasised the fact that something radical must be effected to solve the problem. The cause of the degeneration is attributed almost exclusively to the foods we eat, especially those prepared for the sustenance of the young. Indeed, one authority goes so far as to describe the present as the 'pap' age, from the almost universal tendency to feed the children upon partly cooked proprietary foods, which he describes as being designed for the lazy parent, inasmuch as they require little preparation for the table and also because they need the minimum of mastication. Assuredly, if the teeth are deprived of the greater part of their designed work they are certain to deteriorate. Dental troubles are undoubtedly attributable to the artificial manner in which we live, and the fact cannot be disputed that nowadays we dwell in a highly civilised age when some patent foods are half-prepared and partially digested before consumption. And this state of affairs is responsible for further physical degeneration, in that the organs of the stomach cannot perform their natural tasks properly, for the simple reason that, there being no mastication, the food does not become combined with the requisite quantity of saliva to assist digestion. If we were to revert to the practice of partaking of sufficient hard and dry food so as to exercise and develop the jaws, dental deterioration would rapidly be arrested. That such is the fact is easily verified by observance of the teeth and jaws of sailors. It has also been strikingly shown in the improvement in the physique of boys who have been taken from the London streets and placed on board ship. Their general appearance and stature have improved to a vast extent, but the most noticeable development has been the total change in the shape and expression of their faces. The angle of the lower jaw has improved, while it is increased in size, a result attributed exclusively to the rations of 'hard-tack' and 'salt-junk,' which demand much mastication. The teeth, in common with every other organ of the human machine, must receive their proper quota of exercise, and this can only be effected by chewing, which is the natural and obvious function of the teeth.

TO ATTAIN LONG LIFE.

Dr Reinhardt has published a booklet upon the use of lactic ferments for the prevention and cure of diseases and the prolongation of life, under the title of *One Hundred and Twenty Years of Life and*

How to Attain Them (London Publicity Company). This explains the Metchnikoff sour-milk treatment, and contains directions and precautions to be observed in the preparation of the sour milk. Professors Metchnikoff and Duclaux of the Pasteur Institute noticed while visiting Bulgaria that not only did the inhabitants attain a remarkable age, but that the qualities of youth were preserved to the end. Out of a population of less than three millions there were more than three thousand centenarians, and deaths at the age of one hundred and ten, one hundred and fifteen, and one hundred and twenty were by no means uncommon. Metchnikoff traced this longevity and general soundness of health to the national habit of using sour milk as a daily item of dietary. Guidance is supplied in this booklet as to the manner of making it. Dr Reinhardt concludes that intestinal putrefaction is the chief cause of ill-health among civilised communities to-day, and the most successful remedy is a scientific dietary, including the use of lactic ferments. More, he thinks, can be accomplished by careful and scientific regulation of diet to individual needs than by the use of all the contents of the *Pharmacopœia*. A small consumption of animal food is recommended. Most long livers are small meat-eaters. Dr E. C. Latham has said that it is possible to subdue and finally destroy the desire for alcoholic stimulants by drinking from three to six ounces of buttermilk whenever the desire for intoxicants presents itself.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

A LOVELY SPOT.

By Lady Napier.

IT was a lovely spot. And to think that the day before yesterday we were writing letters and paying Christmas bills by artificial light at midday in London! A dense curtain of yellow fog outside, a raw and deadly cold creeping in in icy draughts through the presumably tightly closed sash-windows and under the doors, creeping across parqueted floors regardless of rugs, chilling the feet, numbing the fingers, ruffling the temper. Why have sash-windows, why have parqueted floors, in such a climate? Who was the inventor of sash-windows—so ugly, so difficult to repair, so draught-enticing? Also the hideous, cumbersome, expensive concomitant, the roller-blind? But they certainly offer a field to the various tradesmen who evolve and repair them.

Well, they were all far enough away at the moment of which we write. The French windows were thrown wide open; brilliant sunshine poured into the room. Down below, at the foot of the olive-clad slope, was the gentle lap-lap of the waves as they broke on the black pudding-stone rocks of the shore; sea and sky met and melted into each other in softest, most ethereal blue. Red admiral butterflies whisked and fluttered in the sunshine, bees buzzed, and lizards sunned themselves in the hot, red earth; the golden globes of the orange and lemon trees shone among the glossy dark-greens of their foliage.

A truly lovely spot! A wooded promontory and a little harbour curving from it, an elbow in the coast. High hills rising almost from the shore gave shelter from *tramontana*, mistral, and other ungentle winds. White villas peered from the olive-woods; an old castle, modernised and made habitable, and annexed by a rich tradesman from Britain, stood on the promontory. The many-coloured, picturesque houses crowding round the harbour were reflected in the still waters of the small port. Gay little yachts and boats were moored in this favoured haven, and the cry of the fish-seller echoed up the white road. Why every fish in that part of the sea has not been caught by now is an unsolved problem. Every day and all day the nets seem to be spread and drawn, and drawn again, and horrid dishes of immature little fish disguised in butter figure largely on the menus of the restaurant.

The terrace of the hotel was a trap for the sun. It was a quiet spot, not very much favoured by the inevitable Germans, though it would be difficult indeed to find a spot in fair Italy free from their aggressive presence. It must be the sun, and the sun only, that attracts them from their own savagely cold, belauded Vaterland; for their noses and spectacled eyes are buried in their German newspapers as a rule, and they have not a glance to spare for the wonderful beauty of the lovely land as they pace to and fro reading, or establish themselves in the most comfortable seats they can find until it is time again to eat—and to eat as only Germans can. The hotel-keepers, for some unfathomable reason, favour them greatly in the matter of food: slabs of pink beef and veal, and horrid dishes of cold meats and German sausage, and greasy potato-salads, and lead-heavy puddings, instead of the delightful Italian macaronis, *risottos*, and lighter fare, wholesome and innocuous.

The hotel in question was at that moment much frequented by ladies—*dames seules*—well able to take care of themselves, however; one, a redoubtable elderly German lady, unattached and unappropriated, and a courageous man indeed would he have been who had ventured to storm her person!

She wore a large, loose coat with large checks, and a short skirt to match, and a white hat—all very *praktisch* (practical), she would have told you. She paced the terrace and read her newspaper with fierce, spectacled, red eyes, and scolded the *facchino* and hard-working little chambermaid (so pretty and willing and bright she was, dear little maid !), and complained of them at the bureau until they would gladly have slain her, judging from their looks as they watched her waddle downstairs to meals. She sat alone at her table in the restaurant, her German newspaper propped up before her; and if she was not helped before most people, or if the food was not to her liking, she let the management know. As we have before remarked, there were a good many other single ladies staying at that time at the hotel, the quiet time of the Riviera year before the rush sets in—old, young, elderly, quiet, shadowy, cross-looking ladies, some of them. In fact, the fair sex preponderated to such an extent that the fellow-traveller of the other sex remarked that he had not meant to come to a cats' home.

The weather was not always ideal—a certain amount of bad, cold, gray, rough days, with sheets of driving rain and whirling olives. The hotel was warm and comfortable. The system of central heating has much to recommend it; at the same time, however, without a flue, and unless windows can be much open, small rooms are apt to become terribly stuffy, probably unwholesome, with the overheated air. The heating arrangement should be carefully turned off at night, or headaches may result.

Olive-trees are the characteristic of the country. The eye finds wonderful repose in the soft, gray-green cloud of their foliage. They are an endless joy to a painter, with their strange, twisted, tortured-looking stems straining upwards to the light; the dense, gray-green masses, with the sharp bits of vivid broken light as the leaves catch the rays of the sun and the boughs part. Then the rich, red-brown earth, and the growing crops, and the picturesque old farmhouses of the *contadini*, often painted of a soft, pink colour—a pink that harmonises to perfection with the olive.

Narrow mule-tracks, paved with rough stones, steep and most fatiguing, lead the pedestrian up among the hills, whence glorious views of the panoramic order may be enjoyed. The only other road is the high-road along the coast, dusty and terrible owing to motor traffic and bicycles. The turns are very sharp, and the motors travel much too fast on these roads for safety. Some, however, have a warning cry which can be heard for miles, irritating to the nerves and temper—a piercing, wailing howl, like that of a steam siren; then down comes the motor, a smother of dust—blinding, choking, provocative of things better left unsaid. There are little boats for those who like to confide themselves to the mercies and moods of the Mediterranean; but squalls are apt to arise, and the little boats look very crank.

It would seem as though I were condemning my lovely spot by faint praise, but it is not so. It is as well to know what to expect, and what one wants, and what one is likely to get. For those who would like to bask in the sun for six or seven hours a day in midwinter, to be able to sit at an open window and drink in a vista of sea and sky and olives and blue mountains incomparably lovely, to take a little walk and sit in the sun, or go for a nose-grinding tramp up a *salita*, let them try my lovely spot. But beware! The sun is often as hot as summer sun; but out of the sun the shade is of the temperature of ice—cold, damp, deadly (if one is overheated, especially). To be as sheltered as my spot, however, the place must be on the side of a hill, therefore without very much outlet to those who like to take exercise in a moderate manner. As is the case all along this coast, the wind can be of a piercing quality—and there is much wind. In our elbow, however, we can bid defiance to it, and pace and sit in the sun most days. But to adventure round a corner on such days as the winds blow is to be seized by the nose and throat with a grip of iron and ice. It is easy, however, to remain in the shelter of the elbow until the wind departs or lulls.

Taking it all round, it is a charming and to be recommended spot, particularly to the quiet and elderly, at the quiet season of the year, say until mid-February, when a more portentous, often be-motored, class obtain, and prices go up. Some courageous person might hint to the management also, that to many the shrieks of the gramophone hour after hour are neither grateful nor comforting, the strains often turning the beautiful scene into a background for a comic opera.

THE GREAT MAGICIAN.

Although the boughs be bare, and the bent trees
Stretch out gaunt arms against a leaden sky;
Although the dreary landscape seem to lie
Beneath the hand of death, and the soft breeze
Of summer-time across the upland leas
Be changed into a weary, haunting cry
Of storm-wind calling storm-wind to draw nigh
And rend to shreds our poor, frail refuges—
Yet, through the gloom, Love comes, to touch my hand
To bid me raise mine eyes, since he stood there
Waiting to still my fears, and make the land
Look like a garden of the Lord; so fair,
That, lo! red roses clothe the desert strand—
Sweet summer's flowers—although the boughs be bare.

KATE MELLERSH.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

SIXTH SERIES.

THE SEÑORITA DOLORES.*

By J. MORTON LEWIS.

CHAPTER I.

DANGERFIELD was seated in his room in Great Ormond Street. It was early summer, and, the night being warm, the window was open, and from an adjacent house came the sound of a woman's voice. He looked up from the book he was reading and frowned; it is hard to study Locke on *The Human Understanding* to the accompaniment of a plaintive love-song, even if an LL.D. depends upon the success of one's efforts. For a few minutes he read on, then closed the book with a snap, lit his pipe, and sat back in his chair. Involuntarily, as the moments passed, he found himself beating time to the music.

The sound of voices roused him from the reverie into which he had fallen. The door opening, he leapt to his feet. 'You, Vincent!' he said, holding out his hand as a young fellow entered.

'Yes.' His visitor sat down in a chair heavily, as one who is tired. He was tall and fair, with curly hair and a cast of countenance peculiar to those who have long generations of Saxon blood running through their veins.

Dangerfield noticed the dust upon his friend's boots, and saw the weariness plainly written on his face; so in silence he handed him his pouch.

Vincent filled his pipe slowly. 'I came to you a year ago,' he said, 'to borrow some money.'

Dangerfield said nothing, but a feeling of uneasiness crept over him.

'I have not been near you since.'

'You paid me.'

'And I've come to say good-bye now.'

'Why?'

The other's lips involuntarily twitched. 'I have been kicked out,' he said. 'The army has no further use for me.'

'Harry!'

Vincent rose to his feet and gripped his friend's shoulder. 'I know what you must think of me. I'm worthless! God knows, perhaps I am.'

'How did it happen?'

Vincent had walked to the window, and his back was turned. 'A duel. Some months ago I lost a lot of money to a fellow at cards. I suspected him then, but could prove nothing. He has been fleecing a subaltern who has only just joined, and I caught him at it—usual old tricks, you know. I accused him at the club, but could prove nothing; he was too clever for that.' Vincent paused. 'So we had a duel. I came back from Calais a week ago.'

Dangerfield looked at his friend's back, which was still turned to him. 'Well!'

'He remained over there, and to-day the colonel asked me to send in my papers. He was very nice, but pointed out that duelling is not allowed, and I was too hot-tempered for his regiment. It's the third row I've got into in six months, and so I've got to leave.' Vincent stopped abruptly, but the movement of his shoulders told more than words.

'How is the other fellow?'

Vincent turned sharply round. 'No, thank God! I haven't got that on my shoulders. I had a message to-day to say he will most probably pull through. I must have missed his heart by a hair.'

'I am glad for your sake,' said Dangerfield. 'And what are you going to do now?'

Vincent drew out a gold watch. 'I embark by to-night's tide for Corunna. My father knows a Spaniard there, a Government official, and no doubt he can help me into the army.'

'Your sword will not rust for long then?'

'But it will not be drawn for England! It will not be drawn for England!' said Vincent, turning away again.

CHAPTER II.

CORUNNA is a small town, with a large jetty; its houses are white and straggling. Its jetty stretches out into the blue waters of the Atlantic like a long white arm, predaceous or protecting, as the fancy paints it. Corunna is a name to conjure with; it is writ large

* *Dramatic Rights Reserved.*

 [*All Rights Reserved.*]

in the history of nations, the mention of it awakens memories and stirs the blood. It is a sleepy little town, with an ever-present air of contentment, as if, fully aware of the part it has played in the world's story, it is satisfied to slumber on and dream of the past, when its streets resounded to the clangour of armed men, and great holes were torn in the jetty, the predecessor of the one which now stands.

The captain of *The Harvester* was a Londoner, possessing a supreme contempt for all foreigners. As he drew his boat alongside the quay he issued his orders in a voice which he gravely calculated drew respect from those gathered to witness his arrival. *The Harvester* moored, he climbed down from his bridge and walked towards a figure standing against the rails and gazing at the white roofs of Corunna, with the green hills behind. 'We have arrived,' he said.

The figure half-turned. 'Ah!' he said; that was all, and fell to looking at the town again.

Amongst other qualifications for a nautical career, Captain Hawkins possessed self-importance, together with an incalculable belief in his own powers and an unselfish love of devoting his spare moments to the attention of other people's business. 'You will be staying in Corunna perhaps?' he queried.

His passenger drew out a watch. 'I shall be staying, perhaps, for half-an-hour.' He smiled as Captain Hawkins turned away in chagrin.

'I will have your baggage put on to the quay,' said that mariner.

It was midday, the hour of siesta, and there were few people abroad as Vincent walked up the narrow street which led to the hills to the north of Corunna.

'That must be it,' he said, looking towards a house, half-way up the slope, the closed green shutters of which were faintly visible from where he stood.

As he toiled up the hill loose stones fell away before his feet and rattled a few yards down the road. When he reached the house with the green shutters he entered the *patio* and rapped upon the wooden door.

For a few moments no one answered the summons; then a short, stout, heavy woman ambled slowly towards him.

'Is Señor Mogenti within?' he inquired, raising his hat.

'But yes,' replied the woman. She surveyed him curiously. 'You are a stranger,' she said, 'or you would know that no one raps upon the door in Corunna.'

'Indeed!' replied Vincent. 'It was from ignorance that I transgressed. And what do they do?'

'They shout,' replied his guide, leading the way indoors.

'Will you please tell Señor Mogenti that the son of his old friend Theodore Vincent is here?'

A few seconds and the señor appeared. He was a short, dark man, with keen, restless eyes and a Van Dyck beard slightly tinged with gray. Of an age difficult to determine, his bearing clearly denoted that his life had been spent in bearing arms. He stood in front of Vincent, his legs apart, and slowly scrutinised him. 'And you are my friend's son? Yes, you are like him—very like him. I should have known you anywhere. The same eyes, the same chin, and the same temper.' He laughed softly, as if at some pleasant recollection. 'It is good to have a temper sometimes. Your father saved my life in a temper.' He pointed to a scar faintly visible down one cheek.

He led the way into the *comedor* which opened on to the piazza. 'And so you are going on to Toledo to join the army against Don Carlos? Well, we shall be pleased to have you; your father's son is always welcome where there is fighting.'

Vincent looked at him in surprise. 'You have heard?' he said.

Señor Mogenti nodded. 'I had a letter from your father this morning.'

'Then you know why I am here?' said Vincent a trifle bitterly.

The señor laid his hand on Vincent's shoulder—he was over a head the shorter. 'Yes, my friend; and you will not need to find quarrels here in Spain—they will be thrust upon you. In a month, perhaps two, Don Carlos may be upon the throne: men will quarrel if he reaches it, and men will quarrel if he fails. It is a way we in Spain have; we quarrel about nothing.'

As he spoke the woman who had opened the door to Vincent entered; later he discovered her name was Juanita. In Spain all women's names are beautiful. In the heyday of youth they have a charm which the women of no other country possess, but when the bloom has vanished things seem somewhat incongruous; to hear a fat and greasy duenna of the market-place answer to the title of Mercedes is a shattering of one's ideals. In her hands she carried a tray bearing food and wine; these she laid upon a table in the piazza, and then withdrew.

Taking his visitor's arm, Señor Mogenti led him outside.

When they had finished a light repast he lit a cigar. 'You will not want to stop in Corunna. No; I have got a horse ready for you, and one of my men will go with you to Toledo. He is one of the few men you can trust; and even with him it would be wiser to choose the centre of the road; it is safer in such times;' and Señor Mogenti jingled some loose money in his pocket. 'If you start this afternoon you will be in Toledo in a fortnight, and you will see many interesting things by the way.'

Late in the afternoon, when the sun had lost much of its overpowering heat, Vincent started.

Señor Mogenti walked with him to the gate, where stood Lasquez, his guide, and two horses. Standing in the doorway, he handed him a letter. 'When you arrive in Toledo you will go to the house of General Vilenta and give him this. I shall join you there in a few days, as soon as I have buckled on my sword.' Seeing the look of astonishment on Vincent's face, he nodded. 'Yes, we old

men are all arming, and the Queen will have need of us all if she is to keep her throne.' Then he bent closer and whispered a few words into his ear.

A fortnight later Vincent found himself in Toledo, 'the heart of Spain.' He entered by the bridge of Alcantara. As they passed beneath its portcullis-fashioned gate, Toledo, the City of Shadows, towered above them. The bells of its many churches were pealing out the summons to matins. At their feet flowed the slow, yellow waters of the Tagus, swollen by recent rains. The sun poured down with almost dazzling power upon the gray roads and bright walls—the remnant of Moorish days. Many nations have passed through Toledo, and each has left its mark upon the city's architecture.

For a moment Vincent stood lost in admiration, while Lasquez looked around him with a less reverent gaze. He had been in Toledo many times, and possessed a supreme contempt for it.

'Phew!' Lasquez said as they cantered by the side of the wall which Wamba built, 'there is a silence, señor; and when there is silence in Toledo'—— He finished the sentence with a shrug of the shoulders and deftly rolled a cigarette.

The streets were almost deserted. At intervals they met a muleteer ambling slowly along in discharge of his business with a sublime disregard for the passage of time; and occasionally from behind the latticed windows a glimpse of some gay mantilla, and beneath a pair of eyes no whit less bright, showed they did not pass by unobserved.

By the Puerta del Sol, Lasquez dismounted. 'We had better walk, señor,' he said; 'these accursed roads were made neither for man nor beast, but they are serviceable in Toledo, for they are silent.'

Riding along the Plaza de St Martin, Vincent pointed to a large house built in the Moorish style, standing in a small park of ilex and cedars. A white flight of marble steps led down into the courtyard. At the foot of them stood a couple of horses awaiting their riders. 'Whom does that house belong to?' he asked.

Lasquez turned half-round. 'That house,' he said, enunciating each word clearly and slowly, 'belongs to the Señorita Dolores.'

Vincent glanced at his companion and smiled. 'And who is the Señorita Dolores?' he asked.

'We will mount here,' said Lasquez; 'the roads are fair travelling—very fair for Toledo.'

'And who is the Señorita Dolores?' asked Vincent again when they were mounted.

'The good God knows,' answered Lasquez; 'I do not, nor any man in Spain, though many would like to.'

'In short, she is the embodiment of feminine charm—an enigma,' rejoined Vincent, digging his spurs into his horse's flanks.

Perhaps the remark passed beyond the depths of Lasquez's understanding. He gave a grunt. 'We will turn to the left, señor,' he said.

CHAPTER III.

VINCENT was standing in the *patio* of General Vilenta's house. Before him, a trim figure in gray service-tunic and brown gaiters, stood the man whom all Spain feared; some even said that the Queen herself stood in awe of the little man, whose visionary gaze gave him almost the appearance of a poet, a man who dealt in fancies rather than in hard facts and steel. He was reading the letter Señor Mogenti had sent him. When he had finished he carefully tore it into small fragments. 'It is well to destroy letters nowadays,' he said with a quiet smile. Then he regarded Vincent closely. 'And you wish to serve under me? Have you seen service?'

'Three years in the Seventy-sixth.'

'Your father was a soldier before you. I remember seeing him once, in Vienna; twenty years ago it must be,' replied the General with his marvellous memory.

'He was there, sir, in 1816—twenty-one years ago.'

'I thought so. And you left your regiment?'

'Because I nearly killed a man,' replied Vincent shortly.

The General stroked his gray moustache. 'In Spain we always kill a man—quite. It is safer.' He paced to and fro a few times, muttering to himself, 'General Vincent's son! General Vincent's son!' Then he stopped abruptly before Vincent. 'You will report yourself at the barracks in a couple of hours. I will see that you are made a special aide-de-camp. I want a few men I can trust. In the meantime I will ring for wine.' He laid his hand on Vincent's shoulder. 'I shall expect great deeds from you. And remember three things: in Spain keep silent, believe no one, and'—he bent nearer and whispered the final admonition—'always kill a man quite.'

Three hours later Vincent was cantering through Toledo with Lasquez, on his way to the barracks with a letter from General Vilenta.

On the journey they met a carriage-and-pair driving towards the Plaza de St Martin. Inside, amidst a pile of cushions, sat a lady, young and pretty, and opposite her a stout, elderly duenna. In passing she gave Vincent a quick glance from her eyes, half-questioning, half-coquettish.

Vincent turned in his saddle and watched the retreating carriage. 'Who is that?' he asked.

'That is the Señorita Dolores,' said Lasquez shortly.

CHAPTER IV.

VINCENT had been installed in his duties for nearly two months. Intrigues raged around Madrid and Toledo. They were days in which a man feared to trust his neighbour. It was a battle waged in the dark, with the hardest weapons of all to combat—subtlety and craft. Fighting had been plentiful, but Vincent had seen none of it, it having mainly been restricted

to the Basque provinces, where Don Carlos held supreme power. He had been on an expedition to Santa Berista bearing a despatch, and on his return stood before General Vilenta.

'You were unmolested?' said the General. 'It is strange!' He read the cipher reply. 'You have travelled thirty-five miles to-day, and each mile of the way you have been shadowed; your life has been in your hands.'

Vincent looked at them. 'They are still clean,' he said.

'You passed the road to Santa Brenna, where the trees overhang and it is almost dark.'

Vincent nodded.

'And you saw nothing, heard nothing?'

'No.'

'Good! My children have done their duty well.'

Vincent looked up in surprise.

The General stared him straight in the eyes. 'I should not have been surprised if you had never left that road alive; but you would have been avenged. There were fifty men of my regiment not a hundred yards to the east.'

'It is the chance of war,' said Vincent with a shrug of the shoulders.

General Vilenta nodded. 'It is the chance of war,' he replied slowly. Suddenly he looked up. 'And how do you like your new friend, *ma capitán?*'

Seeing Vincent's look of surprise, he continued, 'Yes, your new friend, the Señorita Dolores.'

Vincent remained silent.

'She is a beautiful woman,' said General Vilenta slowly—'a most beautiful woman, born to rule.' Then he looked up with a funny little smile. 'The devil was born to rule, my son, and he does it exceedingly well.'

A change came over Vincent's face, a change of which the General made a mental note; he made mental notes of everything likely at some future date to be of service to him, and he kept his notes so well that the kingdom of Spain was beneath his thumb.

'What do you mean?' said Vincent in a strained voice.

The General waved his hand deprecatingly. 'My remark was a truism.'

Vincent ignored his explanation. 'Who is she?' he asked.

'The devil is generally supposed to be of masculine gender,' said the General, with his easy, maddening smile; 'but no doubt you are right. You show a wisdom beyond your years, and a courage for which even I did not give you credit.'

For once the strict discipline Vincent had learned in the British army was forgotten. 'Confound the devil!' he said angrily—'I mean Señorita Dolores. Who is she?'

The General looked at him amusedly, but there was a hard gleam in his eye. 'Of that,' he said, 'you should be the better judge.' He approached his aide-de-camp. 'I know nothing,' he continued in a low voice, 'and I should like to know much.'

As he spoke a servant entered. 'Colonel Gregori wishes a word, *excelencia.*'

The General nodded. 'In five minutes I shall be disengaged,' he said. He turned to Vincent. 'You are free until to-morrow. You are going to the ball at the *palacio* to-night?'

Vincent nodded.

'It is just as well,' he said. 'In such times as the present it is as well to be gay outwardly. One never knows what the morrow may bring forth.'

A moment later Colonel Gregori entered.

'Well?' said General Vilenta.

'Captain Lopez is dead,' answered the soldier. 'We found him on the road to Madrid this afternoon, killed by a knife-thrust in the back.'

'Ah!' said the General. Not a muscle moved as he heard the news.

'And his papers are all taken—nothing else.'

'Ah!' said the General again.

Colonel Gregori regarded his superior officer closely. He had an infinite belief in his powers, a belief that was almost childish in its simple faith.

For a moment there was silence; then General Vilenta spoke. 'I am sorry Lopez is dead. I tried to save him, but we are all pawns in this game, and better lives are staked than those for whom we fight, colonel.'

The colonel nodded; it was a thought that had occurred to him on more than one occasion, as it had occurred to many others in Spain.

'And his papers were blank. The documents on which the Queen's life rests are in my pocket, and Vincent will take them to Madrid to-morrow.'

(To be continued.)

PIONEERING IN PUBLIC-HOUSE REFORM.

By the Lord Bishop of Chester.

THE merits or demerits of last year's Licensing Bill do not come within the scope of this paper. It will be enough to say that in the whirlpool of criticism then set in motion two clear issues rose to the surface from the baffling cross-currents of conflicting ideals and interests. On the one hand, it was almost universally admitted that, in spite of improved social habits, there is still real and pressing need of temperance reform in this country. On the other hand, it became obvious to a large section at least of the thinking public that the remedies applied to intemperance cannot safely run far ahead of popular habits and feelings, and that to reform the public-house is a sounder and more hopeful

aim than the policy of prohibition or even of mere reduction.

This is, of course, no new conviction. Early in his career Mr Chamberlain advocated the municipalisation of licensed victualling in Birmingham. He held that by placing this peculiarly important quasi-monopoly (where all monopolies should be) in public hands, the motive of private gain would be eliminated, the introduction of this or that improvement would be rendered easier, the public-house would be removed from the arena of party politics, and its whole character and purpose be raised. Unhappily Mr Chamberlain's plan found little favour either with temperance extremists or with the Trade, and thus the opportunity of an experiment which would have been so light-giving was lost. Since then the growth of the tied-house system has brought the large majority of inns under the iron grip of the brewery companies, erecting an almost insurmountable barrier in the way of public management on a comprehensive scale.

Sweden and Norway have been more fortunate. In these countries an enlightened temperance policy has produced demonstrably good results in the way of greatly reduced consumption of spirits and improved social habits.

Our own more ardent temperance reformers may fairly be said to regard with disfavour any scheme which aims at mitigating the evils of the liquor traffic, on the ground that the introduction of a measure enforcing total prohibition must be retarded in proportion as such a scheme realised its object. But this view is not shared by temperance leaders in the Scandinavian countries, which at the beginning of last century were among the most drunken, but now rank with the most sober nations of Europe. The Swedish and Norwegian 'Totallists' frankly acknowledge the value of the system of public-house control which has produced such a happy revolution.

For example, Mr Sved Aarrestad, ex-Minister of Agriculture in Norway, and a leader of the prohibition movement there, is quoted in Messrs Hogg and MacCallum Scott's *Licensing in Scandinavia* as saying: 'The company system has been very useful in promoting temperance. It has helped to diminish the use of alcohol. The temperance people would like to see the sale of beer and wine brought under the same system.'

Let me sketch in outline the more outstanding features of the system. First and foremost, it has been recognised in Scandinavia that the control of the sale of spirits ought to be taken out of the hands of interested traders and vested in the community. Thus Sweden, as far back as 1855, gave power by legislation to the municipalities (*a*) to prohibit the traffic altogether, or (*b*) to limit the total number of licenses and to dispose of the remainder either to the highest bidder of approved character or to a *bolag* — that is, disinterested management company. The first company of this kind was formed at Gothenburg, with complete control over all licenses for the sale of spirits, and it proved so far successful that other *bolags* sprang into existence. In Norway similar companies (called *samlags*) were introduced in 1871, and Finland has also adopted the company system. These companies are constituted upon principles which exclude from first to last the element of *personal interest*. The directors are public-spirited citizens whose financial interest is limited to a small percentage upon their invested capital; all profits over and above this fixed percentage are handed to the State, which allots a certain proportion to the municipalities.

Originally, in Sweden, the surplus profits were applied to the relief of the rates; but this plan involved some danger of the public-house being practically 'farmed' by the citizens for their own pecuniary benefit. To remove this temptation, the profits of the Norwegian *samlags* are dealt with in the following fashion: 65 per cent. is paid into the State Exchequer; the remainder is allotted for local purposes, with the proviso that four-sevenths of it shall be ear-marked for 'objects of public utility not being chargeable on any rate, but operating as counter-attractions to the public-house.' Two years ago Sweden adopted a very similar plan for distributing the profits of her *bolags*. By way of comment it may be added that the consumption of spirits in Scandinavia has enormously decreased, to the manifest improvement of the national morals. Curiously enough, however, the sale of beer and wine has not hitherto been placed within the restrictive influence of the companies. It is interesting also to note that not a few municipalities have exercised their veto to prohibit the sale of spirits altogether.

Independently of this important object-lesson abroad, I was first led, about forty years ago, to the idea of trying the experiment of a public-house on fresh lines for the public benefit. Circumstances did not then lend themselves to the idea being carried out, and it lay dormant until the year 1892, when I appealed through the organs of the Press for a systematic and unflinching re-examination of the entertainment of the people problem. In a letter to the *Times* I stated my case as follows:

'May it not be fairly said that hitherto the weak point in very much of our temperance policy has been its one-sided and merely negative character? . . . Sunday closing, local option, the direct veto, total prohibition—these, as usually explained and understood, fail on the constructive side. Their aim is to restrict, or even to abolish, the sale of alcoholic beverages. They do not contemplate the counter-provision of such houses of refreshment as may wholesomely meet — and, while meeting, cultivate and refine — the established needs and tastes of the people. And yet in such a climate as this, and with the hours of labour shortening and the hours of leisure lengthening, the demand for such entertainment cannot wisely be ignored or discountenanced. A merely restrictive policy, though it has done and is doing much to curtail

abuses and minimise temptations, can at best serve only as a half-measure, and if pushed too far must drive the disease inwards and provoke a mischievous reaction. Those who take the darker view of alcohol may be justified in advocating its total prohibition. But the large majority of thoughtful men allow that its moderate use has much to say for itself, and that in any case the deep-rooted habits of the nation are to be modified rather than set at defiance.

'I would, therefore, submit that the reformation so undoubtedly and imperatively demanded must, to be really effective, take the shape of a complete reconstruction of our existing public-house system. Licensed victualling must change hands. Experience has abundantly shown that private enterprise cannot bear the weight of this vast national responsibility. The State, through its local authorities and instrumentalities, must with a firm and liberal hand undertake the provision of houses of refreshment for the people, in which alcoholic beverages, though frankly recognised, will be deposed from their aggressive supremacy and supplied under less seductive conditions. These conditions would, for example, be comfortable, spacious, well-ventilated accommodation; temperance drinks of every kind brought well to the front, invested with prestige and supplied in the most convenient, attractive, and inexpensive way; the pecuniary interest of the managers—for example, in the form of bonus—made to depend entirely on the sale of eatables and non-alcoholic beverages; alcoholic liquors secured against adulteration; newspapers, indoor games, and where practicable outdoor games and music, provided; while the mere drink-shop, the gin-palace, and "the bar"—that pernicious incentive to drinking for drinking's sake—would be utterly abolished.'

An organised attempt to introduce reform on lines similar to the above sketch was the object with which the Public-House Reform Association came into existence about this time. It numbered among its members Mr Joseph Chamberlain, the late Duke of Westminster, Lord Thring, and Judge Hughes. In 1893 I introduced the Authorised Companies Liquor Bill in the House of Lords. The main provision of this Bill was the conferring of parliamentary powers upon a public trust company to obtain control over the whole of the licenses in the town or district in which it was situated. But the country was not ready for such a thoroughgoing experiment, and the Public-House Reform Association, which had lent its support to my programme, presently changed its shape and scope.

The credit for the initial scheme which led to the formation of the society now known as the People's Refreshment-House Association (Limited) belongs to the late Colonel H. J. Craufurd, who had done valuable service in improving the management of army canteens. It is unnecessary to quote the terms in which he put before me his original proposal, because they are substantially embodied in the constitution of the association, which entered on its career in November 1896, registered under the Industrial and Provident Societies Act. Colonel Craufurd was chosen as honorary secretary; the vice-presidents included the Duke of Westminster, Lord Stamford, Lord Chelmsford, the Bishop of Rochester (now Southwark), and Cardinal Vaughan. Sir Colin Scott-Moncrieff, K.C.M.G., is now chairman of the executive council. In 1897 the first public-house was taken over; at present the association controls about seventy houses in different parts of the country. Great care was exercised in framing the constitution to safeguard its principle of disinterested management. This principle was from the first made to apply not only to the conditions imposed upon the managers selected to take charge of the public-houses, but to the regulations governing the functions of the body chosen to direct the business of the association. Taking the latter only for the present: it is provided that the council shall be elected from a list of nominees prepared by the shareholders; that no member other than a registered society, shall hold an interest exceeding two hundred pounds in the shares of the association, and that each member shall have only one vote in respect of the shares or shares held by him.

Capital is raised by the issue of one pound shares, and an outside limit of 5 per cent. is fixed for dividend. As in the Scandinavian system, the net profits which remain over, after making provision for a reserve fund and paying interest on capital, are 'devoted to such objects of public utility, local or general, as the president and vice-presidents, in consultation with the council, may determine.'

Now, let us glance at the aims which the P.R.H.A. exists to promote. They are four in number. The first is: the encouragement of temperance in the use of alcoholic drinks at its public-houses. A very important feature in the scheme is indicated by the second aim: the provision of facilities for the prompt supply of food and non-alcoholic refreshment at such houses. The third aim is: the maintenance of cleanliness and good order. And the fourth is: the purchase of good supplies in the open market.

It will be easily seen that one subtle cause of intemperance can be entirely removed by keeping only alcoholic liquors of the best quality, and it is well known that the virtue of self-respect is imperceptibly reinforced in an atmosphere of wholesome comfort. The association brews its own beer in three inns.

The manner in which these aims are translated into practice may perhaps be most conveniently pictured in a somewhat composite sketch of one of the association's public-houses on an ordinary working day. To describe any single inn as typical of all would be misleading, because the association has control of town as well as village inns and canteens.

From what has already been said, it will have become clear that the P.R.H.A. believes in the policy of making its houses attractive. The inn-fabric is maintained in good repair, and the visitor, as he draws near, notes the bright appearance, suggestive of respectability and comfort. Perhaps, like the 'Sydney Arms' at Chislehurst, the inn possesses a tea-garden; and not infrequently there is a bowling-green attached. At the 'Battle Axes,' Wraxall, seven miles from Bristol, there is a tennis-lawn. The tea-garden of the 'Craufurd Arms,' Wolverton, laid out early in 1908, was much used for bowls, &c., and on Saturday afternoons during the summer there were excellent performances by local bands, the audience sitting at small tables, in the Continental fashion. Entering the inn, the visitor may expect to find neat rooms, well aired and dusted, and with clean windows, arranged with simple but good and solid furniture. Prominently displayed on the walls or in some other conspicuous position he will see notices advertising non-alcoholics; a tariff of prices is also displayed in the bar, tap-room, and parlour, so that there can be no doubt or dispute about the cost of any liquor or food sold there. Credit is not allowed. Probably the inn has a convenient tea-room and one or more bedrooms. Some of the houses have billiard-rooms.

The bar and tap-room are usually equipped with tables and chairs, so that the poorest customer can sit and take his refreshment in comfort. Experience shows that more drinking goes on, and order is more difficult to maintain, in those crude, unfurnished bars where the customers habitually lounge round the bar-counter.

Every P.R.H.A. inn is bound to supply non-alcoholic beverages. The instructions to managers enjoin special attention to the making of tea, coffee, cocoa, &c., with a view to providing them fresh and palatable for each customer; and workmen can obtain their hot cup of tea, or whatever it may be, for exactly the same price as their glass of beer. Any one is at liberty to satisfy his thirst free of charge from the bottles of fresh filtered water which are set out with glasses in the different public rooms. Refreshments in the form of food are provided as a matter of course, not grudgingly and with much delay, as is too often the case in public-houses which concentrate upon the bare sale of alcohol. At one house more tea than beer is often supplied to workmen before the dinner-hour.

The customers who frequent the different houses belonging to the association vary widely in type and in tastes, according as the neighbourhood possesses the characteristics of town or country. The clientèle of many houses would in the course of a single day include carters and cattle-drovers, farm-labourers, navvies, and cycle or motor parties.

An all-important factor in making the reformed public-house a success must always be the personality of the manager. His conduct of the business and his influence over the customers may easily render the house either a complete success or a complete failure.

Among the men employed as managers in the houses controlled by the association we find representatives of the army, the navy, and a variety of civil occupations. It is requisite in every case that the manager should be in sympathy with the aims of his employers; that he should be steady, a good business man, and tactful but firm in maintaining order. The association has been fortunate in finding suitable men who are glad to work under conditions which enable them to make a fair profit without pushing the sale of alcohol, and, to the best of my knowledge, only one of our managers has ever been convicted of any offence against the licensing laws.

A fixed salary is paid to each manager; but he is further allowed the whole of the profits on food, cigarettes, and tobacco, besides two-thirds of the profits on mineral waters. Any profits on cigars go to the funds of the association. The sale of alcoholic beverages, be it large or small, has no sort of influence upon the salary of the manager.

Obviously he has a strong personal reason for drawing the attention of his customers to such provisions of food and non-alcoholic drinks as he keeps in stock. But the question arises, how much is he able to accomplish in this direction? He cannot very well meet an order for a glass of ale with a recommendation to consume a cup of coffee and a sandwich. But he has other resources. He can, for example, avoid every form of advertisement where alcoholics are concerned, while giving rein to his ingenuity in displaying samples of food, mineral waters, milk, &c. He can also accomplish a good deal by getting to know the tastes of his customers, by serving such beverages as tea or cocoa with promptitude, and by taking trouble to see that all food is fresh and served in a clean and palatable way.

The instructions issued by the P.R.H.A. for managers contain several clauses which are intended to be a guide in dealing with the customers who frequent its houses. This paragraph deserves to be quoted verbatim: 'There can be no doubt that a public-house manager who is actuated by a high sense of his responsibility towards the public may, by the exercise of his personal influence, do great and permanent good. He should get to know his customers, or those of them who most frequent his house, so that he may be able, by an opportune and kindly word, to help those whose self-control in the use of intoxicants is weak, or by a timely hint to check the excess which might lead to his having to refuse a customer drink or to order him out of the house.'

As a rule the tactful manager is successful in preventing any of his customers from taking more than he can stand, yet without causing a 'scene' in doing so. By a quiet word or a warning look he intimates that the limit has been reached. One

of the managers employed by the association made it a practice 'to put up his finger' if he thought a customer had had enough. If the required results can be obtained by such pacific methods so much the better; the individual has reason to be grateful because his feelings have been considered, and at the same time other customers who may be present are spared an annoyance and an evil example. But occasions arise when the manager is obliged to take open and decided steps to ensure order. His instructions explicitly justify him in refusing to admit any drunken or quarrelsome person upon the premises, and if a customer shows signs of having taken too much or is guilty of any disorderly conduct, the duty of the manager is to tell such a person immediately to leave the premises. If necessary, the manager may also turn out any recalcitrant customer, though the assistance of a police officer is usually obtained in cases where resistance is offered or threatened.

The manager is, of course, responsible for seeing that the provisions of the Licensing Acts relating to gambling, the sale of drink to children, and so forth are duly observed. He has also to be careful that no games are played except those which have been sanctioned by the council of the association. Various games, such as bowls, tennis, and billiards, have been permitted, and the policy of the association tends to regard with favour the provision of such entertainments. They serve as counter-attractions to mere drinking, and in some cases they have been supplied because the competition of public-houses outside the P.R.H.A. practically made it necessary. It must be added, however, that the opinions of competent and friendly critics differ as to the advisability of having any such games or other adventitious attractions.

There is no doubt that, in cases where the reputation of some houses was not too satisfactory previous to their being acquired by the association, an improved record has followed the change of management. This improvement has, of course, been attended by the loss of some customers. For example, in Messrs Rowntree and Sherwell's *British Gothenburg Experiments*, the Vicar of Plymstock in Devon is quoted as saying of our inn there: 'Many of those who sat and drank by the hour under the old régime, and left the house very drunk at closing-time, now think it too respectable for them, and stay at home. Under the old management the village was often disturbed by rowdyism at night; this has quite disappeared since the association acquired the house.'

In this instance the inn had happily a monopoly of local trade, which means that the temperance results become more far-reaching and more clearly demonstrable than is the case where one or more rival houses provide a refuge for such as find the reformed inn 'too respectable for them.'

Generally speaking, and bearing in mind the fact that a monopoly of local traffic has only been obtained in a few cases, the association may fairly claim to have worked its houses successfully from a temperance point of view.

Financially the association stands in an excellent position. Ever since 1899 the maximum yearly dividend of 5 per cent. has been duly paid, a substantial sum laid by as a reserve fund, and a certain surplus allotted to objects of 'public utility.' In 1908 the sum of one hundred and fifty pounds was placed to the Public Utility Fund account. The allocation of this fund is settled by the council of the association, with due regard to local needs and circumstances.

Grants have been made, *inter alia*, towards the cost of improved water-supplies, for erecting village lamps, for nursing funds, for school funds, for a parish room and a clothing club, and to subsidise country flower and cattle shows.

Such objects are not direct counter-attractions to the public-house, and a certain amount of carefully considered criticism has been directed upon this so-called defect in the policy of the association. While opinions remain divided upon the issue, it should be remembered that the provision of 'direct counter-attractions' presupposes a policy of self-extinction which the P.R.H.A. does not acquiesce in. The objects selected indirectly, but none the less genuinely, promote the cause of temperance by improving the conditions under which the life of the people is lived. Moreover, the provision of counter-attractions means large profits; while reformed management reduces the quantity of alcoholics sold, and so sacrifices a good deal of profit.

A few words in conclusion about the Central Public House Trust Association. Just nine years ago Earl Grey founded this association, which is closely allied to the P.R.H.A., and has adopted almost identical methods, though retaining separate management. It has a less centralised control of its houses, since it has followed the principle of setting up local trust companies, under the general direction of the central association in London. Under the presidency of such able administrators as Earl Grey and his successor, the Earl of Lytton, the companies have rapidly spread over the United Kingdom. Their number is now thirty-seven, including thirty-two in England, Wales, and Ireland, and five in Scotland (not affiliated to the central association). The number of houses under trust management is two hundred and fifty-eight.

Although the numerous county trust companies have unfortunately nothing like a monopoly of licenses within the county, their houses form an instructive chain of object-lessons throughout the country. For example, at two wayside inns belonging to the Leeds Trust scarcely anything was sold under the old management except alcoholics. Now the takings from non-alcoholics and food amount to over seven pounds a week at each house, and working men such as brewers' draymen now ask for tea—an unheard-of request in former days. Again, the Durham Trust reports a very satisfactory increase in the amount of non-alcoholics sold. 'We

are pushing wherever possible the sixpenny dinner, which consists of cold meat, pickles, and bread.' At the annual meeting of the Surrey Trust this year, the chairman, Lord Farrar, raised the question whether the alcoholic liquor sale increased correspondingly with the sale of food. He said that he thought they might give an emphatic 'No' to that idea. In 1908 the alcoholic sales were only thirty-eight pounds in excess of the previous year, an increase of fifteen shillings and twopence per cent., whereas the food sale was five hundred and thirty-four pounds in excess of the previous year, and showed an increase of ten pounds five shillings and elevenpence per cent; therefore it was perfectly clear that the catering in their case must be regarded as the mainstay of their business. The Glasgow Trust has allocated a total sum of £1315 to provide counter-attractions to the public-house. The East of Scotland Trust has by now allotted £3418 to objects of public benefit.

The annual report of the central association will well repay perusal. It not only gives strikingly encouraging examples of successful management, but also frankly admits weak points, and shows the steps taken to tighten and strengthen the system. Everything turns upon vigilant and effective control; and here I am bound to recognise gratefully the self-denying labours of the executive committee of the P.R.H.A., whose unflagging attention to business has raised the pioneer society to such a high level of efficiency.

What the future may have in store for the principle of public management I cannot say; but these associations have certainly been sowing good seed, which may yield fruit in unexpected ways.

THE WHITE POODLE.

THE STORY OF A ROMANTIC WILL.

By W. SHAW SPARROW, Author of *The English House*, *Old England*, &c.

CHAPTER I.

THE green door of a weather-board cabin stood ajar. Near by, under a wide veranda, an invalid sat dozing, with a white poodle asleep on his knees. There was a drowsy hum of wind in hot sunshine, and a dust like chalk-powder floated through the air.

Presently the invalid looked up, roused by the clicking of his gate. The garden was sun-cracked and thirsty; the gate swung open, and through it passed a dark, spruce little man on a tired pony.

'Scorching day, Dr Butler,' the invalid called; and his poodle awoke and growled fiercely.

'Nep bites to-day perhaps?' the doctor asked, laughing.

'Not without leave, doctor. Come along.' And Butler dismounted and came briskly to the veranda.

'Nep's hospitality doesn't improve,' said he; 'and yours, Lilburne, is detestable, for you haven't called me in lately. Why?'

'Because I won't bag your time. You can't patch me up; I'm too far gone for that.'

Butler said nothing, but with his riding-whip he tapped the deck-chair impatiently. Then his manner changed, and he said gently, 'Old man, here's something for you, to be taken in the night when you feel'——

'The night!' interrupted Lilburne. 'It's mid-day *now*, thank goodness! I want a hospital of perpetual daylight. You understand?'

Butler nodded and looked out across the garden. 'When may I come again?'

'This evening, please. And, I say, bring Whitcomb the lawyer.'

'All right.' The doctor then shook hands and left the veranda.

Johannesburg lay five miles to the south-west, and as Butler ambled there through the scorching heat he thought with pity of Tom Lilburne, one of those young men of good family who ruin themselves with debt and drink, and win by that means an exile in some colony or other.

Tom was a broken man, a consumptive, when his family got rid of him; but one relative, his great-aunt Jane Moira, remained his friend, and from her he received by will the interest on twenty thousand pounds in Consols. This capital was never to be touched, but the yearly interest was left unguarded, so that Tom could bequeath it to any one he pleased.

Yet he was anxious. How could he, an outcast, find a proper legatee? That question worried him; and in his cabin, attended by a man-servant and by Nep the poodle, his one amusement was to invent tales about legatees and to elaborate fantastic wills. Once he decided to honour the memory of his great-aunt Jane Moira. A splendid monument should be put up in her village church of Midhurst in Sussex; its cost was to be twenty thousand pounds, and the sculptors or their assignees were to be paid in yearly instalments of three hundred pounds.

But a new idea came to him one night when he could not sleep. His cough shook him like an ague, and a great loneliness pressed upon him like an avenging fate. Despair made the dark hours terrible, and at last his courage broke. 'There's not a pal in this wretched world!' he cried aloud. 'I'm cursed'——

But Nep refused to be forgotten. He whimpered, leapt on to the bed, snuggled to Lilburne, and licked his face, so that Tom was overcome by gratitude. From that moment his legatee was

found. Nep should inherit every farthing of the yearly interest!

Tom was delighted with this quaint decision. He would keep his intentions secret; and the dog, sent out into the world, should find some one to share the legacy. Yes, Nep should choose a new master for himself!

But although these thoughts amused him for several weeks, it was no easy thing to put his legatee under the law's protection; much perseverance was needed, and a month passed before Tom was satisfied. The will then lay in duplicate on his table, and it seemed all right. Yet Tom waited anxiously for Butler to return with Mr Whitcomb the lawyer.

They arrived at seven in the evening. A table was ready with writing materials. They sat down, and Lilburne came to business at once. 'I've been rather bored in this cabin, pegging out daily for six years,' said he.—'Such an unconscionable time in dying isn't cricket on Fortune's part, Mr Whitcomb.' And the lawyer suddenly hung his chin, shut one eye, and coughed with much uneasiness. 'Yet I've managed to kill time,' Tom went on. 'My hobby—a tip-top thing—has been planning and writing wills.'

Mr Whitcomb said 'Ah!' with much interest, and his open eye gazed at the low ceiling.

'Not ordinary wills,' continued Lilburne. 'Mine were pretty to look at—fine penmanship, you know—topping! Here's the last and the best—in duplicate.' He handed two scraps of paper to the lawyer, who accepted them with gingerly reluctance. 'The writing is minute—a teasing thing to do,' said Lilburne with pride.

'And teasing to read!' Whitcomb snapped.

'Try this magnifying-glass,' the other returned.

Whitcomb, troubled and puzzled, frowned with great suspicion at the scraps of paper till Butler told him to be quick. Then he took the magnifying-glass and read the will slowly.

'Great Scott!' he muttered, and his jaw fell again and his left eyelid closed quickly.

'I've done something unique perhaps?' asked Tom.

'You have. This paper lies on the palm of my hand.'

'Well, just read the will aloud to Butler'——

'Unusual—all's unusual this evening!' the lawyer interrupted peevishly.

'Fire away, old man; let's hear it!' cried Butler. And Whitcomb began to read as follows:

'I, Robert Lilburne, dying at Sandy Cabin near Johannesburg, South Africa, make this my last will and testament. Whereas under the will of my great-aunt Jane Moira I am free to bequeath the interest on twenty thousand pounds invested in Consols, I now give and bequeath that yearly interest to a person whose identity will be discovered to my solicitors in the following way: That person will receive from me, through a chosen agent, an exact duplicate of this my will, and this duplicate will be taken by that person, as my legatee, and given to Messrs Cranby & Ross, solicitors, at 25 Chancery Lane, London; and the said solicitors will receive that duplicate as a definite and final proof that my rightful legatee is found. The duplicate is in all ways an exact fac-simile of this my will, and is known to-day only to myself and the two gentlemen who witnessed my signature. Those witnesses, by to-morrow's mail from Johannesburg, will send this my will by registered post to the said Cranby & Ross; while I, through my chosen agent, will transmit the duplicate to my sole legatee. And in confirmation of these my last wishes I now sign my name below, this nineteenth day of March 1906.'

'Bah!' snapped the lawyer.

'Can't you cable for the legatee's name?' asked Butler.

'Impossible, for several reasons. Here's one: I might peg out before receiving a reply. Here's another: a cablegram might fall into dishonest hands, and how could we verify the name sent to us?'

'But, then,' returned the lawyer, 'have you never known the name?'

'Never. You may admire persons without knowing their names.'

'True. But you run a serious risk.'

'Indeed! How?'

Tom leant across the table, and Whitcomb said, 'Well, *any one* might find the duplicate—a thief or your greatest enemy.'

'I know,' Lilburne said calmly.

'But the risk isn't common-sense,' the lawyer persisted.

'It's the only sense I can use here, since my legatee's name can't be got.'

'Yet you can guard yourself,' said the lawyer. 'Your legatee should be a person of good character, and should prove that he received the duplicate will in a manner specified by you and known only to me and Cranby & Ross.'

'I thought of that,' said Lilburne. 'But people have such different views on character. Cranby and Ross might be deucedly particular, and then the money'd stick fast in their Chancery Court of Ideals. No.'

'Here's a suggestion.' It was Butler who spoke. 'Whitcomb shall write out the substance of this conversation and send it to Cranby & Ross, with his signature and mine to the letter.'

'Not bad,' the lawyer agreed. 'It would show how we discussed the will, and that Mr Lilburne held to its unusual terms.'

'Just so,' said Tom. 'Next point, now. Are those papers exact duplicates?'

Whitcomb and Butler spent half-an-hour over that task.

'By Jove! they're like prints from an engraved plate.'

And Lilburne smiled happily at Dr Butler. 'You've noticed the sketches at the four corners of each paper?' he asked with pride.

'A dog's head,' said Whitcomb with a touch of scorn.

'The head of a particular dog—eh, Butler?'

'Certainly. A portrait of Nep, your white poodle.'

'A tip-top friend of mine,' Tom explained. 'That's why I put him in my will.'

The papers were then signed and witnessed.

'Here's an envelope addressed,' said Tom to Mr Whitcomb. 'Seal it up at once, and to-morrow we'll post it, registered, to Cranby & Ross. By the same mail, in another envelope, kindly send your summary of to-day's interview, and with it another will, which I want you to draw up. I'll sign it to-morrow, a day later than my present will.'

'In what terms?' said the lawyer, surprised.

'These: If at the end of seven years Messrs Cranby & Ross or their assigns receive no news of my legatee, then the accumulated interest on the seven years and all future interest on the twenty thousand pounds are given and bequeathed by me under trust to the Royal Academy to be used yearly for the encouragement of dog-painters. Is that clear?'

'Yes.'

'A compliment to your white poodle?' asked Dr Butler.

Tom Lilburne nodded. 'And now for my last point,' said he. 'I'm anxious about my dog; and I feel that my elder brother Henry might like to have the first chance of giving Nep a good home. See?'

'Yes.'

'And, Mr Whitcomb, kindly mention that point in your summary, will you?'

'If you think it important enough.'

'Oh, it's very important!' cried Lilburne. 'It will show I've no ill-will for my brother though I don't leave him my money. He's rich, you see—got every penny of my father's big fortune.'

'Very well,' said Whitcomb. 'And Nep must be sent to your brother?'

'Oh yes. He lives at 105 Tite Street, Chelsea, London. But how is Nep to go to England?'

'I can help you there, perhaps,' said Butler. 'The dog could accompany me when I take my holiday.'

'Good of you, doctor! But Nep's unlike other poodles, as you know; he's difficult and savage—never allows any one, except me, to touch him.'

'Well, Lilburne, make him less unfriendly towards me; then we can travel together.'

The evening's business ended at that; and Butler and Whitcomb went home, not a little astonished by their interview.

Lilburne passed a bad night, but in the morning he got up and waited with feverish anxiety for his friends to return.

They came at midday, bringing with them the second will and a detailed account of yesterday's interview.

'We've put matters at great length,' said Butler, 'and Whitcomb thinks you ought to approve what we've written by signing your name under his signature and mine. It will help your London solicitors to carry out your willed intentions.'

'Good idea!' said Lilburne.

By two o'clock every detail was settled, and Lilburne placed in Whitcomb's hands fifty guineas for any work which might arise at a later time in connection with the will.

His business friends having gone, Tom fetched his white poodle from a small room near the kitchen. Then he drew from his pocket a cylinder of tarnished silver three inches long, an inch in circumference, and with a thin chain that passed through three silver eyes. From one end of this little case he now unscrewed the top and pulled out a circular stick of wood; and after that he took the duplicate will and began to roll it with great care around the stick, the written side inwards. With strong thread the paper was soon tied securely.

Having put back the stick and screwed on the top, Lilburne, with a quick movement, drew the poodle towards him, and his hands played for a moment with the long curls of hair on the dog's neck. 'Here's the place for it, Nep—the very place;' and he hid the little cylinder under the curls and fastened the silver chain quite close to the poodle's neck. 'It can't be seen, Nep, and it won't be found until you choose a new master.'

The dog stared wonderingly at Tom; and his neck twitched, as if the chain and tube tickled him.

'Don't fret, old man; I've done nothing wrong to you. See?'

But the poodle continued to look at him with bright eyes full of questions.

. . . . . .

Lilburne died three weeks later, and was buried at Johannesburg. Nep refused to be comforted, though he accepted Butler as a make-shift friend.

'The poor beast gets thinner every day,' said Butler to Mr Whitcomb, with professional anxiety in his manner. 'A sea voyage may do good, eh?'

'The dear patient will improve, Butler. But when do you leave?'

'Next boat.'

During the voyage to England nothing of moment happened. Everybody wished to make friends with Nep, but the dog snarlingly declined. He ate little, he went on pining, and arrived in England very thin, unkempt, and disreputable-looking—a white poodle only in name. As Butler was afraid to wash Nep, he wondered how this unclean, ill-tempered dog could be given to Henry Lilburne? Ought he to write first, or should he call one morning at Tite Street? Butler decided at last that letters were a nuisance; in them too much or too little would be said; and, besides that, Henry Lilburne might be a man of moods. It would be better to take him by surprise and watch his behaviour to the white poodle.

So one evening Butler called at Tite Street. A sleek footman opened the door.

'Mr Lilburne at home?'

'Yes, sir; but busy. Parliament is sitting.'

'Good! I call on urgent business. I come from South Africa. Can Mr Lilburne spare me five minutes?'

'I'll see, sir, and give 'im your card. The footman went away. In a minute or two he returned.

'Mr Lilburne will see you, sir; but this dog, please—what of 'im, sir?'

'He must come with me,' said the doctor, noticing the servant's hesitation.

'It 's a bit risky, sir, please.' But the man went out into the hall, crossed a short passage, and entered a fine study lined with bookcases. Sitting at a wide bureau that faced the door was a broad-shouldered, red-haired man with a mottled face; he looked a man of action, even of violence.

The butler having left the room, Henry Lilburne said, 'What can I do for you?'

The voice was a surprise for Dr Butler; it made him start, recalling to his memory the voice of poor Tom Lilburne. Nep also was astonished; he pricked up his ears, thrust out his head round the corner of the bureau, and sniffed eagerly.

'Why did you start?' asked Henry Lilburne; and Butler explained why. 'Ah! So you knew my brother?'

'I wrote to you after his death—William Butler—you remember my name?'

'It comes back to me now. Yes; many thanks. Will you take a seat?'

Dr Butler sat down. He disliked this red, frigidly eager man, and wondered how two brothers could be so alike in voice and so unlike in all else. Nep, too, becoming more and more puzzled, strained at his leash, and presently he whined in a low, caressing manner.

'A dog!'

'A white poodle—Nep, your brother's dog.' Butler then related all that he had to say.

From first to last Henry Lilburne was silent, listening with a cold impatience. 'Well, I hate dogs,' he declared at last, 'but I'll look at this one.' He rose quickly. 'The dog's savage, you said?'

'Yes; but he's anxious at present about your voice.'

'Indeed? There's something in family, then, after all!' This was a sneer; and Henry Lilburne laughed unkindly as he moved from his bureau to the fireplace. 'We'll look at each other from a distance,' he added. On reaching the hearthrug Henry Lilburne turned about. 'Ah, a *white* poodle!' he muttered; 'or, rather, a sooty poodle, stained almost black. Has the poor fellow been long in London?' He put the question in a low voice of mock sympathy.

Nep, straining forward to the full length of his leash and sniffing the air quickly, gazed with disappointment at the stranger; but his manner was quite friendly.

'Not very savage now,' said Henry Lilburne. 'He knows the family *aura*, perhaps; they say a family has a distinct and peculiar odour.

'Will you keep Nep?' asked Butler.

'No; I couldn't live with *that* dog. His eyes are too intelligent—they seem uncanny. Some *accident* might happen to the beast if he stayed here. Have I not told you that I *hate* dogs?'

'Well, then, Mr Lilburne, Nep must be mine.'

'Why not?' Henry Lilburne spoke with evident relief. 'I'm upset by such a legacy,' he went on. 'By the way, though, talking of legacies, what about my poor brother's will? Tom had the yearly interest on twenty thousand pounds to bequeath to—to—er—his boon companions.'

'He had no such companions in South Africa,' replied Butler sharply.

'Ah, well!' said Lilburne with a yawn. 'Cranby and Ross have told me of the will and its infantine peculiarity. My brother was—was sane?'

'Quite sane.'

'Then he hit upon something quite new in wills. Ah, well!' And Henry Lilburne yawned again. 'But what became of the duplicate will?' This question was put abruptly and in a sharp tone.

'I don't know.' Butler spoke with equal abruptness. 'Your brother kept that to himself. But he mentioned both the will and *you*, Mr Lilburne, in the last moments of his life.'

'He did?'

'Yes. He said the will was just, and hoped you'd not despise Nep. He spoke urgently on that point.'

'Was that irony?'

'No, certainly not. Tom had been thinking of his boyhood when you taught him to find birds' nests and to climb trees, and was fond of you again.'

'Was that before the legacy of Nep?'

'Three weeks later,' said Butler. 'Your brother was very anxious at the last that Nep should be yours.'

'Impossible! Why, the very odour from a dog annoys me;' and the man's nostrils expanded with disgust.

The legacy, then, was not to remain with Nep at Tite Street; indeed, Henry Lilburne was in a hurry to get rid of his visitors.

'Pardon me, Dr Butler, I must go to the House now; there's a division at nine o'clock.' He crossed the room, saying, 'Just pull that brute aside, please,' and leading the way into the hall, went rapidly to the front door and opened it. 'A fine June evening, doctor,' he said in more friendly tones; but scarcely had he finished speaking when Nep jumped forward, wrenching the leash from Butler's hand. With a bound he reached Henry Lilburne, sprang up at him, and whimpered strangely. Though the dog seemed eager to make friends, Henry Lilburne turned red with anger, cursed, kicked the dog violently several times, and drove poor Nep into the street, yelping and panic-stricken.

'I told you I hated dogs!' Henry Lilburne panted.

'You brute!' cried the doctor excitedly. 'And I'll make this known!' With that threat on his lips he ran into the street, but no dog was to be seen there.

Having searched in vain till ten o'clock, Butler returned to his hotel and sent advertisements to the *Post*, the *Mail*, and the *Times*. The white poodle must be found!

Nep, meanwhile, running here and there in headlong panic, had come at last to a mean little by-street near the King's Road, and all at once a happy voice called to him in a cajoling manner.

'Dig, dig, diggie!' the voice shrilled. 'Come, boy! Come, mannie!' And Nep, panting after his long run, hesitated, then stopped dead, and looked with eagerness across the narrow street, his eyes drawn towards a young fellow who sat in the twilight at the door of a little, slovenly house.

'Come, old man! Poor boy! Poor boy!'

Nep, curious and eager, crossed the roadway; within a few yards of this new friend he halted, and for several moments they gazed at each other—Nep in a sort of pleased doubt, and the young man in excited expectation.

'Come, boy!'

Nep went a step nearer, then another, still pleased and still doubtful.

'And what have they done to you, mannie? Poor old chap!'

'Mr Elwood!' cried a woman's voice from the house; but neither man nor dog heard it, so engrossed were they in watching each other. At last Nep made up his mind, for he jumped forward and licked Elwood's hand. The young fellow, in his delight, wanted to fondle his new chum; but Nep stepped away and showed his teeth, growling.

'Bad form!' said Elwood laughingly. 'Are you a savage, diggie? And shall we go upstairs, old fellow?' He got up and limped to the door. 'I say, Mrs Price, do come here for a second or two!' he called.

In a moment a sunny-faced woman appeared. 'Mr Elwood,' said she, 'you oughter be in bed with that knee of yours, an' all because you will play 'ocky, a-laying of yourself hup as if you 'ad money enough for me an' doctors too.'

'Don't worry about me, Mrs Price. Give all your attention to my new friend. There he is!'

'A dorg it is, Mr Elwood. An' where did 'e come from?'

'Don't know; he's a godsend, so I want to keep him. You won't object?'

'No.'

'Then I'll call him Peter, after your husband. Hurrah!'

Mrs Price pretended to grumble; but Elwood whistled to the poodle, and then limped slowly upstairs to his room, a little attic with a single gas-jet and a small window looking north. Before the window was an easel; the walls were covered with sketches of animals; a narrow, low bed stood in one corner, with a washstand and a hand-bath near to it; a table occupied another corner; and here and there were oddments of useful things, three chairs, two cupboards, a black coal-box, a telephone by the fireplace, a stuffed fox above the mantelpiece, a stuffed eagle perched on a wall-bracket, and other stuffed birds hung by strings from the ceiling.

'Ah Peter,' cried Elwood to Nep, 'what a model you'll be!'

From one cupboard he then took some milk and bread, and shared them equally with the poodle. From the other cupboard he got an old dressing-gown, folded it into a cushion, and having placed it near his bed for Peter to sleep on, whistled with pleasure. He then undressed himself, the happiest boy-man in London. 'Hurrah, what pictures we'll do together, Peter!' he said presently from between the sheets, then turned on his side and slept like a top.

(To be continued.)

A GOLD TRAIN.

CHARLES KINGSLEY, in that most romantic but at the same time realistic of his novels, *Westward Ho!* describes a gold-train in Spanish South America, as it marched, all unconscious, into the ambush laid for it by Amyas Leigh:

'Up they came slowly, and all hearts beat loud at their coming.

'First, about twenty soldiers, only one half of whom were on foot; the other half being borne, incredible as it may seem, each in a chair on the back of a single Indian, while those who marched had consigned their heaviest armour and their arquebuses into the hands of attendant slaves, who were each pricked on at will by the pike of the soldier behind them. . . .

'Last of this troop came some inferior officer, also in his chair, who, as he went slowly up the hill, with his face turned toward the gang which followed, drew every other second the cigar from his lips, to inspirit them with those pious ejaculations . . . which earned for the pious Spaniards of the sixteenth century the uncharitable imputation of being . . . the most abominable swearers of all Europeans.

'A line of Indians, Negros, and Zambos, naked, emaciated, scarred with whips and fetters, and chained together by their left wrists, toiled upwards, panting and perspiring under the burden of a

basket held up by a strap which passed across their foreheads. . . . There were not only old men and youths among them, but women—slender young girls, mothers with children running at their knee; and at the sight a low murmur of indignation rose from the ambushed Englishmen. . . .

'But the first forty, so Amyas counted, bore on their backs a burden which made all, perhaps, but him and Yeo forget even the wretches who bore it. Each basket contained a square package of carefully corded hide, the look whereof friend Amyas knew full well.

'"What 's in they, captain?"

'"Gold!" And at that magic word all eyes were strained greedily forward, and such a rustle followed that Amyas, in the very face of detection, had to whisper, "Be men, be men, or you will spoil all yet!" . . .

'And after them came, with their bearers and attendants, just twenty soldiers more, followed by the officer in charge, who smiled away in his chair, and twirled two huge mustachios, thinking of nothing less than of the English arrows which were itching to be away and through his ribs. The ambush was complete.'

Such was the train as the poet-novelist conceived it, and so accurate was he in all the details of his story that we cannot but suppose that it was a correct description of the march of a gold-bearing party from the mines to the coast when the king of Spain held sway over the north-western part of the South American continent in the days of our Queen Elizabeth.

Gold is still conveyed from the mines to the sea, and in other parts of the world as well, to be thence transported throughout civilisation. Here we propose to give some account of a gold-train as now to be seen in South Africa, and far different we shall find it to be from that which met the eyes of Amyas Leigh.

To take the question of distance first. It is a long way from Johannesburg to Capetown; but as that distance is covered by railway, it is in point of time neither a long, nor is it necessarily a perilous, and certainly it is not a cruel journey. The locomotive takes the place of the toiling Indian slaves; and the guards, though they travel under somewhat strange conditions, are far more comfortable than were the Spanish captain and his men when, seated in their chairs, they were jolted by their bearers up and down the rough mountain-paths.

The train, it is true, is under the control of Government, as was that in the Far West; but it is a far different Government which has to do the work, and the transportation of gold is so managed on the most business-like principles in South Africa that the precious metal is handled as other merchandise would be, save only that additional precautions have to be taken which cause the carrying of gold to differ from that of ordinary goods.

To begin with, though it goes by train it goes in its own special vehicle; and a very strange vehicle indeed is the specie-van, as it is called, on the South African line. It is a long truck, some thirty feet in length; and, except that it has two barrel windows on each side, and what is called a square domed top, it is not unlike an ordinary goods-truck, as it is painted teak colour to correspond with the other coaches which compose the mail-train. But if we were to scrape off this coating of paint we should come to solid steel sides, and indeed it is made of steel throughout. The frame on which the body rests is of the usual bogie character—that is to say, it is furnished with small trucks of six wheels each, one at each end; but attached to the frame and inseparable from it is that which forms the central interest of the vehicle, the safe or coffer which contains the gold. You might cut off the whole of the body portion—that is, if you could manage to negotiate the steel walls—and you would find the safe intact. You might tear off the bogie trucks, and the frame and safe would still be attached to one another. You might hurl the van down an embankment, or send it crashing into other coaches in a collision, and the safe would still be where it was before. There is no possibility of carrying off the safe unless the huge carriage-frame is carried off as well.

The safe rises up through the floor of the van and does not occupy any great space. The remainder of the interior is fitted up as a comfortable travelling saloon. There is a table in the centre, and on each side of this is a sofa. Above are two frame-berths which can be let down at pleasure, there are all the usual arrangements for a long journey by rail, and there is a stove at which cooking can be carried on.

And who are the occupants of this specie-van? They are three picked men of the Transvaal police force, and the journey is taken once a week, though not the same men are always on this duty of guarding the gold-train.

Let us give a little description of the weekly mail-train to which this van is attached. It leaves Johannesburg every Monday at six o'clock in the evening, and arrives in Capetown at the docks and alongside the mail-steamer at midnight the next day; consequently the run is one of thirty hours. It is drawn by a powerful passenger-train locomotive—that is, one with six wheels coupled. The same engine does not run all the way. It is changed with its men, at the different railway systems. Attached to the locomotive are nine sixty-two feet bogie coaches, including a dining-car. It may be mentioned that in these days of luxurious travel trains are fitted up with barbers' shops, and even a hot bath can be obtained on board. Next comes a travelling post-office, and then follows the precious specie-van. The guard's and baggage vans complete the train.

Let us return to the specie-van. When the freight has been placed in the safe, and duly vouched for and locked up, the three guardians enter, and

are themselves locked into the car, the doors of which cannot be opened again until the train reaches Capetown, except for the fact that there is a key kept in a glass case which must be broken before it can be got out. It is obvious, therefore, that this emergency-key cannot be used without leaving plain evidence that such has been the case. This key would probably only be used in case of fire to save the men from being roasted alive. Of course these policemen carry revolvers, but there are no other armed men on the train. They are not all three actually on duty the whole of the thirty hours. Two of them may sleep, or smoke, or cook at will, but one must always be on the alert; and to make sure that this is the case he is provided with cards, one of which he places at intervals of a quarter of an hour in a sort of clock which duly marks the hour at which each is inserted.

All these precautions make it very obvious to train-breakers that there is no chance of robbing the specie-van, and indeed an attack on it has never been attempted. But at times, though only rarely, a train on this system has been 'held up.' Such an attack took place not long after the Boer war, the train selected being the railway service pay-train, which goes from station to station delivering the pay of the men and of the officials, and therefore starts with a considerable amount of ready money in its coffers. On this occasion the train was derailed by the line being purposely broken. No official except the fireman was injured, and the guard shot two of the would-be robbers; the remainder of the gang fled, but were most of them afterwards captured. Even Amyas Leigh would have hesitated before he attacked a gold-train of the present day.

DEEP-SEA LIFE.

By the Honourable GLADYS GRAHAM MURRAY.

NATURALISTS of olden days were of the opinion that there was an absence of life in the deep seas. To-day this theory is known to be incorrect, and the fact that a deep-sea fauna exists is familiar to every zoologist.

The relationship between animals and their environment is a subject which deserves close attention, for, little by little, animals modify themselves to the conditions under which they live. It is, therefore, interesting to consider the physical conditions of the mighty deep. To these enormous depths no sunlight can penetrate, for it has been reckoned that after a depth of five hundred fathoms (three thousand feet) the sun's rays will be unable to pierce their way. Such illumination as exists in very deep waters is doubtless due to the fact that many deep-sea fish possess phosphorescent organs.

The late Sir Wyville Thomson wrote that after he left Cape Verde Islands the sea was a blaze of phosphorescence: 'There was no moon, and although the night was perfectly clear . . . the lustre of the heavens was fairly eclipsed by that of the sea. It was easy to read the smallest print sitting at the after-port in my cabin, and the bows shed on either side rapidly widening wedges of radiance so vivid as to throw the sails and rigging into distinct lights and shadows.'

If phosphorescence such as this exists at great depths it accounts for the well-developed eyes and brilliant colours of some of the deep-sea animals; on the other hand, a large proportion of the denizens of the deep possess either no eyes or eyes reduced to mere vestiges.

At great depths there is no movement of the water, no tides are felt, and no gales blow to ruffle the bottom of the abyss. Owing to the absence of sunlight plant-life ceases to exist, and a vast silence must reign perpetually. It is difficult to realise the immense pressure of such deeps, for at a depth of over two thousand five hundred fathoms (fifteen thousand three hundred feet) the pressure per square inch is two and a half tons; whereas on land the pressure exerted is under fifteen pounds per square inch. Should the fish, therefore, inhabiting these depths get carried upwards to the surface, the swimming-bladder becomes greatly expanded, and when they reach daylight generally bursts.

It is interesting to consider the question of the temperature of the sea. Deep water is always very cold, but owing to the influence of polar currents the temperature for a given depth may not be the same. Research has shown that in the Atlantic Ocean there is a strong predominance of the Antarctic polar current.

The carpet of the deep sea is composed of different muds and oozes. Globigerina ooze is that which is chiefly composed of the shells of that minute animal-life, the *foraminifer*. It is found at depths ranging from five hundred to nearly three thousand fathoms in equatorial and temperate latitudes, but not in Arctic seas. Ninety-five per cent. of this ooze is made up of carbonate of lime.

The commonest of sea-deposits is that known as red mud. This is said to exist over one-third of the earth's surface. The shells of the different animals are acted upon by the free carbonic acid which sea-water contains, and they are quickly ground down by this powerful solvent. Another ooze is radiolarian ooze, in which almost no trace of carbonate of lime is found; this occurs in the deepest waters of the central and western Pacific Ocean, whilst in the deep water near the Antarctic circle a diatom ooze is found.

Zoologists of to-day make a special study of the geographical distribution of terrestrial animals, mapping out the world into different regions and sub-regions; but there is always some debatable ground, for Nature has no set limits, and one fauna will gradually merge into another. In the sea no mountain-ranges or great deserts act as barriers; consequently the fauna of the ocean varies according to the temperature, pressure, the amount of light, the salinity of the water, and the food-supply.

Three great primary zones are recognised. These are the Pelagic, the Neritic, and the Abysmal zones. The Pelagic zone includes the superficial waters of all seas; whilst the Neritic (or shallow-water zone) embraces all depths less than five hundred fathoms, including inland seas, shores of great continents and isles, and shallow banks in the great oceans. The last well-marked zone is the Abysmal, which extends from the five-hundred-fathom line to the greatest depths of the ocean.

It is interesting to consider the views which are advanced by naturalists as to the origin of the mighty abysmal fauna; and the question arises as to whether the curious creatures that live at such mighty depths—many of them in total darkness—are the remnants of the fauna of shallow prehistoric seas, or are the progenitors of the shallow-water population. The explanation which is generally accepted, and which was put forward by the late Professor Mosely, is that the fauna of the deep sea has been derived from successive immigrations of the animals inhabiting the shallow water; and this theory is greatly strengthened by the fact that, as a rule, the deep-sea fauna is much richer in the neighbourhood of land than in regions far from it.

Marine animals pursue three great modes of life. There are those—such as the jelly-fish or medusæ—which float and drift with the currents of the sea, and are scarcely able to determine for themselves the direction in which they travel. This portion of the ocean's fauna is called the *Plankton;* whilst the *Nekton* are those animals which are capable of vigorous swimming movements, and are able to migrate freely from one part of the sea to another. Lastly, there are those animals which remain as fixtures, or are only capable of crawling over the rocks or sand; and to this group the name of the *Benthos* has been given.

It is interesting to look at the colours of the skin of the different deep-sea animals, which vary to a remarkable extent in the separate groups—some brilliant colours being found in certain cases, and in others a sombre hue predominating. Among the mollusca violet is a prevailing colour, and in a specimen brought home by the *Challenger* Expedition a rose-coloured denizen of the deep was reported. Various shades of red seem to prevail among the crustacea, whilst the large eggs of some of the deep-sea genera were of a brilliant light blue. This latter colour is very rarely met with in the fauna of the abyss. To turn to the deep-sea jelly-fishes, deep violet or a yellowish-red hue is said to predominate; whilst Agassiz reported a particular species as being remarkable for the light carmine tint. In speaking of corals and deep-sea anemones, the same author recorded that 'some deep corals were scarlet, deep flesh-coloured, and pinkish-orange.'

The eyes of the deep-sea inhabitants have undergone some curious modifications. In the majority of cases it is usually found that the eyes are either very large or very small. A species of fish dredged up from a depth of over one thousand two hundred feet by the *Porcupine* Expedition possessed a pair of well-developed eyes on short footstalks. In some cases the loss of sight is greatly compensated by the high development of the tactile organs, which probably possess a very delicate sense of touch.

Many deep-sea animals have the power of emitting phosphorescent light, some possessing distinct organs for this purpose. Certain sharks secrete a highly phosphorescent slime in their skin-glands; whilst other deep-sea fish display curious eye-like organs down the sides of the body, forming, as it were, a series of miniature bull's-eye lanterns. Again, others possess glandular organs behind the eyes or on the head and shoulders.

In thinking over the conditions of deep-sea life one is once again brought to realise how each member of the animal kingdom modifies itself according to circumstances. Whether the student is a believer in the great theory of a design in Nature or not, he is brought face to face with the eternal fitness of things.

> 'So careful of the type?' but no,
> From scarpèd cliff and quarried stone
> She cries, 'A thousand types are gone;
> I care for nothing, all shall go.'

But however reckless Nature may appear to be in her use of means, the result is seen to be a general harmony between the living thing and its lifeless surroundings.

THE FACE OF AN ANGEL.

TO H. G. C.

Have you seen an angel-face,
Full of beauty and of grace?
Such a face I too have seen
Fairer than a lily's sheen.

Have you heard an angel-song,
Pure and high and true and strong?
Such a song I sometimes hear
Falling grandly on the ear.

Not alone on Christmas morn,
When our Saviour Christ was born,
Do these angel-forms appear;
They are often very near.

Those who lead us to the light,
Singing songs of hope by night;
These, though human to our eyes,
Are but angels in disguise.

THE PALAIS-ROYAL.

ORIGIN, SPLENDOUR, AND DECADENCE.*

IN THREE PARTS.—PART I.

PARIS, in all my ruinous experience, is the only mine I have meddled with which does not fail in depth. It becomes richer the deeper you delve into its secrets. The bookstalls on the quays afford machinery to the poorest miner, and the only difficulty is an *embarras de richesse* in the choice of shafts. For eight sous I bought *Les Chroniques du Palais-Royal.* In a delightful introduction that reminds one of Scott, Saint Marc presents you to an old marquis, the last of his race, a nonagenarian who had made the palace his home since 1815. He is saturated with the history and spirit of the place. He makes you live through the 'mad, bad, glad, sad' years of the past, through all its changing story.

The official description on a plaque at the Galerie de Chartres entrance to the Palais-Royal, at the back of the Théâtre-Français, is as follows: 'The Palais-Royal is the creation of Cardinal de Richelieu, who caused it to be built, from 1629 to 1636, by the architect Le Mercier, on the sites of the Hôtels de Mercœur et de Rambouillet, and gave it the name of Palais-Royal. It was not named Palais-Royal until 1642, under Louis XIII., to whom the cardinal had bequeathed it.'

Cardinal Richelieu, the great Minister and tyrant of Louis XIII., wanted a palace to match the almost royal state he affected. In 1624 he levelled the old city wall of Charles V. and filled up the moats—Louis giving him the land they occupied—which then stretched from where the Théâtre-Français now stands across the present gardens of the Palais-Royal. Some fourteen years later, in panic-fear of the coalition which was invading France from Picardy and from Burgundy, the people bitterly reproached him for destroying the defences of the city, surrounded his 'Palais-Cardinal,' as it was then called, and prevented his passage to visit the king. With supreme audacity, he went out alone among them and restored confidence. Wonderful voluntary armies were organised, and the war was waged successfully on five frontiers at once. He secured the waste lands and market-gardens near the old walls—'*veritables foyers d'infections.*' † He bought up the rest of the necessary land from the owners of the châteaux and houses, large and small, notably the Hôtel Rambouillet and the academy of Benjamin the famous riding-master. While the palace was being built Richelieu occupied a house standing on a portion of the site of the present theatre, and extending to the Rue de Richelieu. This building was afterwards occupied by Anne of Austria, and known as the Hôtel Bryon. Here were instituted and housed—thanks to his many-sided culture—the first academies of painting and architecture; and in 1673, in the court of the hôtel, without a roof, took place the first public exhibition of pictures in France. How the souls of the artists would suffer if they could witness the degrading exhibitions of decadent vice which are now permitted in the galleries of the Palais-Royal by the guardians of '*Liberté*'!

On the other side of the palace, between the theatre which he attached to it and the Rue des Bons Enfants, Richelieu built the Hôtel Melusine, afterwards occupied by the execrable Abbé Dubois, the tutor and evil genius of the regent. Here, also, honour to his memory, he originated the assemblies of men of letters. Senseless vanity, one of his surprising weaknesses, made him aspire to be their Mæcenas, but he was none the less the real founder of the Academie Française, first chartered by Louis XIII. in 1635.

We need not describe minutely the architecture of Le Mercier, which Sauval, writing thirty years after his death, described as ugly. Outwardly it

† The remains of a large Roman villa were discovered about the centre of the gardens, with huge pipes for a water-supply from the hills round Paris; also, medals of Aurelius and Diocletian, and cuirasses of Amazons.

* *All rights reserved.*

was severe, and in general lines resembled the present building. All that now remains of it are the carved anchors and prows of vessels, emblematic of Richelieu's management of the navy, in the Galerie des Proues, at the right side of the inner or Grande Cour. Where the present Galerie d'Orléans stands there was a fine terrace, with balconies and arcades giving a charming view of the gardens.

The interior of the palace was in many respects very fine, and in some ways unique for that epoch. Besides a chapel and a library, and the cardinal's rooms, there was in the left wing the famous gallery containing the portraits of the twenty-five illustrious men of France, the great captains, &c., of the past —including, of course, Richelieu himself. Turenne was added later. Above Richelieu's portrait were the words, '*Hic stante cuncta moventur.*' He was much wounded, after showing his great collection proudly one day to his courtiers, to find in chalk below it, '*Ergo cedente, omnia quiescent.*' Champaigne, his favourite painter, was paid from about ten pounds to thirty pounds for his portraits.* On the right wing he became the patron of comedy by building what was then a large theatre, with a smaller one attached. He imagined himself a worthy rival of Corneille. He also indulged in private vengeance when he vilified the queen under the thin disguise of *Mirame*, which he produced here. She and Madame de Chevreuse had mocked at his courtship, and encouraged his Eminence to dance a *sarabande*, dressed as a clown, for their edification. Cardinal and courtier, he contrived to assemble in his palace everything that wealth and taste could imagine for the enjoyment of the world, the flesh, and the Church.

The gardens were very large. The Rue de Richelieu and the Rue des Bons Enfants, where he built houses and sold them, were the boundaries then, and they formed quite a park much frequented by lovers in the evenings. In 1650 a very complete miniature fort with a moat was made for Louis XIV. (who was nearly drowned in one of the ponds, thanks to his brother Philippe) and his 'Garde d'Honneur' of boys. Hare, stag, and boar hunts, and a battle between a bull and dogs, were organised.

Richelieu's power and royal splendour naturally became a source of danger to himself, and in 1639 he thought it politic to hand over formally, by deed of gift, the Palais-Cardinal and its adjuncts to his king and his successors on the throne. In effect it seems to have been an absolute alienation, though the deed of gift reserved the rents to his heirs, who were to be 'head-porters in perpetuity.' Thenceforward it was best known as the Palais-Royal; in 1793 it became the Palais National, then the Palais Egalité, then the Jardin de la Révolution (by decree), in 1800 the Palais du Tribunat, then the Palais Marchand, and again in 1822 the Palais d'Orléans.

Richelieu's body was worn-out by his active genius, and this seventeenth-century Napoleon died in December 1642, at the age of fifty-seven. Full of contradictions as his character was, one can almost credit him when, dying, he protested that he had no enemies to forgive (most of them had been beheaded), having none but those of the State, and that he had never served other ends than those of religion and the State. One of the finest monuments in Paris is his splendid tomb at the Church of the Sorbonne, which he built and where he elected to be buried, in the University of Paris, which he instituted and fostered throughout his life.

Here ends the first, and to my mind the most interesting, period of the history of the Palais-Royal, because of the great personality of the cardinal-founder.

After Louis XIII.'s death at St Germains five months later, Anne of Austria moved with her two sons from the Louvre to the Palais-Royal, where she was joined by Cardinal Mazarin with his suite and his guards. More treasures of art were accumulated and improvements made, and wonderful fêtes took place. At the marriage of Ladislas, king of Poland, to the daughter of the Duc de Nevers in 1645, during three days there were balls, garden-parties, Italian and French plays, and spectacles. Next year fête after fête was held in honour of the visit of the Prince of Wales, whom Mazarin wanted to marry to the 'Grande Demoiselle,' Mademoiselle de Montpensier. She, however, at that time had set her heart on the German emperor.

In 1648 began La Fronde, the war between Mazarin and the people. The Palais-Royal was invaded by the populace, headed by the Parliament; and to save the situation and prevent its destruction by fire, Anne had to yield to their demands for the release of Broussel and Blancmesnil. In 1649, after the execution of Charles I., Evelyn, with his father-in-law, presented letters from Charles's son to Anne and Louis at the Palais-Royal. He describes it in detail, and especially a wonderful opera in which the king and Court acted marvellously. In 1651 there was another mutiny of the people, and Anne threw open the palace, when many entered young Louis's room and watched him sleeping, and departed appeased and loyal. After this, disliking the lack of privacy and safety which resulted from her giving the public access to the gardens, Anne returned to the Louvre. For nine years the palace was more or less deserted by the Court, and was only occupied by Henrietta Maria, daughter of Henry IV. of France and queen of England (so often painted by Van Dyck), and her daughter. She was magnificently received in 1644, but latterly, as an exile, was much neglected. She complained to Cardinal de Retz that her daughter could not rise one day, as she was not allowed a fire.

* Sandoz names the twenty-five, but regrets their dispersion at various dates. Another writer says they were removed to Versailles. A few may perhaps be found there, in the interesting Attique du Nord.

Her attendants were supposed to have sold everything valuable that they could remove.

Louis XIV., however, often visited the Hôtel Bryon to play billiards and enjoy the fêtes which he gave in the gardens. At a fête in 1656 the public were admitted to the smaller theatre for the first time, and payment for seats was instituted. In 1660 Henrietta Maria's son, Charles II., recovered the English throne. Next year her daughter was married in the Palais-Royal to Louis's only brother, Monsieur Philippe de France, formerly Duc d'Anjou, but after the death of his uncle Gaston, the year before, known as Duc d'Orléans. They made the Palais-Royal their home, and it was often afterwards called the Palais d'Orléans, though it was not handed over to them till 1692. Charles I.'s widow was delighted to retire to a country residence at Colombes, where she died in 1669.

Huge sums were spent on decoration. Even bedroom ceilings were painted by Noel Coypel, Errard, Gougeon, &c. Bills still exist for about fifty thousand pounds spent on furnishings. Richelieu's galleries were restored, and a retinue of over a hundred attendants was accommodated in the palace. Madame's food-bills amounted to four thousand pounds a month, though the wine that was drunk at the prince's tables was only forty-two centimes a litre.

In 1671 Le Nôtre—who, I think, laid out Hampton Court, as well as the most famous gardens of France—then sixty-one years old, but who lived another twenty-six years, was employed to rearrange the gardens, and Louis gave a number of statues of nymphs and satyrs from the gardens at Versailles.

The large theatre on the right wing of the palace, where Louis XIV. in 1660 allowed Molière to install himself, and where he died at the age of fifty-three while acting the chief part in the *Malade Imaginaire*, was restored after a fire in 1663, and arranged for opera. The Duchess Henrietta died in 1670, only twenty-six years old, some say poisoned by the duke. Next year he married Elisabeth Charlotte, daughter of the Elector Palatine, who two years later became the mother of the future regent. The duke's success in leading the armies of France in the wars between 1667 and 1677 made him immensely popular and excited the jealousy of Le Grand Monarque, who relieved him of his command of the army. In 1692 Louis, to secure the marriage of his daughter by Madame de Maintenon, Mademoiselle de Blois, to his nephew, Philippe Duc de Chartres, Orléans's son, gave the Palais-Royal to his brother and his heirs. This was not done without difficulty, owing to the terms of Richelieu's gift of it to the kings of France exclusively. Next year Mademoiselle Montpensier left him all her property. He, with the Condés, was now the richest subject of France, and the Palais d'Orléans continued to benefit from his fine taste and generous purse. He employed Le Grand Mansard to design some new apartments on the left wing.

Antoine Coypel—to whom the regent gave a pension of six hundred pounds a year—decorated the new picture-gallery, the Galerie d'Énée, from 1694 to 1705. The duke enjoyed more liberty here than at Versailles, but the same extreme luxury. At numerous and ever-wonderful fêtes charming ladies discussed the dances of the town, and drew the most costly gifts in china, jewellery, &c. at his lotteries. One night's presents would now draw all the world of art to Christie's, and realise thousands of pounds. He loved diamonds, like Catharine de Medici and Anne of Austria. After his death, of apoplexy, in 1701, at St Cloud, one hundred and thirty-nine pieces of jewellery were valued at three hundred and twenty thousand pounds. The decorations must have been marvellous then. Between three and four hundred pieces of tapestry, choice crystal lustres, china, porcelain, miniatures, pier-glasses, marquetry tables, bronzes, with the finest pictures everywhere, made the palace famous for its beauty and gaiety.

With the regency, however, began, on Louis XIV.'s death in 1715, the most brilliant period of our story. For many years the palace was the real seat of government as well as the gay centre of fashion and the wildest and most shameless debauchery. The regent was universally allowed to have been—in a French sense, I suppose—the man the best of his time for his amiable character, brilliant gifts (especially memory), wide intelligence, and distinguished love of art. He wrote good operas, painted both pictures and miniatures well, and his taste as a collector was undoubted. Spoilt from infancy as he was, and unluckily tutored by the evil Abbé Dubois, his libertinage in that age was almost inevitable. Neither his mother nor his wife was shocked when he brought up a son by Mademoiselle de Sery (whom he made Comtesse d'Argenton) along with his legitimate children in the palace. Louis XIV. loaded his nephew with honours and riches, and entitled him 'Little Son of France.' He was distinguished for his courage and capacity in arms at the siege of Mons in 1691 when only seventeen, at Steinkerk next year, and at Neerwinden; but the jealous '*Roi Soleil*' cut his career short for some years, and excluded him from Versailles. He had too much time on his hands, which may account for the well-known scandalous list of his conquests in another line. His income and expenditure were well over one million pounds a year. Small wonder that he required a *chancellerie* housed at 19 Rue des Bons Enfants, a most interesting building, which exists still, but which then, of course, directly fronted the gardens. His mother was now in the right wing, and busied in training her dogs, cats, parrots, and pigeons to perform various clever circus tricks, such as drawing and driving miniature carriages, to amuse her small grandson, the future devout duke. She died a year before the regent, and some one suggested the epitaph '*Ci-gît l'Oisivetê*' (Idleness being Mother of all the Vices).

His wife was in the left wing. Each duchess

had separate and large establishments. The taste of Madame Lucifer, as he called his wife, was costly: wonderful overmantels of mirrors with fine bronze and gold decoration, splendid fireplaces, exquisite satin embroideries for beds and furniture, and magnificent wood and marble carvings everywhere. There were several sets of everything for each room —curtains, tapestries, furniture, &c. She collected over sixty snuff-boxes which would now be priceless. One cost nearly twenty-six thousand pounds. Richelieu had started the custom of leaving all articles connected with the duties of any member of the household to that individual. The Count d'Argenson, her chancellor, had no easy task when she died in settling the disputes between the various dukes and duchesses of the household over horses and carriages, furniture, clothes, &c. The regent worked very hard, giving audiences, interviewing Ministers, &c., till two o'clock, when he had a cup of chocolate. He then shut himself up in his private apartments on the ground floor, looking on the Rue de Richelieu, and was inaccessible for business. Here were held his celebrated suppers, and here took place the infamous orgies with his *roués*, as he called his intimate courtiers, and his mistresses, ladies of the Court, including his own daughters, opera-dancers, and others.

The grand apartments were used in 1717 to fête Peter the Great and various ambassadors, and for the marriage of Mademoiselle Montpensier to the future king of Spain in 1721. The year before the regent had given refuge to the notorious Scottish banker Law (promoter of the Mississippi Scheme), and protected him from the fury of the mob by excluding it from the palace with his guards.

The famous masked balls at the opera were opened at eleven (five francs for entry). The regent arrived about one with the Duc de Noailles, and danced till four, or stayed there all night if well amused. In 1719 his daughter and mistress, the Duchesse de Berri, died at the age of twenty-four, worn out by her vices. Her father lost interest in life, and refused to struggle against death, which overtook him four years later. However his private life may be execrated, he was admittedly an able and conscientious guardian of king and State. He kept his undesirable intimates rigorously away from the young king, and his reticence about State affairs in his most abandoned moments of debauchery was extraordinary.

His *petits soupers* were the beginnings of the exquisite cuisine which has made France famous. One cannot picture the table of Le Grand Monarque without a shudder. He was proud of his powers, and dined in public, as royalty did till the Revolution. The caustic second wife of his brother describes him as generally eating four soups, an entrée, a pheasant and a partridge, an enormous salad, huge slices of ham, mutton with plenty of garlic, ending up with pastry, fruit, and hard-boiled eggs. The meats were often all in one central dish, mingled with the fish, poultry, game, black-puddings, and vegetables. Louis refused the fork, a novelty of his day, and like most other people used his hands. Fish, meat, everything was tainted with horrible scents, the mania of this perfumed Court, which would remind us of soaps; and there was none of the refinement, the delicacy of taste, and the artistic science which the regent deserves the credit of introducing into French cookery. He abolished the awful ragouts and salmagundi from his table, and the brilliance, wit, and beauty of the guests were regarded as the best sauces. In the days of Henri IV. one glass for the company—which it was etiquette to empty at a draught—was considered enough, and two attendants stretched a sort of bib below the fair duchesses' chins while they drained the common beaker like a sconced undergraduate of Oxford. The regent and his friends often cooked special dishes themselves, and were very proud of their science. The pleasure of being well served, and the use of fine glass and plate, began to be intelligently enjoyed. Brillat-Savarin's aphorism may be recalled: '*Les animaux se repaissent, l'homme mange, l'homme d'esprit seul sait manger.*' Till its recent decadence, the Palais-Royal retained a reputation for the best restaurants and provision-shops in Paris. Brillat-Savarin himself and most of the old memoirs refer to it in this way as well as in connection with history.

At the time of the regent's death his only son Louis was twenty years old. Weak in character and body as he was, the only exercise that attracted him was the dance; and this taste led him to the notorious opera-balls, and caused some vicious episodes in his otherwise blameless and devout, if colourless, career. In 1724 he was married by his managing mother to a Princesse Jeanne de Baden-Baden, and lost her two years after. He became morose, and overworked his weak brain with the study of holy books.

In 1741 the duke merited his name of '*Le Dévot*' by entering Sainte Geneviève, where he remained, at a *pension* of a louis a day for himself and his valet, till his death in 1752. Vatout and others describe the only vigorous action of his life. He is said in his wild fanaticism to have caused to be burnt and otherwise destroyed forty of the *chefs-d'œuvre* of the old masters, priceless, the glory of Italian art, on the ground of the indelicacy of the subjects. But Champier denies the accuracy of these stories, but allows that he may have damaged two pictures by Correggio.

In 1743 the regent's irrepressible widow married her grandson Louis-Philippe, Duc de Chartres, to a Bourbon Conti, a most unsuitable brat (according to her cloistered father-in-law) of seventeen, but very beautiful. A magnificent illumination was given at the Palais-Royal when they arrived there after the wedding at Versailles. This marriage was a great failure. The duke, though only eighteen at this time, had already begun his distinguished military career at Dettingen, where his horse was killed under him. After a year or two the *spirituelle* duchess tired of her somewhat dull husband, and endless intrigues filled the scandalous

memoirs of the day. The duke and duchess rivalled each other in the brilliance and extravagance of their fêtes, and never was the Palais-Royal so gay or so splendid. Their former chancellor, d'Argenson, was not far wrong in seeing inevitable ruin ahead. The old opera-house was burnt in 1763; the young Duc de Chartres, the Philippe Egalité of the Revolution), aged sixteen, worked splendidly at the pumps. Houses were purchased near, and it was rebuilt as well as almost the whole of the Palais-Royal, parts of which had become too old and fragile, under the charge of Contant d'Ivry. The statues to the right in the inner court represent Military Talent, Prudence, and Liberality; those to the left by Gérard representing Science, Commerce, Agriculture, and Navigation were only put up in 1830, when Fontaine balanced and completed the scheme of d'Ivry.

In 1748 French hospitality was stained, to please England, by the arrest of Prince Charles Edward at the Palais-Royal.

In 1756 the duke (now d'Orléans) was brave enough to try the experiment of vaccination, then new and much mistrusted, on his only son. Three years later the duchess died of consumption at the age of thirty-three, and in spite of her sins had a tremendous funeral procession to the Church of Val de Grâce, where the Orléans family were all buried. In 1768 a fête was given in the palace in honour of the visit of the young king of Denmark, Christian VII. After wonderful fireworks, about seven hundred great nobles of France sat down to dinner, which was followed by a splendid ball. Next year, at the fête to celebrate the marriage of the Duc de Chartres to Mademoiselle de la Penthièvre, the diamonds were superb. One lady, Madame Berchini, was covered with them, including several chains round her neck (lent her by friends). In trying to stifle a sneeze she burst one of the chains, and could only recover a few stones; but what was her joy next day to find that on a careful search instituted by her host, the Duc d'Orléans, being made, not only all those she had lost were discovered, but a good many others which no one had missed or claimed!

Latterly the duke left the palace and society for the life of a quiet country philosopher. He was always a great sportsman and a really clever actor. In 1773 he had secretly married a widow, the Marquise de Montesson, which caused a quarrel with his son. In 1780 he handed over the Palais-Royal to his son Philippe, afterwards Egalité, with its life of luxury and splendour, and five years later he died.

(To be continued.)

THE SEÑORITA DOLORES.

CHAPTER V.

VINCENT rode slowly up the road, across the Zocodover, then by devious, narrow, winding streets down into the Plaza de St Martin. Here he quickened his pace until he came to the gray house which stood within its own grounds. Riding up to the door, he dismounted. 'The Señorita Dolores de Garcia?' he inquired of the servant.

'But yes, señor, she expects you.'

Vincent passed through the *patio* into the drawing-room beyond. A few minutes passed, and the señorita entered to greet him. It was late in the afternoon, and the rays of the sun shone in through the open window, burnishing the gold tapestry of the furniture and throwing light beams across her face and hair as she stepped into the room. She was below the medium height, dark, with masses of wavy black hair hanging low over her forehead beneath the mantilla she wore, and veiling a pair of eyes, the languor and depth of which could only belong to a woman of Spain.

As she entered a faint perfume floated towards him. 'It is good of you to come,' she said, smiling—'so good of you!'

Had another woman been present she would have noticed a nervousness in the señorita's manner, an obvious restraint; but with Vincent it passed undetected.

She pointed to a chair. 'But you will sit down?' she said. 'I have ordered my servants to bring in tea. I am so English, you know; I spent many years there, and I love my cup of afternoon tea. They do not understand me here because I like it, so we shall be fellow-exiles.'

Vincent looked towards her. 'If all exile was like this!' he said.

She laughed and shrugged her shoulders. 'That depends, señor, on the person who is in exile. Some people could be happy anywhere. Yourself, for instance.'

'I, señorita! I long for my country, and never forget it until I am here.'

The entry of a servant prevented the Señorita Dolores from replying.

When the man had left, Vincent was looking out of the window across the Plaza to the river Tagus, which flowed swiftly by.

For a moment the señorita watched him; then she said, 'I often wish, señor, I did not live so close to that'

'Why?'

She toyed with her fan; then, looking up, made a little grimace. 'I do not know. There was an old *padre* to whom I used to confess—he is dead now—who told me when I was young that the stream of life was just like the Tagus, bearing us onward and onward to the sea, and somehow I have never

forgotten.' She paused. 'I heard it whispered the other day that soon the Tagus will flow with blood again, as it did twenty years ago. Do you think so?'

The words of hidden warning General Vilenta had given him came with a rush to Vincent's mind. 'No,' he answered, 'there will be no blood drawn; there is no cause for it.'

The señorita sighed. 'I am glad of it. And yet you ride each day here, there, and everywhere with despatches — to Madrid, where the Queen Regent is; to Torrijos, and Talavera.'

Vincent laughed a trifle uneasily. More than once when in the company of the señorita he had found the conversation drifting into political channels.

'It is my business,' he replied.

'And to-morrow?'

'To-morrow I ride to Madrid again.'

Once more a gleam lit up the señorita's eyes. 'Where the Queen and Queen Regent are?'

'Yes,' answered Vincent.

'Have you ever spoken to them?'

'Once when I took a letter to the Queen Regent.'

Suddenly Señorita Dolores leant forward. 'Señor,' she said, 'you promised me you would tell me one day why you left England.'

A haggard look came into Vincent's eyes. 'I left with the mark of Cain upon my brow.' He pointed to his forehead.

'You killed a man?'

Vincent looked towards her. 'Yes,' he said simply. 'I had a letter yesterday morning to say he was dead.'

'You killed him in a duel?'

'Yes; it was over cards.'

'Over cards—ah!' The señorita became suddenly interested. 'What was his name?'

Vincent looked at her, wondering what could be her reason for wanting to know. 'Segrim,' he answered.

It was getting dusk, and too dark for Vincent to see that his companion's face had gone a deadly white.

'And you killed him?' she said with an eagerness that did not escape his notice. 'I am glad it was in a duel.' She rose. 'In Spain they do things differently.'

By the time Vincent had risen to say good-bye she had recovered her composure. 'I shall see you at the ball to-night?' he said.

'Yes,' she affirmed with a slight nod.

'And how shall I know you?' he said, holding her hand in his.

'I shall be wearing a red rose.' She drew him to a table on which stood a bowl of flowers. 'See, I will give you one.'

He took it and buttoned it in his coat. 'I shall always keep it,' he said gravely.

'Then you will be very foolish,' she replied. 'Flowers are like vows, not meant to be kept.'

He looked at her, but the smile upon her lips deceived him. 'I do not agree with you, señorita,' he said, his hand upon the door.

CHAPTER VI.

THE señorita stood where he had left her, alone among the shadows. 'You fool!' she said bitterly to herself; 'you little fool!' Then she passed out of the room, up a long flight of stairs into her boudoir. There she unlocked a box and drew out from amidst a pile of papers the photo of a man. He was dark and handsome, although to some his eyes would be perhaps too closely set. 'And so you are dead!' she said. 'Thank God!' Then she turned the photograph over. On the back was written the name 'F. Segrim.'

Ten minutes later she was in the garden, walking side by side with a tall man dressed in a gray riding-cloak, and on his head was a light sombrero rakishly on one side.

'Señorita,' he said, 'you have news for me!'

'I!' She looked up in surprise, and tried to read his unfathomable eyes, failing as many another had done.

'But yes,' he replied; 'has not the Señor Vincent told you anything?'

The señorita shuddered, and a lawn handkerchief she was holding in her hand fluttered to the ground.

Señor Morella bent down and recovered it. 'Nothing?' he suggested with a dry smile. 'Then the Señor Vincent must be very obdurate to overcome all your wiles.'

The señorita looked at him with flashing eyes, and her bosom heaved as she spoke. 'Cannot even the spy of Señor Morella have one friend?'

'She has many friends,' replied the señor with unctuous courtesy; 'believe me, señorita, many friends.'

The Señorita Dolores said nothing. She felt as many another had done in the presence of this man, the accredited friend and counsellor of Don Carlos, that there was nothing to be said.

'You have heard the news,' he continued a moment later. 'Acting on your instructions, we stopped Captain Lopez and took his papers from him.'

The gaze of the woman at his side was bent upon the ground.

'And they were blank. It was a ruse to outwit us.'

Then she turned upon him. 'You do not suggest that I led you astray? I got the information, and believed it.'

'From Señor Vincent?' interposed the Spaniard.

'No,' replied the señorita in a low, calm voice; 'not from the Señor Vincent.'

Something in her tone made the Spaniard glance quickly at her; then, encountering something which he did not quite understand, he shrugged his shoulders. Under such circumstances it is an

easy gesture, so misleading, since it may mean so much and again so little.

'The despatches must go,' he said suggestively. 'Do you know when, and who will take them?'

'Why must they go?' asked the señorita to gain time.

Señor Morella spread out his hands. 'You must know that as well as I—General Vilenta in Toledo and Señor Sarrion in Madrid. It requires no answer.'

'But the Queen Regent is in Madrid,' said the señorita.

The Spaniard looked at her, wondering how much or how little she knew. 'The Queen Regent is not in Madrid,' he said.

The Señorita Dolores came to an abrupt stop. 'What!' she exclaimed incredulously. 'Then where is she?'

'That is what I want you to find out.'

'She is not in Madrid?' she repeated.

'No; for we blew up her house in the Calle Mayor yesterday, and they are laughing at us now because we blew it up a week too late.'

CHAPTER VII.

WHEN the señorita entered the *palacio* the ball was already in progress. As she walked across the first *salon* a figure dissociated himself from the group gathered at the farthest door and hurried over to meet her. Even had he not worn the rose she had given him the señorita would have recognised him.

'At last!' he said. 'I was afraid I had missed you in the crush, or that you were not coming.'

Behind his mask the señorita saw his eyes look passionately into hers.

'In your country it is polite to be late, and I had so many things to attend to.'

He offered her his arm. 'Let us go into the gardens,' he said; 'it is cool there, and there are so many people here.'

She laid her hand on his arm with a tremor. She felt she was dallying on the verge of a paradise, toying with a happiness that could never be hers, and more than once as they passed through the corridors she looked up wistfully at his face.

When they reached the grounds, as if by common consent they strolled towards the most secluded part, and then in silence sat down in the shade of some cedars. To their left a fountain splashed with a melodious tinkle, and the water shone in the moonlight. At their feet lay the lights of that city of discontent and treachery, Toledo—the city that in the Carlist days gathered into its arms all the intriguers and rogues of Spain, and, that not sufficing, many from other lands as well; and, beyond, the house in the Plaza de St Martin and the Tagus.

'The same river that you dislike so much!' said Vincent, lighting a cigarette and following the direction in which she was looking.

'I do not hate it, señor,' she replied. 'Oh no; I was thinking at that moment how grand it looked with the reflection of the moon.'

As she spoke a man and a woman walked by chattering and laughing. After they had passed, Vincent heard a rustle in the bushes behind them, and, turning sharply, saw the shadow of a man rise and follow the couple. He looked at the señorita to see if she had noticed it, but apparently she was still engrossed in the view.

Her hand was reposing idly on her lap. Leaning towards her, he took it in his. 'Señorita Dolores!' he said.

She started. 'Señor,' she faltered, trying to disengage her fingers from his strong grasp.

'Dolores,' he said again gently, 'to-morrow I am going on a journey from which I may never return. General Vilenta has honoured me with a mission which he would give to few men. Yesterday I should have been glad. To-day, Dolores, dear Dolores, I am sorry, because I have met you.'

The señorita turned away with a funny little sigh, half of sorrow, half of happiness, and wholly incomprehensible to the man by her side. Then she put her hand to her heart with a quick gesture as if it pained her. 'Don't, señor!' she said.

Vincent slipped his arm around her waist and drew her to him. At first she resisted, then with a choking little sob laid her head on his shoulder. Tearing her mask from her face, he saw her eyes were dim with tears.

'Señor, señor,' she said, 'why could you not let me keep my secret?'

He drew her face up to his and kissed her quivering lips. 'Then you care, dear Dolores—you care! God bless you!'

The señorita said nothing, but lay in his arms, her eyes fixed upon his face. Then she slowly drew aside his arms. '*Carissima mia*,' she said gently, 'I love you; but yes, and for to-night we will be lovers, and we will be happy, and think of nothing else. Afterwards'—— She gave a little sigh.

He leant towards her. 'Dolores, what do you mean? Nothing can make any difference. You love me, and to me you are all the world.'

'And when you know everything I shall be less than this.' She plucked a leaf from an ilex-bush near by and cast it away.

'What do you mean?'

She rose, and the moonlight, streaming upon her face, showed it white and drawn. 'Señor, do not ask me; trust me to-night—just for to-night,' she said, falling on her knees at his feet and taking his hand in hers. 'You will know soon enough; yes, you will know soon enough.'

A doubt assailed him. 'There is no one else?'

She shook her head. 'No, *carissima mia*, there is no one else.' She rose and sat down again by his side. 'Tell me,' she said, 'where are you going to-morrow, since it is so dangerous?'

'To Madrid,' he answered.

Her eyes opened wide in horror, and her breath came and went in short, painful stabs. 'You must

not!' she said. 'Promise me you will not! Oh Harry, you must not!'

'Why not?' he asked, looking at her strangely.

'There is danger for those who travel to Madrid,' she replied. 'Only yesterday'——

'Yes,' said Vincent in a voice suddenly grown hard, 'only yesterday'——

The señorita did not answer, but gazed at him, a deep fear in her eyes.

'Yesterday Captain Lopez was found dead upon the road, and you know about it?'

'Yes,' replied the Señorita Dolores in a low voice, 'I know about it.'

'Then you are a Carlist? I understand now.'

At the sound of footsteps upon the gravel Vincent turned, and an aide-de-camp of General Vilenta came upon them round the bend.

'Ah, you are here, Vincent!' he said. 'I have been looking for you everywhere. The General must see you at once. He is at his house.'

Vincent bowed. 'I shall be there in five minutes,' he replied.

When the aide-de-camp had left, the Señorita Dolores turned to Vincent. 'So our love has not lasted even this evening,' she said with a funny little laugh.

For answer Vincent took out the rose which was still in his buttonhole and handed it to her in silence.

Mechanically she took it, and, standing before him, plucked the petals out idly one by one and cast them upon the ground. 'Señor,' she said in a low voice, 'which way are you travelling to Madrid? Perhaps I can save you.'

Vincent gazed at her for a second, and his eyes hardened. 'I am going by Cettini,' he said, 'so that perhaps you can save me, or perhaps you can send some men to lie in wait for me. There is a dark wood outside Cettini;' and he turned upon his heel and walked away.

The Señorita Dolores remained standing where he had left her, idly plucking at the flower until there was nothing left but the bare stalk; then, with a low, choking cry, she shook her head defiantly as if to cast off some great burden, and followed him into the light and the laughter.

CHAPTER VIII.

A QUARTER of an hour later Vincent stood before General Vilenta.

The General was seated at his desk writing a despatch. When it was finished he sealed it up in a blue envelope. 'It is ten o'clock, Vincent,' he said. 'I want this despatch to be in Aranjuez by midnight. Can you do it?'

Vincent nodded.

'Good! I have had your horse saddled; it is waiting in the Calle España now. As soon as you have seen the General Espero and delivered this into his own hands, ride straight back here and report; you will find me in this room.'

Within ten minutes Vincent had passed over the bridge of Alcantara and was galloping across the first of the twenty-five miles that separated him from his point of objective.

The divine Godhead, whom so many affect to despise, shows His kindness to His creatures in many thousand little, unconsidered ways, too slight to penetrate the dim reasoning of mankind. As Vincent left the vicinity of the Tagus the road became more barren and stony, and more than once the animal he rode slipped, so that he had little time to think—which was perhaps as well, for his mind was bitter.

Whilst Vincent covered the ground between Toledo and Aranjuez, the Señorita Dolores sat in an anteroom talking to Señor Morella. Between them, on a table, stood a bottle of maraschino, and the señor was delicately holding a half-empty glass between his finger and thumb.

'Then you have heard who is going to Madrid to-morrow?' he said.

'Yes,' replied the señorita.

Had Señor Morella been a clever man he would have divined something in the speaker's voice to cause him uneasiness; as it was, he only possessed a cheap cunning, so it escaped his notice.

'Your friend the Englishman?'

'But yes,' replied Señorita Dolores.

'It is strange how these Englishmen succeed everywhere they go,' mused the Spaniard; 'and yet they are so uncouth, so rough, so ungallant, as a Frenchman would say.'

In fencing with words silence is the best foil, so the señorita said nothing, and pitied the ignorance of the man before her.

'It is with women they fail; it is always your sex that outwit them. Were it not so they would overrun the world and divide it piecemeal between them.' He leant forward. 'And so he told you he was going to Madrid?'

'Yes,' replied the woman by his side.

'Then perhaps he told you which way he is travelling. There are two roads to Madrid from Toledo.'

The señorita looked up at her companion, and her eyes betrayed nothing. 'He is going by Santa Breeda,' she answered.

'And not by Cettini, the usual way? One would expect an Englishman to do as much.'

Twelve hours later, half-an-hour too late, Señor Morella realised why the señorita smiled at his words.

At five minutes to two in the morning Vincent stood again before his General.

The idol of the Spanish army smiled as he noiselessly entered the room. 'And you thought I was asleep, my son?' he said with a dry smile. 'But they teach you to ride well in England, if they do not teach you wisdom. And, after all, that comes with years, when the hair is gray and the heart cold;' and he tugged musingly at his moustache.

When he had finished reading the despatch Vincent had brought with him, he pointed to a couch in the corner of the room. 'You had better

lie down,' he said, 'and get what rest you can. In four hours I want you to start for Madrid.'

The Santa Breeda road to Madrid is almost a straight line from Toledo to the village which gives it its name, and beyond to the capital. Excepting a few orange-groves, it affords little shelter and less seclusion. Dotted along the road are a few white farmhouses, each with its own little *patio* and *piazza*, and behind its sweet-smelling garden. Notwithstanding it is four miles longer than the Cettini road, and far less picturesque, it is the way mostly chosen by travellers between Toledo and Madrid; for in Spain time is no object, and it is far wiser to be an hour late at one's destination than never to reach it at all, and the woods that fringe the Cettini road hold many secrets.

It was nine o'clock on the following morning, and Vincent had started on his journey over two hours previously.

Just outside Santa Breeda, on the side most distant from Toledo, stands a house; its garden borders on to the white, dusty main road, and is divided from it by a low, brightly painted wooden fence. Behind this, in the shelter of a bush, crouched six men; they were chatting together and smoking the inevitable cigarette. Slightly apart from them, his gaze directed towards the village, stood a seventh.

Amongst other attributes in a diversified and hardly to be deemed commendable character, Señor Morella left nothing to his subordinates. The hour was early and the heat stifling; with a frown he languidly made a cigarette and lighted it. 'Paquito,' he said to one of the men, 'be good enough to go inside and ask the señora to give me a glass of vermouth.'

The man addressed rose, and a few minutes later returned with the cordial. The señor stood sipping it for a few minutes. When he had drunk the last drop he drew out his watch. 'It is twenty minutes to ten,' he said tersely. 'You will put out your cigarettes.'

For the next half-hour he paced impatiently to and fro, alternately looking at his watch, then along the road to St Breeda.

Nearly an hour later a countryman ambled leisurely along, driving before him a herd of cattle. Señor Morella questioned him closely. Had he seen a horseman riding from Toledo? The man replied in the negative, with a shake of the head and many ejaculations. Seemingly in Spain the lower classes are inordinately religious, since they appeal so frequently and fervently to the calendar of saints.

Suddenly there dawned upon Señor Morella the reason for the ingenuous smile the Señorita Dolores had given him on the preceding night, and his face went white with rage. 'Paquito! Sebastian!' he called out, 'the horses! Get them saddled as soon as you can.'

Señor Morella exercised over his subordinates as great a fear as General Vilenta, but in his instance it was blended with no love.

The six men hurried to the stable to obey his command, and, once out of earshot, joked amongst themselves at his discomfiture. They were men of Murcia, who served Don Carlos because he paid them well and fairly regularly, not men of the Basque Provinces, who would have laid down their lives for the Pretender.

'Ah, *mi caballero*,' said Paquito, digging a *confrère* in the ribs with a bony forefinger, 'the grand señor, curse him, has overrun the mark!' and he expectorated upon the stone floor with much satisfaction.

A little later the seven men were galloping towards Madrid.

Two miles from the capital the St Breeda road joins the one from Cettini. As they rode into the fork connecting the two, Señor Morella, who was in front, saw half a mile ahead a solitary horseman.

Hearing the sound of hoofs upon the road behind him, the man turned round in his saddle, and the distance between them became greater.

For over a mile Señor Morella gave chase, trying in vain to catch up with the solitary figure; then, as they approached the city and houses began to appear at frequent intervals on either side, he reined in.

'You will go on to Madrid and await orders,' he said to Paquito and his companions. He turned his horse in the direction of Toledo.—'And I will go and interview the Señorita Dolores,' he added, as if to himself.

(To be continued.)

CHRISTMAS FRUIT.

By Eustace Miles.

ONE of the pleasantest associations of Christmas is the fruit. Besides the sugary, crystallised fruit (of which perhaps the less said the better), there is always, at least in upper and middle class families, the fresh fruit and the dried fruit and nuts at dessert, to say nothing of the dried fruit in the Christmas pudding and mince-pies.

And from the humanitarian point of view the fruit is the least objectionable part of our food: the taint of the shambles is not about it; it is in harmony with the highest ethical ideas of Christmas Day. And perhaps from the health point of view the use of fresh fruit does something to counteract the excess of other foods, and to keep the body less clogged than it would otherwise be. From the æsthetic point of view nothing could be more

admirable than the array of fruit—the oranges, apples, bananas, raisins, figs, dates, and, in the plum-pudding, the sultanas and currants, and so on.

The orange itself has always been invested with romance, perhaps because the Crusaders, who first met with the fruit in the Levant, fostered the theory that it was the golden apple of the Hesperides. 'Psychic' people set the orange high among fruits. Then there is the date, which was an object of peculiar veneration in prehistoric times; it was a symbol of helpfulness, and we need not wonder at this when we consider its value to the Egyptians. The fig, besides its well-known health-properties, carries us back to the days of Greece when athletes used figs as an important part of their dietary.

It is very pleasant, from whatever point of view one looks at it, to find fruit taking a more important place than ever before in Christmas fare. This change has been steady during recent years. For instance, a quarter of a century ago we used not to have bananas at Christmas. Our oranges came (and very sour they were as a rule) from Spain and Italy, our prunes from France, our figs and dates from a few ports in Asia Minor and Northern Africa, while our apples and pears were almost exclusively home products.

Think also of the prices twenty-five years ago. Boxes of about three hundred St Michael oranges cost from sixteen to eighteen shillings a box wholesale in Covent Garden, Egyptian dates fifty shillings a hundredweight, apples twelve shillings a bushel, and pears from threepence to ninepence each.

To-day the above-mentioned small range of producing countries would not nearly supply the enormous demand. We draw now on the whole globe, and still we need more than we can get at a moderate price. Take apples as an example. In 1870 two-thirds of the entire stock of apples in the country were exhausted at Christmas. At the present time the supply of marketable English apples, except for a few varieties used at dessert, is exhausted long before, and at Christmas we are drawing on American and Canadian supplies. In 1870 we had none of these, only Normandy pippins, which sold wholesale in Covent Garden at ninety-five shillings a hundredweight at Christmas-time. Again, as late as 1886 bananas did not find their way into England regularly; they only reached here irregularly from time to time. Now, although their best time is July and August, they are to be found also at Christmas. They are among the cheapest and most popular of all Christmas fruits. Some of the best prunes come now from California and Oregon. Trade with these countries is comparatively recent. California also gives us excellent bottled fruits.

The first consignment of Jamaica oranges, which form an important part of the present trade of Jamaica, was in 1867. The first consignment of Jaffa oranges to England was as recent as 1885; these had to be transhipped at Alexandria, since no English steamer was then running direct. To-day oranges are also grown largely in Florida and elsewhere.

It was the Indian and Colonial Exhibition of 1886 that first drew colonial fruits to England in any quantity. Australian apples reached us then for the first time; but Tasmania, the great apple and pear country, was, I believe, not represented at all. In 1874 some apples had reached Vienna for the International Exhibition from New South Wales; they were packed in cotton-wool, and this was thought a wonderfully clever idea. In 1886 Messrs Scrutton & Sons began to bring fresh fruit from the West Indies in cool chambers specially fitted up for the purpose, and I believe the Elder Line has recently put on special ships for the banana-trade.

It must be noticed that we do not get the best of all these fruits from the ordinary grocers. Some specialist in fruit, like Mr Bilson of Gray's Inn Road (to whom I am very much indebted for some of the information here, and who has had twenty years' experience of the trade, and has grown up with it), will give much better samples of Christmas fruit than one who is not conversant with the differences between the better and the inferior classes. For instance, the ordinary grocer will perhaps be unable to tell you that the best raisins are the Malaga, very dark and thin-skinned muscatels, beautifully sweet. These raisins have to be dried in the sun, artificial drying experiments having proved a comparative failure. Probably in part because of the abundance of sunlight, Australia and the Cape will soon become important countries for raisins. The fruit is prepared for packing. It is dipped for an instant in boiling water for the sake of sterilisation, and then it is dried on straw in the sun, when it shrinks to a half or a third of its original bulk. The ordinary raisin of the grocer is a cheaper kind—larger, redder, and coarser.

Figs begin to come in in November. The figs from Turkey are the best. The unpressed are better than the pressed; they are more fleshy and juicy. Two harvests are gathered each year in the Levant. We get the second or summer crop. The commoner varieties are sulphured before they are dried in the sun, and the sulphur tends to destroy the flavour.

The finest sultanas are the Greek. The commoner kinds are highly sulphured, so as to produce a clean colour. In Asia Minor sultanas are still brought into port on the backs of camels, and are repacked before shipment.

The best currants are the small black, rich and fleshy kind; the ordinary provincials which are commonly used are far inferior. There has been an enormous growth recently in the currant-trade with Greece: it has been advertised freely. Let us hope that Australia will experiment with currant-growing, and reap some of the harvest of this advertising.

Of prunes the French no longer hold the decidedly

best kinds. California and Oregon compete with France, the Oregon variety being stoneless.

The best Canadian and Californian apples begin to arrive early in November, and are actually at their best about Christmas-time. The Newtown pippins and the northern spy (a variety like the Baldwin, and excellent for table and cooking) are among the best kinds.

Pears come from the same districts, but of course are more perishable.

Oranges are sweeter and riper now than they used to be at Christmas. Valencias are the finest kind to use at Christmas—Valencia oranges and Messina melons.

As to dates, Tafilets come first (from Algeria) and Egyptian second. The common date, the Tunis or honey date, is dressed with syrup before it is pressed; hence its sweetness.

Candied peels are brought over in brine-pickle; then the salt is washed out, and the peel cooked and crystallised in a sugar-solution here.

Bananas are not naturally at their best at Christmas-time; they are artificially ripened, and therefore dearer. Still, they are a most popular fruit, and are indispensable in fruit-salads, &c.

Turning to the dried fruits—apricots, apples, peaches, &c.—we find that they are all of fairly modern growth and chiefly from America, which does the best trade. The same applies to bottled fruits. California is now bottling fruits in distilled water. There is no doubt that the bottled fruits have come to stay.

The origin of the canning of fruit is interesting. Years ago, when the excavations of Pompeii were beginning, some Americans discovered many jars of preserved figs in what had been the pantry of a house. One of these jars was opened, and the figs were found to be fresh and good. The hint was taken, and the very next year fruit-canning was introduced in the United States. An interesting account is given in *Food* for September 15, 1884.

A word may be said about the food-value of these fruits, so that we may consider how far they are likely to take the place of other Christmas foods; certainly the other Christmas foods are not likely to take *their* place! First and foremost come the nuts, which, as a general rule, can take the place of any flesh-foods, especially if they are properly prepared. Already many families use Brazil-nuts or pine-kernels or other nuts freely in the Christmas plum-pudding. Nuts are the only fruits that have any considerable body-building value.

In an entirely different class come the dried fruits, which are comparatively poor in body-building elements or proteid, but are rich in a kind of sugar which is generally very easily digested. Figs, dates, prunes, and sultanas have a reputation as aperients; they were and are an important part of the ancient dietary of many peoples.

The fresh fruits, excepting the banana, which stands as distinct from them, have scarcely any body-building value; their chief value is because of their pure water and natural 'salts.' Different fruits have different effects, some being useful for one purpose, others for another; but among the most honoured of all fruits for their health-value are apples, grapes, and melons. Almost every healing virtue has been attributed to the apple—for instance, the power of dissolving uric acid; and the grape-cure is familiar, by name at least, to every one. Lemon is well known to be a cooling fruit and a preventive of scurvy. It would be easy to devote page after page to the subject of the curative effects of various fruits.

Here, however, it must suffice to ask, what will become of the orthodox roast-beef and turkey-and-sausages a century hence? Will they still generally survive, or will they have given place to a non-flesh dinner, not necessarily of fruits only, for that would be unwise, but with fruits as part of the healthy elements in the meal, and also because of old associations with Christmas-time? For when we see side by side at Christmas-time, in the poorer districts or in the richer districts, the stalls or shops of the butchers, poulterers, and fishmongers on the one hand, and of the fruiterers and greengrocers on the other hand, we cannot hesitate for a moment as to which is the pleasanter sight, which is the one that we should rather perpetuate, which is the one which we should prefer that our children should associate with the idea of Christmas.

THE WHITE POODLE.

CHAPTER II.

THE next morning after breakfast—a plain meal of tea and dry bread—Elwood got some bones from Mrs Price and made Peter happy. This done, he sketched the poodle hour after hour till one o'clock, at which time he went to the telephone and rang up. 'Is that you, Miss Lynch? Good! Yes, thanks, the knee is better, though I can't get out yet; and this telephone doesn't help me much with editors, who seem to swear at it when they speak to me. Right you are! My pecker's all right. For I've something to tell you. I've a new friend—a dog—a ripping poodle. He ought to be white, you know, but isn't, being deuced dirty. Wash him? Rather not. He'd bite—has dignity, you see. Good-day. These little talks are awfully jolly.'

Here the conversation ended, and Elwood and Peter had lunch together on bread and milk.

Ethel Lynch and Frank Elwood had been chums

for three years; they met first as students in their local art school at Norwich, and found they had tastes in common. They came to London at the same time, without money and without friends, but bore with equal cheerfulness their uphill struggle as animal-painters. After the hockey accident their friendship was carried on by telephone every day at one o'clock.

Peter was the subject of several talks, and Miss Lynch was so delighted with Elwood's enthusiasm that one morning she said, 'Oh, I long ever so much to see the dear, clever poodle! Is it impossible? May I not call in the afternoon?'

The question came pat, and Frank Elwood blushed with pleasure at the telephone. Then he frowned and raised objections. 'I'm in a garret, you know,' he explained; 'there's only one room.' He paused at that, and listened eagerly. But the next moment he cried out with delight, 'How clever you are! Yes, no doubt my landlady *could* make it look quite right. So you'll come at six o'clock? Splendid!'

Elwood consulted Mrs Price, and she, good woman, understood his feelings. The attic became quite a good studio, with a sofa in one corner, and the washstand, when covered up, lookéd rather like a primitive lay-figure.

Miss Lynch arrived in time and surprised Mrs Price, 'cause she's that neat an' pretty, and dressin' is that tiresome slow when you 'urry.'

And the poodle, like Mrs Price, fell in love with Ethel Lynch. He allowed her even to pat him; and this astonished Elwood, because Peter hated to be touched.

'That explains why you haven't washed him,' said Ethel. 'The dear thing isn't presentable, you know; and if you keep him'——

'If I keep him?' Elwood interrupted. 'I *say*, what do you mean by that?'

In reply Ethel took from her purse a cutting from the *Post*. It was Dr Butler's advertisement, and Elwood read it with alarm.

'By Jove!' he exclaimed, 'two white poodles couldn't be lost in Chelsea on the same evening. Dash!'

'You'll reply?' asked Ethel with sympathy.

'I must. Proper thing, you know. But this room without Peter'——

'Oh, I *am* sorry!' said Ethel. 'What hard lines!'

Elwood was indeed crestfallen. Yet he wrote frankly to Butler, asking the doctor to look in, and hoping that Peter was the wrong dog after all.

Dr Butler came the following morning at eleven o'clock. Elwood received him nervously, and his lips trembled when Butler and the poodle recognised each other.

'His name's Nep, Mr Elwood; but there's no need for you to look down on your luck.' The doctor then explained all the circumstances, adding, 'The dog has chosen a good home; so I shall leave him with you, of course. He never cared two straws for me—just accepted me *pro tem.*'

After that the two men soon became friends.

'Perhaps you'll let me buy a sketch or two of Nep?' Butler hinted. 'And I could see you from time to time. That leg of yours needs attention. You've given your doctor the slip, I suppose? Patients do that sort of thing.'

So there was plenty of good news for Ethel Lynch. 'He's a tip-top little man, that doctor!' Elwood declared. 'Bought two sketches at once, five guineas each, and paid for 'em down. Hurrah!'

Butler formed a habit of calling at tea-time—always with some parcels in his hand.

'You see, old man,' he laughed, 'your knee requires tea-cakes and other nourishing trifles like beef and bananas. Bad knees are as hungry as schoolboys—or should be, anyway.'

It was indeed a jolly time for Frank Elwood. But Miss Lynch was not yet happy, because Nep needed a presentable coat, being really too black for a white poodle; so he had to be trained to face water. Miss Lynch suggested that a shallow bath of tepid water should stand all day in the studio, and that Elwood, from time to time, should tempt Nep to wet his dear little feet. Thus encouraged, the dog soon understood that something out of the common was expected from him. If he wished to enjoy any of the gifts that Dr Butler brought to the studio, he had to walk through the water in that bath. Yet he never lost his temper; and that is why he stood one evening in the tub, with Ethel kneeling at one side and Elwood on the other. The girl's left hand clasped the poodle's neck, and Elwood's right hand was partly over it.

'Do you feel anything?' she asked slowly.

'And you?' he replied tenderly.

'Yes; I feel—I feel something *under* my hand—something hard under Nep's curls.'

Elwood nodded.

'And I,' said he—'I feel your—your jolly little hand—and something under it at the side. What can it be?'

'Suppose we look?' Ethel answered; and Elwood at once fumbled in the poodle's curls and disclosed the metal cylinder.

'Great Scott! what's this?' he asked.

'And there's a chain here,' said Ethel—'a very thin chain, and so close to dear Nep's skin that I can hardly put my little finger under it. Ah, had you overfed our pet he'd have been—have been strangled! Cruel, cruel!'

Quickly she unloosed the chain, saying to Nep as she threw her arms about his neck, 'Oh, the poor boy! Did they wish to strangle him?'

The next moment Elwood held up the little cylinder. 'Silver?' he asked.

'Tarnished,' she replied.

'We found it together, at the same moment precisely; so it belongs to both of us,' said he, blushing.

'Sportsmen, I suppose, would toss up for it,' the girl suggested; but she touched the silver with a lingering curiosity.

'Toss up for it!' cried Elwood in astonishment. 'No, no! It belongs—to both of us, *of course!*'

'But Nep—Nep is *yours*,' Miss Lynch persisted while examining the silver tube with still greater interest.

'Nep shall belong to both of us—if you like,' said a new voice in a broken whisper.

But Ethel kept silent, the voice being not in the least like Elwood's. What she said was this, 'There's writing on this case, and *you* didn't find it.'

'It's yours, then!' he replied eagerly. 'What does it say?'

Ethel shot one quick glance at him and then began to read: 'To be opened by Nep's friend and mine.—T. LILBURNE. March 1906.'

'I say!' cried the lad.

'What's inside?' asked the girl.

'I'll open it, Effie—Ethel—Miss Lynch. But his hands shook.

'Let me try,' said Ethel demurely.

'Bosh!' At last the top was fumblingly unscrewed, and Elwood held up the little roll of paper, while Nep frisked about the room as if he understood everything. The paper was soon unrolled, and Ethel and Frank, their cheeks very close together, began to examine their treasure-trove. Elwood pointed at once to Nep's portrait at the corners, while Ethel, woman-like and practical, tried to decipher the minute handwriting.

'It's—it's a will!' she declared all at once.

'Nonsense!'

'Listen to this, then;' and though often puzzled for a moment by the handwriting, she read the paper aloud, word by word.

'Was there ever such a romance?' she whispered.

'Twenty thousand pounds in Consols!' Elwood shouted. 'Marvellous! Miraculous! Didn't I say from the first that Nep was a godsend?'

'You did indeed.'

'Yet we're in a fix, Miss Lynch.'

'A fix, Mr Elwood?'

'Of course. We've found this will to-together, and by rights—by *rights*, you know—we ought to share it to-together.' The lad's voice trembled and broke.

'Together?' she asked quite calmly.

'Share and share alike,' he stuttered. 'Oh yes!'

'How very, very generous, Mr Elwood!' said Ethel sweetly. 'But would you really *like* to send me half the interest every year? Really—truly? Would not that be too much?'

'Rather! A jolly sight too much, because I didn't mean that at all, you know.'

Yet the girl still looked at him with a most provoking simplicity and coolness. 'After all,' she argued, 'the will was found on Nep, and Nep is *your* own dog, not mine, so I've no right at all to a single penny-piece. That's settled, then;' and Ethel beamed at him, and Frank was so much annoyed by her cheerfulness that he said he felt sure she would make him mad.

'It's share and share alike!' he cried. 'We found it at the same moment, I say, and if you won't be reasonable I shall do—something—terrible!'

'How ungrateful you are to dear Nep!' said Ethel primly.

And Elwood put both hands inside his collar and pulled at it. 'There's only one way now out of the fix,' he cried huskily: 'the will can be destroyed—torn into bits!'

'Is that a quite reasonable way?' Ethel murmured.

'But what am I to do, anyway?' asked Frank. 'It would be dashed unreasonable on my part if I asked you to mar—marry me, because I'm not—half good enough for you—and you know it, of course; so Nep—well, Nep wasn't a godsend after all!'

It was then that their eyes met; and something in Ethel's compelled him to cry, 'How stunning! How wonderful!' And what Nep thought of the next proceedings I can't say.

Then Butler came in, forgetting his usual tap on the door, and very much he regretted his indiscretion. But Elwood mentioned the will at once, speaking in a great fluster; and Ethel, in confusion, had many things to say about that paper, though not so many as the good doctor gladly detailed.

'And Henry Lilburne won't dispute your right to the money. He had a fair chance of keeping Nep, and he behaved scandalously to the dog. He can't forget that fact. But we'll see the lawyers in the morning, and they'll communicate at once with Tom Lilburne's brother.'

There was a pause.

But presently Ethel said, 'Poor, dear Nep isn't washed yet; and see how patient he is, waiting to be made white as a snowball!—Come, Frank!—Do legacies make men lazy?'

'Not always,' said Butler; and he was right. Frank and Mrs Elwood are now among the most successful painters in London, thanks to the good use they make of Nep's legacy.

THE END.

BANKING EXPERIENCES.

THEORETICALLY a bank must never take risks—all its business must be of the safest character possible; but any bank official who keeps his eyes open and endeavours to learn something of the inner working of banking during the years he is in a subordinate position will come to understand that this theory cannot be carried out in practice. Once a bank-clerk finds himself in a responsible position he will have to take risks, often big risks; and if he has not the courage to do so he is unfitted for his post.

I remember, in my early banking days, when I was in the security department of our head-office in the City, I saw a good deal of banking behind the scenes, and a very useful experience it was. I remember well the occasion when a big discount house, who did a very large business with us, got suddenly and unexpectedly into difficulties through the failure of a large financial firm in Berlin. The discount house in question owed us at the time one hundred and seventy thousand pounds, only half of which was well secured. If we stopped advancing them further sums it meant the collapse of the house and a loss to the bank of probably eighty or ninety thousand pounds. If we continued to maintain their credit, the house would most likely pull through and we should lose nothing; or, on the other hand, we might sustain a crippling loss if the discount house ultimately failed. Our manager sent for a couple of the directors, and in ten minutes they decided to take the risk and see the discount house through. A fortnight later the house owed us three hundred thousand pounds. Rumours of 'a big City failure' were getting into the papers, but our bank never faltered in the policy they had adopted. One morning the discount house owed us half a million. Then came the crisis. Another one hundred thousand pounds was wanted. 'Pay it,' said our managing director. For a day our bank was tottering, but it stood the strain, and the next morning the discount house paid us in nearly half the sum they owed us, and the crisis was over.

On another occasion I remember a stockbroker came to ask for an advance of eighty-seven thousand pounds to enable him to meet his account on the Stock Exchange. He only wanted the money for a day, and if his request was refused it meant that he would be hammered the following morning. The security he offered was simply his character and reputation as a business man. His reason for the required overdraft was an irregularity in some share certificates which he had sold for a client. The irregularity, if his story was true, would be put right in a day, when the shares could be delivered and paid for. The manager had simply to figure out in a few minutes whether to trust his customer or not, for he had no time to consult his directors. He decided to advance the money, but when the broker left the office I saw there were a couple of beads of perspiration on the manager's forehead. The next day, at 3 P.M. the amount of the overdraft was paid in to the broker's account; but I believe the manager spent the greater part of the previous night walking about his bedroom.

In a big City bank such experiences are common enough, and they take years off men's lives. Be a banker as shrewd, clever, and cautious as you will, he must run enormous risks at times. The risk may always result in his favour, or it may not: but one failure, one slight error in an intricate calculation of a host of innumerable chances and probabilities, made in less time than it takes to write this line, means extinction so far as his career in the bank's service is concerned. Some men will only play for safety, and you may see them all over the country seated on stools behind their counter-rails diligently and faithfully performing their duties. The risks or the prizes of banking are not for them.

I remember well the first time I took the responsibility of a tolerably big risk on my own shoulders. I was then the acting manager of one of our branches in a big manufacturing town in the north. There was a lot of 'queer' business about, and I was instructed to be extremely careful in dealing with some of our customers, a great many of whom were engaged in businesses of a very speculative character. A few days after I had taken up charge of the bank a customer came in with a bill for twenty-seven thousand pounds accepted by a well-known firm of London financiers. The customer was a woollen manufacturer, whom I shall call Mr X. When he presented the bill he requested to be allowed to draw against it for ten thousand pounds, as he required the money at once to complete the purchase of some business he had bought. I had to decide whether the bill was genuine or not. If the latter, it was as good as a Bank of England note; if not, it was of course worthless. I was familiar enough with the signature of the firm which was on the bill, which appeared to be genuine; but should I advance ten thousand pounds on it? That was the question I had to decide in a couple of minutes, and after a few moments' thought I determined to do so. The following week, when we presented the bill for payment, it was duly honoured. Had I refused to advance the money I should have lost a very good customer; on the other hand, if the bill had been a forgery I should have been retired from the bank's service.

I had another curious experience whilst I was doing duty at this branch. One of our biggest customers was a Mr Z., a builder. He had begun a few years previously in quite a small way, and

had made money very rapidly. He was a bold, daring, and successful speculator; but I had been warned to be particularly careful in dealing with him, as it had got to the ears of our directors that the man had 'bitten off more than he could chew,' and was not as financially sound as he was generally considered to be. He had a standing arrangement with our bank for an overdraft of one hundred thousand pounds, which was well enough secured; but I had strict injunctions not to let him exceed this limit unless he lodged further security.

One day Mr Z. was shown into my private office. He was a stout, dapper, fresh-faced man, very keen and business-like in his manner. He informed me that he had paid out twenty thousand pounds in three different cheques that day. 'They will come in to you to-morrow,' he said. 'You will meet them, of course; but I thought I would mention the matter to you, as I believe I am overdrawn to the amount of my arranged overdraft with your bank.' I thought I detected a slight, very slight, tremor in his voice, but outwardly he appeared quite unconcerned.

'It is quite impossible that I can do so,' I replied, 'unless you deposit security for the amount.'

He looked hard at me for a few moments, and then said quickly, 'It is a square thousand in your pocket if you pay these cheques.'

I shook my head.

'I'll make it fifteen hundred.'

'Impossible,' I answered; 'there is no use in discussing the matter.'

I saw his hands grip the table convulsively; then he started up from the chair where he had been sitting, and the next instant he was holding a revolver within an inch of my face. 'Swear to pay these cheques,' he said, 'or you are a dead man!'

I looked at him steadily, and after a few seconds he put the revolver in his pocket with a laugh as he did so. 'You are a brave man,' he said, 'and they have got a faithful servant in you. Good-bye.' He held out his hand, which I took, and the next moment he was gone. The following day his cheques came in, which we returned marked, 'Refer to drawer;' but the drawer of them was then lying dead in his study, shot through the brain by his own hand.

It is often policy to oblige even a small customer by advancing him money on no security whatever, though of course such advances are necessarily always of a very limited character. In deciding on such matters one has to take into consideration the extent and character of the customer's business, and, perhaps even more, the extent of the business he can influence. Of course it pays a bank to be specially civil to a person who can bring them business—business, that is, of a desirable character; nowadays, as a matter of fact, most people who can do so are fully aware of this fact, and expect something more than civility. In plain words, a person who introduces good business to a bank wants to be paid for his services, and personally I think it is a much better policy to pay him a definitely arranged sum of money than, as is the plan with some banking concerns, specially to favour and oblige him as occasions to do so arise. Some few years ago I had a customer who, though he was not very well-off, and maintained but a comparatively trifling balance to his credit, certainly possessed the power of influencing a good deal of valuable business. He was the means of introducing several excellent customers to us, and for a time he never even hinted that he expected to be recompensed in any way. That he would do so some time or other I did not doubt; and I was right. He began by asking to be allowed to overdraw his account for a trifling amount; then he asked me to buy some speculative shares for him, and suggested that I ought to advance the money required for this purpose. This I at once refused to do, and asked him point-blank how much he expected to be paid for the business he had brought to us. He got very angry with me; declared he had never expected to be paid anything, but that as one good turn deserved another he considered I should have obliged him; and finally ended by hinting that others might be found willing to do so. Ultimately, acting on my advice, our directors paid him one hundred pounds, and ever since I have always made definite terms with any person who brings us business. Some people actually live by this means; but the modern bank-tout is a person, as a general rule, whose character is not altogether above suspicion, and one has naturally to be particularly careful in dealing with him—or her, for it is a calling occasionally followed by the gentle sex. There is usually something wrong with business introduced by such people, though a man requires often to be marvellously keen to detect that something. The first step in one of the biggest swindles perpetrated on a bank of recent years was the introduction by a tout of an apparently perfectly respectable gentleman in a large way of business to the manager of the head office of a very well-known banking concern. The tout vanished with a commission of five hundred pounds in his pocket, and the gentleman began his dealings with the bank in a seemingly honourable and satisfactory manner, and continued doing so for over a twelvemonth, when the crash came. He was one of those clever criminals who invariably succeed in hoodwinking men accustomed to straight business dealings, however shrewd and cautious they may be. This particular individual had been operating with forged bills in a very complicated and ingenious manner, by which he swindled the bank out of twenty-seven thousand pounds, and then ended his career by shooting himself one night in his bedroom at a hotel in Paris. Of course, the usual comment, 'The bank should have known there was something wrong,' was made in this instance; and so no doubt it should. A bank should never be swindled, a railway train should never leave the track, and a liner should never get on a rock; but

nevertheless all these things do occur sometimes, and it is beyond the power of human ingenuity completely to guard against their occurrence.

A bank may be swindled by some one either in or outside its employ, though the former danger has been greatly minimised since the Goudie frauds on the Bank of Liverpool. Since that period every bank I know of has made it a rule that each of its officials must take a holiday once a year, when his books are carefully checked by another. Just before this rule came into force a really remarkable series of frauds was committed by the cashier at a West End branch of a well-known banking concern. The plan adopted by the cashier was this: When a customer lodged cash to his credit the cashier put the money in his pocket, omitting of course to enter it in his cash-book. Consequently such cash items never appeared in any of the bank-ledgers, which balanced correctly each day. But the difficulty the cashier was confronted with was how to get these items credited in the customers' pass-books, which were written up by the ledger-clerk. To do this he started keeping separate pass-books himself for each customer whose money he had stolen; in these he entered all the money the customers had lodged, which showed the balances as they ought to have appeared in the bank-ledgers, and whenever one of these customers came in for his pass-book the cashier always took care to hand him the one which he had written up himself. Remarkable as it may seem, neither the ledger-clerk nor the manager ever suspected that the cashier was keeping a second set of pass-books which he used to write up after office-hours. Of course, to carry on the fraud successfully, the cashier could never take a holiday, for he ran a tremendous risk of detection by being absent from his post for even half-an-hour. For two years he carried on these frauds. Then one day he suddenly broke down. He went into the bank-manager's room, began sobbing like a child, and asked that the police should be sent for. He got seven years' penal servitude. Such a swindle nowadays would be impossible. In addition to every bank official being compelled to take an annual holiday, the system of inspection by the bank inspectors is far more thorough than it used to be, and more constant; and it must be remembered that, with a few occasional exceptions, bank officials are strictly honourable men of very high character.

The chances against the average bank official even attempting to perpetrate a fraud are very great indeed. But any bank is more or less open to attack by the outside swindler. For example, on one occasion a few years ago a well-dressed lady presented a cheque for five hundred pounds for payment at our City office. The cheque was signed apparently by a very wealthy customer of ours. It was, in fact, a perfect forgery, which the smartest cashier would have failed to detect. Our cashier never suspected anything wrong, and was actually counting out the money to pay to the lady, when she suddenly fainted. Her nerves failed her at the critical moment. Whilst we were endeavouring to bring her to, the customer whose name was on the cheque came into the office, and we learned that the cheque was a forgery. When the lady recovered consciousness she was arrested in our office. She belonged to a gang of forgers who were then operating extensively in London, Paris, and Berlin, and she was ultimately sent to penal servitude for a long term, with two confederates. It was simply by the merest chance that the bank did not pay away five hundred pounds on that occasion, and the incident will show how impossible it is for any bank effectively to safeguard against the operations of a really clever and audacious swindler. As a matter of fact, swindlers are rarely both clever and audacious. Nearly all of them, like most other classes of criminals, come to grief through some stupid piece of carelessness or of bungling, or by their nerves failing them at the critical moment. A man once presented a cheque for fifty pounds at a suburban branch of our bank which I was then managing. The signature on the cheque was perfectly forged; but the cashier was a very sharp clerk, and as he was counting out the gold he saw that the man's hands, which were resting on the counter, were trembling. The cashier then took up the cheque and brought it into my office to show it to me and to tell me why he had done so. When I came out to see the man he was gone. We informed the police of the matter, but we never saw him again.

FAIRY TUNES.

YESTREEN I lay a-dreaming in the hill above the sea,
And I heard the fairy pipers playing fairy tunes to me.
And the little fairy fiddlers at their jigging in the glen—
Oh, 'twas like a bit of boyhood brought into my days again!

For it 's heavy is the burden of the tunes myself must play,
And every night that darkens drifts me farther still away
From the times when I lay dreaming till the rising of the moon,
And hushed my heart for glamour of the fairy pipers' tune.

Ah! sore 's the song that often beats against my life's shut door,
And its tune, I'm thinking always, is the tune of 'Nevermore.'
There are sorrows in the winding tracks that lead me up the glen,
And my soul and its old gladness would not know themselves again.

But it 's grand to get a breathing hour and lie alone at ease,
And see the shining sun like beaten silver on the seas,
And hear the drones like wonder-tunes blown out of dreams again,
And the little fairy fiddlers at their jigging in the glen.

THE CUSTOM OF WAR.

Farewell, then, ancient men of might,
Crusader, errant squire and knight,
Our coats and customs soften.

SO sang Tom Hood in his 'Lament on the Decline of Chivalry,' and it is notable that in the general softening of manners in the last two centuries the grim 'custom of war' has also been considerably mollified. By the custom of war is meant that code of laws and usages, mostly unwritten, which regulates the conduct of belligerents towards each other. It is little more than a century since this custom of war permitted the General of a besieging army to encourage his men with the promise that when the place fell they would be allowed to sack it for a day and plunder freely. Such a right is never now exercised against civilised enemies; but the old practice has, it is to be feared, been more than once connived at, to say the very least, in the case of 'uncivilised' foes. To go back a little farther, one finds honourable soldiers summoning a castle or fortress to surrender, and warning the garrison that, as the place was considered to be untenable, they would give no quarter if they were forced to storm it.

We have a reference to this custom in one of Major Dugald Dalgetty's stories of the glorious wars of Gustavus Adolphus, when he tells Menteith:

'I once saw a brigade of Irish, at the taking of Frankfort upon the Oder, stand to it with sword and pike until they beat off the blue-and-yellow Swedish brigades, esteemed as stout as any that fought under the immortal Gustavus. And although stout Hepburn, valiant Lumsdale, courageous Monroe, with myself and other cavaliers, made entry elsewhere at point of pike, yet had we all met with such opposition we had returned with great loss and little profit. Wherefore these valiant Irishes, being all put to the sword, as is usual in such cases, did nevertheless gain immortal praise and honour.'

Scott here makes the major speak the language of his time. The refusal of quarter was defended on the ground that men who held out when there was no chance of victory were inflicting useless loss on their opponents, and thus deserved to forfeit their own lives. But nowadays the threat to massacre the heroes of a desperate defence would be regarded as infamous. War in this respect has become more chivalrous. And the whole process or evolution of the 'custom' has been in the direction of humanising war. In the Middle Ages quarter was given to knights and nobles, for they could be held to profitable ransom; but mere common soldiers were freely ridden down, for there was no profit in making them prisoners. Strangely enough, this was the indirect result of a great forward step in the progress of civilisation. Soldiers of still earlier times, when slavery was a world-wide institution, were anxious to take hundreds of prisoners, for they could be enslaved, and so were worth money. The abolition of slavery led at first to more slaughter in the rout of a beaten army.

War at the best is a horrible business. Only those who have never seen it have any other opinion. But though the actual means of destruction have grown more deadly, war has become in a great degree humanised, and is not so horrible as it was. The tendency now is to avoid useless killing and mere destruction for its own sake, and quarter is always freely given. Men who have ceased to resist actively are indeed sometimes killed when blood is hot, as when a position is stormed with the bayonet or in the first rush of victorious cavalry; but there is no slaughter in cold blood. Far less is there any idea of the deliberate killing of non-combatants, though if they are within the range of fire they must, of course, take their chance. The wounded are cared for, to whichever side they belong. Plunder and outrage are sternly repressed.

It is easy enough for a logical-minded critic to point out the contradiction of first using the resources of science to disable a man, and then taking even greater trouble to restore him to health. The

 [*All Rights Reserved.*]

contradiction disappears when one notes that the object of the soldier who is no longer a bloodthirsty barbarian, but a civilised Christian, is primarily not to kill his enemies, but to break their power of resistance and put them *hors de combat*, or (to use a phrase taken from peace manœuvres) 'put them out of action.' This is no mere ideal distinction, but happily represents a fact, the outcome of centuries of progress. The Red Indian killed outright and took the scalps of his enemies. More than one Eastern fighting-race collected the heads of as many slain foes as possible. The European soldier kills, but the killing is not massacre; it is the result of using deadly weapons to knock out and terrify his opponents. A General does not exult in the number of the dead on the other side. What he aims at is to have crowds of wounded and unwounded prisoners, with as many thousands more of the enemy as possible dispersed, disorganised, cut off from their supplies, and no longer dangerous. Hence killing for the mere sake of killing is avoided.

Even in the heat of battle this is so. After one of our victories in the Sudan an officer, telling me of his personal experiences, said, 'I rode in among the Dervishes. They had no fight in them, and were bolting like rabbits. I could easily have shot half-a-dozen with my pistol; but it's not my business to kill men running, but to lead my battalion.' Another officer who now wears the V.C. told how in a cavalry fight the opposing troops met in a cloud of dust, and as it cleared he saw a Dervish horseman, cut off from his friends, riding beside him. 'I could have killed him,' he said; 'but he looked such a sportsman that I let him go.' Outposts remain in sight of each other for days without exchanging a shot. Disciplined troops soon realise that killing stray men is of no particular advantage, and firing on the outpost-line means disturbance of the rest of the camp or bivouac behind it. It is only uncivilised hillmen of the Indian north-west frontier who keep every one awake by sniping or sending long-range shots at random into a camp.

Nothing is more unlike the stay-at-home civilian's idea of war than the conduct of opposing outpost-lines. General Sir Richard Harrison, in his recently published *Recollections*, describes a visit he made to the outposts of the Federal army during the American Civil War. The Confederate picket-line was well within rifle-range, and he was able, after an exchange of friendly signals, to ride across and have a talk with the Southerners. 'A hill only was between the combatants,' he says; 'but they had been fighting too long and too seriously to keep up an incessant conflict between outposts. In fact, they had arrived at the condition experienced by our troops and the French at the end of the Peninsular war. Sentries and vedettes signalled when an advance was imminent from either side; and, unless special orders had been received to the contrary, the outposts retired before the signal without an attempt to shed blood.'

General Harrison's reference to the Peninsula reminds us that the records of that war are full of instances of the friendly courtesy of the opposing forces. Men on hostile outpost-lines would slip across to ask for a light or buy tobacco from each other. A British officer inspecting the outposts saw an advanced French sentry asleep. Instead of carrying him off a prisoner, he rode over and woke him up, and told him he did not want to see a young fellow get into trouble by being found asleep at his post. In a lull of the fighting at Talavera French and English soldiers came down to the same stream and drank together.

In the lines outside Metz and Paris during the Franco-German war there was the same tendency for the tacit truce on the outpost-lines to lead to irregular fraternisation between the opposing forces; but on account of the fear of its being taken advantage of for purposes of espionage, strong measures were adopted to keep Frenchmen and Germans from smoking, drinking, and playing cards together.

When it comes to actual fighting, the custom of war forbids certain effective methods of getting rid of an enemy. One may cut off his water-supply, and thus inflict serious suffering on all concerned, and if the deprivation is prolonged produce an outbreak of pestilence; but one must not poison wells, reservoirs, or streams. The rebels in Arabia practised this method against the Turks; and in the war between Japan and China the Japanese in their advance through Corea did not use the village wells, but substituted for them Abyssinian tube-wells and other methods of obtaining a reliable supply, because they had been warned that the Chinese might poison the wells—conduct which civilised belligerents regard as utter savagery. The underlying principle of the unwritten code that allows one to cut off the water-supply and forbids one to poison it appears to be that a belligerent may take steps that will indirectly cause sickness among the enemy, but must not work directly and intentionally for this end. In earlier centuries the distinction was not made so delicately. A medieval writer on artillery describes how to produce pestilence in a besieged town. His method is to allow the dead bodies of horses and cattle to become corrupt, and then cut them into convenient pieces and shoot them into the town with catapults. One wonders if this plan was ever adopted.

The custom of war—which in this case is to some extent set forth in international conventions—also forbids mere useless maiming and the infliction of avoidable suffering. Thus the use of the explosive rifle-bullet is forbidden. In other words, one may inflict a bullet-wound that will disable a man, perhaps kill him; but one must not do it in such a way as inevitably to inflict horrible and deadly wounds. On this principle there has followed a

tacit understanding among civilised nations not to use soft-nosed, collapsible bullets that 'set up' or 'mushroom,' the kind of bullets now used against big game. This was why during our South African war army orders forbade the use of the Dum-dum rifle-bullet and of a type of enlarging pistol-bullet. But there is a tendency to use these ugly bullets against savage foes. The reason for making this difference is that whilst the more or less educated civilised soldier, when he is hit even by a small bullet, and the injury is slight, will mostly become nervously anxious to have it attended to at once; while the uneducated barbarian, who has no nerves to worry him, and, as Mr Kipling puts it, 'knows no more of his inside arrangements than an eight-day clock does of its works,' is very likely to come on and get to close quarters even after two or three small bullets have gone through him. This is why the soldier, who is handier with the rifle than the bayonet, likes to have a 'man-stopping' bullet.

Explosive bullets being forbidden, a lower limit has to be set to the size of projectiles that carry a bursting-charge. No shell must weigh less than half a kilogramme — that is, roughly, a pound. Hence the smallest shell used is the little one-inch steel shell for the 'pom-pom,' fired in sets of ten, that burst like a string of crackers. In South Africa they inflicted few casualties, but they got strangely on men's nerves. Rifle and heavy artillery fire was easier to face than these nasty little projectiles.

One wishes the prohibition against small exploding projectiles could be extended to the grenades filled with high explosives that were introduced by the Japanese in their war with Russia. They were used in storming entrenchments, and were fired from wooden mortars which two men could run up with to the firing-point. They produced hideous injuries, blowing away limbs, faces, one side of the body, crippling for life those they did not kill outright. It may not be generally known that our army has practically adopted the idea, and experiments have been made at Woolwich with high explosive grenades and portable mortars. It seems a repulsively cruel method of fighting, though it must be said that ordinary heavy shell-fire also inflicts very nasty injuries.

In one respect war has become notably less chivalrous. In the Middle Ages, up to a comparatively late date, there was a disposition to regard battle as a tournament on a large scale. There was an idea that armies should be matched on equal terms on a 'fair field.' When James IV. of Scotland marched across the Border in 1513, and on the approach of Lord Surrey's English army took up a position to await battle 'on Flodden Hill, steep on both flanks, and defended in front by the deep river Till,' Surrey sent him a letter complaining that 'he had put himself into ground more like a fortress or a camp than any indifferent [that is, equal and fair] ground for battle to be tried.' A modern General receiving such a letter would think his opponent had lost his wits. By interposing between the Scottish camp and Scotland, Surrey succeeded in luring King James into leaving his vantage-ground and attacking, with disastrous results. Nowadays 'everything is fair in war' except assassination and treachery.

Spies are hanged or shot if they are detected, not because espionage is a crime in itself, but to make the spy's business more difficult and deter people from taking it up. The essence of espionage is disguise. An officer, if he is in uniform, may venture as far as he likes to go to reconnoitre an enemy. He is not a spy unless he disguises himself. The Japanese in the last war showed themselves past-masters in espionage, but they used methods that Western nations would consider unjustifiable. They employed natives of Corea and Manchuria to act as spies in the Russian lines, and, if report speaks truly, these agents ran a double risk. If the Russians detected them they were hanged; if they came back without satisfactory information, they might be shot by their employers 'to encourage the others.' Our Eastern allies still keep to a very grim kind of custom of war. Rumour says that at the naval battle of Tsu-shima hopelessly wounded men were quietly dropped overboard to clear the decks and save unnecessary trouble.

Connected with the custom as to spies are the written or unwritten laws that forbid the people of the country from taking an active part in its defence unless they have at least some plain badge to show they are combatants. The whole legislation as to patriotic action of civilians is a little confused. The German military law orders that in case of invasion the levy *en masse*, or Landsturm, is to be called out, and the armed inhabitants who thus come into action need not have uniforms; yet the Prussians used to shoot captured *franc tireurs* in France on the ground that they were irregular combatants, without recognised uniform or commissioned officers. It is generally recognised that the people of a town may fight in its defence without uniforms, for in a siege all the people within the fortifications are presumably enemies of the besieger.

The Hague Convention recognises the right of the civilians of an invaded district not yet effectively subdued by the invader to fight in its defence even if they are not uniformed. Thus the execution of Mr Brown for defending his home, in the play known as *An Englishman's Home*, is an episode based on ignorance of current military usage, though the author of the play is a soldier.

The use and abuse of the white flag of truce is, again, a subject of much discussion. There probably has been no war in recent years in which each side did not charge the other with treacherous misuse of this flag. Sometimes the origin of such

charges is clearly that—as in the case of our own men in the surrender at Nicholson's Nek—while some are ready to surrender and show the white flag, others are anxious to fight on and continue firing. It may not be generally known that the recognised custom of war allows troops in certain cases to fire on the bearer of a white flag. To display the flag means that one wants to communicate. If the other side is willing to do so they cease firing, stop their advance, and signal to the white-flag bearer to come forward. But they are also free to refuse to communicate. In this case they may signal a refusal and continue advancing and firing. If the bearer of the white flag persists in coming on he may be shot down. The reason for this is that if the mere display of a white flag necessarily stopped the fighting it might be used at a critical moment to delay temporarily the advance of the attack on an important point. But the right of refusing to let the white flag come forward is very rarely used.

The most satisfactory development of the custom of war is the legislation as to the Red Cross embodied in the Geneva Conventions. Its effect is to neutralise and give as much security as possible to all that is connected with the care of the sick and wounded. The change does not affect only the actual battlefield. In the American Civil War the Federals treated quinine as contraband when the Confederate hospitals were fever-stricken for the want of it. Now the cases marked with the Red Cross would be passed through the outpost-lines. The Red Cross flag, the most honoured standard displayed in war, is really the flag of Switzerland, with the colours reversed. The Swiss flag is a white cross on a red ground, the ambulance flag makes the ground white and the cross red; and Switzerland has the further honour that the legislation for the care of the wounded was drawn up in a Swiss city. Thus it was not without reason that a Swiss orator once said: 'Our flag does not fly as the standard of conquering and devastating armies, but it is a flag of ours that is carried into the midst of the misery and ruin of war all the world over, and has already been displayed on a hundred battlefields as the symbol, not of war and death, but of life, mercy, and charity.'

THE SEÑORITA DOLORES.

CHAPTER IX.

THAT afternoon the Señorita Dolores lay on a couch in the piazza of her house in the Plaza de St Martin. On her knees lay a book which she did not read. From the Tagus a fresh wind had risen, and was blowing a fragrant scent of heliotrope upon her from the garden. Her eyes were half-closed. In the bosom of her dress was pinned a cluster of red roses, and more than once she looked thoughtfully at them.

She rose as a servant entered. 'The Señor Morella, señorita.'

A queer look came into her eyes; it was not anger, nor yet fear, but a curious blending of the two, and she drew herself up as if to meet a foe.

When the Spaniard entered, straight from his journey from Madrid, the dust of the roads still upon his boots and clothes, she was standing facing him.

'Well,' she said, 'you have got the despatches?' Her voice was void of feeling, and its lack of expression somewhat puzzled Señor Morella.

He advanced until he was within a couple of feet of her, towering above her like a giant. 'No, señorita, we did not take the despatches, because Señor Vincent did not go by the St Breeda road.'

Señorita Dolores met his gaze unflinchingly. 'Then he went by the Cettini road;' and there was a sudden gladness in her heart, although she realised that perhaps he would never know that she had saved his life.

'Yes,' said Señor Morella, 'he went by the Cettini road; and you knew that he was going that way.' He did not wait for the señorita's reply. 'I am not going to ask you why you deceived me. In a sudden whim the Creator made women incomprehensible; but, señorita, there was once a man in Madrid who lied to me, and he was found next morning on the roadside dead.'

'Stabbed between the shoulders—from behind!' rejoined Señorita Dolores.

The Spaniard found her gaze awkward to meet. 'No man fools me twice,' he answered in a voice tense with passion.

The señorita laughed. There was the gladness of springtime in her heart since Vincent was safe. 'And a woman, how many times, señor?' she asked.

He frowned. He felt the conversation was being conducted in a strain somewhat beyond his comprehension. He understood threats, however skilfully veiled, and he understood diplomacy of a certain low, cunning nature, but he had yet to master the soft parry and thrust of a woman's tongue. 'Once also,' he answered.

'And since I have transgressed—once?' said the señorita.

Inwardly the Señor Morella sighed with relief. 'It is essential to the interest of our party,' he replied, 'that we find out within the next eight-

and-forty hours where the Queen Regent is in hiding. It is in your power to find out.'

'How?'

'Through your friend Señor Vincent.'

'And if I refuse?'

The Spaniard looked down at her. 'Then, señorita,' he said in a soft voice, 'I shall have to tell the world that your brother sold Spanish military secrets to a foreign Power in order to pay off debts he had incurred gambling in England.'

'Gambling with a man called Segrim, a man you paid to get him into your power.'

'That my friend himself will prove is not true,' said the Spaniard, feeling himself upon more certain ground.

'He cannot, since he is dead,' replied the señorita, watching her companion's face.

'Dead!' said the Spaniard solicitously. 'I am sorry to hear such news, since yesterday I left him in Madrid alive and well.' He walked towards the curtain that led into the room beyond. Drawing it aside, he paused for a second. 'And you will let me know, señorita?' he said.

Señorita Dolores was standing by the couch. With one hand she tightly clutched the wooden rail at the head. 'You shall hear from me in forty-eight hours,' she said.

The curtain rustled, and he was gone.

The señorita stood still for a moment; her face was white, and all the light had gone from her eyes.

'Segrim alive!' she murmured. 'Segrim alive!' Then she sank upon the couch and buried her face in her hands.

CHAPTER X.

THAT evening the wind changed and blew in heavy gusts from the north as Vincent rode into Toledo. He made his way straight to General Vilenta's house in the Calle de Correo.

Giving his horse to a servant, he entered what the General genially termed his workshop, where the welfare of Spain was superintended. It was a bare room, devoid of all unnecessary ornamentation save on the walls, which were hung with costly tapestry, the General's one extravagance in an otherwise frugal life. In the corner stood the couch on which he had spent the previous night, and covering the entrance to the piazza was a heavy curtain, drawn close to keep out the cold.

The General was seated, talking to Colonel Gregori. As Vincent came into the room he rose, and a smile crossed his face for a second. He had grown to love the English aide-de-camp, who counted danger as nought, and came smiling and imperturbable out of every difficulty.

'You have returned, as usual,' he said, 'half-an-hour before your time.'

Vincent drew a despatch out of his pocket and handed it to him. 'I was followed to Madrid,' he said; 'but my pursuers chose the Santa Breeda road. There were seven of them; so perhaps it was as well that they made a mistake.'

The General laughed; there was a curious little ring in his mirth, and his brow puckered as if he were counting in his mind how many of the seven would have reached Madrid alive.

'And to-night, passing the woods by Cettini, a man fell upon me from behind a tree.'

'It is dangerous work travelling upon the Spanish Queen's business,' said General Vilenta. 'And the man, my son?'

'I left him on the road,' said Vincent. 'There were some papers in his pocket.' He handed them to the General, who took them and glanced through the pages.

'I am glad you are learning the lessons Spain has to teach,' he said softly.

He resumed his seat. 'And so men waited for you along the St Breeda road? That was strange, since our men seldom travel that way.' He looked up at Vincent. 'Did you tell any one along which road you were travelling?'

Vincent bit his lip and remained silent.

'And did you tell your friend the truth?'

'Yes,' said Vincent.

General Vilenta rose and laid a hand on his shoulder. 'My son,' he said, 'I should not trust—a friend too much, if I were you. I did once.' He laughed dryly and shrugged his shoulders. 'Perhaps that is why I am here. When God made—friends, He at the same time created an enigma—an enigma that many men have ruined their lives in trying to solve.' Then he went and sat down again.

'You think I have betrayed my trust?' said Vincent.

'No,' replied the General; 'you have been indiscreet, and youth is always that. Discretion only comes with gray hairs, and then it comes too late. To-morrow I am going to place a greater trust in you. For the past week the Queen Regent has been in Toledo.'

Vincent looked up in surprise.

'No one has known except four of us; it would not have been safe for more to have been in the secret. To-morrow evening you will take her a letter and place yourself unreservedly at her disposal. The mission is full of danger. I would go myself; but I am known, and I should not reach her house alive. With you there is just a chance, and the future of Spain depends upon that chance.'

'I will take it,' said Vincent.

The General nodded. 'I will give you the letter now,' he said; and, rising, he walked towards the curtain which led on to the piazza. Before it he hesitated for a second, then drew his sword and drove it through the tapestry. There was a scream and the sound of some one falling heavily.

Vincent and the colonel rushed towards the spot, while General Vilenta flung aside the curtain. Stretched on the ground, and breathing heavily, lay the form of a man. From a wound above his heart a stream of blood was flowing on to the white stone.

'Did you not hear the curtain move?' said the General quietly. 'He has been there for ten minutes.'

By the time his body had been dragged into the room the man had choked out his last breath. General Vilenta was a good swordsman, and knew to a nicety the exact spot at which to strike; but even the most astute make mistakes, and in the minute which they spent in carrying the body into the room another man crept from a shadow in the piazza, and, leaping lightly over the rails, sped away into the darkness.

The dead man's head was bent low over his body; as Colonel Gregori lifted it Vincent leant forward with a quick exclamation. Then he went down on his knees and peered into the features. 'Thank God!' he said.

He rose and turned to the two soldiers who were silently watching him. 'I left England because I fought that man in a duel,' he said. 'I heard afterwards that he was dead.'

'Then it was Frederick Segrim you fought?' said the General. 'It was a great pity you did not kill him; it would have saved Spain a lot of trouble if you had.'

After Vincent had left, the General turned to Colonel Gregori. 'I wonder why that woman saved his life?' he said.

'What woman?' asked the colonel.

'Señorita Dolores.'

'The Carlist spy!'

The General lighted a cigar. 'I think before Satan was expelled from heaven he must have been the Creator's chief designer, and Señorita Dolores is his masterpiece.'

CHAPTER XI.

JULY 13, 1838, was a day which changed the destinies of many men. It was on July 13 that Don Carlos's troops, driven at last to open combat, ill-conditioned many of them, fighting not from patriotism but from hope of personal gain, and led by men prompted by no worthier motives, were routed, and the first blow was struck that was unconditionally to give Isabella the three crowns. Also, it was a day of import to many concerned in this story.

When Vincent awoke after a brief slumber, Lasquez was by the side of his couch, as gay and debonair as ever, although he had spent the night gambling with two *contrabandista* in a small inn on the road to Talavera; and even at that moment a man lay still in a corn-field not a mile out of Toledo, a knife-wound between the shoulders—a man who had cheated to win a few paltry pesetas. In Spain men are indolent and careless of life, and Lasquez was a magnificent specimen of his country.

'A letter for you, señor,' he said with a courtly bow.

Vincent took the envelope and looked at it. It was dated from London, and was three weeks old. Then he opened it.

It was from a firm of solicitors in Leadenhall Street, to say his father had been dead for over a month, and had died intestate.

Vincent read it through with a total lack of emotion. It is not easy to mourn the loss of a parent whom you have seldom seen, and only remember as a solemn and impassive Nemesis. Such a father leaves children behind him who are either failures or grand successes—it is a throw of the dice which; but he passes to the grave with little sorrow.

The fact that he was heir to a large income had little effect upon Vincent; his was a nature that had never been sorely troubled by scarcity of money, and sudden affluence made little difference. He was of the stuff from which our finest soldiers are made: a couch and breakfast day by day, a good horse and burnished sword, and he was happy. England has made many mistakes, and it was no light one when she told Harry Vincent that she had no further use for his weapon and sent him adrift to fight for another country.

He laid the letter down upon a chair by his side. 'You are late, Lasquez!' he said.

'But yes, señor; I was delayed on the way to your excellency's.'

'Ah!' On the light-blue shirt which Lasquez wore beneath his coat Vincent noticed a stain; it was red, and had not yet fully dried, so he forbore to ask any further questions. An hour later he was in the presence of General Vilenta.

The General betrayed no excitement at the glorious tidings of victory which had reached him. He was seated before the plain oak table on which he transacted all his business. On the surface, close by where he sat, were three round holes diving perpendicularly into the wood. They might or might not have been caused by round shot—the General was silent on the point; but whenever he mentioned the name of Señor Moreda his fingers softly caressed the spots, and a retrospective little smile played round the corners of his mouth.

'Yes, it was a splendid victory,' he said in answer to Vincent's inquiries; 'but it was twelve hours too soon. To-morrow, and it would have won the game for us. Now'——

Something in his tone made Vincent look at him curiously. 'Now?'

'The game is in your hands.' He handed Vincent a letter. 'You will take this to Queen Christina this evening, and place yourself at her dispos-

If events turn out as I expect,' he smiled grimly, 'you will escort Queen Isabella and the Queen Regent to Madrid to-night. A carriage will be waiting for you by the Puerta del Cambron. I shall await their Majesties in Madrid for the *coup d'état*.'

'And if they will not go?'

'Then Don Carlos will be king to-morrow, and you and I, my friend, will be assassinated.' And General Vilenta handed his aide-de-camp a cigar.

There is a glorious, sublime uncertainty about affairs in Spain. It is a country where indolence and chance reign supreme, and carelessness runs riot unchecked. Some day the people will awaken and put their house in order, and then the world will wonder, for the reckless courage that marked their ancestors two hundred years ago still kindles within the breast of the man in the street and the baby in arms; it only needs a reformer, a man who can lead them, a second Pizarro, and the country will awaken from its long lassitude.

The Señorita Dolores was in her *sala;* a cool breeze blew in through the open windows, and the clematis which covered the piazza cast a shade across the room. She was seated on a long couch, her head resting among a pile of cushions. Her cheeks were pale, and in her eyes there was that look which men who have been upon the battlefield see in the eyes of their comrades at the critical moment—one of courage, fear, excitement curiously blended. By her side was a letter, the ink of which was scarcely dry. She picked it up and read it through. It was short, and addressed to Señor Morella:

'Dear Señor,—The forty-eight hours are nearly over, and I have made my choice. It is a cowardly one perhaps, but it cannot be expected that I, a mere woman, could evince the courage which marks Don Carlos's lieutenant. For two years I have served you in order to save the honour of my family. I have the information you require; but it will go with me, and the honour of Spain will be saved at the cost of a woman's life. When you come this afternoon you will be shown into this room, and I shall receive you; but, *gracias à Dios*, I shall be beyond your power. *Adios!*

'Dolores de Garcia.'

In another envelope she placed a red rose and a slip of paper; on the paper were the words: '*Adios, carissima mia!* Ask my friend Señor Morella, and he will tell you everything.'

She smiled as she sealed down this envelope, for it was addressed to Vincent, and contained what was essentially a woman's revenge. This done, she lay back on the couch, and who knows what thoughts were passing through her mind?

The hour of siesta had come and gone, and the shadows lengthened upon the streets of Toledo. Everywhere there was a silence, and men looked suspiciously at their fellow-passengers in the streets. At the corners the muleteers and *contrabandista* (great men in Spain) talked together in whispers, unusual in a country which is given to much singing and acclamation. Those in authority noticed it, and many clever enough to read the signs made silent preparation. The Guardias Civiles were kept in barracks, prepared for any eventuality.

Father Padrona was one typical of many priests in Spain, the men who, poorly paid, cement the country more closely to the Mother Church than all the edicts and absolutions of a generous Pope. Large of heart and poor in pocket, he worked among the peasants of Toledo for a salary at which the *lazzaroni* of Naples would scoff, and that irregularly paid. The muleteers respected him (which is saying much), their wives revered him, and their children kissed the hem of his much-repaired and shabby garments as if they were the sacred vestments of Him who suffered upon the Cross.

The *padre* was tall and thin, his hair white and closely cropped. He bore the marks of a man who had once been handsome, but the lines of poverty and care were deeply cut; and on his face, for those who cared to read, was the suggestion of a tale that would never pass his lips.

Passing along the path by the side of the Tagus, he meditatively acknowledged the salutes of those he met. In the Plaza de St Martin he stopped before the gates of the señorita's house, then slowly entered and walked up the drive.

'The Señorita de Mogenti?' he asked of the servant who came in answer to his summons; and five minutes later they stood facing one another, these two who were to hold the destiny of Spain in their hands for a few brief hours.

The *padre* looked down at the little woman before him, scarcely reaching up to his shoulder, and in his quiet way, in a single glance, took in her beauty. 'I understand,' he said to himself; for, passing as he did among all classes in Toledo, the *padre* heard many things. 'I have brought you two letters,' he said gravely, handing her a couple of envelopes on which the dust from the roads lay thick; on one was the imprint of a cloven hoof, as if a mule or a bullock had stamped the envelope beneath its foot with the happy heedlessness of ignorance. 'I found them upon the road to Talavera.'

The señorita took them and glanced at the dates. 'And they are nearly a fortnight old!' she said with a light laugh.

'That is nothing,' replied the *padre*, with a funny smile; 'time travels lightly here. But it was fortunate I found them.' How fortunate he did not know.

'You will sit down,' said the señorita; 'you are tired if you have walked from Talavera.'

The *padre* arranged his cassock. 'I will sit down, not that I am tired, but because I wish to speak to you.'

The señorita watched him in silence.

'I am priest at the Church of St Mary the Virgin Mother, and among my flock there are many black sheep, and strange tales come to my ears.' The *padre* looked up, to find the señorita's eyes fixed upon him.

'Yes,' she said, feeling a sudden strange interest.

'To-day I heard something.' He flicked some dust off his cassock. 'That I am going to tell you —why I do not know.' He drew his chair nearer hers. 'We priests love to meddle with politics,' he concluded with a dry laugh. Then he suddenly became serious and spoke in a whisper. 'The Queen and her mother are in Toledo.'

The señorita nodded.

'To-night they are going to Madrid if a certain messenger reaches them safely. That messenger will be waylaid in the Calle de los Santos, which is dark and silent, and the message taken from him. And to-morrow Don Carlos will be proclaimed king in Madrid, and the Queen and her mother will be found assassinated.'

The *padre* watched his listener's face, and a gleam as of one who has found his surmise to be correct lit up his eyes as the señorita asked, 'And the messenger?'

'El Capitan Vincent,' he replied quietly.

'Ah!' The señorita had risen to her feet. 'Why did you come and tell me this?' she asked.

'I knew of no one else,' replied the *padre*, 'and I do not wish to see Don Carlos upon the throne. I love Spain, wayward country though it is.'

'You must hear many strange tales?' said the señorita.

'Yes,' replied the *padre*, and he glanced towards a bowl of red roses standing on the table.

'Then I wonder,' she continued, speaking very slowly, 'that you came to me.'

'It was because I hear so much that I came. If I were you, señorita, I should read those two letters.' They had dropped from the señorita's lap. He rose, and, picking them up, handed them to her.

She broke open the envelopes, and when she had read them, said, 'You know the contents of them?'

'I think so. Your brother is dead?' said the *padre*.

She nodded, and there was a new hope in her eyes. 'Yes; and thank Jesu he died as a man, for his Queen!' She looked at the *padre* with a funny look in her eyes. 'These are strange words for a Carlist spy.'

The *padre* came and laid his hand on her shoulder. 'My child,' he said, 'you have had a hard life, but you have saved your brother's honour and the honour of your family. Now'—

'I am going to save Queen Isabella.'

He nodded and walked towards the door. With his hand on the latch he paused. 'There is one who does not forget, my daughter. For the rest of your days may your path be strewn with roses—red roses!' and he walked into the *patio* with a ruminative smile on his face.

CHAPTER XII.

FOR a few minutes after the *padre's* departure the señorita remained where he had left her, buried deep in thought; then she slowly crossed the room and tore up the two letters she had written.

Sitting down at her escritoire, she took up pen and paper. The letter she wrote was a short one, and it was written with a minute precision, as if she carefully studied each letter before she formed it. When the note was finished she surveyed the result. 'I think it will do,' she said to herself; 'it is a very good imitation—very good!' Then she rang a bell at her side. 'Tell Señor Morella, if he calls to-night, that he shall have my answer by the time he requires; and send Marcos to me,' she said to the servant who answered it.

A few minutes later Marcos appeared. He was tall and dark, and essentially typical of his class.

'You called for me, *madama*,' he said.

'Yes,' replied the señorita. 'I want you and José to be in the Zocodover in an hour's time. You will meet there a young señor; with him you will go to the Calle de los Santos, and you will do whatever he commands.' She paused. 'Marcos, you are not as a rule forgetful; do not forget to take a sharp knife with you to-night. It may prove useful.'

Marcos smiled, disclosing a row of white, even teeth. 'It is well, *madama*,' he said. 'I shall not forget.'

(To be continued.)

LIFE IN THE AUSTRALIAN NEVER-NEVER.

MY first year in Australia was spent on a Queensland cattle-station lying about two hundred miles inland from the flourishing port of Rockhampton. Misled by a seductive advertisement that appeared in a home paper, I had been foolish enough to undertake to pay the proprietor the sum of one hundred pounds for initiation into the art of cattle management; consequently the experience gained by me during the first twelve months following my arrival was but little. The owner of the station—Hawkwood, we will call it—was a man of singularly unpleasing manner, and entirely lacked the geniality which so strongly characterises the average Australian squatter. As he showed very clearly

that he preferred my money to my company, I soon decided on leaving at the first opportunity. Let me here caution British youths ambitious of becoming Australian squatters not on any account to pay for their board and lodging on the station where they intend to serve as cadets.

At the expiration of my first year I made an arrangement with a gentleman who was half-owner of a large western station to join him as a non-paying cadet. Mr P. was an Englishman of good family, and a few years before had bought a half-interest in an extensive and newly settled pastoral property lying on the Diamantina River, some eight hundred miles by road from the coast. The run embraced a considerable area of country, being exactly forty miles square, and in extent exceeded many a German principality. So far, it was but lightly stocked with some five thousand head of cattle and one hundred and twenty horses; and the place being at that time one of the most remote stations in the far west of Queensland, I was told that it would offer capital opportunities for obtaining rough experience.

Owing to the prevalence of a severe drought the journey to my new destination—Bulgaroo was its euphonious name—occupied nearly six weeks. I was accompanied by a newly engaged married couple, and we had charge of a number of valuable mares intended for the station stud.

Six weeks' travelling on horseback, without a break, becomes tedious, even in Australia. It was, therefore, with feelings of distinct relief that on the expiration of that period we saw—from the summit of a low plateau overgrown with stunted shrubs and cut in half by a picturesque gorge cleft in the course of ages by the Djamantina, which here sensibly contracts in width—the shimmering, bluish specks, apparently floating in mid-air, recognised by my companion as our long-desired destination. After we had disposed of the greater portion of the ten long miles which intervened, the specks referred to took the shape of four small buildings clinging to the side of a red sand-ridge. To the right, four miles distant across a tract of bare, flooded country, might be seen the line of stunted trees which marked the course of the river. Behind rose, some fifty feet high, the ridge of gleaming red sand; and from its summit similar ridges, rising billow-like one after another, might be seen as far as the eye could reach. Away to the left extended vast plains, broken here and there by singular sandstone kopjes, winding lines of low scrub denoting dried-up watercourses, and sandhills. The scene recalled the ancient times when a shallow sea rolled over the whole region, studded with innumerable islets and sandbanks.

Over the slightly elevated ground five miles and more back from the river the plains were sprinkled thickly with the tussocks of Mitchell grass, the squatter's best friend. This grass has wonderful powers of resisting drought. Its roots, plunged twenty feet underground, absorb moisture enough to keep the plant alive through the hottest summer; in fact, Mitchell grass is said to be able to survive a rainless period extending over three years. A few weeks after a fall of rain the profusion of green, succulent blades it puts forth is amazing; a month or two later the fierce sun turns these into natural hay, and in this condition Mitchell grass provides fodder of admirable fattening and sustaining power for stock of all kinds.

The station buildings at Bulgaroo were not of exactly imposing dimensions. Considering that every stick of timber—poor stuff at best—had to be drawn by bullocks, over country waterless at most times and frightfully boggy after rain, for a distance of forty miles, and that every sheet of iron for roofing cost at the rate of fifty pounds a ton for freight alone when delivered at the station, ambitious efforts in the way of architecture were hardly to be expected. There were four buildings in all—a store (which served also as a residence for the manager and myself), a hut for the stockmen and occasional visitors, a kitchen and sleeping-room for the married couple, and a small shed where the stock of salt-beef was kept. All were built of rough wooden slabs, and were quite innocent of windows. Glass is a commodity only seen in the form of bottles on a western station. The store contained but a single room about twenty-four feet long and twelve wide, and for the greater part was filled with a wonderful assortment of articles varying from reels of cotton to collapsible boats. Two of the latter, used to drive cattle from the neighbourhood of the river during inundations, and for getting stores, &c., at such rare times, were suspended to the rafters overhead. In the main, bags of flour and sugar, boxes of tea, tobacco, and groceries, tinned jams in particular, filled this small emporium, just enough space being left at one end for two rough beds and a big box—our dining-table—between them. The only fireplace was in the kitchen, where the newly imported lady, who enjoyed the distinction of being the only white member of her sex within a distance of two hundred miles, perspired over her pots and camp-ovens, more or less assisted by a couple of black apprentices. Her husband served as hewer of wood and drawer of water to the establishment. His office, as regards the latter function, was no sinecure. The nearest permanent water was to be found in the bed of the Diamantina River over four miles away. Had the homestead been built any nearer it would have been liable to be swept away during flood-time, the waters actually washing the base of the ridge selected as the site. Once a week Jack Harris yoked up his team of bullocks and set off for the river, accompanied by a small retinue of blacks carrying billies and buckets to fill the tanks on the wagon. This was a protracted business, as eight hundred gallons formed the load, and it was not safe to take the cumbrous vehicle near the brink of the waterhole. For a small community of about ten persons eight hundred gallons seem a liberal weekly allowance; but a

horse or two had usually to be watered at the station, and in so dry a climate thirst is chronic. Of the quality of the water little can be said. It was fresh and fairly fluid; but its tawny colour, due to a large percentage of mud, was not inviting to the eye. What was used for drinking purposes was in a degree clarified by the simple process of pouring it into a cask and stirring a shovelful of wood ashes in it, a thick sediment later settling to the bottom. The flavour of the beverage, however, was not improved by the admixture of potash. Needless to say, our linen soon lost its original whiteness in spite of the most heroic efforts of our laundress. The uniform worn by Bulgaroo station officials was of a Chinese hue.

The ordinary day's work was as follows. The staff on the place, I should first mention, consisted of the manager, two white stockmen, two black supernumeraries, the married couple before mentioned, and myself. A few black women acted as irregular assistants to the lady of the kitchen. Early rising was the rule. Before daylight each morning the two blackboys, carrying bridles, went off in search of the horses, which (as there was no paddock to restrain their wanderings) frequently had to be driven in from a distance of several miles. Sometimes, too, in sportive humour, they would gallop off in precisely the opposite direction to the station, and give the poor darkies the pleasure of a long chase previous to the day's ride. At length, however, to the impatient eyes of the watchers from the station would appear the welcome cloud of dust, and presently would be heard the familiar sound suggestive of the old line, '*Quadrupedante putrem sonitu quatit ungula campum,*' as the mob came galloping towards the stockyard. The required horses would then be caught and saddled with expedition, the remainder turned out, and away we would go, usually in two parties. During the wet season a packhorse was often taken; for when water was to be found far back from the river the cattle would split up into small lots and scatter far and wide. The operation of 'going round the tracks'—that is to say, outside the remotest herd and driving all the stragglers inwards—was a lengthy one, as frequently odd beasts of roving tendencies would be found thirty or forty miles away from the homestead. Fortunately, along the edge of a considerable portion of the run was a belt of barren spinifex country which served as a natural boundary. Spinifex or porcupine-grass, when of two or three years' growth, would put the Scotch thistle to shame. So sharp are the round, spear-like blades that the lightest touch draws blood; and when matted together, the tussocks, each from two to three feet high, form a barricade that is well-nigh impenetrable.

During the dry months—that is, for eleven out of twelve—there is no difficulty whatever in finding the cattle even on areas so enormous as those embraced by western stations. Each herd selects some particular waterhole as its headquarters, and there it is sure to be found at any time between sunrise and sunset. During the day the animals do not eat, but refresh themselves by lying in the scanty shade obtainable near a waterhole or by standing belly-deep in the muddy water. In the evening they trail out in long lines in different directions towards their various pasture-grounds, returning early the next morning. Mustering the herds is, therefore, an easy business; for the parties of riders have simply to visit the various waterholes in succession, and collect the cattle as they go, all the herds converging on the main cattle-camp, which is situated as centrally as possible. When the muster is complete, and a dense mass of from two to five thousand head of bellowing animals has been rounded up on the spot selected, the work of 'cutting out' begins. A couple of experienced men mounted on well-trained horses work their way into the herd and choose out the cows with unbranded calves, or the bullocks that may be required, gently coaxing them outwards to the edge of the circle, and then deftly cutting them off from the main body and driving them to the place where a couple of blackboys are in charge of the selected animals. Vociferations and whip-crackings are strongly discountenanced on a cattle-camp where the man in charge knows his business. Everything is done as quietly as possible in order to spare both men, horses, and cattle. The skill acquired by an old stock-horse in this kind of work is wonderful. Once he has been shown the beast to be driven from the herd he will manage the business alone, if left to himself, dodging and turning with such rapidity that the most active cow finds it hopeless to circumvent him. A novice, however, would find it no easy task to keep his seat amid these gyrations. Many a poor Johnny Raw has added gaiety to the proceedings by suddenly flying in an undignified attitude in one direction, while his mount shot off in another.

Work on the cattle-camp is the most interesting and exhilarating of all that falls to the lot of the squatter and his assistants. All is animation: the dense mass of bellowing and perturbed beasts, visibly resentful of the interruption of their tranquil midday siesta; the riders careering around to prevent rushes and stampedes in various directions; the din of hoofs and raucous bellows; and the clouds of dust that overhang the whole scene. When several hundred head of cattle have to be 'cut out' operations may be prolonged until after sunset, and then follows the long, weary drive to the stock-yard. As early as possible next morning branding commences, for it is advisable to turn the cattle out again as soon as possible, because when they are confined lack of shade and water is apt to cause serious losses. After the calves are separated from their mothers, a rather delicate operation, and one that often taxes the agility of the operator, the former are one by one 'scruffed'—that is, seized by a couple of men and held down while knife and branding-iron are applied. Exceptionally big,

powerful calves are lassoed with green-hide ropes. The whole business is by no means pleasant, and it is a delightful sensation when all is over to rush to the nearest waterhole, plunge in and transfer to its cool contents the pounds of dust you have collected in the yards, and then substitute clean garments for the defiled rags worn before. At Bulgaroo, unfortunately, only a meagre shower-bath could be afforded, as after a hard day's work eight miles were too far to walk for a swim. That luxury had usually to be reserved for a Sunday.

Game on a western station in Queensland is at ordinary times very scarce. Kangaroos and the larger marsupials, owing to the constant attacks of natives and dingoes, are very rarely seen, and can only be found in the dry, scrubby country far back and almost inaccessible. Kites and crows at ordinary times are the only specimens of bird-life, though after rain ducks and waterfowl in abundance pay a fleeting visit to the freshly created swamps and lagoons. A beautiful little spoonbill duck with a bright pink spot below each eye is particularly noticeable, and vast flocks of pigeons occasionally frequent the larger waterholes. Emus are rather plentiful on the Diamantina, and I have seen as many as forty-eight together. Now and then the stockmen indulge in an emu-hunt, frequently without success, for the long stride of the bird taxes the powers of the fleetest horse. The sport, however, is a cruel one; for the emu is both inoffensive and beautiful when living, and quite useless when dead. The omnivorous blackfellow, certainly, will eat its flesh with enthusiasm; but his palate is not fastidious. The writer once tried emu-steak, and soon treated it as Macbeth recommends us to treat physic.

For the table the bustard is the king of game-birds on the plains. Weighing often over twenty pounds, fat, and of most delicate flavour, he is a prize worth securing. But he is very distrustful of human society; and as he frequents localities where there is no cover for stalking purposes, the sportsman has to resort to strategy to bag him. On foot there is no chance of getting within range, but if the stalker rides or drives in circles round him, gradually closing in nearer and nearer, he is thrown apparently into such a state of mental confusion that he cannot make up his mind whether there is danger or not until the fatal shot is fired. After a grass-fire these birds may often be seen in large numbers picking up roasted grasshoppers and other insects; but they are then far too wary to permit a near approach.

Dingoes, or native dogs, abounded on Bulgaroo run during my time. Probably they are now becoming scarce. Within the first six months following the original occupation of the country no less than a thousand of the animals were destroyed by poison. The method employed was simply to season small pieces of meat or fat with a few grains of strychnine, wrap them in paper (to prevent crows, &c., from taking them), and drop them at short intervals along cattle-tracks and about waterholes. The carcasses of dead beasts were also treated in like manner, and scores of unhappy dogs often paid the penalty for a single banquet. It was rather ghastly work; but the horrible mutilations inflicted by the depredators on young calves and foals, and the heavy losses sustained by the stock-owners, made it absolutely necessary. No cow could leave her new-born calf sleeping in a snug corner under the shade of a bush and wander away a few yards to graze but a sneaking marauder might seize and half-devour it before she returned. One year every foal born on the station was destroyed in this way, and hundreds of calves no doubt perished also. When camped out we had to be particularly careful of our saddlery and stock-whips. One night I was aroused by the stealthy movements of an animal close to me, and saw only a couple of yards away a dingo coolly investigating the contents of the ration-bags. For want of a better weapon I seized a billy and threw it against his ribs, whereupon, with a howl of surprise, he fled precipitately. During a severe drought the dingoes, like the cattle, suffered terribly. We frequently came across miserable brutes in so weak a condition from hunger that they could scarcely crawl along, and the stockmen killed them by scores with the handles of their whips or stirrup-irons.

In the foregoing rather desultory observations I have dealt exclusively with the outdoor life and occupations of the back-country settler. In truth, sleeping and sometimes eating are almost his sole indoor employments. Many of his nights, too, are spent under the starlit sky. Sunday is practically the only day when the squatter is 'at home.' At Bulgaroo station the day of rest was one of intolerable boredom. Reading was almost impossible, for to escape the plague of flies we had to submit to the plague of darkness. Whenever the door was opened and the bright sunlight admitted we had to take refuge within our mosquito-curtains to enjoy any comfort. As to eating, our meals consisted only of a gulp and a gobble. A perfect tornado of hungry insects would accompany the cook, dive into our eyes and ears, explore if possible our mouths and throats, tangle themselves up in our hair, sprawl in a black mass over the jam, sugar, meat, &c., and finally drown themselves in our tea. As Sydney Smith said, in the west of Queensland 'you eat flies, drink flies, breathe flies.' It was only by vigorously flourishing a handkerchief with one hand and rapidly plying fork or spoon with the other that the corporeal furnace could be supplied with the necessary amount of fuel. To eat was, indeed, a perpetual effort; but how the tea disappeared, flies and all, when the thermometer stood, as it usually did in summer, at from one hundred and ten to one hundred and twenty degrees in the shade! Milk, by the way, except in the condensed form, we never tasted, although, as before mentioned, there were about five thousand head of cattle on the place. Preserved potatoes were our only vegetable.

The nights spent in the open during the wet season were long spasms of torture. As soon as the sun set and the tormentors of the day, the flies, had departed, the tormentors of the night, mosquitoes, assailed us with even greater virulence. In vain, to repel or at least mitigate the ferocity of their attacks, would we adopt the blacks' expedient of sitting in the middle of a circle of small smouldering fires until we felt nearly cured; our fiendish assailants would charge through the thickest smoke and pierce even the horny skin of the toughest old bushman with their delicate lancets. The varieties of the tribe were infinite: big, long-legged fellows called Scots Greys, which would dart in with a hum like that of a Jew's-harp, to be promptly reduced to paste; brown and gray imps, of numberless shades; and, worst of all, minute black demons that settled on the skin light as thistledown, gorged themselves until scarce able to fly, and left behind a most irritating reminder of each visit. Often, worried beyond endurance, the writer would wriggle out of his blanket, in which for defence he had rolled himself like an Egyptian mummy, seize a smouldering 'argol,' and walk up and down for hours to try to obtain some relief. But for insect-pests life in Central Australia would be most agreeable. The persecution endured from them, however, is destructive of all comfort. One can never enjoy a decent meal, a tranquil hour for reading, a pleasant ride or walk, or an untroubled sleep.

Of what are called 'social' pleasures we dwellers in the Never-Never were entirely deprived. Once a fortnight—in the wet season once every five or six weeks—our only regular visitor, the mailman, would ride up to the station, deposit his bag of papers and letters, replace it by an empty one, catch and saddle a fresh horse, and pass on. Having between three and four hundred miles to ride weekly, he had no time to waste in conversation. Now and then a travelling drover passed, or a swagsman, who, if in funds, would buy flour, sugar, tea, beef, and tobacco, which are the necessaries of a bushman's life, at the station store; if destitute he would receive gratis supplies sufficient to carry him on to the next station. Prices, it may be mentioned, were rather high: flour and sugar each one shilling a pound, tea four shillings and sixpence, tobacco about the same, and so on. Nothing could be got for less than a shilling; and for want of coin cheques were the chief circulating medium. The long distances that intervened between the various stations and the inconveniences of travel fortunately deprived us of the attentions of the sundowner. This professional sturdy beggar of Australia does not relish walks of thirty or forty miles between his places of refreshment, and so preys on the unlucky squatters in the settled districts only. Occasionally a jovial stockman off for his periodic spree would pass by, gay in his snowy moleskins, red shirt, and cabbage-tree hat. One of our men, after three years' hard work on the station, went off in this fashion, mounted on a valuable horse, and with a cheque for seventy pounds, his accumulated wages, in his pocket. Six weeks later he reached the coast, a dejected figure, on foot, penniless, and utterly dismantled. It is not necessary to travel the road between Jerusalem and Jericho to fall into the hands of—publicans.

No serious attempt will be made to discuss the financial and practical aspects of the life of a back-country squatter. It may, however, be remarked that the business is, in a large degree, a lottery. A few good seasons mean rapidly increasing herds, large numbers of fat bullocks, and perhaps a handsome fortune if a sale of the property be effected before nature's pendulum commences its backward swing. On the other hand, a succession of dry seasons at the start may deprive the pioneer of all his capital and reduce him to the position of manager (on behalf of some bank or capitalist) of the property that he formerly owned. In the early days enterprising men with little or no capital had a good chance of becoming wealthy pastoralists. Abundance of magnificent grazing country could then be had in return for the labour of finding it and applying for it, under lease, from the Government. A couple of good bushmen, with a blackboy and a small outfit of horses, provisions, &c., might, after a single successful exploring trip, acquire at nominal prices grazing rights for twenty-one years over thousands of square miles of valuable country. Then, with the lease or leases in their pockets, they could approach capitalists or station-owners whose runs were becoming overstocked, and, in return for a substantial consideration, transfer to them their interest in half the areas selected, reserving the remainder for themselves. The money received for the portion transferred would enable them to stock the land retained, and the successful adventurers would then have become the proprietors of a fine station at a trifling cost. By repeating the proceeding they might—and often in bygone days did—obtain several additional stations, and ultimately become very wealthy men. In the Northern Territory and the Kimberley District of West Australia land-grabbing of this kind may still be indulged in, although it is no work for a novice. In the eastern states no land worth taking up now remains unoccupied. The intending pastoralist must buy his station ready formed, and pay as a rule a good price for it. The usual custom is for a station property to be sold at so much a head for the cattle running on it; lease-hold rights, fencing, buildings, and improvements being thrown in. Thus a fair price for a run of, say, four hundred square miles of country, with a carrying capacity of six thousand head of cattle, and stocked with, we will suppose, five thousand, might be reckoned at about six pounds per head, or thirty thousand pounds for the whole property. If a large run were greatly understocked, of course the price per head of the cattle on it would be proportionately increased; and in

all cases, naturally, the quality and position of the country itself, the water-supply, &c., would count for much.

Just a final word of advice to a possible purchaser may be given. Let him on no account buy a station during a run of good seasons. If so, owners being reluctant to sell, he will be charged an enormous price. The best time to buy is during the last stages of a prolonged drought, when properties are, often by compulsion, thrown wholesale on the market. The richest pastoralist Australia has yet produced, the late Mr Tyson, when questioned by his friends as to the secret of his success, was in the habit of defining the golden rule of the successful business man thus: 'Buy when others sell, and sell when others buy.' The philosophy of money-making could hardly be summed up with greater accuracy and terseness.

THE PALAIS-ROYAL

PART II.

IN some ways the most exciting and fullest portion of the history of the Palais-Royal now begins, but it has rather lost its interest for me. Philippe Egalité used it as a financial pawn with which to gamble, and if possible pay his debts. The last gentleman of the princely house had gone, and one is inclined to believe that Philippe's real father was to be looked for outside the family, as he himself formally alleged unavailingly, to save his neck, when he accepted the name of Egalité, after voting for his royal cousin's death. However, the present Palais-Royal is chiefly due to his greed and business instinct, and the story must be told.

The *salon* governed by his wife must be mentioned. Every one properly presented could sup on opera nights, and on other nights the intimates (about twenty) would meet. Madame de Genlis and many other cultured and charming women contributed to the gay and distinguished tone of the circle.

Advised by the economist Beaudeau, the Duke Philippe (then of Chartres) planned to make a vast sum, first, by encroaching on and surrounding the gardens with the buildings which now exist, with their hundred and eighty arcades and shops; secondly, by building the new streets of Montpensier, Beaujolais, and Valois, called after his sons.

Meantime, in 1781, the Opera was again destroyed by fire, and the town, to whom it now belonged, refused to use the site again. Philippe was determined to have a theatre, however. Hence the Comédie-Française was included in the plans of Victor Louis, a really great architect. By letters patent he was allowed to build the streets and galleries he had planned, despite the impotent curses of the older neighbours, whose amenity from being near the garden was destroyed without compensation. No effort was spared to stop him; every power from Parliament downwards was invoked, all in vain. Warned that he would ruin himself over such a huge scheme, the duke replied, 'Not at all, for every one throws stones at me.'* He promised to make it the joy of Paris and the rendezvous of fashion; to create 'a gathering of architecture great and homogeneous,' as Richelieu had planned. In September of this year the transformation was begun under Victor Louis, then fifty years old. There was a great public outcry when the Elm of Cracovie was cut down—so called, some say, because the affairs of Poland were so much discussed under it, others because it heard *tant et tant de craques* from the *Courier de l'Europe* or the *Gazette de Leyde*. It had become quite an institution where people met and exchanged news. Baron Grimm in 1784 describes at great length and with much enthusiasm the beauty of the ladies of various positions in and out of society, with their marvellous clinging Greek dresses, almost transparent, and huge hats, who promenaded under the arcades and in the leafy avenues on the fine evenings. The soft effects of the one hundred and eighty lights of the arcades and of the new lamps *à la quinquet* of the cafés and shops were bewitchingly becoming to the charming promenaders. The three sides of the garden were enclosed by the present buildings as they are now, except that three fleurs-de-lis carved in the stone over each arch were removed in 1830.

The plans for the side next the palace could not be carried out owing to want of funds, and the famous Galeries de Bois were constructed in 1784. Here the double promenade, with the three rows of small shops known as the Camp des Tartares, became for half a century the most elegant, the most mixed, and the most 'fiery rendezvous of business and gallantry.' It took hours to get from one end to the other at times. Hideous sheds of wood, on the gardens side a few barred windows and black stove-pipes, on the side of the now misnamed Cour d'Honneur mean and irregular coach-houses and 'leans-to,' gave the court the aspect of a *Pantagruelique hôtellerie*. Each miserable shop, about six yards square, fetched as much as a thousand crowns. They were occupied by booksellers (founders of great firms like Didot), great merchants, dressmakers, tailors, and bad characters

* Carlyle wrote: 'The chestnut avenues shall fall: time-honoured boscages, under which the opera Hamadryads were wont to wander, not inexorable to man. Paris moans aloud, . . . the Palais-Royal shall again, and more than ever, be the Sorcerer's Sabbath and Satan-at-Home of our planet.'

of all kinds, who purveyed the most marvellous variety of wares, while monstrous and disgusting exhibitions were numerous. Louvet de Couvray, the author of *Faublas*, entitled his novel on Parisian morals after this Camp des Tartares, says Sandoz. A curious contrast to this plague-spot, which has also disappeared, existed for some years a few paces distant. The famous underground circus, occupying nearly half of the gardens next the Galeries de Bois, was built in 1786 and destroyed by fire in 1798. It was not rebuilt, and the gardens were restored. After various vicissitudes it was leased to Désaudray, a savant, who made it famous as a Lycée des Arts. It was regarded as one of the phenomena of the Revolution. It was composed of ninety-two members, including Berthollet, Berthoud, Boissy d'Anglas, Lavoisier, Lebrun, Parmentier, &c. It gave free lectures, and encouraged science by giving prizes and medals to students of all nations. Its first *séance* was attended by five thousand people, including the great artists and savants of the day. It needed some courage to open such a *lycée* in those days, when every scientific body had been dissolved and all instruction done away with.

The duke became popular again by lighting huge fires in the gardens, for the people, in the hard winter of 1788–89. He lived in the Valois wing, in the arcades numbered 178, 179, 180, where now is the Directoire des Beaux-Arts. The theatre was finished in 1790, and the whole of the new buildings cost nearly two million five hundred thousand pounds. His debts to his two thousand five hundred creditors were enormous—how made no one seems to know, though his parents had been extravagant to a degree for some years. He sold all his numerous châteaux and houses in and near Paris. Caring nothing for art, he even sold the part of the palace built by Mansard for the Galerie d'Énée and Catharine of Russia's collection of medals and engraved seals. Worse still, he sold surreptitiously to the foreigner the greatest collection of pictures in France, celebrated all over Europe. James Christie, a sailor who was starting a picture business in London, bought them for a hundred thousand guineas in 1790; but the arrangement fell through. The curious can still see the contract fully signed in the Bibliothèque Nationale. The duke ultimately sold most of them in 1792 for thirty thousand pounds to a Belgian banker, who sold them in England to the Duke of Bridgewater, Lord Carlisle, and Lord Gower, afterwards Marquis of Stafford, for forty-three thousand pounds. These purchasers disposed of most of them again at a large profit. The few kept by the Duke d'Orléans became State property at his death.

Political clubs under various disguises used the Palais-Royal, and Victor Hugo described it as the 'centre of the revolutionary comet.' The gardens became the forum of the people. Here on the 12th July 1789 Camille Desmoulins, mounted on a table in front of the Café Foy, announced the dismissal of Necker and summoned the people '*Aux Armes*' to defend themselves against the royal mercenaries and to take the Bastille. To the question whether they would have green cockades (the colour of hope) or the blue of Cincinnatus (the colour of free America), the reply was green. The supply of ribbons running out, he pulled a branch off the nearest tree, and every revolutionary was soon to be distinguished by a similar mark. One of the few good modern statues in Paris was lately placed here to recall the young orator.

'*La vie, la mort, le plaisir rapide, grossier, violent, le plaisir exterminateur: voilà le Palais-Royal de '88*,' writes Michelet. Here, at No. 114, near where the present Café Véfour stands, the royal guard Paris, on the eve of Louis XVI.'s execution, as he could not find the Duke d'Orléans, stabbed to death Le Pelletier de St Fargeau, who had also voted for it. This crime so enraged the people that the king's last chance of pardon vanished. Here a dummy Pope, a Lafayette, a Jacobin in *carmagnole* and *bonnet rouge* were burnt in effigy. Here Royalist and Jacobin fought. Here the excellent fare of the restaurants was quietly enjoyed by men like Barras, De Thionville, Courtois. Here Barras lodged with Mademoiselle Montansier, of the Théâtre Montansier in the palace, and invited Bonaparte to dine and suggested that he should marry the old actress. Here later Bonaparte made his début in the *salons* of Mesdames Tallien, Château-Renaud, De Staël, and others. At this time the palace was becoming more royal in its sympathies, and the popular Royalist singer Ange Pitou then sang his sarcastic verses to huge audiences, who joined in the chorus.

In 1800 the Tribune was installed in the palace, now called the Palais et Jardin du Tribunat. In 1805 there were fifteen restaurants, twenty cafés, eighteen gaming-houses, eleven pawnshops, besides all the smaller establishments underground, the clubs of the day, the freak exhibitions, ventriloquists, &c. In the upper flats and garrets the much-written-about 'nymphs of the Palais-Royal' resided. All classes were welcome at the various gambling-dens, from the poor workman with his two-franc piece, the lowest stake allowed, to the foreign prince with his unlimited golden eagles. Adventurers and thieves of course abounded, often dirty, haggard, and livid from starvation. Towards midnight the shot that told of one more surrender to despair was not infrequent. The best known of these dens, No. 113, which seems to contain the unlucky number, ruined hundreds a night. Balzac in *La Peau de Chagrin* and Dumas in *La Femme au Collier de Velours*, among a crowd of others, describe it. Always open, it recalled Virgil: '*Noctes atque dies patet atri janua Ditis.*' There were balls and suppers given in these bright halls, and the seven deadly sins were the hosts. It is said that the beautiful city of Paris may still be said to live to some extent on the proceeds of gambling, though the old open houses are now illegal. Roughly, no

club can exist in France without a large profit from the play of its members, so large a proportion of the subscriptions is taken by the State. The Morgue and the Treasury are still largely upheld by the same iniquitous method.

In 1807 the Tribunat was dissolved by the Emperor Napoleon, and the Palais-Royal was again united to the Crown. The Bourse was installed on the ground floor just opposite the Galeries de Bois. Napoleon thought of joining the palace to the Louvre and the Tuileries by arches, galleries, and colonnades, and making the most magnificent royal palace in the world. Nothing was done, and it rather lost its political character. Its dominant character was its love of well-being and joy. It is described in 1813 as the greatest fair in the world, its pleasures and seductions multiplying at each step, as varied as the decorations: tailors who would measure you and make you clothes while you lunched, every kind of eatable in the world, and cooks to make the most exotic and impossible dishes with the aid of an *Almanach de Gastronomie*. To see the Palais-Royal and die was then the vow of the foreigner. It was Paris in itself, and all Paris, and it was dreamed of as an enchanted palace of the *Arabian Nights*.

So thought the allies when they entered Paris on the abdication of Napoleon, and the Bourbons were hurrying back to recover their rights. In May 1814 Egalité's son, Louis Philippe, Duc d'Orléans, went alone on foot to the palace of his fathers, piously kissed the first two or three steps of the grand staircase, and claimed the property. Despite difficulties, the architect Fontaine was able to get it ready for him by September, when he brought his family from Sicily. Next month the Duc de Nemours was born there. During the Hundred Days Lucien Bonaparte occupied it without interfering with the improvements which had been begun. Life under the arcades once again became exciting. With Waterloo a gambling fever seized the Bourse, still housed in the palace. The English and the Prussians insolently thronged the galleries and the cafés. The *émigrés* enjoyed once more the gay heart of Paris.

The duke had a hard task struggling to recover his father's property and rents. He had practically to accept a sum of money and buy back the Palais-Royal gradually. The Théâtre-Français again became part of it, and the duke restored it completely in 1822. Of course it now belonged to the State. In 1824 he got a large indemnity for his mother's property, seized at the Revolution, and set to work seriously, with Fontaine as chief architect, to restore the palace. It was calculated to cost eleven million francs and to take eighteen years. In 1828 they replaced the infamous Galeries de Bois—the leases of the shops there having run out—by the present Galerie d'Orléans. The Galerie de Chartres and the Galerie des Proues were also added, and at many other points the plans of Victor Louis were completed and the whole property isolated. The attic windows all round were allowed to be made *à la* Mansard, a design which gave the rooms a pleasanter light and more view; but Chabrol in 1875–80 restored all the attic windows to the *tabatière* or flat snuff-box model, according to the primitive plans, to the great detriment of the attics. The duke cleansed the galleries of the lower classes of tenants, and filled them with the most decorative shops.

In 1830 he gave a great dinner and fête to his brother-in-law, Francis I., king of Naples. Charles X. was present with his family, and all the notabilities of the time. The court was closed to the public, as the duke had been warned that there might be disorder; but a large crowd thronged the gardens after dinner and expressed their admiration, and Charles jealously reproached Fontaine for keeping his best work for the duke. The king's salutes to his people from the terrace of the Galerie d'Orléans were received in silence. In the middle of the night a great noise proceeded from the gardens, flames arose, and lighted lanterns were hurled about by unknown hands. The enemies of the duke regarded each other meaningly, and a guest remarked, 'This is very much a Neapoliton ball, for we dance on a volcano.' The duke told the king next day it was only some children's play.

The dissolution of the Chamber had required new elections, which were a triumph for the bourgeois and the Liberal party. All wondered what the king would do in the face of this majority, hostile if not to his person, at least to his retrograde ideas. He and his nobles wanted the right of primogeniture re-established, the Church to recover its ancient splendour, and the Court to lead the Parliament. The bourgeois liked the king as a safeguard against what they called the populace, whom they hated and scorned; they did not like the aristocracy, who scorned them. For themselves, they demanded a reduction of public expenditure, a slight diminution in the taxes qualifying an elector, the suppression of the Swiss mercenaries, more liberty for the press, and the re-establishment of the Garde Nationale. The populace really did not understand or take much interest in politics. They were Bonapartist and anti-clerical in opinion. They detested the aristocracy. The Bourbons they disliked chiefly because their accession was associated for them with the humiliations of their country.

The king refused their demands, and on the 24th July 1830 prepared the mandate doing away with the liberty of the press and altering the electoral régime. When the twenty-five Ministers were ranged round the table to sign, D'Haussey, Minister of Marine, asked the king if he meant to go on with it even if the Ministers refused to sign. Charles replied 'Yes' firmly, and they all signed.

When the mandate appeared in the *Moniteur* on the 26th July it was received at first in silent stupefaction. Then agitation began in the Palais-Royal, and soon there was a Camille Desmoulins on every seat. A postillion who rode to Fontainebleau

that night, and told his comrade the news, said the Parisians were very angry. There was to be no more Chamber, no more newspapers, and no more liberty of the press. 'So much the better,' replied the other; 'as long as bread is two sous and wine four, I don't care.' And he voiced the opinion of the people, who were not represented in the Chamber and had no organ of their own in the press. The bourgeois, though they mistrusted the people, did everything to stir them into revolt, and finally succeeded. On the 27th July the gendarmes cleared the mob out of the Palais-Royal gardens and shut the gates; but the crowds formed again under the galleries. The shops below the arcades were shut, and barricades erected in the Rues St Honoré, de l'Echelle, de Richelieu, and des Pyramides. No one knew what was happening. The Duke d'Orléans awaited the issue of events at Neuilly. He benefited by the faults of Charles; and the patriots, who were simply at first the lower classes round the Palais-Royal, whom the rich bourgeois had excited beyond control, accepted him as their champion, seduced by all the good that was said of him. A Provisional Government was formed, including Gérard and Lafayette. The latter had accepted the general command of the Garde Nationale, not as deputy but as an old patriot of 1789. The royal guards, taking the offensive, chased the inhabitants from the Place du Palais-Royal. On the 29th July Marmont, Duc de Raguse—hated by the people because his name recalled invasion and Paris devastated—who had been given command of the troops of Paris, tried to save the king by occupying the Palais-Royal and the surrounding streets with the Swiss and royal guards. The Rues de Rohan, de Valois, de Richelieu, and St Honoré were the scenes of the most bloody encounters. It was necessary to defeat the last of the royal troops entrenched in the Théâtre-Français and in the houses round. The carnage among the populace was frightful, but at last the cartridges of the royalists were exhausted, and they had to surrender; but the useless butchery which they had just caused rendered quarter impossible, and they were exterminated. At one o'clock the Louvre and the Tuileries were taken by the victorious people. Any one might now enter the Palais-Royal, and a curious but honest company calling themselves Le Régiment de la Charte bivouacked on the staircases. The merchants of the palace gave aid to the wounded. The combatants were as honest as they were brave. Men in tatters were watching that no disorder took place, and that nothing was stolen from the royal palaces. Lafayette wished to give five francs each to the poorest; they refused it. The enthusiasm was immense. Every one embraced. The central figure of this universal joy was Lafayette. A beating of drums having announced his arrival at the Palais-Royal, he had to resign himself to the fate of the hero of the *Maine*. History repeats itself after forty-one years. On the wheel of fortune at its highest point we have again General Lafayette, crushed beneath it the Comte d'Artois.

Charles X., in refuge, withdrew the mandate. Too late! The people refused to have him as king, and voted for the Duc d'Orléans. He hesitated. Chateaubriand implored him to remain faithful to the king, but he finally walked to Paris. On the 30th July the deputies carried an address to him at the Palais-Royal. Next day the duke finally consented, and saluted the people from the terrace.

On the 7th August 1830 the throne, being declared vacant, was given to the duke; and the Palais-Royal during several months sheltered King Louis-Philippe and his family. On the 1st October 1831 they abandoned it for the Tuileries. His sister and counsellor, Madame Adelaide, stayed on at the Palais-Royal. It was said that for the first time since the days of Richelieu the two palaces ceased to be rivals and lived in perfect harmony. The gardens and galleries of the Palais-Royal, the restoration of which was just finished, became henceforth a most well-behaved promenade. Already men forgot the ancient galleries so propitious for every adventure. The palace was purified; sin and luxury went to the boulevards. On the 31st December 1836, at midnight, the warrant against gambling closed out the last habitués, and the gaming-houses large and small shut their doors and put out their lights. The old Palais-Royal had lived.

(To be continued.)

CHIMES.

Listen to the tinkling tingle
Of the far-off rippling rhymes
From the crested steeple mingle—
Crooning, twittering chimes;
Listen to their mystic lays
Through the ivy-cloistered bays.

Hear them wailing, singing, sighing,
Notes of joy, then sad, forlorn;
Through the sky their arrows flying
From the silent morn,
Dying in the twilight pale
As the lingering shadows fail.

Far away, like curlews stealing
O'er a storm-washed, murky sea,
Come their calls with broken pealing,
O'er the wine-red lea,
Dying in the distance quite
As the sunset into night.

Hearts are breaking, men are falling,
In the cities black and grim;
Still the chimes with sweet notes calling
Chant the evening hymn,
Some to joy, and some to pain,
Some to loss, and some to gain.

Sad they are, yet sweet and lonely,
Softly, slowly stealing on
Through the flower-lit copses only,
Lightly, gently heard, then gone.
So like chimes our voices cease
Into silence, love, and peace.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

SOME have wondered now and then why it is that the sentiment of Christmas is not quite the same in the great city as it is out in the lonely country, why it is that on the one hand the heart seems to have somewhat less of sympathy with the season, why it is that on the other this season brings with it more of a depressing sadness. For these things are so, and there are sound reasons which the man of the city may discover for himself if he sits in a contemplative silence by his fireside on Christmas Night, and as he stirs round the burning coals lets his fancy roam down along the dead years of the past and away into the far northland, or out into the east or the west, or along some country lane in sunny June, or up into the hills on a cool September day. The flood of recollection that comes upon him is dear and delightful; but there is some melancholy in it all, that deep melancholy of the things that are past, are gone for ever and ever. This man of the city is for the most part a phlegmatic fellow, whose soul has been a little chilled by closer contact with realities that are not presented with such coldness and grimness elsewhere, whose finer sentiments have often been a little dulled by that tenseness of strife and complexity of interest with which he is associated. And he is frequently the man to whom the London life, with all its strange and mystic influences, alternately stimulating and enervating, is after all not the natural one; he is a man with a past, and that past, away in the careless days of youth, was not lived amid the noisy din of the Strand or the nightly glare of the big lights of Piccadilly Circus, but in shady lanes and on hillsides, where under the starry skies of night the wind soughed as in a lullaby over sleeping Nature. The people who live in London, taking them generally, have probably more friends than those who live in smaller places; circumstances almost necessarily bring this state of things about. But the friendships of the town are often inclined to be a little more complex, and at the same time a little shallower, than the simple but deep and abiding associations that are made in the country. Home-life is more artificial in the town; the straining tendencies are all against the simplicity which is the essence of it in its best form; and so it comes about that even the old Londoner, the man with a hundred searching interests, one who loves London dearly for all the intellectual delight that she affords him, and could never live without her, yet never entirely loses a certain sense of loneliness. It may be forgotten for a while when the mind is sustained and exalted in a fevered present; but there are some moments of slackening and reaction, when the thoughts wander away to the past, with all its might-have-beens. It is at the Christmas-time that this is most often done, and even through the sadness of it all there comes a glow of pleasure when in spirit the lonely folk of the great city are with the generous, open-hearted companions of a former time and a simpler life, and it seems for once, as they sit by the fireside and see kind faces in the quivering flames, that their souls are warmed, that they are drinking the old wine of heaven and are the better for it.

* * *

It has been commonly remarked of late that cases of nervous breakdown are very much upon the increase, and some casual inquiry has been made into the matter in certain medical and other circles. This increase was most noticeable during the recent autumn and at the beginning of the winter. Twice in one day great headlines in the papers told us of the strange and unexpected deaths of men of some considerable distinction from this cause, and it is quite certain that the state of the nervous system of the average man living in a great centre of population and industry, and being himself keenly engaged in the business and affairs of life, is one of much greater tension than it was ten years ago, and is much more liable to suffer from shock. Neurasthenia is now one of the commonest of complaints, and we are assured that every medical practitioner who has an extensive practice in the great cities,

 [*All Rights Reserved.*]

but particularly in the Metropolis, obtains an increasing number of nerve-patients year after year in proportion to the number of those who consult him with reference to other troubles. In so far as the recent epidemic, as it might be termed, is concerned, it is believed by the faculty that the depressing weather which was experienced during the summer and autumn months was one of the chief contributory causes. Our contemplative doctors tell us that at the best of times the townsman suffers from the want of sunshine, the great vitaliser. Even that which lights upon him has had some of its best properties removed from it by filtration through the peculiar atmosphere. The constant advice, therefore, of the nerve specialists to their patients is that they should retire to some place where the hours of clear sunshine are many and the conditions that prevail are the most bracing. But while the weather may accelerate a breakdown, the tendency towards it is created beforehand by the increasing strain on the nervous system due to the modern conditions of life, which we are assured upon medical authority are such as only the strongest nerves can bear without showing clear and often distressing signs of weakness, and for which in particular the increased facilities for transit and communication which have been so rapidly developed in recent times are responsible. Life has suddenly been made faster, more compressed. Two or even three of the old days are crowded into one, and the change has been brought about so quickly that Nature has not yet had time to adapt the man to the state he has to endure. Physically and nervously he is unequal to the conditions by which he is surrounded; and though for the time being the average duration of human life in the great cities may be as great as ever, or even, thanks to sanitary science, greater, this can be but a temporary maintenance, and in a very little while we may have to cease to regard the threescore years and ten as the natural span of life to which the man who lives wisely and carefully may, in the absence of any unexpected disease, reasonably expect to attain. If in the course of a few years it should come about, as some optimistic investigators do predict, that many of us will be flying through the air mounted on or amid wings of aeroplanes, what then will be the increase of this strain? There are some wise men who are shaking their heads and saying that they see no cause for satisfaction in this desperate raid by man upon the most cherished secrets of Nature. She has yielded him expedients by which he may run with the speed of the wind and sail faster than the fishes. From the earth she has lately given him new elements by which many of the conditions of his life may be completely revolutionised. The voice which less than a hundred years ago had a limit of a single room now speaks across the world. But the man, greedy beyond reason, will now leave the earth along which he has had to crawl since first he was evolved, and, usurping the privileges of the birds of the air, will fly through space. Little wonder that some philosophers are fearful as to what the end will be of these daring ravages, and seem to see in this man-flying an unforgivable trespass upon Nature, just as some others do when the bodies of living things are cut open that men may see the wonderful and mysterious workings of the organs within. Such reflections as these, gloomy to a certain degree as they must be, are more or less inevitable to many minds as we approach the beginning of another new year. In these days we come upon the opening of these new periods of time with more doubt and timidity and more nervous expectancy than was once the case.

* * *

As one effect of the nervous strain upon the people it is quite certain that the habit of taking drugs is largely on the increase. In a large proportion of chemists' shops you may now see glass cabinets containing little bottles of tabloid preparations of a narcotic character, such as veronal, which are sold freely and indiscriminately to whomsoever may ask for them and pay the little price that is demanded. Again, cigarette-smoking in its worst form—inhaling—is now more practised than ever it was. Among the younger men of the town engaged in strenuous mental occupations it is all but universal. It has a deadening influence upon the nerves, and it is a habit which, once contracted, is at least as difficult to cure in the victim as is the drink habit in a man who has completely surrendered to alcohol. On the other hand, we find that there is now an enormous and fast-increasing consumption of preparations of divers kinds which come under the general description of nerve-foods. Those who are concerned will tell you that there is 'a fortune' in any new thing of this kind which has some reasonable basis, and is thoroughly well advertised in a 'catchy' and appealing manner. Again, among the classes which suffer most from the nervous strain we find the system of teetotalism growing most rapidly, which in itself is a good thing; but the object nine times out of ten is not to serve a principle or promote happiness, but merely to be able to thresh out the very last ounce of available energy from an overworked brain. Then any new scheme, fanciful or otherwise, for enabling the individual to do more work and stand more strain is welcomed eagerly and tried. New foods and new ways of eating them are wanted; new forms of exercise are suggested; new systems of rest and sleep are tried. As each novel idea is brought along it is put forward in all the panoply of large type, and established temporarily as something of a mild sensation, something that will enable this poor beggar of an overworked and overstrained man to do a little more work and perhaps feel the strain a little less. Thus it was only the other day that we found the very greatest publicity—many printed headlines—being given to some curious and interesting statements made by Sir Lauder Brunton, indicating how the heart might be so suited that it

would feed the brain to the best advantage and enable it to labour to the full extent.

* * *

Perhaps here, for a little relief, we may tell his tale, particularly as it has been suggested that the experiments he has made for the promotion of mental activity may be responsible in the future for those who work in studies and libraries, in offices, in reading-rooms, and even in schools, assuming an entirely new position of head and body while at work. The suggestion that is indicated, let it be said at once, is that the head should be laid flat upon the table, or nearly so, while the person is engaged in his mental work; and here one is tempted to observe that it has indeed been found by most writers that when busiest and working hardest they have their bodies arched and bent forward and their heads low down towards the paper. Not one of them in twenty will do his work sitting upright with shoulders square according to the method that was enjoined upon them by their schoolmasters. It is not that this position is uncomfortable; it is simply that it is found that ideas will not come, and that if they do come, they cannot be well developed to their consummation in written words when this attitude is maintained. There is at all events this in preliminary to support the suggestion of Sir Lauder Brunton. His simple premise is that the efficient working of the brain is largely dependent upon the supply of blood to that organ, that prolonged physical exertion enfeebles the circulation, and the task of the heart to pump blood up to the brain becomes more difficult, and that in such circumstances, if it is the object to get the brain to work better, it is necessary to render the heart some assistance in its uphill task. He narrates a personal experience in favour of his point. Once, he says, after a long day's work, he was called upon at night to write an article immediately. He attempted the task, with pen, ink, and paper before him, but was unable to obtain a single idea or to write down a word. Philosophically he set himself to reason out this aggravating situation. His brain was the same as it was yesterday, and it worked satisfactorily then; why would it not do so now? Then he remembered that the day before he was not so tired, and very likely his circulation was a little brisker; so perhaps he should now give his heart some help in its work of pumping the blood. Therefore he laid his head flat upon the table, and at once the ideas began to flow and his pen to record them upon the paper. A good start having been made, he thought he might resume the ordinary sitting posture; but when he did so his mind immediately became a blank again, and necessity compelled him to lay his head flat upon the table and finish his article while in that position. Sir Lauder Brunton says that since that time he has frequently adopted the same posture with satisfactory results when he wished to stimulate the brain after physical fatigue; and let it not be forgotten that this gentleman is one of the most distinguished physicians of the day. He says that incidentally in connection with the same subject he has studied some of the methods of writers and others who had acquired various habits owing to their unconscious efforts to increase the circulation of blood to the brain. It seems to him that this circulation is increased by the act of mastication, probably because of its stimulating some branch of the fifth nerve. An experiment that was made by Marey proved that during mastication the flow of blood through the carotid artery was accelerated, and perhaps it may be that this accounts for the various chewing habits that are prevalent even among people of education and refinement who have work to do. Thus it was a habit of the late Lord Derby to eat brandied cherries when he was engaged in severe mental labour, and Sir Lauder Brunton knows an editor who always eats figs when writing his leading articles.

* * *

It is in the winter that the stage and all that pertains to it interests the people most closely, and never did it do so more than now. There is a variety of good reasons why this is so. At the outset of the present season there was a great outburst of activity on the part of those associated with the production of the drama. They had been stimulated in divers ways. The previous season had been tolerably successful, though not really productive of great results. In the meantime titular honours were bestowed upon two of the foremost workers for the stage, and there came also that long-drawn-out discussion under official auspices upon the functions of the censor of plays and the question as to whether they should be exercised at all or not. The evidence was conflicting, but most interesting in its contents of individual opinion and anecdote. Then from the country and the seaside there came back a public sorely depressed from a want of sunshine and from an excess of rain, craving hungrily for something that would cheer its spirits. Here were the theatres given their best opportunity. Amid all this there were certain new movements astir in dramatic affairs, or revivals of old methods, and keen arguments upon various matters of method and procedure. Something in the nature of a very high-class repertory theatre became established in the West End, and then we had a most entertaining discussion upon the respective rights of control by the playwright and the player of the interpretation on the stage of the written words. This is a delicate question, and how the matter is administered in practice is a point upon which the public has not infrequently been a little curious. In the general way, the author of the play, the prime creator of the idea, is naturally somewhat jealous of the picture that he made in his mind, and would have it faithfully reproduced on the stage down even to the smallest inflection of voice. His efforts to this end are constantly great, and they are necessary, for it must happen in many cases that the mere words of the characters and the stage directions that are given

with them convey little idea of the author's conception or of the possibilities of the piece. This is certainly one reason why it is so difficult to gain an introduction as a playwright, and why many really good plays of modern production remain unacted, and will always do so. In an aside, however, one might remark that the care and patience exercised by managers in the examination of plays submitted to their judgment are much underestimated, and the trials they sometimes endure in this matter are not at all understood. Thus we heard recently of the case of one amiable and intelligent gentleman whose chief claim to distinction was that he had made a great fortune abroad. He came home with the impression that he was a Pinero, and by every means at his command set about establishing himself as such. He wrote a play, and forced it upon the attention of a leading agent, who examined it. 'Do you know how long your first act will take upon the stage?' the agent asked of Crœsus; and when the latter inquired how long, the agent answered that on a conservative calculation it would occupy nine hours! However, on this point of the respective powers and privileges of playwrights and players, the latter are apparently inclined to be self-assertive, and, leading ladies especially, take the view that the author-producer may easily go too far when coaching those whose duty it is to interpret the words that he has written. Thus we have had Miss Violet Vanbrugh observing, 'Let the author tell me I have got to leave the room with scorn; but please let me manage the scorn by myself!' and she remarks upon the keen annoyance that is felt by the player who has 'made a hit with one big, telling line' to have the author come along afterwards and require that line to be delivered with quite another inflection. It is a pretty point, and one that can hardly be settled. One feature of the most modern stagecraft that must impress the most frequent and thoughtful playgoers in these times is the increase in the number of leading actors and actresses who carry the unemotional style to what is surely a considerable excess. Of course they are managers only who have the privilege of this peculiar method; it is not permitted in the paid servants of the production. It is no doubt the fact that the true art is to conceal the art; but perhaps the concealment may be too complete after all, and the player who merely speaks, or it may be little more than whispers, the words of the part with never any inflection of the voice is surely making too much sacrifice to vanity.

* * *

The publishers of books tell us in a half-confidence that the season is quite a good one, that the public are buying well, and that on the whole the authors are writing not at all badly. It appears to be settled that the six-shilling novel shall continue to be priced at six shillings and sold at four-and-sixpence as it has been formerly. Experiments in other directions have not generally proved very satisfactory. Following upon some remarks that have been made in these pages upon the various emoluments that accrue to publishers and authors, upon the various degrees of starvation and ruin to which both classes are being subjected, and the difficulties that beset the new writer and the dangers of encouraging him, there are one or two items of gossip in literary circles in London which will be entertaining to the average reader. Thus we hear authentically that one well-known author has received one thousand pounds down, with a heavy royalty, for his new book, and that another has been paid seven hundred pounds for some short stories which in book-form, at all events, are not generally regarded as very saleable articles. Also, it is being said that the new writer of one of the most popular books of the year is not a man, as is generally supposed—the idea having been, if not encouraged, at all events not discouraged—but a young lady of great talent, ambition, and courage, who gave up a situation as secretary and typist in order to embark upon a bold adventure in literature. And, again, it is being said that from one new book, accidentally discovered, a certain minor publishing house has made as much profit as will almost clear its working expenses for the year. It may very well be taken, despite all the alarmist rumours and the eternal complaints of all concerned, that the business of the writing and publication of books is by no means in an unhealthy state. By the way, one sometimes feels that it is a little unfortunate that the general public are not kept better acquainted, by some system or other which is entirely lacking, with the productions of new literature in the Continental countries. Surely there might be more ventures on English translations of such than there are. This reflection applies particularly to German literature. Bismarck literature might very likely 'go' nearly as well as the Napoleonic, with which the public never appear to be satiated; but at the time of writing little or nothing has been heard here of a new biography of the Iron Chancellor, written by Professor Erich Marck, which contains some revelations that are of special interest to British readers. There is a piquant and seemingly new story of how, in the days of his youth, the subject of the book became fascinated with, engaged to, and nearly married a charming English girl.' The author of the book refers to her as a Miss Russell, and as belonging to the highest English aristocracy. At the time of this happening Bismarck was only twenty-two years of age, and had just put his foot upon the first rung of the Prussian bureaucratic ladder as a 'referendar' at Aix-la-Chapelle. He met Miss Russell at Wiesbaden in 1836, when she was out there with her uncle and aunt, the Duke and Duchess of C. The acquaintance was renewed in the following year, when Bismarck made open confession of his tender sentiments towards 'the British blonde of unusual beauty.' He was so overcome by these sentiments that he neglected pressing official duties in order that he might follow the lady to Switzerland, and

then, according to the biographer, a betrothal appears actually to have taken place. Bismarck exceeded his leave from official duties by two months, and then, suddenly remembering that he was a Prussian civil servant after all, he wrote to headquarters from Berne, with many apologies and humble requests for his grave fault to be excused. A little while later the engagement was broken off, when, where, or why nobody seems ever to have heard; but it is related that the young man of the great future took this final separation very much to heart, and that there are letters and incidents to show that for a long period he was in a gloomy and almost irreconcilable mood.

THE SEÑORITA DOLORES.

CHAPTER XIII.

THE Calle de los Santos is a narrow, roughly cobbled street in the heart of Toledo. It is so narrow that a pannier-laden donkey cannot with ease pass through it. On either side are dark, overhanging houses, divided at intervals by passages which lead circuitously to the Arco de la Sangre and to the Zocodover.

There is a curious incongruity about the manner in which they bestow names in Spain. The Arco de la Sangre is no more notorious for the spilling of blood than many another spot in the City of Shadows; and certainly the Calle de los Santos is not the recognised abode of saints—it is where the *contrabandista* live, and more murders have been committed in the Calle de los Santos than in any other street in Spain, a hard-earned reputation of which many in Toledo are justly proud.

At one end is the Church of St Joseph, which casts deep shadows along the way. The hour of eight had just been sounded on its sonorous bell. In the shadow of a doorway crouched six men; they were the roughest of the rough, men one would expect to meet in the Calle de los Santos, of uncertain, vagrant nationality, with rascaldom writ plain on their faces.

One of them lighted a cigarette. 'Tis my luck!' he said, expectorating discontentedly; 'the moon is always shining when I have some work on hand.'

One of his companions laughed, and the sound was not pleasant to hear. 'The moon makes men light-headed; see that it makes you light-handed to-night. 'Tis just sufficient will creep in here, and not too much. The men who built the Calle de los Santos knew their business.' The speaker stopped suddenly and clutched the arm of the man nearest him. With a long, thin finger, stained brown with cigarette-smoking, he pointed up the road. Three men were passing across the steps of St Joseph's; they turned down the Calle de los Santos, and the six men crouched farther into the darkness of the doorway. They did it easily and without comment, as if from a habit born of long custom.

The three men walked quickly down the road, carefully choosing the middle. Opposite the doorway they stopped, and half-a-dozen knives were silently withdrawn and held in readiness.

Then the shortest of the three men advanced a few paces. 'Baptista!' he said in a low, distinct voice. 'Baptista!'

There was no reply, but to the two waiting behind their leader the darkness seemed to deepen.

'Señor Baptista!'

Still there was no reply.

'I come from Señor Morella.'

'Yes,' said a voice from the darkness.

'I have a letter from him for you.'

'I cannot read it now; it is too dark. Besides, I have other work to do.'

'Then I must read it to you.' The speaker tore open the envelope and read the message. It was short and to the point, and informed the six men waiting in the doorway that at the last moment their master had sent down a Señor Avila to take over command of the party.

Baptista was a man of many parts, and for a couple of minutes he swore fluently, with a strange mixture of Basque and Neapolitan oaths. 'And who is this Señor Avila?' he asked.

'I am this Señor Avila,' said the man in the road.

Baptista looked at the figure before him and laughed. The señor was little over five feet, and slight in build, and beneath a deep sombrero hung a cluster of dark curls.

Señor Avila's eyes flashed, and he drew a knife. 'My friends,' he said in a high-pitched, passionate voice, which, had Baptista and his companions been clever men, would have told them many things, 'courtesy does not cost much, and I expect it, even from half-bred Neapolitans; and if I do not get it I shall put my knife into those shadows, which would be a pity, for I should assuredly hit some one, you are so close together.'

Baptista came out and stood on the narrow, cobbled road. He was a tall and in his way a handsome man, with dark, flashing eyes and a heavy moustache. He looked disdainfully at Señor Avila.

The Spaniard returned the gaze in no wise abashed. 'The Englishman will be down here in about ten minutes. You will await him here with your companions in the shadows, since you do it so well. My friends and I will be on the other side of the road. When he comes, you will stop his horse and stun him; the rest you will leave to me. As soon as you have done your work you will disappear—you know how.' There was a wealth of meaning in the words.

Baptista smiled amiably. 'And if I do not disappear?' he said.

Señor Avila fingered his knife. 'Then I shall assist you,' he responded courteously.

Baptista was wise inasmuch as he knew when he had met his master, and he made no comment as Señor Avila walked away to join his companions.

The chimes of St Joseph's had struck out the half-hour, and the moon had risen to its summit and threw a white light amidst the shadows of the Calle de los Santos.

Baptista suddenly threw away the cigarette he was smoking. From the distance came the sound of a horse's hoofs; a few seconds, and a horseman came round the corner of St Joseph's.

Baptista's hands clenched and unclenched nervously. Despite the hero of romance, it is always the most fearless men who show some sign of temerity before the conflict.

As the horseman approached at a gallop he whispered a few words to his companions.

A few seconds, and nine men sprang into the roadway. There was a rush, a stifled cry as one of the Spaniards fell, then silence followed, and Señor Avila bent down beside the prostrate figure of Vincent. 'You haven't killed him?' he said fearfully.

Baptista regarded him with contempt. He possessed a sublime indifference for death. 'No, señor,' he replied; 'he is only stunned, and will awake in an hour. The blow I gave him would not hurt a babe.'

Señor Avila carefully searched the unconscious man's pockets; from an inner one he drew out a letter. Glancing at the address, he gave a sigh of satisfaction, and put it carefully away in the folds of his cloak.

Then he arose and addressed his two friends. 'You will carry him to where I told you.'

'And you, señor?' asked Marcos.

'I have business to attend to,' said Señor Avila, and he mounted Vincent's horse.

In five minutes the Calle de los Santos was empty; but in the shadow of a doorway lay the body of a Spaniard, the one Vincent had killed with a blow from his sword before he fell.

CHAPTER XIV.

IN the Calle de Plata, which lies to the north of Toledo, there is or was an old Moorish house standing alone amidst a terrace of gardens which stretch down to the Tagus. It is not large, and is far less pretentious than many another house in Toledo; but it has played a great part in the history of Spain, and even to-day a Carlist cannot pass its ruins without feelings of sorrow and almost anger at the successful way it kept the secret entrusted to its care.

The night was warm; a hot, sand-laden breeze blew across the Tagus and in at the open windows. In the large room which led direct on to the *patio* were a couple of ladies. The elder of the two sat in a corner, beneath the light of some candles, reading. Although she was past middle age, there was still on her features a suggestion of that great beauty which had been hers in younger days. There was a look of weariness on her face, as of one who has passed through great trouble, or one who has had to relinquish some great power while still passionate to retain it; a Queen never forgetting her sovereignty, but before all things a woman, never forgetting her power over men. Such was Queen Christina, and for such there are always hours of pain when the heart is no longer young and the power to please has gone. It is said that many had killed themselves for hopeless love of her; her punishment lay in after-years when her kingdom divided against her, and she had to live on hour by hour in constant dread of treachery.

On the other side of the room sat the woman against whom Don Carlos was fighting, and from whom he would have wrested the crown had he possessed but half the courage that marked the more ardent of his followers, men who, scantily clothed and half-fed, resisted the arms of Spain and willingly laid down their lives for him.

The Queen Regent put down the despatch she was reading. 'It is warm, my child,' she said—'very warm.'

As she spoke the door opened and a servant entered. 'A messenger, señora, from General Vilenta.'

A couple of minutes later Señor Avila was bowing before the two Queens.

'You are not Señor Vincent,' said the Queen Regent sharply, 'for I know him. Who are you?'

If there was any fear at that moment in her mind, Queen Christina, one of the cleverest women who ever sat upon a throne, gave no sign of it.

'No, your Majesty; Señor Vincent has met with a slight accident on the way, and I have acted as his deputy.'

'Does General Vilenta know?'

'General Vilenta awaits your Majesties in Madrid.'

The Queen displayed no surprise. 'Ah,' she said, and opening the letter, read it through.

When she had finished she rose. 'We will be with you, ready, in half-an-hour.—Isabella, we leave for Madrid.'

'To-night?' said the Queen, who had as yet hardly fully realised all the uneasiness that attaches to a crowned head.

'In half-an-hour,' replied Queen Christina.

CHAPTER XV.

WHEN Vincent recovered consciousness he found himself in the señorita's *sala*; on the table by his side rested a bowl of roses. At first he felt only a vague sense of his surroundings. His head was aching with a dull, heavy pain, and he passed his hand wearily across his forehead.

With the action came remembrance—the Church of St Joseph, the men in the Calle de los Santos, and the sudden blow. Leaping to his feet, he turned out the contents of his inner pocket. The letter on which the hopes of Queen Isabella rested was gone.

'My God!' he said, and rushed to the door. Before he had taken a dozen steps Father Padrona entered. Vincent made to rush past him, when the priest laid a restraining hand on his arm. 'One moment, Captain Vincent,' he said—'one moment.'

'I cannot stop!' cried Vincent. His eyes were ablaze with self-anger and reproach. Every second he expected to hear the dull, heavy roar which would denote the price of his folly—the life of a Queen.

The grip on his sleeve tightened. 'The Queen is safe. I have myself seen her on the road to Madrid an hour since.'

'And the letter?'

'That too is safe.'

'How do you know?'

'I am Father Padrona,' said the priest with a funny little laugh, 'and I hear many things—very many things.'

He drew Vincent to the window. In the courtyard stood a couple of horses. 'In half-an-hour we will go to Madrid, you and I,' he said, 'and we shall arrive thirty-five minutes after the Queen.'

'We will start now,' said Vincent eagerly.

The *padre* looked at him. 'We will start in half-an-hour. Meanwhile I will tell you a little story—a story about red roses, my friend—red roses.'

'What do you mean?' said Vincent.

'Will you start now?' asked Father Padrona with a quiet little smile.

Seeing the look of doubt on Vincent's face, he drew a wooden crucifix from the bosom of his cassock and held it before him.

'By this,' he said with an impressive dignity, 'I swear your letter is safe and the Queen in Madrid.'

The action told more than the words, and Vincent flushed. 'I beg your pardon, father,' he said, and sat down.

'I am not surprised that you doubt me,' said the *padre;* 'it is one of the compensations for living in this blessed land of indolence and deception.'

Among the many tales that Father Padrona had heard was the one of Señorita Dolores's life, and he told it to Vincent simply and directly, omitting nothing and adding nothing.

When he had finished Vincent leapt to his feet. 'Father,' he said, 'I have been a pure, unadulterated ass!'

Father Padrona had spent many years in England, and understood the meaning of the particularly Anglo-Saxon idiom. 'It is well to find out one's folly in time,' he said; and a funny, almost wistful, look came over his face, as if he too had once made an error of judgment and had found out his mistake too late. 'We will start for Madrid now,' he said a minute later.

The two men hurried into the courtyard, and the *padre* untethered the two horses. 'They are good animals,' he said, noting the look of admiration on Vincent's face.

'I was wondering why we did not get such horses in the army,' said the Englishman.

The *padre* leapt lightly into the saddle. As he felt the flanks of the animal beneath him a burden seemed suddenly lifted from off his shoulders. A boyish look of excitement lit up his eyes. He was no longer a priest but a man; and, looking at him, Vincent wondered what his past history had been.

'That is one of the Church's secrets,' he answered, as he led the way into the Plaza.

There was an unusual quiet everywhere as they rode through the streets of Toledo. Of men, so of silence, there are degrees of it. There is the silence which one can trust and feel at rest in—it diffuses everywhere a sense of calm and peace; and there is that which is the very reverse—it is too deep, too heavily charged and oppressive. And the silence that rested on the streets of Toledo as Vincent and the *padre* rode through them was of the latter category, and both noticed it.

The priest threw back his cassock. 'Phew!' he said; 'it is hot. My son, we will walk through the town; we can gallop when we reach the country. A lot depends upon to-night, and we may be stopped if we show too much haste. They do not understand the value of time in this country, and are suspicious.'

'They will not stop me again!' said Vincent through clenched teeth; and the *padre* smiled.

They had passed through the Puerta del Sol and reached the open country. Ahead lay the wooded road through Ventni.

Suddenly from behind them there came a heavy roar, and a column of flame leapt into the sky. For a second it illumined the streets of Toledo. High above them, thin columns of smoke broke into the moonlight and hung over the city.

'They are exactly two hours late,' said the *padre,* drawing out a heavy nickel watch with a much dented and tarnished case.

'Thanks to Dolores,' said Vincent in a strange voice.

'Thanks to a woman,' responded the *padre* with a shrug of the shoulders, and they continued on their way.

Galloping across the silent, moonlit country, each realised that by his side was a man who understood and loved horses, and a man who knew how to treat them.

As they rode into the streets of Madrid, Vincent turned to his companion. 'You have not always been a priest?' he said.

'No, my son,' answered the *padre;* 'once I was a pure, unadulterated ass.' And with that he changed the subject. Only once did he refer to it again, and then only indirectly when they reined in before the *palacio.* Father Padrona leant across his saddle and looked along the road they had traversed. A

high colour was upon his cheeks. 'It has been a grand ride, my son; it is such nights that make my life worth living.'

Then he dismounted.

CHAPTER XVI.

INSIDE the *palacio* itself there was a scene of bustle such as had not been witnessed for many months. The corridors were thronged with the officers of the Guardias Royales. In the anteroom stood groups of men in uniform blazing with decorations discussing the *coup d'état*, of which the next few hours was to witness the success or failure.

Amongst them all passed General Vilenta, the soul of imperturbability, with a ready smile and word for all whom he encountered.

'He is iron!' said one who watched him pass, turning to a lady at his side.

She shivered. 'I often wonder if he has a soul,' was her reply.

Only once did the General show any signs of the great responsibility that lay upon his shoulders. It was when it neared the hour at which the two Queens should arrive if all had gone well. No one saw it. He was in a corridor alone. With a heavy sigh, he sat down on a lounge and drew out his watch. As he watched the minute-hand slowly passing round, the look on his face told plainly of the tremendous strain under which he was working. '*Oh Dios!*' he whispered.

As the door swung open and an orderly entered he rose to his feet again.

'Ah Miguel,' he said calmly—'you. Remember, your place is in the grand vestibule to-night, and if there is trouble later you are to slip out to the barracks.' The iron mask had fallen, hiding all feelings, and he was the soldier again, with a mind too great to overlook the smallest detail.

Twenty minutes later there was the sound of horses in the *patio*, the great doors of the palace swung open, and on the marble steps stood General Vilenta, hatless and calm. Even at that moment, when the feelings of those around, suffering from the tension of hours of suspense and anxiety, relieved themselves in a buzz of whispered conversation, there was no sign of triumph or relief visible upon his face. Not even a passing gleam of surprise crossed it as, walking up the steps behind the two Queens, came the diminutive figure of Señor Avila.

Graciously the Queen Dowager accepted his arm, and with the officers closing up behind them they passed into the room set apart for the Queen's reception.

'General,' she said, 'I am sorry to hear of Captain Vincent's accident. I was anxious to meet this young Englishman who has done so much for our cause, but you sent us a most excellent substitute.'

The General betrayed no sign that the Queen's remark conveyed any news to him. 'He is a tried man,' he answered, wondering what had befallen Vincent.

The Queen Dowager tapped him lightly on the arm with her fan. 'For once, General, I have outwitted you;' and she whispered a few words into his ear.

More than once during the next hour General Vilenta covertly watched the señor; in fact, it was seldom that he allowed the little man to pass out of his sight. As soon as possible he retired into a private room for a few moments, and sent an orderly to fetch him. He spent the time awaiting his arrival pacing up and down the room. There was a frown upon his face. 'I wonder why,' he said to himself more than once.

Presently the door opened, and Señor Avila entered.

As soon as they were alone the General approached with outstretched hands. 'Señorita Dolores,' he said, 'why have you done this?'

The girl looked at him and sank upon a couch.

'You have saved our Queen,' continued the General. 'Why have you, above all women, done it?'

'You know I am a Carlist spy?' she said.

'I know you were,' said the General.

The strain of the past few hours proved too much for the señorita. She rose and stretched out her arms. 'Then why do you not arrest me?' she said with a funny little catch in her voice. Then she sank back upon the couch.

As if in answer to the General's question, an orderly appeared at the door. 'Captain Vincent has arrived and wishes to see you.'

Close on his heels entered Vincent and Father Padrona. The Englishman walked straight up to the General. 'I have failed,' he said simply. Then he noticed the figure upon the couch. 'Señorita Dolores!' he said.

The General looked at them for a second, hesitated, then, perhaps reading something in the *padre's* eyes, took him by the arm and led him from the room. 'We are not wanted here,' he said, 'and I understand now. And a woman has done what I could not do—save a Crown!'

Arm-in-arm the man of war and the man of peace passed into an anteroom together, and for the second time that day Father Padrona told the story of Señorita Dolores.

When they were alone Vincent knelt by the señorita's side. 'Dolores, dear Dolores,' he said, 'I have come to take back that rose if you will give it to me.'

She drew herself up. 'I am a Carlist,' she said; 'have you forgotten? That is why you went away.'

'I have learnt since then'—Vincent hesitated, afraid lest he should betray the *padre*—'many things.'

The señorita looked at him with a glad smile. 'And who told you—the priest who hears so many tales—Father Padrona?'

'Yes,' replied Vincent.

'Still, I cannot marry you,' she said. 'Remember, I have betrayed my cause, and my life is worth'—— She made a slight gesture.

Vincent rose and stepped back a few paces.

'Here,' he said, 'perhaps; but to-night I resign my commission, and to-morrow, if you will have it so, we will leave Spain, and commence a new life in England.' He stretched out his arms towards her. 'Dolores!'

The girl took a red rose from her cloak, then she rose, and holding it out, came slowly towards him.

CHAPTER XVII.

A QUARTER of an hour later Vincent stood before his commander.

'I know why you have come,' said the General, 'and it will be Spain's loss. When do you leave?'

'To-morrow,' replied Vincent.

The General nodded. 'Perhaps it is as well; and you will have a company of your old corps to guard you; we can spare them now. You will go by way of Portugal. The northern roads are still blocked. I had hoped you would clear them.'

'I shall go the quickest way,' replied Vincent.

General Vilenta smiled. 'I can understand,' he said; 'you have learnt the third lesson, and you are not a Spaniard. The Queens have expressed a wish to see you both. As soon as the señorita is ready we will go in.'

'You have told her, then?'

The General smiled. 'The Queen knew all along. She is a wonderful woman. Vincent, I am not an admirer of women as a rule, especially when they play with the edged tools of politics; but for two I have the greatest respect—one the Queen Christina, the other the señorita who is to become your wife.'

THE END.

THE PALAIS-ROYAL.

PART III.

NEVERTHELESS, the Palais-Royal was to awake to the sound of arms at no very distant date. On the 23rd February 1848 agitation reigned all around. On the 24th barricades were erected, and there were bloody charges, with cries of 'Reform!' In spite of the concessions of Louis-Philippe, the riot became revolution. At this time the Place du Palais-Royal was not as large as it is now; the Château d'Eau, built by De Cotta in 1776, being in the centre, with narrow streets at each side leading to the Tuileries.

The Palais-Royal was attacked by the mob, and the Garde Nationale at the stable side. The troops defended it and the Château d'Eau, and would not surrender even when all their officers were wounded or dead. Dr Lessere, to save useless bloodshed, filled an oil-barrel with shavings, rolled it against the door of the château, and set fire to it. The soldiers soon evacuated their post. Marshal Gérard, on horseback, and carrying a green branch, read the act of abdication of Louis-Philippe on the Place. The people invaded the Tuileries, which he had just abandoned. They forced the gates of the Palais-Royal at the Galerie de Valois, and pillaged the entire place. A superb collection of two thousand five hundred engravings, a collection of ancient portraits and historical pictures representing the chief events which had occurred at the Palais-Royal since its origin, the furniture, and even the statues in the gardens, all were burnt, stolen, or destroyed. Thus disappeared the works of the most famous artists, Van Dyck, Mignard, Champaigne, &c., which had been lately brought together by Louis-Philippe. A few escaped, luckily, such as 'Le Cuirassier' of Géricault, now in the Louvre, which had been lent by the king to a charitable exhibition in the Boulevard Bonne Nouvelle. Others were kept and resold by the more practical invaders. All that could be recovered were afterwards given back to the Orléans family.

An ambulance had been arranged in the Galerie d'Orléans at the beginning of the action, the inhabitants bringing out their mattresses. The Café d'Orléans made tea and drinks for the sufferers, Chevet supplied food, and wine and cognac were taken from the cellars of the Duc de Montpensier, who had just escaped.

Immediately after the proclamation of the Republic the palace became the Palais-Nationale and State property. Here were revived the furious harangues of the year II. (1794), and the apartments were invaded by clubs of all shades and degrees of violence, the most ardent being 'The Society of the Rights of Man.' Afterwards the Comptoir Nationale d'Escompte was housed in the palace, and the Garde Nationale also for a time. In 1850–52 public exhibitions of painting and sculpture were given here. A huge temporary building on the plan of Prosper Chabrol, which cost one hundred and fifty-nine thousand francs, was erected for the purpose in the Cour d'Honneur, and was demolished in 1852. In the same year the palace, renamed Palais-Royal, was given by the Emperor Louis Napoléon as a residence to his uncle, the old King Jérôme of Westphalia, and to his son, Prince Jérôme Napoléon. The old king, 'essentially a gentleman, paternal, affable, and of honesty undeniable,' scarcely quitted the palace. He soon collected round him a little Court whose charm made up for its want of magnificence. His horses were his one extravagance; and, not wishing his carriages to be confused with those of the emperor,

he ordered his master of horse to find him within a month a service of twenty black carriage horses and twelve white mares. The master of horse had them trained and ready by the appointed date, and he describes how he shut the gates of the *cour intérieure*, and in this small square showed off the animals harnessed in twos and fours, and going round at full gallop, with postillions, and received modestly the compliments of his patron. King Jérôme died in 1860. The Ministry of Algiers and of the Colonies, which had been installed in the palace two years before, with Prince Jérôme at its head, was also done away with in this year; but the prince, who had married Princesse Clotilde, daughter of Victor Emmanuel, in 1859, stayed on in the apartments. At this period Louis Napoléon made the access to the palace and the theatre more easy by pulling down some private houses and giving the ground to the town, who turned it into the Place du Théâtre-Français.

In 1860–64 the present theatre was built. The architect, Prosper Chabrol, gave to the interior of the palace a more noble and simple appearance, with a more severe style of decoration and less profusion of details. A little Court, cosmopolitan, sceptical, joyous, and *spirituelle*, here surrounded Prince Jérôme, whose economy was much less strict than that of his father. Great ladies, politicians, and officials rubbed shoulders with writers, artists, and actresses of the Théâtre-Français. The Princesse Mathilde was often here, and the Duchesse de Grammont, with the Comte d'Orsay, her brother; also Lord and Lady Holland, Sir Henry Lennox, M. Petrucelli della Gatina, the Prince Danilo, the brothers De Goncourt, Thiers, Arsène Houssaye, Edmond About, Flaubert, Paul de Musset, Renan, Sainte-Beuve, Taine, Émile Augier (whose anti-clerical *verve* was the joy of the famous Friday dinners), and, lastly, Émile de Girardin, the friend who had most influence with the prince. The princess, who was very pious, built an oratory on the Cour de Nemours, of which one can still see the stained-glass windows from the Place du Théâtre-Français.

The Government, with a view to making a grand entrance to the gardens at the end next the Rue Vivienne, thought it would be wise to shut up the smaller passages and to suppress all the tables of the lemonade-sellers in the gardens, so propitious to Camille Desmoulins and other *motionairés*. They made Louvet, proprietor of the Café de la Rotonde, an exception. The cafés and shops under the arcades benefited by the prosperity which marked the sixties under Louis Napoleon. It was into this palace, enjoying the quiet evening of old age, that burst, on 19th July 1870, the news that war was declared with Prussia. Prince Jérôme, who had been away and had not voted for the war, told the emperor and his Ministers that they were fools or traitors. Hearing the soldiers shouting '*A Berlin!*' as they passed, he said that if they ever returned from Berlin it would be without having got there.

On the 4th September 1870 a battalion of the Garde Nationale peacefully took possession of the Palais-Royal. Princess Clotilde left it haughtily, respectfully saluted by the crowd. The palace again belonged to the State, and during the Commune it had a governor. On the 23rd May 1871 an order was given by the Comité du Salut Public to burn the palace and fall back on the Hôtel de Ville. Leopold Boursier, then governor, and other officers, along with the crowd, brought barrels of paraffin, and deliberately prepared fires in the Pavillon de Valois up against the Théâtre-Français, in the Cour de Nemours, and in the building between them facing the Cour d'Honneur. They had previously damaged and stolen many valuable objects. It was 3 A.M. on the 24th May when they lighted the fires, with cries of '*Vive la Commune!*' The Pavillon de Valois, saturated with paraffin, blazed up immediately. The inhabitants of the quarter knew that if the flames were not mastered the palace, the theatre, and the Rue de Richelieu would all be destroyed. But they dared not leave their houses, because Communists in ambush on the roof of the Hôtel du Louvre and behind a barricade in the Rue de Rivoli fired without mercy on all who tried to subdue the flames. However, some heroes, headed by Monsieur Alfred Lesaché, ran to the rescue. Water was very scarce, but they got a fire-pump, which the fusillade forced them to abandon several times. They cut off the Pavillon de Valois and sacrificed it to save the Théâtre-Français. About 5 A.M. twenty-nine workmen of the Banque de France arrived with another fire-engine. They managed to extinguish the fire starting in the Pavillon de Nemours, and thus saved many precious objects belonging to Prince Jérôme. Other firemen, including fifty men of the Bataillon de la Banque, and finally some regular soldiers, joined the rescuers. The Valois wing and a portion of the central building were the only parts devoured by the flames. The men from the Bank had saved the whole quarter, and when the Garde Nationale was disarmed the Bataillon de la Banque were alone allowed to keep their arms in recognition of their bravery. The grateful inhabitants also got up a large subscription for their deliverers.

The creation of the Avenue de l'Opéra and the movement of the richer classes to the west, the increasing difficulty of access owing to the closing of some of the passages to squeeze in more shops, the later dinner-hour which made the old promenade after dinner impossible, the suppression of the tables in the cafés in the gardens under the Second Empire, &c., in addition to the closing of the gambling-houses and the expulsion of vice already noticed, account for the present decadence of the Palais-Royal. Attempts have been made by organising fêtes and historical pageants to put new life into its old bones, but in vain. The charm of the place at present, with its wonderful memories of the great past, is the peace and quiet beauty of this oasis in the busiest and most populous

centre of Paris. It is the happy hunting-ground of bourgeois children and their dogs and pets of all kinds.

Champier writes: 'We would wish it an old age worthy of the generations which have survived there, fought, loved, played, worked; worthy of the episodes of its changing history, which was so often that of France — by turns severe, joyful, dashing, open-hearted, and finally morose as a ruined gentleman who is not certain of the next day.'

THE END.

THE MONTH: SCIENCE AND ARTS.

AN ELECTROLYTIC BLEACHING-PROCESS.

A WELL-KNOWN electrical engineer has recently perfected an electrolytic bleaching-process, the introduction of which should prove of far-reaching importance to many industries. Recently, in the course of some private demonstrations, the possibilities of the new discovery were very convincingly shown to the writer. First a pocket-handkerchief was soaked in ordinary office red ink, and then immersed in a dish containing the colourless and odourless bleaching-agent. Instantly the red stain disappeared, and the handkerchief was left as white as when new. The same result followed the treating of black ink and other stains; they disappeared as if by magic from the affected article. In laundries, where the removal of stains from white fabrics is at present accomplished by the drastic agent chloride of lime, which rapidly corrodes the fibres of the textile, the new process should be found extremely useful in the treatment of table-cloths, white dresses, and so forth, which are so liable to become stained in use. The electrolytic agent can only be used for white materials, since if applied to coloured textiles it will remove not only the stain but the colouring of the fabric as well. The stain, say of ink, is not merely dissolved from the article, but is rendered quite transparent in the electrolytic solution. This was graphically proved by filling a test-tube half-full of red or black ink. When the electrolytic solution was poured into the tube the conversion of the red, black, or blue into the colour of pure water within the course of two or three seconds was visible, and recalled the magician's well-known trick of converting wine into water in a large decanter, with the exception that in this case 'there is no deception.' The inventor has also applied his process to pulp manufacture, wherein at present the manufacturers can only obtain a creamy or ecru tone with the bleaching-agents at their command. By electrolytic agency, however, the pulp is rendered the purest white. Though the general *modus operandi* is to use the electric current while bleaching is in progress, the liquid can be kept for a short while in a non-actinic bottle, and in the event of an ink-stain, say, on a white dress, a little poured from the bottle on to the mark will bring about its complete eradication. No rubbing is required, and the absence of any kind of corrosive agent in the solution is an absolute guard against any deterioration of the fabric at the part treated.

AUTOMATIC FOG-SIGNALLING FOR RAILWAYS.

As is well known, the envelopment of our iron roads with thick fog paralyses traffic and burdens the railways with a heavy expense, not only in the consumption of the detonators to give an acoustic warning to the engine-drivers, but in the wages of the men who place the detonators upon the metals for each succeeding train. A retired Dutch naval officer, however, has devised a cheap, simple, efficient, and highly reliable means of accomplishing the same object, without the services of the fogman, by automatic electrical agency, working in such a manner that it acts as a complete check upon the signalman. The detonator, comprising a special cartridge, is discharged beside the track at a height level with the driver in his cab, and the sound of the explosion is projected through a funnel-shaped horn in the direction of the approaching train, so that the driver receives the full blast of the signal. In a box placed alongside the track is mounted a wheel carrying around its periphery a continuous groove, in which the cartridges are slipped in much the same way as the rifleman carries his ammunition in his bandoleer. This wheel is caused to revolve by a heavy weight on the same principle as a weight-driven clock. The cartridges are of special design, carrying a small metal cap on one side, into which is inserted a small screw, having at its inner end a short piece of platinum wire, one end of the latter being connected to the cap itself, which is insulated from the screw by a piece of ebonite. The platinum loop thus formed is surrounded by a small charge of gun-cotton, around which is packed common black powder or any other explosive. The wheel can only revolve the space of one cartridge at a time, and when brought into the firing position, which is the neck of the trumpet, is held there by a metal spring-buffer, the end of which presses against the cartridge-cap. This part of the apparatus is suitably connected to the rails by wires (a length of each rail being insulated) and the batteries. An electrical circuit is thus formed which is broken by the distance between a pair of rails. When the engine passes into this section the current flows from one rail to the other through the engine itself, the circuit is completed, the platinum loop in the cartridge is fused, the gun-

cotton fired, and the cartridge exploded. The apparatus is exceedingly simple both in design and operation. After the discharge the circular magazine advances sufficiently to bring the next cartridge into firing position for the next train. Should the line be clear and the semaphore lowered, the device acting in conjunction therewith is thrown out of action, so that no detonators are uselessly fired. Should any breakdown in the apparatus occur, it immediately gives the danger-signal and communicates the fact to the signal-box with which it is working. After each explosion it sets an alarm-bell ringing in the box until the latter is disconnected by the signalman turning a switch, whereby he performs a definite action acknowledging that he has received the signal that the approaching train has been stopped in the block. Suitable arrangements are also provided to warn the signalman when the magazine requires recharging; and should he ignore the fact the last cartridge explodes, pulling up the train whether the line is clear or not, and the block mechanism is held fixed and cannot be reopened until the signalman recharges the fogging apparatus. The system has been tried, and has demonstrated its efficiency and reliability.

A NOVEL FLEXIBLE RULE.

Though the flexible rule is a convenient little device, its handiness has been very appreciably extended by a new ingenious feature in its design. The actual rule comprises a strip of flexible steel graduated in the usual manner, but from one end to the other it is centrally pierced with small triangular cuts, the wedged-shaped tongues thus projecting being bent over so as to grip a piece of lead wire which is inserted lengthwise along the metal strip. The result is that, although the flexibility of the rule is still preserved, once bent in a certain position it will retain that shape until it is reset, and will not spring back, as in the case of the ordinary rule of this type; and as one face of the rule is quite flat it can be used with a pencil. The device affords a simple and efficient means of drawing curves, and will be much appreciated by those who suddenly want to prepare a design on the spot for, say, the bend of a pipe, a suggestion for moulding, and so forth more correctly than is possible by just rough sketching. The advantage of this rule is that there is no tendency to kink. Being inexpensive and serviceable, it will be found a useful acquisition to the pocket of many workers, and capable in many instances of doing quite as good work as more cumbersome and costly instruments.

A SIX-MILE IRRIGATION-TUNNEL.

Within the past few years the importance of irrigation has been fully realised by the United States Government, and several huge and comprehensive projects have been undertaken to divert the superfluity of water in one territory for the purpose of reclaiming the arid, waterless land of another district. In this reclamation work one of the most arduous undertakings has been carried to success in the face of remarkable difficulties. This was the piercing of a mountain range in the southern corner of Colorado by a tunnel six miles in length, so as to tap the waters of the Gunnison River, and turn the supply thus obtained to the parched Uncompahgre sage-brush desert twenty miles distant, by swelling the volume of the Uncompahgre River. The district in which this mountain range is situated is among the wildest even in Colorado, and the survey itself was an epoch-making achievement. But the boring of the tunnel was a sore tax upon the engineers, and the difficulties encountered threatened to dispute the feasibility of the idea as propounded by the surveying parties. A private firm who undertook the contract gave it up in despair, and then the Government Reclamation Service took it personally in hand. The tunnel was driven from both sides of the range simultaneously. At the west end the rock-hogs had not proceeded far before they pierced a large pocket charged with carbonic acid gas. The men abandoned their work, and it was some time before the air was purified to enable the rock-face to be approached again. Then subterranean springs, treacherous slipping gravel, and veins of other gases were tapped in turn. The temperature rose to unbearable degrees, and it required one hundred horse-power alone to drive the ventilating-fans. Labour was another difficulty. Men were paid about twelve shillings and sixpence per day, and with free lodging and baths could save about three pounds a week after paying all expenses, including three shillings a day for food. But their average stay was about two weeks. The isolation of the workings depressed them, besides which there were many other places where they could command big wages. The tunnel is ten and a half feet wide by twelve in height, and is lined throughout with concrete. Emerging from the mountain, the concrete canal winds through scorching valleys and pierces intervening adobe hills to the extent of two thousand feet, until the Uncompahgre River is gained. Thirteen hundred cubic feet of water drawn from the Gunnison are discharged into the Uncompahgre River every second, and by this means more than two hundred square miles of sun-baked desert has been reclaimed for fruit-farming, at a total cost of eight hundred thousand pounds.

HONOUR TO WHOM HONOUR IS DUE.

By dint of much patience and dogged perseverance, Dr Wülffing announced some time ago the perfection of a blue-black oxide of iron from ferrous liquors which constitutes a most excellent protective paint for iron. The commercial possibilities of the process aroused considerable interest, and the process was described in the 'Month' some time ago. Further investigation of the subject, however, has revealed the astonishing fact that the same idea was described years before

by a Scotsman, Dr William Gregory, sometime of Aberdeen, and subsequently of Edinburgh. His process is practically the same. Dr Wülffing pursued his patient labours in absolute ignorance of Dr Gregory's success, for the simple reason that the significance of the latter's work was not realised at the time, and few chemistry books have even mentioned his efforts in this direction. Some of the more severely technical treatises, such as one co-edited by Liebig, fully describe the process and adequately credit Gregory for his efforts, so that the fact cannot be disputed. Though Gregory's work does not detract from the merit of Wülffing's investigations and success, yet it transfers the honour of the discovery of the artificial production of magnetic iron from Germany to Scotland. It affords a striking instance of how an invention may be born before its time, then quite forgotten, and afterwards rediscovered by another worker in the same field, who effects his task when the time is opportune and receives all the honour extended to the discoverer of an important new invention. Such experiences are, however, inseparable from research and inventive effort.

THE 'PORHYDROMETER.'

Shipping circles have been interested in the remarkable invention of an Italian engineer, Emilio di Lorenzi, the function of which is to determine accurately the weight of a ship's cargo. The device is extremely simple. In the centre of the vessel is a cylindrical chamber extending from a point below the light-loadline, which denotes the empty vessel, to one above the maximum loadline. In the chamber is a float or aerometer, the upper end of which is connected with one extremity of a lever, while the other end acts upon a steelyard similar to those used in ordinary weighing-machines. The float-chamber is connected by some suitable means with the water in which the vessel is floating, so that the water-level within the chamber may always be at the same level as that outside. When the vessel is loaded or the cargo discharged, this action brings about a more or less immersion of the float, thereby indicating fluctuations in the weight of the cargo. These differences are recorded on the steelyard, and show the weight of the load taken on board or removed from the ship. It will be seen that by this ingenious arrangement the ship is really converted into a gigantic weighbridge, and the apparatus is so sensitive that it will notify the weight of a person stepping on or off the ship. The device is applicable to any class of vessel from the barge to the gigantic liner, and in every instance will perform its task with remarkable accuracy. The aerometer, which is the 'mainspring' of the apparatus, has to be specially designed in regard to its external shape and so forth for the vessel upon which it is installed, but otherwise all the parts are standardised. Once set, the machine can never become deranged, and varying densities of the water do not affect the accuracy of its readings. The device was thoroughly tested by the Italian Government, and the readings were found to be so correctly given that the Customs were authorised to accept any readings by porhydrometer. This is a vital consideration to shipping-men, for there is a difference of 200 per cent. in weighing-dues at Italian ports in favour of this instrument. To the captain compelled to coal abroad it acts as an infallible check upon the quantity of coal delivered to the ship, and its utility is still further increased by the fact that in the event of the vessel so equipped springing a leak it will instantly notify the captain by ringing an electric alarm-bell. Being inexpensive and easily fitted, it should form an indispensable acquisition to the up-to-date ship.

THE 'PANFLEX' SPRING MOTOR-WHEEL.

Many devices for overcoming the troubles of the pneumatic tire, but without any sacrifice of its all-important resiliency, have been evolved from time to time. The general trend of such efforts has been towards substituting the air-cushion by an arrangement of coiled springs which would absorb all shock and vibration. The majority of these, however, have proved unsatisfactory, and consequently the pneumatic tire, with its liability to punctures, is still tolerated by the motorist. The latest device to this end, however, is the most perfect substitute for the pneumatic tire that has yet been produced. It is the invention of the Hon. C. A. Parsons, M.A., M.Inst.C.E., and is known as the 'panflex'—flexible in all directions. It comprises two metal rims designed to form a metal channel between them on the inner side, the face of which is perfectly smooth in the case of a non-driving wheel, and corrugated for a driving-wheel. The inner part is the hub with the spokes projecting for a short distance, the outer extremities of which end in a tire shrunk on. Outside this tire radiate in all directions a series of specially formed powerful springs of the coiled type. The ends of the springs are screwed and soldered into caps, one cap being bolted to the tire shrunk on to the spokes, while the outer end is free. The outer end of the spring, however, has its cap grooved and shod with treads of rubber. Inside each spring a hollow steel tube is longitudinally inserted, and secured to the lower cap. There is no rigid connection between the spring and rim of the wheel, the rubber-shod ends of the coil springs being kept in position by the two metal rims on the outer tire, which prevents them from jumping out of position. When the wheel rests on the ground the weight of the car depresses the springs where the wheel is in contact with the ground, and those at the top are free of the rim. When the car is moving the spring-spokes, as it were, walk round the inner face of the outer tire, the rubber shoes of the springs forming a tight grip upon the metallic surface, so that slipping is quite impossible. In the case of the driving-wheels this grip is considerably greater, owing to the corrugated surface with which the

shoes come into contact. The wheel itself is fitted with a solid rubber tire. These wheels have been used on a high-powered car, and their resiliency is very pronounced. Whereas a run of about four thousand miles represents the life of the average pneumatic tire, the panflex will run for ten or twelve thousand miles without any repairs. With this new tire, the tire expenses, instead of being about a penny per mile, are only about one farthing—a very considerable economy. Expenses are confined to the renewal of the solid rubber tire and the rubber shoes at the ends of the spiral springs, and experience shows that their life runs into at least ten thousand miles. The chance of a spring breaking is very remote. If it does, it can be replaced in a few minutes on the road.

PASTEURISATION OF BOTTLED LIQUIDS.

Within the past few years pasteurisation of bottled liquids of all descriptions, to keep them in perfect condition for long periods, has come more extensively into vogue. Several devices to this end have been introduced, one especially proving very efficient. This is the Gasquet system, which possesses many ingenious features and excellent advantages. In this process the requisite preservation is carried out in such a manner that the treatment is uniform, and each bottle is bound to be exposed to the same degree of heat for the same length of time, two most important points in successful pasteurisation. The instrument is of simple design, and is most economical in its operation, as experience in breweries in the treatment of bottled beers has sufficiently shown. The heat of the water around the bottles is gradually raised until it finally attains one hundred and fifty-eight degrees Fahrenheit, at which point it is maintained for a certain length of time, and there are certain warning devices attached which enable the work to be accomplished with mathematical accuracy. The heat is then slowly reduced to a prescribed point, when the bottles may be safely removed from the machine. This gradual heating and cooling operation not only protects the bottles against breakage, but also preserves the flavour of the liquid contents, which is a vital consideration. The wear and tear of the apparatus is very small, being limited to the suction and delivery pipes. The same water is used over and over again, and two or three men are quite capable of tending a machine treating four thousand bottles or so per hour. Steam consumption also is very low. The apparatus can be made to meet any dimensions or to suit any convenient corner without impairing its efficiency.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE OLD GLASS-PAINTERS AND THEIR WORKS.

By SARAH WILSON, Author of *The Romance of our Ancient Churches.*

WE know it was John Thornton of Coventry who painted the glass in the great east window of York Minster in 1405. An indenture drawn up in the reign of Henry the Eighth gives us the names of the artists who painted four of the windows in the chapel of King's College, Cambridge. The two first mentioned are Francis Williamson of Southwark, glazier (they all called themselves glaziers in those days); and Simon Symonds, glazier, of St Margaret's, Westminster, who agreed to glaze these four windows with imagery, in orient colours, of the Old Law and the New, in every way in manner and goodness like those in the King's Chapel at Westminster, and like the work of Bernard Flower, deceased, for which they were to be paid sixteenpence per foot. A second deed tells us of Richard Bounde of St Clement's Danes, Thomas Reve of St Sepulchre's, and James Nicholson of Southwark, all glaziers, who agreed with the authorities to set up eighteen windows in the upper story of King's College Chapel, like those of the King's new chapel at Westminster, as Bernard Flower, then deceased, had undertaken to do. Dugdale mentions a John Prudde of Westminster, who agreed to paint the windows of the chapel in which the Countess of Warwick was interred at Tewkesbury with stories and images of the finest colours—blue, yellow, red, purple, sanguine, and violet—which stories were to be traced or pictured by another painter in rich colours at his charge, and for which he was to receive two shillings for every foot of glass. In Walpole's catalogue of engravers we find it stated that Mr Francis Price, engraver, executed a portrait in mezzotinto of Mr Henry Gyles, the glass-painter, in the reign of Charles the Second. Thus we have the names of nine individuals who practised this art either in Lancastrian, Tudor, or Stuart times. Further research would doubtless give us more.

We next hear of two painters named Price, who in an advertisement issued from Hatton Garden in the early part of the eighteenth century stated that their art had fallen in estimation of late in consequence of an impression that the secret of making the red colour in glass was lost, and they gave notice that they could make it exactly as it had been made in former ages. Some of their work has been identified in Denton Church, Norfolk, and in a chapel at Copt Hall, near Epping. Still later particulars are known in connection with the work of Benjamin West for St George's Chapel, Windsor

Castle, which was executed by Forest and Jervis in 1788.

We are fairly rich in specimens of the works of the old glass-painters. The wave of destruction that passed over the land in the sixteenth and seventeenth centuries cleared away a large number, but still we can look upon some splendid examples. The petition of the women of Middlesex, dated 1641, and signed by twelve thousand names, doubtless put many custodians of such treasures on their guard. These petitioners stated their desire that 'prophane glasse windows whose superstitious paint makes many idolators may be humbled and dashed in pieces against the ground; for our consciens tels us that they are diabolical, and the Father of Darkness was the inventor of them, being the chiefe Patrone to damnable Pride.' Several windows were taken out of their places and safely hidden till the time came when they could be restored to their original setting; as in the case of the Jesse window at Llanrhaiadr. In various country churches we may see gatherings of fragments of ancient glass eked out with new, placed in some of the less prominent windows, as in St Michael's Church, Alnwick, where, in a small window in the west end a cluster of such relics bears three words, 'Janete et Esebella,' an evident effort to perpetuate identities now utterly forgotten. In Leicestershire there are but few village churches without such fragments; in short, they are of frequent occurrence.

The earliest glass, as is well known, aimed only at the effect of glass mosaic-work. The figures on it were outlined with thick black lines, and the backgrounds were merely flat surfaces of rich reds and blues. Later, in the fourteenth century, there were canopies over the figures, heraldic embellishments, and other devices. As time went on perspective and shadows were introduced, and a more pictorial treatment came into vogue. The whole of a window, though divided into several lights by mullions, was treated as one picture with various figures in it, and with distant landscapes in the background. After many years of development on these lines a reaction set in; and the best authorities contended that the work of the glass-painter should not arrest the eye when one entered a building to the exclusion of the other details, but should be subservient to the general effect, and await more minute inspection for recognition of the subjects treated. It was advanced, too, that brilliancy and transparency being the proper qualities of glass, they should be made evident, and the leadwork with which the figures were outlined should be treated as part of the design and not hidden. An enthusiast, Mr Charles Winston, employed chemists to analyse the colouring matter of old glass; and there ensued a very successful revival of the art towards the middle of last century.

Some of the glass in Canterbury Cathedral is claimed to be the oldest in the land. This is attributed to the twelfth century. There is one window of later workmanship on the north side of the choir for which a Spanish ambassador is said to have offered ten thousand pounds in vain. There are ten prophets, twelve apostles, and fourteen bishops delineated in it, and the rest of the glass is filled with ecclesiastical devices. The great west window contains the arms of Richard the Second, and has several figures, including ten saints and twelve apostles, with two youths kneeling, besides representations of seven kings with crowns and sceptres. The effect of all this superb glass, so gem-like in its brilliancy, is much the same as that of a vast shrine covered with jewels, such as was shown to Erasmus, when he declared the rich sight was more than a royal spectacle.

The windows in Fairford Church have been attributed to the genius of Albert Dürer, who with Lucas of Leyden and a French painter in Marseilles executed work of the kind. In Dürer's diary, telling of his visit to Antwerp, he mentions intercourse with four glass-painters there. One Master Dietrich gave him some red colour obtained from newly baked bricks; and he bought for four stivers a quantity of kettle-brown, an alkali the ashes of which are used in the making of glass. Thus, though we may not be able to prove that he executed the Fairford glass, we can be sure there are good grounds for believing that he added glass-painting to the other arts he practised. There is Flemish work to be met with elsewhere.

Lincoln, Salisbury, and Gloucester Cathedrals have good specimens of ancient glass. The great western window of the last-mentioned escaped destruction at the Reformation, but was removed in 1679 in consequence of an order of the chapter, in which it was called 'a certain scandalous picture of ye Holy Trinity.' When the glass was taken out it was obediently broken up by a precentor who afterwards became bishop. The pieces seem to have been collected and preserved, for there is a local impression that much of it has been put back in its old place. The glass in the east window was not condemned, and a few years ago was taken out, cleaned, and restored at a cost of six hundred pounds. The western window of Salisbury Cathedral is of thirteenth-century glass; and there is some Flemish glass in this edifice. The Five Sisters of York are of an earlier date than John Thornton's work. Worcestershire has some good glass in the churches at Maseley, Great Malvern, and Bredon. Oxfordshire and Shropshire are also fortunate, and Kent has a fair store.

Besides the actions depicted by figures and the wording of inscriptions on scrolls and borders, the work of the old glass-painters had another language. This was colour. Their deep blues and ruby-reds and other colours had as much meaning as beauty. Just as the particular colour used in heraldry makes a 'difference,' so their tints conveyed a special meaning to those who understood. This language of colours was inaugurated when the rainbow was set in the skies for a covenant; and it is advanced that, in the same way as we still speak of signing our

names—a lingering survival of the custom formerly performed with a device—this devout aspect of colours has obtained in all countries and through all the centuries. To-day brides wear white and mourners don black, and, among other associations, we think blue is true or represents truth. A French antiquary of much learning, M. Frederic Portal, has divided the subject into three branches—divine, consecrated, and profane—from all of which he has gathered a conviction of the identity of primitive religions and the importance colour formerly played in the presentment of religious ideas. Thus, from his point of view, the great glass windows had two significations—the apparent and the hidden. The miniaturists as well as the glass-painters worked in the light of this knowledge. They represented St John in a green robe, to signify regeneration; St Peter in a golden yellow, the emblem of faith; they draped Christ and the Virgin in red and blue, signifying divine love and truth; when they wished to represent the Messiah in His ministry they robed Him in blue, when He was represented as combating temptation they made His robes black, and during the Passion they made them violet; Judas they draped in yellow, the colour ordinarily worn by Jews in the Middle Ages; and we learn from Bede that the tomb of Jesus was painted of the intermingled colours of red and white in the seventh century. The Cross was often painted a green colour to signify regeneration, and in the case of the glass in Chartres Cathedral it was given a border of red, the symbol of divine love.

When we remember the limitations attending the manufacture of the glass, owing to the absence of the knowledge that discoveries in chemistry have now made familiar, our appreciation of the achievements of the old artists can but be increased. It has been suggested that the excellence at which they arrived was looked upon as their personal property and the way in which it was accomplished kept a profound secret; and that each artist probably never disclosed his mystery of recipes, pigments, fluxes, and processes. Be that as it may, as we look upon the productions of their art, and note the delicacy and grace of their touch and treatment, and think of the significance of the subjects they chose and their relation to the current thought of their day, we may call to mind the symbolism of their colours, and find ourselves impressed with the amount of learning, culture, devotion, and piety that must have filled the hearts of the old glass-painters.

SEA-FOG.

The sails drip idly, and no hand can steer;
The blank fog, redolent of gloom and death,
Smooths the cowed ocean to a stagnant mere,
And one dark nothingness, a prospect drear,
Falls, and engulfs us with its icy breath.

The pale lookout, his lonely watch to keep,
Stands shivering, peering vainly through the dense
Gray atmosphere, whose dank uneasy sleep
Is faintly shaken as chill whispers creep
Athwart a silence audible, intense.

The ship lies stifled, longing for the brave
Fresh breeze, whose sunny breath will lift the pall
And resurrect her from her dismal grave,
Fill her white wings, and waft her o'er the wave,
Setting her dancing to the ocean's call.

JULIAN TENISON.

Volume XII. of the Sixth Series of CHAMBERS'S JOURNAL *is now completed, price Nine Shillings.*
A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.
A cloth case for binding the whole of the numbers for 1909 *is also ready.*
Back numbers to complete sets may be had at all times.
Annual subscription, including postage to any address, either at home or abroad, 9*s.* 6*d.*

The January Part of CHAMBERS'S JOURNAL (published about 21st December) will contain the opening instalments of an original and striking story

ENTITLED

LAURISTONS,

By JOHN OXENHAM,

Author of 'Barbe of Grand Bayou,' 'John of Gerisau,' 'Giant Circumstance,' 'Our Lady of Deliverance,' &c.

Also the first instalment of 'THE FORGOTTEN ROCK,' a powerful short story by Mr JOHN FOSTER, author of 'The Luck o' the Spey,' &c.

There will be Novelettes and Stories by other writers, and the usual entertaining and instructive Articles.

END OF THE TWELFTH VOLUME.

Printed and Published by W. & R. CHAMBERS, LIMITED, LONDON AND EDINBURGH.

CHRISTMAS 1909.

HARRIS OF THE MOUNTAIN.

AN ECHO OF THE PENINSULAR WAR.

By Captain CECIL NORTH,

Author of 'The Moorish Treasure,' 'The Hermit of the Irati,' 'Hoppy,' &c.

PAUL BOULTON, coat-tails flying and cane swinging viciously, strode out of the club and down Piccadilly, his handsome face, usually so bright and debonair, overcast with disgust and anger. 'After her money! After her money!' he muttered. 'There was no mistaking Granville's words nor whom he meant: "Paul's after her money." I heard it quite distinctly; and besides, when he caught sight of me close beside him, his face and those of the other chaps were quite enough to tell me whom they had been gassing about.

'Curse the wretched money!' he went on furiously, as he cannoned off an inoffensive old man who came hurriedly round a corner. 'Why must it be always set down to fortune-hunting if a poor man happens to fall head over ears in love with a girl who is blessed with heaps of stuff? But there it is: just because Tommie rolls in it, every fellow who is attracted by her sweet face and jolly ways—and goodness knows I am not the only one!—is put down as a scurvy money-grubber unless he has a pile of his own. As for my modest income, it wouldn't do much more than pay the washing if I married her. She'd have me, too, I feel pretty sure, after what she said at Lady Bertha's dance, bless her dear heart! But I'd sooner she thought me that most horrible of things, a male flirt, than be branded as a fellow living on his wife's money.'

Meanwhile the young lady in question, Miss Taormina Harris—called thus after the Sicilian town wherein she happened to have been born, but known to her friends as Tommie, the only child and heiress of the late Sir Scrimgeour Harris, whose wealth was reputed to be very great—sat in a cosy drawing-room of her beautiful house in Grosvenor Square, lazily sipping her tea and chatting with her aunt, who lived with her and carried out the duties of chaperon in a liberal spirit—Mrs Rupert Restall.

Tommie, without being a beauty in the lady-novelist's style, was nevertheless very good to look upon: just one of the crowd of tall, fair-haired, white-toothed, blue-eyed girls, the like of whom you may see in numbers at any fashionable gathering during the London season. Like hundreds of other nice women in the same 'smart set,' as the literary ladies love to call that stratum of society of which they write so glibly and are so profoundly ignorant, her mind and life were as clean as her delicately white hands in spite of these same ladies, who would have us believe that to be pretty, smart, and popular in society means being, on the quiet, what the charwomen would call a 'thoroughly bad lot.'

'I cannot see it, child,' Mrs Restall was saying. 'You allow that Paul Boulton is the sort of man you would like to marry, and show, by a thousand little things, that (to put it plainly) you are extremely fond of him; and yet, though it's palpable enough that he is very much in love with you, he doesn't propose to you evidently because of some rubbishy ideas about your money. And you, on your side, calmly sit there and tell me that if he did ask you to marry him, you don't feel sure that, in spite of what your heart tells you, you would have him, because, forsooth, he might after all be only attracted by your fortune, like the rest of 'em! Good gracious! there's a maid and a man who would jump into each other's arms if they hadn't two penny-pieces to rub together, and never dream of doubting their mutual love; and just because one happens to be blessed with the wherewithal to secure their future from being worried with sordid cares, they fight shy of each other, and can't see that the money has nothing to do with it, and that if the man had it instead of the maid they would have been married and happy long ago. Oh, I've no patience with such a pair of idiots!'

Tommie, who had listened to her aunt with evident amusement, smiled serenely. 'You dear old sweetie,' she said, 'you take so much for granted! It's quite true that I do like Paul Boulton most terrifically, and I really think that he *is* honestly in love with me, for his devotion seems sincere and as if he meant it. But there, you see, so did that of others; and I am convinced now, from their behaviour after I refused them, that, with the exception of poor Jimmy Vereker, who was killed in South Africa, it was really my wretched money that was at the bottom of their attentions.'

'Oh, well, my dear, go your own way,' grumbled Mrs Restall. 'I wash my hands of you and your love-affairs. I suppose it will come out all right in the end; but, for goodness' sake, don't—oh, don't—encourage that horrible man Daunte! If ever there was a downright fortune-hunter, there's a specimen, in spite of his good looks and title.'

Tommie gravely raised a long-handled pair of glasses to her pretty eyes and attentively scanned her aunt's plump, gem-covered fingers. 'Yes, you darling,' she remarked with solemnity, 'they are a little sticky; run away and wash 'em, and perhaps you will feel better. As for Lord Claud Daunte,' she went on with a sudden change of manner, 'you may rest quite easy in your mind concerning him and his love-affairs. Nothing would induce me to listen seriously to him. I don't know, but I almost think that I detest the sight of him.'

Mrs Restall stared. 'What an odd girl you really are, Tommie!' she at length exclaimed, shaking her head gently. 'If those are honestly your ideas, why on earth, may I ask, do you let the creature dangle after you as you do?'

'Oh, I don't know. Why do I do anything? Why do I eat and drink and sleep? Why am I so rich? Why am I alive? Oh, how sick and weary I am of it all! I've a good mind to'——

'Mr Boulton,' announced a footman, flinging wide the door, and ushering in a tall, good-looking fellow, whose lean flanks and bronzed face, with the tell-tale white patch caused by the forage-cap, betrayed the soldier.

'How do, Mrs Restall?—How do, Miss Tommie? May a poor, parched fighting-man, half-choked with Long Valley dust, beg a cup of tea? By the bye, I've a bone to pick with you, young lady! Why weren't you at Lady Oban's dance last night? You said you were going!'

'I was!' cried Tommie. 'We went on from the Pembrokes'. Why weren't you there?'

'What's the use of talking like that? You know quite well that of course I was there and stayed as long as I could. But we were under orders for a rotten early field-day this morning, parading at a hideous hour; so I had to hook it at about one—only just in time, too, to catch the "cold meat," and then had to walk all the way to camp from Farnboro' Station, for there wasn't a cab there, for a wonder. Didn't get to bed at all, as a matter of fact, which accounts for my boiled-owl appearance.'

'Catch the cold meat!' exclaimed Mrs Restall. 'What on earth do you mean, Mr Boulton?'

The young man grinned. 'Oh, that's what we call the train that goes from Nine Elms Goods Station about one o'clock every morning. The railway people put on a first-class carriage for the convenience of fellows who have to get back at Aldershot for early work of any kind, and who miss, or who don't try to catch, the last passenger-train at midnight. That's all right enough for doing a dinner or theatre; but for a dance, if you can't sleep in town, the "cold meat" gives you practically another hour, which

means a lot if there is anybody there you particularly want to see.'

'Yes, I understand so far; though to be jolted down in the small hours in a luggage-train to a station five miles from your ultimate destination appears to me to be hardly good enough, especially for you young men who love comfort so—unless, of course, the somebody happens to be particularly charming. Still, why, oh why, the cold meat?'

''Cause it takes the dead bodies down to Brookwood Cemetery,' laughed Boulton. 'Jolly expressive name, too, don't you think—— Eh, what?'

Mrs Restall gave a shriek. 'Oh, you perfect horror!' she cried in the shrill tones affected by fashionable women as she rose from her seat; though Tommie openly joined in the youth's mirth, like the pair of big children they were.

'After that, I really must remove myself from the neighbourhood of such ghoulish people. I've *trente-six mille* letters to write, and so I'll leave you two babies to your quarrels; for, in spite of your indecent approval of his sepulchral jokes, Tommie, I see that Mr Boulton still means picking that bone with you.'

'Poor darling!' cried the girl as her chaperon moved towards the door. 'Of course, after cold meat we always pick the bone. Run away from the nasty people, then, and write your thirty-six thousand letters—meaning six, I suppose—and don't forget that the victoria comes round in an hour to take us to Clothaire's. And do try to be punctual for once in a while!'

'And now,' said the brown young man as the door closed behind the swishing Restall skirts, and his laughing eyes grew grave, 'I want to say something that you probably won't understand, Tommie, and which, I suppose, will make me appear quite mad in your eyes. As for the bone, we will consider it picked. I quite understand how it was that I didn't see you last night, and so couldn't ask you a very important question—a question of life and death to me.'

'It 's coming!' said Tommie to herself. 'I've heard that preamble before. Oh dear me, I wish I knew! Is it me or my money he 's in love with?'

'You must have seen for ever so long,' he went on, 'how awfully fond I am of you, Tommie dear; and last night I had resolved to put my fortune to the test and ask you. Well—er—er—now I 'm blest if I can do it!'

'What 's come to the boy?' thought the amazed Tommie. 'Was there ever such a thing as this? He implies in so many words that he loved me, and wanted to marry me, last night, and then comes here and stutters out that to-day he 's changed his mind! Why say anything at all about it, then? Is the boy quite cracked, or has the Aldershot sun been too much for his poor head?' But she quietly said—though her sinking heart told her that, now she had lost him, the man beside her was of a truth the only one in the world for her—'Please don't distress yourself, Mr Boulton. I won't pretend not to understand you. That 's not my way, you know. What has happened to you since last night, or why you wanted to tell me all this, doesn't really interest me in the least. Perhaps the Oban fizz was responsible for your very kind intention towards me yesterday. Anyhow, you would have been disappointed had you met me and succeeded in carrying out your benevolent ideas. We are good chums, aren't we? And that 's what we will remain, if you please; so never attempt to spoil it, Paul, my dear boy;' and she patted his arm with a frankly sisterly, not to say patronising, air. 'There, now,' she continued, smiling on the mortified lover in the most friendly way, 'I 'm sure you feel better after your quite unnecessary confession; so I 'll run away too, for I also have letters to write. You can find your own way out, can't you? Bye-bye! Sure to see you again soon, somewhere or other;' and an outwardly very cool and self-possessed, but inwardly stormy, young woman rose swiftly from her seat and swept gracefully towards the door.

But this was quite too much for Paul. Springing to his feet with a cry of 'Oh, I say, Tommie, don't go; wait till I tell you more about it! It was something that ass Granville said in the club this afternoon that—— Oh, I say, Tommie, do stop; you must listen! Oh, what rot!' as the lady, without taking the least notice of his words, passed through the door and closed it quietly behind her—if the truth must be told—within an inch of her distracted lover's somewhat Wellingtonian nose.

'And now, what 's to be done?' queried the discomfited warrior, as with a rueful countenance he pulled his neat little pointed moustache until he must have sensibly increased its length. 'I seem to have made a pretty large ass of myself. It 's all that brute Granville's fault. I've gone and done it now and no mistake, and completely settled my hash. And I know, too, in spite of what she said just now, that Tommie likes me better than the rest of the crowd. Why didn't I let things alone? I can't help her having tons of stuff, and God knows it was for her dear little self I wanted her. It 's foolishness, after all, having such old-fashioned pride. Who cares nowadays what people think or say about one? Oh my sacred aunt, what 's to be done now? The club, I suppose, and a drink and a think. That 's the ticket, clear thinking—like old Haldane and his Territorials! I 'm off.'

But thinking invoked by drinking is not usually a success; and the blighted Paul's case was no exception to the rule, for indeed there was little that was clear about it. Nor did any-

thing come of the attempt save a worse confusion of ideas, and so presently the futile effort to solve the difficulty was given up and relief sought for and found in the eminently peaceful columns of the *Pasture*. Here, under the heading of 'Angling News,' a glowing correspondent, over the signature of 'Veritas,' gave some very vivid particulars of a fishing expedition undertaken in the valleys of the Western Pyrenees, where the mountain streams rush down into the lowlands of the little-known Basque country, and where, according to the author, the merry trout were to be captured in their hundreds by any one equipped with more delicate tackle and lures than the coarse gut and crude bundles of feathers used by the local sportsmen.

Fired by this contributor's account of red-letter days spent amid glorious scenery, where the fisherman, his basket overflowing with spotted half-pounders, wended his homeward way to his picturesque inn to eat the eat and sleep the sleep of the just amid surroundings of the most scrupulous civility and cleanliness, &c.

Paul, who was an enthusiastic and not unskilful wielder of the rod, had suddenly a most magnificent inspiration. 'I'll do it!' he cried. 'I'll do it! I'll get leave; I know how to work that! The Colonel's wife, dear little soul, will do anything for me if I dance half the night with her at the assembly rooms to-morrow. And then, in the solitude of the boundless mountains, untrodden by Englishmen since the army of the great Wellington drove the Frenchmen over them, I'll get over my troubles in communing with the trout and nature; and—and—well, in plain English, I'll hook it, and see how I feel after a month's absence from my naughty Tommie's charms.'

Then he paid for his drinks, which, it will be judged, had been of a certain potency; cocked his well-ironed topper a shade, but only a shade, out of the perpendicular; and, full of dreams and noble resolves, swaggered for the second time out into Piccadilly, where we can now safely leave him.

The front door at the Grosvenor Square house had hardly banged five minutes behind the dismissed suitor when the overfed footman was again obliged to throw down his 'penny dreadful,' and once more sullenly crawl up the kitchen stairs, to answer the irritating electric bell, with the rude but truthful remark, ''Ere's another of them mashers, I'll bet!'

Lord Claud Daunte was a fine figure of a man, and he knew it. Anywhere between the thirties and forties, tall and spare of frame, swarthy as a gipsy, hair and eyes of a raven-black, in his dark-gray frock-coat, neat tie (the only bit of bright colour about him), and pale-lavender gloves, he looked the smart, well-born man of the world which *Debrett*, with admirable conciseness, set down that he was. He was remarkably popular with women, who, infallible concerning their own sex, are easily mistaken in the other. But men knew better. Though he went everywhere, was a good shot and horseman, and had done nothing as far as was actually known to account for it, men—with the exception of a certain rather fast set—fought more or less shy of him; and though he had hundreds of acquaintances, he possessed no real friends. He had once been in a crack cavalry regiment, but left heavily in debt; and how he managed to live now as he did, enjoying all the good things of life and going everywhere that the butterflies of fashion went, was one of those human puzzles so common in the London world. His father was notoriously as poor as a church mouse, and the source of Lord Claud's income was a mystery.

Tommie—that slightly self-willed, not to say obstinate, young person—had always been gracious towards this scion of nobility. Well aware of his unpopularity among the right sort of men, she had nevertheless allowed herself, in a spirit of contrariety, to show him more favour, dance oftener with him—nay, let it be honestly said, flirt more openly with him, not from any special pleasure in the process, but from the human and more particularly feminine trait of championing the under-dog — than any of her other admirers.

At Lady Oban's dance the previous night he had been extremely pressing in his attentions, and the girl had felt that if she had so wished, and given him an opportunity, she would certainly have had another scalp to hang on her already well-garnished belt.

She had, however, as she so well knew how, easily postponed the operation; but she now, as she swept downstairs again to the drawing-room to receive her new visitor, popped her head into her aunt's boudoir *en route*, and told her not to leave her letter-writing. For, still hot and angry with Paul, she was determined to let Lord Claud make his proposal if he had a mind to; it would be soothing to her feelings, she felt, though she had not the slightest intention of accepting the man.

As she expected, after the usual greetings had passed between them, Lord Claud commenced the attack, but with such a confident manner and assured air of success that the girl laughed softly to herself as she pictured the tumble he was presently going to take.

But when the crucial moment arrived, and he got his answer—a soft and gentle one, it is true, but final and decided nevertheless—he betrayed none of the feelings usually associated with the rejected lover, but smiled genially instead, and made the following curious and irrelevant remark: 'Do you know, Tommie,' he said, 'some quite too delightful love-letters from a girl who was at school at Hastings years ago came in an unexpected manner into my hands

the other day. They were written to a valet who called himself Captain Cyril Vere, a sort of second Koepenick captain masquerading as a gentleman down there. They are quite the funniest things I have ever read. I 'll show them to you before any one else, so that you may have the first laugh. They will amuse you most awfully.'

The girl sprang to her feet with a low cry of horror. The blood left her cheeks and then flew back again in a crimson wave. She faced the still smiling man with blazing eyes and clenched hands. 'You would betray a girl's secrets like that, my lord?' she cried in fine scorn. 'Ah, now I know why decent men avoid you, and whence comes the money that enables you to live as you do without any visible means of income! You are a cad, Lord Claud Daunte, and, what is worse, a cowardly blackmailer!'

Lord Claud gazed at her with an air of the greatest astonishment. 'Are you mad, Tommie?' he asked. 'What on earth do you mean? Cad—blackmailer—because I happen to have a few schoolgirl-letters which I was going to show you to make you laugh! Come, come; that is taking the matter in quite the wrong light! But if you really mean that you take an interest in the things—or maybe you know the writer, eh?—why, I 'll give them to you the day you tell me you will marry me, and you can send them back to their fair, if foolish, owner. A valet! Fancy, it seems almost a pity to deprive town of such a capital joke, though, doesn't it?'

Tommie sat down suddenly; the cold-blooded fiendishness of this man's behaviour appalled her. Well she understood him! The letters he alluded to so lightly were her own! She had been the amorous schoolgirl, their author. Her mind flew back to the time when, at Hastings, years before—how old was she? Sixteen perhaps—she had embarked upon her first love-affair, a harmless, if surreptitious, thing with the dashing Captain Vere. Yes, she had written to him shoals of silly letters, though she could not remember much about their contents. But they were doubtless lovelorn enough to provide material for an immense amount of ridicule at her expense should they ever get whispered about, and ridicule was a thing she could not stand. It was all very well to say that Daunte could not make them known without utterly damning himself in the eyes of everybody. She felt sure that he was capable of doing it, and yet finding a method of avoiding his name coming out in connection with them; he was as clever as he was unscrupulous. Her heart sank as she thought of the grins and nudges that would greet her appearance in society should the story of her valet, her Koepenick captain—that name would just give the necessary neat handle to the anecdote—get about. She must find some way out of it. Why not marry the man and lead him a life that would amply revenge her? No, she could not do that; there was Paul!—Paul, the quixotic donkey who had insulted her that very afternoon! Her blood boiled up afresh at the recollection of that painful interview. What a bad time she was having, to be sure! She might perhaps, if she kept cool, gain time. Time was everything. She might think out something, or something might turn up, to save her. She would be diplomatic and keep the man at bay for the present.

She looked steadily at her persecutor. 'Forgive me, Lord Claud,' she said; 'I lost my head for a moment. The name Cyril Vere told me at once that the matter you spoke of concerned a very dear friend of mine who—er—who was at school with me, and I was alarmed and indignant for her sake. I would do much for her, even to the extent of agreeing to your proposals; but I cannot be sure of my feelings just yet. Ask me again at the end of the summer. I shall know then if I can like you—I do not say love you—sufficiently to be your wife. Yes, that is how it must be for the present, Lord Claud. Please say nothing to anybody about anything just yet, and in two months' time come to me again and you shall have a final answer.'

Daunte was a wily man. He knew—none better—when to be hard and when not to unduly press a victory; for it was a victory, he felt sure, that he had thus ingloriously gained. So, inwardly exultant, though outwardly discreetly grave, he took poor Tommie's hand, bowed low over it, lightly brushing it with his lips, and murmuring softly but very distinctly, 'So be it, lady fair. I accept my fate. For a couple of months you shall see nothing whatever of me; and then, when I come to you again, I pray that you will make me the happiest man on earth,' he quietly left the room and the house.

But once in the friendly shelter of a cab and free from window observation, he gave full vent to his feelings. 'Got her, by Jupiter!' he cried; 'yes, her and her money. A blackguardly trick, some thin-skinned fools would call it; but all 's fair in love or war. And I really am rather fond of her in a way, though there will be a bit of a rumpus, I expect, in another quarter when my engagement gets about. But money can do anything. Ah! that 's the real magic nowadays, and once the knot is tied I shall have heaps of that to smooth away all troubles. How lucky it was that I took that fellow Soames into my service—I beg his pardon, Captain Cyril Vere! Fancy coming across such a lever as those letters by chance like that—poor, harmless little schoolgirl-letters as they are, too!—practically worth nothing to anybody else, yet to me full value, as it has turned out, for the fifty pounds

I gave for them—the exorbitant ruffian! But Master Soames must be out of the country before my engagement is known. Although his little game with the fond schoolgirl has turned out trumps for me, he might just have kept a letter or two back—who knows?—and I have no intention of allowing Lady Claud Daunte to be blackmailed. Ha, ha, ha! She won't be in a hurry to tell anybody, so that I'll make my plans directly; and then when she says "Yes," I'll have everything ready to start Soames off to America at once. Two months is not long, and I was right to give in to her. Of course she hopes that something will turn up to checkmake me. But I can't see what there is to fear. I have the letters; and, by Gad! I'd use 'em, too, and laugh her out of England. She knows that well enough, and will go through with it, never fear. Her fortune is absolutely safe, all invested in gilt-edged securities; she's no Yankee heiress with her money at the mercy of Wall Street. And it will be mine in six months; not a day longer will I give her. Yes, my haughty young Tommie, I think you've met your master! Good business!'

Yet had Lord Claud been able to foresee what the result of thirty shillings' worth of angling literature, contributed by a total stranger to him and his affairs to the columns of a sixpenny weekly paper, would be to him and his nefarious schemes, he would hardly have been so complacent.

But Providence has wonderful means of settling matters as it desires in spite of all our clever attempts to arrange them in our own good or bad fashion, and in this instance it simply sufficed to bring two men and the *Pasture* together and the trick was as good as done. Claud Daunte, like Paul Boulton, was a fisherman, and the haverings of 'Veritas' caught his eye. The man's picturesque description of scenery and sport in the Pyrenees also caught his fancy, and a trip to this angler's paradise appeared exactly to fall in with his plans. He had promised Tommie that she should see nothing of him for two months; and he had an idea that it would look well, and perhaps favourably impress the girl, if he left the country and freed her from any chance of meeting him for the greater part of that time. He looked forward to a comfortable future without too much friction, and hoped that, once married, Tommie would forget, or at all events forgive, the means he had used to get her. He believed, in his vanity, that she really liked him better than anybody else, and meant to turn this into real affection in course of time. He knew nothing of her love for Paul. How could he? There were so many flies buzzing round the golden honey-pot, and none seemed so favoured as himself.

Now 'Veritas' had given the little town of Tardets on the Saisons river, in the Basque provinces of the Basses Pyrénées, as a good centre at which to stay, also mentioning the most comfortable and moderate inn out of the three the place supported.

Here, then, at the Hôtel Soulé, arrived late one glowing afternoon, when the setting sun was flooding the mountain-tops with crimson and gold, his lordship—rods, baggage, and all—to encounter just coming out of the door, armed with rod and flies for the negotiation of the evening rise, no less a person than his friend—Paul would have repudiated the term, but we use it for want of a better—and now no-longer-to-be-feared rival, Paul Boulton.

They met as is the fashion of Englishmen.

'Hallo!' said Daunte.

'H'are you?' said Boulton.

'Fishin' any good?' said Daunte.

'Rotten!' said Boulton, and went his way.

And this, alas! was true.

Encircling them, the glorious mountains—rearing their chestnut-clothed slopes to the skies, while farther back the higher peaks, naked and scarred, thrust upwards, deep into the fleecy clouds—were there in all their majesty, as faithfully described by 'Veritas.' Beside them, the rushing river—in appearance an ideal trout-stream, brawling noisily from a narrow gorge to spread out in the wider part of the valley into gliding reaches and sunny shallows, with here and there deep, rock-bound pools that should afford sanctuary to aldermanic fish, the cozening of which with the most ethereal of floating flies would be indeed a joy—was there, as more or less honestly portrayed by the scribe; but where were the denizens of these limpid waters? Where were the pounders and half-pounders, laden with which—again according to 'Veritas'—would the merest tyro in the gentle art nightly stagger joyfully home, provided that his tackle was fine and had been bought (address mentioned) at the shop enjoying the author's patronage?

They existed only in that person's fertile imagination! What rivers, however trouty, designed by nature, could resist the treatment accorded to the waters of the Basque country? Netted by day and by night, the deeper pools (whose rocky bottoms render this impossible) treated to lime and other poisons (occasionally varied by dynamite), night-lines thickly fringing the banks whenever the water is coloured, and an utterly disregarded close season—what wonder, then, that it is only in the most inaccessible parts that the harassed fish can find a haven? Fishery-laws there are in France, and the Basque country is supposed to come under them; but they are entirely in abeyance as far as that part of the land is concerned, those charged with their enforcement carefully ignoring the poaching openly carried on under their very eyes. Kind friends see to it that their tables do not lack fish; and, drawing their pay regu-

[*Christmas Number.*

larly, they pass their lives peacefully in the cafés, far from the river-banks, and as long as they interfere with nobody, nobody interferes with them.

But if the fishing is a fraud, there are hundreds of miles of picturesque water in this land of rivers to be tried and explored for the trouble of it, for you fish where you will in the Pyrenees. Delightful little-known valleys abound, each with its stream, and its old-world villages buried away, where the stranger is comparatively unknown, and, when he does appear, a person to be entertained with the best—provided, of course, that he behaves as a gentleman, for the Basques are an ancient and proud race.

Within twenty-four hours of London, yet, for the major part, with their simplicity still unspoilt (though the auto-car will soon abolish that), these grand mountains, full of historic interest to the soldier, who can still discover the old redoubts of the Peninsular war, afford a delightful summer jaunt; and both Boulton and Daunte, though they cursed 'Veritas' with fervour in the beginning, began to look upon his fairy tale with more lenient eyes after they had been a few days in his mendacious fishing-paradise.

They saw little of each other. Out all day, they met only at the evening meal, which they took together in the dining-room of the inn. They were on guardedly friendly terms: for though each believed the other to be an admirer of the heiress, they were also aware that they were but two of a crowd, and neither knew the extent to which the other's devotion had been carried. Hence they spent their evenings peacefully enough over their pipes and coffee, sitting outside on the pavement in front of the old nail-studded oak door, too tired to talk much, and watching the great droves of belled sheep and cattle as they went tinkling past in the white moonlight on their night-marches from the hot and thirsty plains to the cool, green pasturage of the higher mountains, where they were destined to pass the summer.

One day, far up at the head of a small and narrow valley, a branch of the main one down which the big river ran, Paul Boulton was overtaken by one of those tremendous thunder-storms which during the hot months cruise about the peaks, bringing much-needed rain and relief to those lofty regions, and tantalising by their close proximity the sweltering plains below, which they threaten but seldom bless with the longed-for moisture pent in their dusky bosoms. Drenched to the skin, and almost blinded by the continuous lightning which darted about from point to point in flaming ribbons, he was glad to shelter in a small farm-house which he happily stumbled upon, perched high on the mountain-side. Here he was most hospitably welcomed by the Basque owner and his wife, the former a stalwart, clean-shaven fellow, whose red-gold hair and bright-blue eyes struck a strange and unaccountable note where raven locks and swarthy skins were the almost universal rule. In spite of Paul's protests—who, like all his kind, hated a fuss—nothing would content this worthy pair but that the slumbering logs in the huge open kitchen hearth should be blown up by the asthmatic and complaining bellows into crackling, ruddy life, and his wringing coat and flannel shirt put in front of them to dry, while the man's best Sunday garment should be brought from its workaday repose to cover his guest's naked shoulders.

Now, Paul, when he first joined his distinguished regiment, had allowed—in all the youthful pride of the newly made subaltern—a soldier-artist in indigo and needles to tattoo, with more or less skill, the regimental number and crest on his forearm; and the blue device, visible as he shed his wet shirt, caught his host's curious eye.

The effect was remarkable. Rushing up, he seized unceremoniously upon the Englishman's wrist, and gazed earnestly at the strange sight, shouting excitedly the while to his wife (who had withdrawn to the inner room) in their weird but not unlovely Souletin tongue.

'Gently—gently, my friend!' quoth Paul in French, which he spoke fluently. 'When you have quite done with that arm, which happens to belong to me, perhaps you will let me complete the process of extricating my head from this wet rag? Ah, that's better! And now, might I ask what the devil is the matter with you, and why does the sight of this little ornamentation appear to have driven you slightly *toc-toc?*'

'A thousand pardons!' cried the farmer, still trembling with suppressed emotion. 'You must truly wonder at my want of manners! But wait—ah yes, wait a moment until my wife brings the box, and then you will be more astonished than ever, and will comprehend why it is that the sudden sight of that picture on your arm caused me so much excitement. But here comes the wife; I hear her dragging it,' he continued, rushing to the door which evidently led into the bedroom and throwing it open. '*Vous voilà, Marie;*' and there appeared the woman, backing slowly into the kitchen, painfully pulling after her over the black oaken floor a long but narrow box, which she deposited with a grunt of satisfaction at the feet of the wondering Paul. Then, to the accompaniment of a stream of unintelligible words, the key was produced and fitted into the common lock, the lid jerked back, and a large piece of old sheeting having been raised, there underneath, to Paul's immense amazement, was disclosed (shako, sword, cross-belts, and all) the faded, war-worn uniform of an officer in his own regiment of at least a hundred years ago!

There was not a shadow of doubt about it: the plates on the cross-belts and the clasp of the sword-belt bore the very crest and number, the reproduction of which on Paul's arm had first attracted his host's attention.

'Good heavens!' muttered the Englishman. 'A relic of the Peninsular war! This man's ancestors must have stripped some poor devil's body and kept his kit in the family for some unknown reason.—How did you get these things, sir?' he asked a shade sternly, the sight of this honoured old uniform in the hands of the hereditary enemy calling up vague pictures of battlefield ghouls, sharp knives, and wounded men, in spite of White Cities and *ententes cordiales;* but he was hardly prepared for the answer, which came clean, sharp, and to the point.

'He was my grandfather, sir,' said the Basque, 'and these were the clothes he came to us in.'

'But, good gracious, man, he must have been an Englishman—and an officer, too! How could he be your grandfather? Tell me all you can about him!'

'But certainly, sir, with pleasure, if you will sit down. It is little enough; perhaps you who carry the same marks can tell us more. An officer, say you? *Tiens, tiens! c'est bien drôle!* We did not know—how could we?—and he never said so. We thought him a simple soldier, or a sergeant at most; and, begging your pardon, he was not an Englishman, but of a neighbouring country and of our own religion—an Irelandais, he said he was, and no friend of the perfidious English, though he fought for them. He was a mercenary—as are all your soldiers, so I have heard.'

'Umph!' snorted Paul, reddening. 'Never mind about that; you 've heard wrong, though it would take too long to explain to you now. Get along with your story, please, and begin at the beginning.'

'*Pardon, monsieur,*' said the Basque politely and with the true mountaineer's courtesy; 'no offence. It's quite simple. There had been much fighting among the valleys round about here, and my great-grandfather had been out at night with his wife looking for anything useful that might have been—er—thrown away. They found this Irishman in a bush-covered hollow; he was badly wounded and quite unconscious. See, the old blood-stains are still on his coat! He had red hair and blue eyes, like mine—then an unknown colour in this country, but not so since, I am told; and this so interested my great-grandmother that she persuaded her husband to help her to carry him home here. They managed this successfully together, and cared for this strange guest as well as they could, treating his hurt, after our mountain fashion, with herbs and poultices; and by-and-by he got quite well, except that his memory at times was not very clear. My grandmother, the only child of the home, was, I believe, a very pretty girl. Anyhow, she and the Irishman fell in love with each other; and he being, as I said, of our faith, there was no difficulty. He also had a belt full of English gold, excellent stuff, round his waist when they found him. What an honest couple—*hein, monsieur?* And the long and the short of it was that he stayed here and got married, and the money was very useful. He remembered little of the past, except that he was weary of war, he said; and when the old people died and the farm came to my grandmother, they worked it very well together. They had but one child, a son, who was my father, and that is all I know. Nobody ever came to look for him, and he said he never wanted to go away any more. And when he died my father buried him at Lacarry, where all of us lie; though I think his grave must have been used again by this time, for I have not noticed his cross for many years. Now it is my turn. Tell me, please, sir, why you bear the same marks on your arm as are on the belts of my grandfather.'

'Because I am an officer in the same regiment as was your grandfather,' answered Paul, 'and when I return to it—I am on leave now—I will search in the records and see what I can find out about him; there surely will be something. But what is your name? Of course it will be the same as his?'

'Well, I suppose so,' laughed the farmer gaily. 'Arismendi it is—a good old Basque name.'

'Arismendi?' pondered Paul. 'That can't be so. At least,' he added hastily, 'I mean, it couldn't have been your grandfather's real name; he probably didn't remember it. A bother that! Still, a missing officer, given his regiment and the neighbourhood of the fight, shouldn't be an impossible thing to trace, though what good it will do after all I really don't quite see.'

'Ah, well, monsieur, as you will! It has been a great pleasure to talk to you and learn that my grandfather was an officer of that fine army that would have conquered any but the soldiers of Napoleon. Oh yes, I have been to school and learnt history.'

Paul smiled, but said nothing. He had once seen an officially approved school text-book in which was given a table of navies of the world, in order of size, and France headed the list. England was only mentioned in a microscopic footnote, stating, 'This table does not include Angleterre;' and he quite understood how history might be taught after the same rather puerile fashion.

But his coat was now almost dry, and the storm had gone on its noisy way; and so, with repeated handshakes, and minus the contents of his cigar-case, which was all he felt he dared

[*Christmas Number.*

offer the farmer for his hospitality, he found his way back to his inn in time for a late but, as usual, excellent meal; afterwards, over his pipe, recounting his day's adventures to a rather sleepy fellow-lodger.

It did not appear to interest Lord Claud to any great degree. He said little, except to ask one or two questions, one of which was, Had Paul carefully gone through the contents of the box? The answer that he had not disturbed the things except to look at the badges seemed to satisfy his listener's languid curiosity, and presently the latter said good-night and slowly went off to his room.

They had been sitting, as usual, outside in the dark; but had Paul been able to see the eager interest in his companion's eyes as he listened to the story of his day's doings he (Paul) would not have remarked to himself, as he too shortly afterwards sought his bed, 'Silly sort of chap, Daunte; didn't take the slightest interest in this discovery of mine. If it had been a pretty girl, now, it would have been quite another kettle of fish, I 'll be bound.'

But no sooner had Lord Claud reached the seclusion of his bedroom than his indifferent manner completely vanished.

'By Jingo!' he cried, uttering his thoughts aloud and pacing up and down the polished floor, as was his habit when under the influence of strong excitement; 'and he never saw it! Arismendi? Why, it 's as plain as a pikestaff! Mendi means "of the Mountain" in Basque; I remember that quite well among the other items of information our garrulous host showered on our devoted heads the other evening. Mendibista, view of the mountain; Mendiarris or Arismendi—it doesn't matter which—Arris of the Mountain or Harris of the Mountain. Perhaps that ass Boulton doesn't know that Tommie's great-uncle, from whom the family dollars came, was the lieutenant who was in his regiment in the Peninsular days, and was reported missing after one of the numerous affairs towards the end of the war, leaving no kith or kin but a brother, her grandfather. His death was allowed to be presumed after a long interval, and thus the money came down to her eventually. I took very good care to find out all about it before going in for the heiress, for in these matters one can't be too careful; and now here 's a direct descendant of the missing man turned up in this Basque boor, I 'll bet a hundred! I must investigate myself and see if I can't find some more certain proofs than the man's story; though I fear it 's right enough. They should not be difficult to suppress, if I do. I suppose any papers, even the kit itself, could be bought if necessary. Tommie must never get an inkling of this affair, that 's clear, for she 'd give up her fortune like a shot if I know anything of her quixotic temperament; and, nice little girl as she is, without her money she would be no sort of a wife for your humble servant.

'Let me see, now,' he went on reflectively. 'I must find out to-morrow exactly whereabouts this devil of a farm lies, and go up there on the quiet and make a thorough examination of that box. I don't suppose that oaf downstairs will bother much about it when he gets to England; something else will have filled his fat head by then. But even if he does discover in the regimental records that there was a Lieutenant Harris in the corps during the war, it 's a hundred to one that he will be put down as killed and not missing. I know the slack way these precious documents are kept, and I 'll be bound my lad won't connect the ancient lieutenant with Arismendi or our fair Tommie. No, I think it 's safe enough; and if once I put my fingers upon any proofs of identity that may exist, we may take it for granted that this worthy Basque will remain as he is—not have his simple life ruined by a sudden access to wealth. Ha, ha! Besides, what business have outsiders with these things? It would be a cursed shame, even were she not going to be Lady Claud, to upset our Tommie's apple-cart and hand over her money to a savage who would probably drink himself to death in a year. "Where ignorance is bliss," &c., applies here, if anywhere; and so we 'll let this Basque descendant of the Harrises stew in his own juice.'

. . . . . .

It was market-day in Tardets, the bi-weekly and eagerly anticipated occasion when the simple mountain-folk, forsaking their ungetatable farmsteads at dawn, slowly descended from east and west and south into the main valley, by breakneck and perilous paths, to forgather on the crowded 'Place' for drink and gossip.

The men walked, usually driving before them an antiquated and meagre cow or a couple of complaining pigs, ostensibly for sale, but of a truth only to serve as a pretext for their owners to take a holiday. These useful, if fearsome, animals seldom changed hands; they spent that part of the long day unoccupied by their toilsome travels in blissful repose under the friendly plane-trees the while their noble masters smoked, drank, and argued in the cafés, which are more numerous in French villages than are even the public-houses in ours. At the end of the day, somewhere about five o'clock, these patient quadrupeds, well knowing their business, would start upon their return journey, and, carefully leading their by this time yawning proprietors, would at some hour during the night safely gain the haven of their untidy homes.

The women generally rode on donkeys or mules—many on high and clumsy pack-saddles, some astride. They represented the real business part of the expedition, and each bore on her lap or suspended beside her mount baskets

of eggs, consumptive-looking vegetables of the commonest sort, and—this, alas! invariably—bunches of skinny, woebegone fowls, hanging head downwards, their beaks agape, and with their wretched legs so tightly tied together with cruelly thin string or yarn that their swollen feet looked like so many unwholesome puff-balls. Happily their martyrdom was confined to the single journey. Chickens were always marketable goods; and though the haggling housewives who bought them with so much violent gesticulation would throw them down, still tied, in the corner of the kitchen or scullery, and leave them thus for the night, at all events their weight did not hang from their ankles any more, and the next day would surely see them fulfilling their appointed destiny of still further increasing the barrel-like proportions of monsieur the precepteur, the brigadier of gendarmerie, or some other equally well-to-do functionary.

It was on such a day as this, about a week after his discovery of the old uniform, that Paul, wandering about the crowd, snap-shotting such figures as took his fancy, encountered his friend Arismendi. He took his photograph, and a glass of sour wine with him, for the red-headed man would not be denied; and it was as they stood chatting outside the café that he was considerably astonished by the Basque remarking, 'Your friend was cleverer than you, monsieur, for he found a paper in my grandfather's red coat, sewn inside the lining. He said it was written in English, and was an account of some of the battles, which, however interesting, was of no value except to a writer of military history, which was what he happened to be himself. Of course, that being so, I would have gladly given it to him for nothing; but as he offered me twenty francs for it, why, I took it. Business is business, you know, and a louis d'or is not to be had for nothing every day.'

Paul stared. 'You must be mistaken,' he said. 'I haven't any friend here—at least, not now,' he corrected as he remembered Daunte. 'There was another Englishman staying at the inn, but he has been gone some time now. When was it he came up to you, and what was he like?'

'Two days only after you, monsieur,' replied the farmer; 'and as to describing him, all I remember was that'—— And then he proceeded to give a somewhat fanciful sketch of his visitor, but one quite accurate enough to enable Paul to recognise it as being meant for Lord Claud Daunte.

'Yes,' he said reflectively; 'that, no doubt, was the gentleman at the inn. But it was strange that he made no mention to me of having gone to see you! I dare say the paper wasn't of sufficient interest for him to speak about. I shall likely be your way again before I go; and if I do I'll look you up. Just now I must be off—no, not another drop, thank you. *Au revoir.*' And pushing through the noisy throng, Boulton slowly made his way back to his quarters.

'Most odd!' he mused. 'There must have been something more in that business than I have yet grasped. Daunte is not the sort of chap to be writing military history. Good Lord, what a liar! And then there is a secretiveness about this visit to Arismendi's farm, and the finding and taking a paper,—ay, and, by Jove! his sudden resolve to go home—the next day, it would be, though he told me he meant to stay on another couple of weeks—that is distinctly fishy. And yet I suppose that it is, after all, no business of mine, except that this mysterious old officer certainly belonged to my regiment. I wish now that I had gone through his kit at the time. Stupid of me, but I never dreamed of hidden papers; I thought, naturally enough, that the farmer would have known of anything of that sort, and shown it to me. Well, well, I'll go and have another look; there may be something yet to see—something that may give me a clue to Master Daunte's little game, for that he has a little game I am pretty well morally certain.'

True to his resolve, he went a couple of days later to the secluded farm once more, and this time he carefully examined the contents of the box. But nothing rewarded his efforts, and he was about to make his farewell—not, it must be confessed, particularly disappointed, for, except for a certain curiosity, he felt no especial interest in the case—when his host's wife, who up to then had remained a stolid and passing spectator of his search, quietly remarked, 'There is some writing on the sword, I remember, if monsieur could pull it out and look.'

Paul obeyed, though with difficulty, the old blade sticking hard in the scabbard. But hardly had he drawn it a few inches when he uttered a hastily suppressed exclamation of astonishment, for there, close to the hilt, staring at him in tarnished damascened letters of gold, was not only the maker's name, but 'E. A. Harris, 52nd L.I., Hexford Manor, Oxon.,' together with a crest—a mailed hand, on which was perched a falcon.

And no wonder that Paul could hardly credit the evidence of his eyes; for here, in a remote gorge in the Pyrenees, he saw before him the name, country address, and family crest of the girl he loved, and had, he thought, lost, in far-away London town!

His first impulse was to blurt out his discovery, his second to be silent; and when Arismendi's voice broke upon his ears with the question, 'Well, monsieur, does that tell you anything?' he had managed to collect his scattered thoughts.

'Yes; the name of the maker of the sword,' he answered quietly. 'It is not much; but it may help me to identify who exactly was your grandfather, if the shop is still in existence. But keep everything just as it is now,' he continued; 'and, above all, do not allow a soul to examine the contents of this box until you hear from me, which will be when I have had time to make the proper inquiries. And mind you don't allow that gentleman who took away the paper, should he come here again, to know anything about the maker's name on the sword. If he should bother you, keep him at arm's-length; tell him nothing; keep the box hidden. All this you must do, because'—as an afterthought struck him—'there may be money for you if you do as I tell you. I don't know yet; but I do know if this gentleman comes again it will be to cheat you out of it, so look out.'

'A nice character I have given friend Daunte,' he said to himself as he descended the steep path a few minutes later; 'and for no reason, I am afraid, except innate distrust of the fellow. Well, I can have done no harm. I must get back to England, though, at once and see into this business. It's an ancestor of Tommie's, that's certain; but who it was and how this will affect her, if at all, I haven't the least idea. But there is something very serious in it, I fear. Daunte's secrecy about his visit up here, and his taking that paper and subsequent bolt for home, mean something; and that something I'm going to ferret out and put a stop to, if necessary, for Tommie's sake. Who knows what mischief a man like that may not be contemplating?'

. . . . . .

'Ah, my dear Mr Boulton, where have you been hiding yourself all this time?' exclaimed Mrs Restall as she shook Paul cordially by the hand and made room for him beside her on the sofa in the Grosvenor Square snuggery where we first made her acquaintance in the opening portion of this story. 'Tommie isn't in. She 'll be so dreadfully sorry to have missed you; she won't be back till just before dinner. But now that you have found your way here again, perhaps you 'll deign to honour us with a little more of your company. You may cheer her up a bit, for I don't know what has come to the child lately; she 's as moppy as a sick crow,' she rattled on. 'You really must not neglect your old friends in this way! We heard that you had gone on leave. How you managed it at this time of year is a mystery. But now that you are back again you must tell us why you ran away in the middle of the London season, and carry a face—my dear young friend, if I may say so—as long as an undertaker's.'

'So 'd you if you were as worried as I am,' quoth Paul gloomily. 'Look here, Mrs Restall: you are such a good sort, and have always been so friendly towards me, that I am going to tell you what 's the matter, and ask you to give me your advice and tell me frankly what you think I ought to do. But you will treat everything I say in confidence, won't you, please?' he added hastily.

Mrs Restall considered him a moment in silence and then shook her head. 'Paul Boulton,' she said solemnly, 'I may or may not guess what ails you; I fancy I do, for I have not been blind these last months, and I am quite ready to hear your woes. But only on one condition; and that is, that you must have perfect confidence in my discretion, and allow me to be the best judge whether I shall tell anybody all or any part of what I hear from you. I positively refuse to be bound down to a silence which I may find, after hearing your story, most regrettable to have to keep. I am old enough to be your mother, dear boy,' she went on sweetly and gravely. 'Come, treat me as you would have treated her had she been alive; she was one of my dearest friends. And if you can't do that, then let us say nothing more about it, and we will talk about other things.'

Paul hesitated. Not on account of his love-affairs—these, he felt convinced, would find a sympathetic ally in Tommie's aunt; but had he any right to speak about the other thing? He was torn by conflicting emotions. When he thought of the heiress, perhaps no longer such—for he had without difficulty discovered that the Lieutenant E. A. Harris, formerly of his regiment and of Hexford Manor, Oxfordshire, whose death intestate at the close of the Peninsular war had been taken for granted, had been Tommie's great-uncle, whose wealth she now enjoyed—his heart leapt for joy. If the Basque's story were true—and the fellow's appearance alone almost confirmed it—he was the real heir to the money, which consequently no longer would stand in the path of his wooing. But could he honourably bring this, to him, desirable change about? It was all a dreadful tangle; but surely this kindly woman of the world, his mother's old friend, was the proper person to unravel it. And, besides, there was Daunte to be considered. Whatever he, Paul, might do, this doubtful scion of a noble house might undo; for that he scented a mystery—if, indeed, he had not already solved it with the aid of the filched paper—was certain. Yes, that decided it: Mrs Restall was the proper person to confide in without reserve. She should tell him what she considered the proper course to pursue, and share his responsibility.

Tommie's aunt listened at first with a pleasant sort of maternal air, as if she knew exactly what was coming and the remedy she was prepared to suggest. But as Paul's tale progressed her demeanour became grave and concerned

in the extreme, and when he had finished she gazed at him in blank astonishment.

'Incredible! Impossible! I cannot believe it!' she exclaimed. 'Of course we must have legal proof of the marriage before we can do anything. And then, why, we must tell Tommie, I suppose; there can be no question about that, I fear. And everything being clear and above-board, there is no doubt what she will do, I know. But do not distress yourself, dear lad; she will not be penniless though all this luxury must go. She will still have quite a respectable little income inherited from her mother, which nobody can touch — about seven hundred a year or so. I am betraying no confidences when I tell you that I am sure she is fond of you. And your quixotic ideas will not shy at her having this small fortune, I dare say; and when she is no longer the rich Miss Harris, perhaps you will both behave like sensible people.'

'Oh, you are a brick!' cried Paul. 'I've got a little too—about three hundred a year—and, by Jove! I'll ask her to-morrow. We shall do on a thousand, and no darned idiots like Granville & Company can possibly call me a fortune-hunter then.'

'Steady, steady, young man!' laughed Mrs Restall. 'Aren't you going ahead a bit too fast? We must not be in too great a hurry to conclude that this misfortune—for, in spite of you, I cannot regard it otherwise—is really a *fait accompli*. There is much to be done before I shall be really convinced that Tommie's money has to leave her. Come, to business. I will get ready at once, and we will go together, if you are free, to my own lawyer—a clever, discreet man — and instruct him to look into this matter, and send out a confidential clerk to — what do you call this out-of-the-way place—Tardets?—and examine all the marriage-registers round about—for I suppose they do have such things in France, don't they?—without this Basque person knowing anything about it.'

'Yes, I expect they have books and things like that in the churches and *mairies*,' answered Paul; 'but goodness knows what may have happened to them — the old ones, I mean—during the stormy times at the end of the war.'

But his fears were unfounded. Wellington enforced a severe discipline; and the agent, sent out within twenty-four hours of Mrs Restall's visit to her man of law, had no difficulty in finding proofs of the marriage he sought both in church and *mairie*, and he soon returned with properly attested evidence that left no doubt that Jean-Pierre Arismendi, of the Basteretche Farm, perched high up in the recesses of the Amphoura valley, by Tardets-Sorholus, in the department of the Basses Pyrénées, France, was the rightful owner of the Harris thousands.

Then, with much misgiving, Mrs Restall told Tommie; and, as she had quite expected, the girl, though her astonishment and momentary dismay were intense, did not hesitate to declare her intention of putting the right person in possession of his own with the least possible delay. Yet that delay must include, she positively maintained, a period of at least three weeks, during which the secret of the discovery must be kept — not a step taken, not a hint allowed to leak out.

She would give no reason for this to her aunt, nor would she give the ardent lover Paul an answer to the question he hastened to ask her the moment it was certain that she was no longer a great heiress. She did let him know, however, in her usual frank way, that she had forgiven him his extraordinary behaviour the day after Lady Oban's dance, and was not indifferent to his affection. But she resolutely refused to say more for the present, telling him that for the next couple of months or so she must remain a perfectly free agent.

Both Paul and Mrs Restall were much mystified by this queer condition, the latter, with true womanly want of reason, insisting on connecting her niece's behaviour with Lord Claud Daunte, though the lover laughed the idea to scorn.

'Dear lady,' he said, 'Tommie cares for me; of that I am cock-sure, and consequently Daunte won't have a look in. The man's away—has been for ever so long now, as you know. I met him in the mountains; and though I agree with you that he has probably found something in the paper he sneaked, and may be even now hatching some scheme or other, Tommie can't possibly know of anything of the kind. And besides, blackmail—— No, dash my buttons! the man's a gentleman after all, and, however mysteriously he may get his living, he couldn't be as bad as that. Besides, Tommie wouldn't listen to any idea of buying his silence about the new claimant even if Daunte had found out what we have; that we know'—he said 'we' already—'and ain't we going to hand over the dollars on our own virtuous initiative? No, my dear aunt-in-law-to-be, Daunte's not in this show.'

But to all of this Mrs Restall simply answered, 'You 'll see, Master Cocksure. I don't care in the least for all your fine reasons and arguments. Mark an old woman's words, Lord Claud is at the bottom of this waywardness of Tommie's. I can't explain why I think so, but I 'm certain I 'm right.'

. . . . . .

Meanwhile his lordship was lying quiet in the country, and keeping his promise not to come near what he now looked upon as his certain victim until the stipulated two months had expired. For he too, since his return to England, had not been idle, and had made certain

discoveries through the medium of a private-inquiry agent and the records in the mayor's office at Tardets.

The letter he had found had previously, too, put all doubts at rest; for it was a declaration in English, signed and dated by Lieutenant Harris of the 52nd Regiment of Light Infantry, to the effect that, tired of wars, wounds, and all the shams of society and wealth, he had married Marie Bertzacoitie of Basteretche Farm, &c., and intended to live and die where he was, and let the world and his brother consider him dead.

Secure in the possession of this dangerous document, the discovery of which by Boulton or any other meddler would have completely upset his designs upon the heiress, and convinced that, so far, his late fellow-fisherman had either taken no steps to unearth the fantastic Arismendi, formerly of the 52nd, or had been baffled at the very outset by the name, and had not persisted, Daunte, at the end of the two months, after announcing his intention by letter, made the momentous call at Grosvenor Square which he hoped would put him in the triumphant and envied position of the accepted suitor of a rich and beautiful girl.

His reception by his fair young hostess—whom he found all alone, smiling, and not looking in the least unhappy—created a most pleasant impression. If not exactly gushing, Tommie was completely gracious; and when, after tea and a general skimming of the topics of the hour, Lord Claud thought the moment had arrived to bring matters to a head, the schemer entered upon his task practically sure that his victory was already achieved.

'And now, Tommie,' he softly said, 'I have kept my word and not bothered you, as you asked; and I expect you to do the same, and tell me—er—let us speak plainly—is it to be peace or war?'

'Peace, of course, Lord Claud,' the girl answered brightly. 'I have thought the matter well out; and though I think you were rather horrid to me at our last interview, I know the saying about all being fair in love or war is generally accepted as true, and so I made all excuses for your love for me, which I believe is of that kind which will use any means to attain its end. So here is my answer: if you still want me, I'll marry you whenever you like.'

Lord Claud could hardly believe the evidence of his senses. No fuss, no appeals to his honour, a clear surrender to—he almost felt inclined to believe—not fear of the schoolgirl-letters, but his own fascinating self. Here, indeed, was an easy and triumphant ending to his schemes; here was the fortune, practically in his own hands, about which he had so often dreamed. He would destroy that old paper of Harris's to-night; it was better out of the way now that all was right. And, yes, by Jove! he'd clinch the affair now with Tommie by giving her the packet of rubbish which he had brought with him; for, once having taken back her letters, he knew the girl would not go back on her word.

So, with an excellent imitation of real passion, he caught her in his arms and kissed her, and then, with the best grace in the world, drew out his offering, and, pressing it into her hands, said smilingly, 'Now, darling, there is my part of the bargain. There are your sweet little love-letters, which, I need hardly say, now that you have given yourself to me, I never intended to use except as a means of trying to frighten you into leaving off flirting, and to induce you to settle down with the one of all your troop of adorers whom I knew you really loved after all.'

'Ah!' The girl clutched the precious packet with eager hand and blazing eyes. Then, seeming to remember herself, she dropped her heavily fringed lids, and, quietly rising from her seat, walked across the room to a large and handsome writing-table, where she placed the letters under the solid flap that covered the interior and its many drawers, snapping it down with a resounding click of the patent spring-lock. Then she returned to her accepted admirer, who had witnessed her act with an amused smile, two bright pink spots showing vividly on her pale cheeks, a prey to the liveliest fear, though outwardly calm and self-possessed.

Half her task was done, but it was the easier one. She had promised to marry a man she hated and despised, staking all her hopes of future happiness on the effect produced by her next words. Should her estimate of the coward before her, and his real reasons for wishing to make her his wife, be a wrong one, then indeed would her fate be a dark one.

'Lord Claud,' she said sweetly, looking shyly at her lover, 'I forgot to tell you there has happened something that will affect our fortunes rather, though we shall still have enough, with your income—which I know is not large, is it?—to live in some quiet little country town, perhaps in Ireland or abroad. It has just been discovered that my great-uncle, Ettrick Harris, who was supposed to have been killed in the Peninsular war, and whose money came to grandpapa, was'——

But Daunte, pale and trembling, sprang to his feet with a stifled cry of rage. 'Tricked, by heaven!' he hissed. 'I might have known it all along! Oh, fool that I was to trust your smooth tongue and lying lips! So that was the explanation of your unexpected sweetness, was it? Ah, you think that you will still become "my lady," don't you? A pretty little plan to foist your penniless self on to me and catch a title! But you need not congratulate yourself yet. I wouldn't have you as a gift, a pauper masquerading as a wealthy woman to get a

decent husband! I'll be even with you yet! I'll'——

'Don't you think you'd better go?' cut in Tommie, who, bursting with joy at the accuracy of her judgment and the success of her daring scheme to obtain her letters and her subsequent freedom, had risen during this tirade and stood calmly, her hand upon the bell.

The beaten schemer glared at the slim, white-robed figure that had so cleverly won the game; he could almost have found it in his heart to strangle her. Instead, with a curse, he strode to the door, passing out of it and her life at the same moment. Nor did he ever cross her path again. Afraid of the story of his discomfiture getting about, and ashamed to face the ridicule that would ensue, he decided to leave his country for another where his title and talents would be more appreciated. In America he throve exceedingly; and entering into politics as a naturalised citizen of the screaming eagle, he soon gained a position of the highest civic importance.

And so Tommie was free, and married the right man after all. She handed over her fortune to the lawful owner, who did not drink himself to death, as his lordship had so amiably prophesied, but became instead the owner of many farms in the rich Pyrenean valleys, mayor of Tardets, then deputy of his *département*, and finally, easily tracing his descent—money being as great a wizard in republican France as in monarchical England—from a noble family that flourished at the time of Charlemagne, blossomed into the Comte de Basteretche, with a château in the foothills and mansions at Pau and Biarritz.

And good fortune came also to the young couple he had dispossessed. An erratic and romantic old lady, learning of Tommie's straightforward and honourable dealings with her unknown Basque cousin, immediately made a will in her favour, a thing she was constantly doing to complete strangers who had done any action she admired. Luckily she took herself off to a better world before she could revoke her testament and make another for the benefit of the next person who caught her wayward fancy. The will held good, and the Boultons became extremely wealthy people; and if Lord Claud heard of it—and it was in all the newspapers—it must have given the finishing touch to his defeat.

. . . . . .

And the purple mountains still frown down upon the plains, and the bubbling river still winds down from the gorges to the sea. And 'Veritas,' the mendacious one, still from time to time contributes his fairy tales—unaware, doubtless, of the far-reaching effects which the perusal of one of them at least had upon the lives of many people.

WHAT MIGHT HAVE BEEN.

We look up bravely at the lowering sky,
We turn our faces to the bitter blast,
We brace our nerves to leave the well-loved Past—
Where lie life's smiling lowlands—and we hie
Upward and onward. Never once a sigh
Passes our lips. For us the lot is cast;
We march along, undaunted, to the last.
God points the path; we climb it till we die!

Yet who amongst us, in some stilly night,
Creeps not away unto some spot where lean
The trees of dreamland—where the mystic light
Shines through the shimmering leaves on grasses green
That grow upon a grave, where, cold and white,
Lies buried deep our one, sweet Might-have-been?

KATE MELLERSH.

Four Hundred Years Ago.

By R. L. MACKIE.

HARDLY six weeks have passed since the news first came to St Andrews, yet in that time how much has happened! At times it seems only yesterday, at times it seems years ago, since I stood on the skirts of the crowd that circled the market-cross and saw the sun glitter on the tabards of the heralds. The trumpets rang out; then in clear, passionless tones the Marchmont Herald bade us know that it was the pleasure of our sovereign lord James the Fourth to lead an expedition into England, and that all his liege subjects who could bear arms were expected to assemble on the Boroughmuir of Edinburgh before the seventeenth day of August. Another blast from the trumpets, and the crowd broke up into chattering groups.

We of the Cathedral clergy had expected the news for some time, for we had heard of the French queen's gift to King James, and we knew his chivalrous nature. The present hour seemed to smile upon us, for Henry of England was abroad, engaged in a desperate adventure, while Scotland had never before been so powerful or so ready to act as one man in the cause of her king. Yet a strange heaviness settled on my spirit as the blare of the trumpets died away; it seemed as if the light had gone from the sky, although the August sun still shone unclouded over my head. I turned suddenly and went along the narrow streets to the Cathedral. How peaceful and reassuring it seemed in its calm, austere beauty! There, in the silence of the nave, I knelt before a little altar and prayed that the hearts of our warriors might be pure and their arms strong in the day of battle. But though I felt stronger, the weight of fear still hung about me.

In the next ten days there was much riding of messengers to the scattered hamlets and castles in the outlying districts, much clanging of hammers on helmet and breastplate, much clattering of horse-hoofs and tread of armed men; while in the Castle lights burned all night, for our young Archbishop sat late at the council-board. He was to lead the St Andrews levies in person, being as much a knight as a priest—slow to hang back when danger threatened the realm. He had been made Archbishop at eighteen, while I, who counted sixty years to my life—forty-two of them spent in the service of the Church—remained a simple canon of the Cathedral. Yet I loved the boy for his pure, brave, open heart, and for that nameless Stuart grace of his; and it almost vexed me that he was going to venture his life in the press of armed men.

On Monday the 15th our little army had to set out for Edinburgh. On the Sunday Mass was said in the Cathedral, the Archbishop himself celebrating, while I was one of the assistants. A moving sight it was when one looked upon these kneeling figures, most of them already clad in their armour, and thought of the perils they had to brave before they could return! Yet as the sacred words fell on my ear, and the soft notes of the *Agnus Dei* thrilled out, death seemed indeed a little thing if one could meet it with a pure heart.

The service had ended and we were leaving the vestry, when I felt a touch upon my shoulder. I turned and found myself facing the Archbishop. 'Come to the Castle to-night after complines,' he said. 'I shall give orders to my guards, and they will admit you without any trouble. This may be my last night in St Andrews, and I must talk.' With these words he left me, and I noticed that his gait was heavy and his eyes sunken like the eyes of one who fasts or broods over a hidden care.

At ten o'clock I went to the Castle, and found the Archbishop in a little room on the northern side. He came up to me and gripped my hands; then he led me into the light and made me sit down. I waited for him to speak, but for five minutes the silence was unbroken.

'I am unwilling to speak,' he said at last, 'for my words will seem mere foolishness. I feel that all is not right with this expedition.'

He looked over to me; but I was silent, for his words echoed my own thoughts.

'You know,' he continued, 'I think that no cause which we Stuarts undertake will ever prosper. People smile at the name of my father the king, and think that he is the happiest and the most careless of mortals. But about his waist, even under the gayest carnival dress, he wears an iron chain. How many of them know that? How many of them know of those terrible fits of black despair, when he puts on the clothes of a monk and, in some lonely monastery, spends day after day in hopeless brooding? How many of them have heard of those wild ambitions, those mad hopes, that shoot across his tangled mind, or of that cherished dream in which he sees himself leading the armies of Christendom to the Holy Sepulchre?

And can we look for success with such a leader? No; there is a doom upon our House, and it will not be long before James the Fourth follows in the way he made his father tread.'

He was pacing the room now, with flushed face and tightly clenched hands. 'As for myself,' he went on, 'strange thoughts beat upon my brain, and I do not know where to turn. Men sneer at the "boy-Archbishop;" but, believe me, I would fain have done something for the Church and for Scotland. I was a pupil of Erasmus, remember, and I dreamed once—— No matter; I am done with all that now.'

I saw that it was time for me to speak. 'Oh, my lord, why will you say these things? You are only twenty-two, and you have a long life before you—a life which, I know, will be fragrant with good deeds. To-morrow you set out to win your spurs, and in a few weeks the bells will be ringing for your return. It is good that you should think soberly of what lies before you, but you have no cause for fearfulness or despair.'

'Your words sound well, good father,' he replied; 'but they cannot reason this black foreboding out of my brain. I can attend to the business of the expedition; but all the time it seems far away from me and of little account. I cannot sleep at nights; and when I do fall into a doze I start up suddenly, for I fancy I hear my father calling me—calling for help. I can almost swear that I hear the voice echoing in the room after I am wide awake; but my father is in Edinburgh, fifty miles away. Then at times I will grow passionately fond of trivial, everyday things—the very voices of men in the streets, or the creaking of a country-man's cart, or the sound of a spinning-wheel; and it seems hard to turn one's back on this comfortable, home-like world of ours. I am only twenty-two, as you said, and this makes it all the harder.'

I felt that I could not allow this to go on; so I said, 'My lord, you must put these foolish fancies behind you. You have sat too long over the council-table, and this is the result. With a good night's rest your cheerfulness will return. Meantime you must set your face sternly against these black imaginings. You are Archbishop; but I am an old man, and I tell you that a man's time never comes till his work has been accomplished, and yours is yet to be done. The issue is not in our hands: why should we trouble when a Judge wiser than mortal men has the decision?'

So I spoke, striving to comfort him, but in vain; for his fears were my fears, and my heart was heavy within me. He had sunk into a chair while I was speaking; now he rose slowly to his feet. 'I go to-morrow,' he said, 'and I want to look once more on this wild North Sea of ours before I leave.' He opened a little door opposite the one by which I had entered, and beckoned me to follow. I found myself on a little platform seventy feet above the waves which were crashing and grinding on the rocks. Behind us loomed the dark bulk of the Castle, shutting out any view of the town; before us was the blackness of the night, broken only by the glimmer of a star or the faint flash of a breaking wave. I knew that I was in a castle full of armed men, beside a crowded city; but never before had I felt so solitary. I could see the youth at my elbow gazing out into the darkness, and I wondered what thoughts possessed his mind. I knew they were hard to bear; and, as an older man should, I went over to him and placed my hand on his shoulder. At that moment a sudden light shot over the sky and died away, only to glow more brightly a moment after. We both started and turned our gaze to the north, where the light had appeared. Now, to our astonishment, we saw a great arch of luminous white, from which darted jets of white and crimson flame. It was a beautiful but a terrifying sight, and I saw that the boy-Archbishop looked like a ghost.

'My lord, be not afraid,' I said; 'it is only the northern light. I have seen it often in the many years I have lived here. It means nothing.'

'Yes, you try to speak calmly, good father; but you know what it means. Men call these quivering streaks of light the Merry Dancers, and cross themselves when they see them. Yes; the Merry Dancers are flaming in the sky to-night, and we start for England to-morrow! Come into the light and close the shutters, and let us try to forget what we have seen.'

Again we found ourselves in the little room. My lord stood trembling for a moment with his hand at his head; then he turned to me. 'Leave me, good father, leave me, and pray for me to-night. God only knows what the end of this will be! Leave me, and stand at the West Port to-morrow as we ride away. Good-night.'

Fain would I have comforted him; but there was no comfort in me, filled as I was with my own fears. So, with a few formal words, I took my leave.

Morning came—not gray and cloudy as befitted a day of departure, but very bright, with a soft breeze from the south. I had been early astir, for my thoughts would not give me much rest, and when I heard the trumpets blowing from the town I hurried along the clamorous streets till I came to the West Port. I waited for half-an-hour among the gathering crowds till the trumpets grew louder, and near the Church of the Holy Trinity I could see the glittering of spears. Along the street they came: two hundred archers and spearmen from the neighbouring country marching first, led by Melville on

Strathtyrum; then two hundred spearmen and cross-bowmen from the town, with the Provost riding somewhat awkwardly at their head; then, under the golden banner with the bend-sinister, marched fourscore pikemen and arquebusiers from the Castle. Last came a band of about fifty horsemen—churchmen in armour, country lairds, and cadets of honourable houses—the bodyguard of the Archbishop; and, in the midst of them, the Archbishop himself, with his melancholy, fate-stricken face. When he saw me he halted his horse, and I pushed through the crowd at his signal. He bent over me, and I could catch the words, 'Pray for me, good father; pray for me.' Then, with a wave of his hand, he rode off.

. . . . . .

And now, as the fields turned from green to gold and the apples gleamed red in the orchard, there passed a weary month. There were none in the town but women and children and aged men, and often as I passed along the streets at night I could hear a sound of weeping. News reached us at rare intervals; we knew about the end of August that James had entered England, but after that we heard nothing. On the night of Friday the 9th of September the Merry Dancers again appeared in the sky, brighter and more terrible than before; and many a one thought of the five hundred of our own people in England, and said a prayer before he went to rest.

Now, who will believe what I am about to tell? You will say that I am crazed with sorrow and have had bad dreams. But the thing I saw was no dream. It was on the night of Sunday the 11th of September. I could not sleep, and, as the night was warm, I stole from my cell and crept into the cloisters. For some minutes I paced round and round, trying to fight down my thoughts; then I stopped short. What sound was that? Surely the note of the organ, and—yes, a faint light gleamed from one of the farthest windows! But it was long past the hour of complines, and I knew that the Cathedral must be empty. Again the sound swelled out; there was no mistaking it this time—the organ was playing. Slowly I opened the door in the north-west corner of the cloisters, and silently I glided into the nave. It was quite dark where I stood; but as I looked from behind the great pillars I could see dim lights burning in the choir. And now I heard the voices of singers blending with the organ-music, and I could make out the words:

Requiem æternam dona eis, Domine;
Requiem æternam dona eis, Domine;
Et lux perpetua luceat eis.

It was the beginning of the Requiem Mass! Why had I not heard of this service, and why was it being held at this strange and almost forbidden hour? I felt that I must unravel the mystery; so I crept nearer the choir, keeping in the obscurity of the aisle all the time. Suddenly a cry of entreaty rang through the length of the minster, and I shrank into the darkness:

Kyrie eleïson!
Christe eleïson!
Kyrie eleïson!

They were the old familiar words—words we repeated seven times a day; but never had I heard them sung with such passion and entreaty. The notes died away, and I could hear the words of the priest, clear and slow, echoing in the vault above me. Slowly I drew near the rood-screen and glided to the door of hammered ironwork which separates the choir from the nave. I had almost gained it when the organ rang out again, and the singers took up the words of that awful hymn:

Dies iræ, dies illa,
Solvet sæclum in favilla,
Teste David cum Sybilla.

Tuba mirum spargens sonum
Per sepulchra regionum
Coget omnes ante thronum.

Rex tremendæ majestatis!
Qui salvandos salvas gratis,
Salva me, fons pietatis!

I had sung it often, light-heartedly enough at times; but now it made me shudder as if I were lost in some great darkness, and only with the last lines did my courage return:

Lacrymosa dies illa
Qua resurget ex favilla
Judicandus homo reus.
Huic ergo parce, Deus,
Pie Jesu!
Jesu Domine!
Dona eis requiem.

Now, while the creed was being chanted, I drew near and looked through the door. There were few lights save the candles on the altar, but in the dimness I could see that the choir was filled with the shapes of armed men. Who were they, whence had they come, and why had they chosen this hour for their service? I felt afraid, yet I could not leave the place; I *had* to get to the bottom of the mystery. I pressed my face against the grille-work and peered into the choir; I gave a little start and gazed again. There could be no doubt of it—our men had come back from England, and their ranks were thinned but little! Yes; but why had they stolen through the streets without warning any one of their coming, and why were they singing a Requiem Mass at such a time? In vain I puzzled myself over these questions while the service went on; and the sight of the priest who was officiating made me wonder still more, for it was the Archbishop himself who

stood at the altar. I was glad and fearful by turns—glad that they had all come home, fearful of I know not what. So I stood, almost in a trance, through that beautiful, solemn service, till the closing invocation surged up and died away:

Lux æterna, luceat eis, Domine; cum sanctis tuis in æternum, quia pius es.
Dona eis requiem æternum, et lux perpetua luceat eis.
Cum sanctis tuis in æternum, quia pius es.

The benediction was said, the doors swung open, and the Archbishop stepped down, followed by his attendant priests. I sprang forward to welcome him; but he passed on with calm, regardless gaze, and disappeared into the shadows of the nave. I stared after him in astonishment; but he never turned, and the crowd of armed men soon distracted my attention. There they were: the Archbishop's own men; the townsfolk, with their Provost among them; and the spearmen and archers from the country-side, though Melville of Strathtyrum did not walk with them. I knew many of them; but they all hurried past me with cold, set faces, and as they passed it seemed as if a chilling blast of wind swept through the minster in their train. Soon the last of them disappeared into the darkness of the nave, and I heard a sound as of a door being shut.

. . . . . .

I must have fallen asleep where I stood, worn out with anxiety; for when I next looked round the September dawn was beginning to light the Cathedral, and I was lying beside the rood-screen. I went over to the little shrine in the southern aisle and knelt there for a brief space; then I passed out into the town, for I was determined to hear more of this strange home-coming.

To my surprise, there was no stir in the streets—no noise save the pattering of autumn leaves on the walks. I walked the whole length of the town, but I met no one till I came to the West Port. The gates were open, and two-score men in hacked and battered armour were marching through. At their head rode Melville of Strathtyrum, very pale, with a bandage round his head; and six men, carrying some heavy burden, brought up the rear. Their leader reined in his weary horse when he saw me.

'You have let your friends outstrip you,' I said. 'When I saw them last night, and you not among them, I feared the worst for you; but now—welcome home!'

He stared at me as if he were trying to grasp my meaning; then he bit his lip. 'This is no time for jesting, sir priest. What friends do you mean?'

'Why, the rest of the company that left here a month ago. They were in the minster last night.'

Melville crossed himself, and his voice trembled as he answered me. 'What you mean, good father, I cannot tell. This I can tell, that Scotland is a broken country. Three nights ago the English met us at Flodden'—He choked, and could not go on for full two minutes. 'That great army is scattered; the king'——

'Surely he has not been captured?' I gasped.

'He is dead, and thirteen of his earls lie with him.'

A mist rose before my eyes, and my heart drummed wildly at my ribs. When I spoke the sound of my own voice astonished me; it seemed as if it came from a great way off. 'Our Archbishop has escaped—he must have escaped. I saw him a few hours ago. He will guide the nation in these dark times.'

'I cannot fathom the meaning of these dark sayings,' said Melville curtly. 'The Archbishop is here.'

'Where?' I asked in surprise, glancing round the company.

He pointed to the burden which six of his men bore. 'There! Desperately did we fight for it, and we have brought him home. The other five hundred who shared his fate we have left on the field. Let me go, good father, for I cannot speak!'

I watched them march into the town, and in a short time I heard a great cry go up to heaven. Such a cry went up from every town and village in Scotland that morning—the lament for those who would never return.

THE LOST LAND OF FAERIE.

OUT in the woods I used to stray—
I used to see the fairies play,
I knew what beast and bird did say,
Where went the eagle through the air,
And on the rock the serpent's way. . . .
But since my hand my lover kissed
That other world is lost in mist!

Out on the cliffs I used to go
To watch the tide's strange ebb and flow,
The seal-folk playing down below,
The mermaids combing out their hair—
Their secrets all I used to know. . . .
But since my lover kissed my lips
That other world is in eclipse.

MARIA STEUART.

LONE WOLF.

BY C. G. D. ROBERTS,

AUTHOR OF 'AROUND THE CAMP-FIRE,' 'THE KINDRED OF THE WILD,' &C.

CHAPTER I.

NOT, like his grim ancestors for a thousand generations, in some dark cave of the hills was he whelped, but in a narrow iron cage littered with straw. Two brothers and a sister made at the same time a like inauspicious entrance upon an alien and fettered existence. And because their silent, untamable mother loved too savagely the hereditary freedom of her race to endure the thought of bearing her young into a life of bondage, she would have killed them, mercifully, even while their blind baby-mouths were groping for her breasts; but the watchful keeper forestalled her. Whelps of the great gray timber-wolf, born in captivity and therefore likely to be docile, were rare and precious. The four little sprawlers, helpless and hungrily whimpering, were given into the care of a foster-mother, a sorrowing brown spaniel bitch who had just been robbed of her own puppies.

When old enough to be weaned, the two brothers and the sister, sturdy and sleek as any wolf-cubs of the hills, were sold to a dealer in wild animals, who carried them off to Hamburg. But Lone Wolf, as Toomey the trainer had already named him, stayed with the circus. He was the biggest, the most intelligent, and the most teachable cub of the whole litter; and Toomey, who had an unerring eye for quality in a beast, expected to make of him a star performer among wolves.

Job Toomey had been a hunter and a trapper in the backwoods of New Brunswick, where his instinctive knowledge of the wild kindreds had won him a success which presently sickened him. His heart revolted against the slaughter of the creatures which he found so interesting, and for a time, his occupation gone, he had drifted aimlessly about the settlements. Then, at the performance of a travelling circus, which boasted two trained bears and a little trick-elephant, he had got his cue. It was borne in upon him that he was meant to be an animal-trainer. Then and there he joined the circus at a nominal wage, and within six months found himself an acknowledged indispensable. In less than a year he had become a well-known trainer, employed in one of the biggest menageries of America. Not only for his wonderful comprehension and command of animals was he noted, but also for his pose, to which he clung obstinately, of giving his performances always in the homespun garb of a backwoodsman instead of in the conventional evening-dress.

Lone Wolf! It seemed a somewhat imaginative name for the prison-born whelp; but as he grew out of cubhood his character and his stature alike seemed to justify it. Influenced by the example of his gentle foster-mother, he was docility itself toward his tamer, whom he came to love well after the reticent fashion of his race. But toward all others, man and beast alike, his reserve was cold and dangerous. Toomey apparently absorbed all the affection which his lonely nature had to spare. In return for this singleness of regard, Toomey trained him with a firm patience which never forgot to be kind; and made him by the time he was three years old quite the cleverest and most distinguished performing wolf who had ever adorned a show.

He was now as tall as the very tallest Great Dane, but with a depth of shoulder and chest and a punishing length and strength of jaw that no dog ever could boast. When he looked at Toomey his eyes wore the expression of a faithful and understanding follower; but when he answered the stares of the crowd through the bars of his cage the greenish fire that flamed in their inscrutable depths was ominous and untamed. In all save his willing subjection to Toomey's mastery he was a true wolf of the savage and gigantic breed of the north-western timber. To all spectators this was aggressively obvious; and therefore the marvel of seeing this sinister gray beast with the murderous fangs so submissive to Toomey's gentlest bidding never grew stale. In every audience there were always some spectators hopefully pessimistic, who vowed that the great wolf would some day turn upon his master and tear his throat. To be sure, Lone Wolf was not by any means the only beast whom the backwoodsman had performing for the delectation of his audiences. But all the others—the lions, the leopards, the tiger, the elephant, the two zebras, and the white bear—seemed really subdued, as it were hypnotised into harmlessness. It was Lone Wolf only who kept the air of having never yielded up his spirit, of being always, in some way, not the slave but the free collaborator.

Ordinarily, in spite of the wild fire smouldering in his veins, Lone Wolf was well enough content. The show was so big and so

important that it was accustomed to visit only the great centres and to make long stops at each place. At such times his life contained some measure of freedom. He would be given a frequent chance of exercise in some secure enclosure where he could run and jump, and stretch his mighty muscles, and breathe deep. And not infrequently, after dark as a rule, his master would snap a massive chain upon his collar and lead him out on leash like a dog into the verdurous freshness of park or country lane. But when the show was on tour, then it was very different. Lone Wolf hated fiercely the narrow cage in which he had to travel. He hated the harsh, incessant noise of the grinding rails, the swaying and lurching of the trucks, the dizzying procession of the landscape past the barred slits which served as windows to his car. Moreover, sometimes the unwieldy length of the circus train would be halted for an hour or two on some forest siding to let the regular traffic of the line go by. Then, as his wondering eyes caught glimpses of shadowed glades, and mysterious wooded aisles, and far-off hills and horizons, or wild, pungent smells of fir-thicket and cedar-swamp drew in upon the wind to his uplifted nostrils, his veins would run hot with an uncomprehended but savage longing for delights which he had never known, for a freedom of which he had never learned or guessed. At such times his muscles would ache and quiver till he felt like dashing himself blindly against his bars. And if the halt happened to take place at night, with perhaps a white moon staring in upon him from over a naked hill-top, he would lift his lean muzzle straight up toward the roof of his cage and give utterance to a terrible sound of which he knew not the meaning —the long, shrill gathering-cry of the pack. This would rouse all the other beasts to a frenzy of wails and screeches and growls and roars, till Toomey would have to come and stop his performance by darkening the cage with a tarpaulin. At the sound of Toomey's voice, soothing yet overmastering, the great wolf would lie down quietly, and the ghostly summons of his far-ravaging fathers would haunt his spirit no more.

After one of these long journeys the show was halted at an inland city for a stop of many weeks; and to house the show a cluster of wooden shanties was run up on the outskirts of the city, forming a sort of mushroom village flanked by the great white exhibition tents. In one of these shanties, near the centre of the cluster, Lone Wolf's cage was sheltered, along with the cages of the puma, the leopard, and the little, black Himalayan bear. Immediately adjoining this shanty was the spacious open shed where the elephants were tethered.

That same night, a little before dawn, when the wearied attendants were sleeping heavily, Lone Wolf's nostrils caught a strange smell which made him spring to his feet and sniff anxiously at the suddenly acrid air. A strange, reddish glow was dispersing the dark outside his window. From the other cages came uneasy mutterings and movements; and the little black bear, who was very wise, began to whine. The dull glow leapt into a glare; and then the elephants trumpeted the alarm. Instantly the night was loud with shoutings and tramplings and howlings and rushings to and fro. A cloud of choking smoke blew into Lone Wolf's cage, making him cough and wonder anxiously why Toomey didn't come. The next moment Toomey came, with one of the keepers and an elephant. Frantically they began pushing and dragging out the cages. But there was a wind, and before the first cage, that of the puma, was more than clear of the door, the flames were on top of them like a leaping tiger. Panic-stricken, the elephant screamed and bolted. The keeper, shouting, 'We can't save any more in this house. Let's git the lions out!' made off with one arm over his eyes, doggedly dragging the heavy cage of the puma. The keeper was right. He had his work cut out for him, as it was, to save the screeching puma. As for Toomey, his escape was already almost cut off; but he could not endure to save himself without giving the imprisoned beasts a chance for their lives. Dashing at the three remaining cages, he tore them open; and then, with a summons to Lone Wolf to follow him, he threw his arms over his face and dashed through the flames.

The three animals sprang out at once into the middle of the floor; but their position seemed already hopeless. The leopard, thoroughly cowed, leaped back into his cage and curled up in the farthest corner, spitting insanely. Lone Wolf dashed at the door by which Toomey had fled; but a whirl of flame in his face drove him back to the middle of the floor, where the little bear stood whimpering. Just at this moment a massive torrent of water from a fire-engine crashed through the window, drenching Lone Wolf and knocking the bear clean over. The beneficent stream was whisked away again in an instant, having work to do elsewhere than on this already doomed and hopeless shed. But to the wise little bear it had shown a way of escape. Out through the window he scurried; and Lone Wolf went after him in one tremendous leap just as the flames swooped in and licked the floor clean, and slew the huddled leopard in its cage.

Outside, in the awful heat, the alternations of the dazzling glare and blinding smoke, the tumult of the shouting and the engines, the roar of the flames, and the ripping crash of the streams, and the cries of the beasts, Lone Wolf found himself utterly confused. But he trusted, for some reason, the sagacity of the bear, and followed his shaggy form, bearing diagonally up and across the wind. Presently

[*Christmas Number.*

a cyclone of suffocating smoke enveloped him, and he lost his guide. But straight ahead he darted, stretched out at top speed, belly to the ground; and in another moment he emerged into the clear air. His eyes smarting savagely, his nose and lips scorched, his wet fur singed, he hardly realised at first his escape, but raced straight on across the fields for several hundred yards. Then, at the edge of a wood, he stopped and looked back. The little bear was nowhere to be seen. The night wind here blew deliciously cool upon his face. But there was the mad red monster roaring and raging still as if it would eat up the world. The terror of it was in his veins. He sprang into the covert of the wood, and ran wildly, with the one impulse to get as far away as possible.

Before he had gone two miles he came out upon an open country of fields and pastures and farmyards and little thickets. Straight on he galloped, through the gardens and the farmyards as well as the open fields. In the pastures the cattle, roused by the glare in the sky, stamped and snorted at him as he passed, and now and then a man's voice yelled at him angrily as his long form tore through flower-beds or trellised vines. He had no idea of avoiding the farmhouses, for he had at first no fear of men; but at length an alert farmer got a long shot at him with a fowling-piece, and two or three small leaden pellets caught him in the hind-quarters; they did not go deep enough to do him serious harm, but they hurt enough to teach him that men were dangerous. Thereupon he swerved from the uncompromising straight line of his flight and made for the waste places. When the light of the fire had quite died out behind him the first of the dawn was creeping up the sky; and by this time he had come to a barren region of low thickets, ragged woods, and rocks thrusting up through a meagre, whitish soil.

Till the sun was some hours high Lone Wolf pressed on, his terror of the fire now lost in a sense of delighted freedom. By this time he was growing hungry, and for an instant the impulse seized him to turn back and seek his master. But no, that way lay the scorching of the flames. Instead of turning, he ran on all the faster. Suddenly a rabbit bounded up almost beneath his nose. Hitherto he had never tasted living prey, but with a sure instinct he sprang after the rabbit. To his fierce disappointment, however, the nimble little beast was so inconsiderate as to take refuge in a dense bramble-thicket which he could not penetrate. His muzzle, smarting and tender from the fire, could not endure the harsh prickles, so after prowling about the thicket for a half-hour in the wistful hope that the rabbit might come out, he resumed his journey. He had no idea, of course, where he wanted to go, but he felt that there must be a place somewhere where there were plenty of rabbits and no bramble-thickets.

Late in the afternoon he came upon the fringes of a settlement, which he skirted with caution. In a remote pasture-field, among rough hillocks and gnarled, fire-scarred stumps, he ran suddenly into a flock of sheep. For a moment he was puzzled at the sight; but the prompt flight of the startled animals suggested pursuit. In a moment he had borne down the hindermost. To reach for its throat was a sure instinct; and he feasted with a growing zest of savagery upon the hot flesh. Before he realised it, he was dragging the substantial remnant of his meal to a place of hiding under an overhanging rock. Then, well content with himself, he crept into a dark thicket and slept for several hours.

When he awoke a new-risen moon was shining, with something in her light which half-bewildered him, half-stung him to uncomprehended desires. Skulking to the crest of a naked knoll, he saw the landscape spread out all around him, with the few twinkling lights of the straggling village below the slopes of the pasture. But not for lights, or for villages, or for men was his concern. Sitting up very straight on his gaunt haunches, he stretched his muzzle towards the taunting moon, and began to sound that long, dreadful gathering-cry of his race.

It was an unknown or a long-forgotten voice in those neighbourhoods; but none who heard it needed to have it explained. In half-a-minute every dog in the settlement was howling, barking, or yelping in rage or fear. To Lone Wolf all this clamour was as nothing. He paid no more attention to it than as if it had been the twittering of sparrows. Then doors opened and lights flashed as men came out to see what was the matter. Clearly visible, silhouetted against the low moon, Lone Wolf kept up his sinister chant to the unseen. But presently, out of the corner of his eye, he noted half-a-dozen men approaching up the pasture, with the noisy dogs at their heels. Men! That was different! Could it be that they wanted him? All at once he experienced a qualm of conscience, so to speak, about the sheep he had killed. It occurred to him that if sheep belonged to men there might be trouble ahead. Abruptly he stopped his serenading of the moon, slipped over the crest of the knoll, and made off at a long, tireless gallop which before morning had put leagues between himself and the angry villagers.

After this he gave a wide berth to settlements; and, having made his first kill, he suddenly found himself an accomplished hunter. It was as if long-buried memories had sprung all at once to life—memories, indeed, not of his own but of his ancestors; and he knew all at once how to stalk the shy wild rabbits, to run down

and kill the red deer. The country through which he journeyed was well stocked with game, and he fed abundantly as he went with no more effort than just enough to give zest to his freedom. In this fashion he kept on for many days, working ever northward just because the wild lands stretched in that direction; and at last he came upon the skirts of a cone-shaped mountain, ragged with ancient forest, rising solitary and supreme out of a measureless expanse of wooded plain. From a jutting shoulder of rock his keen eyes noted but one straggling settlement, groups of scattered clearings wide apart on the skirts of the great hill. They were too far off to mar the vast seclusion of the height; and Lone Wolf, finding a cave in the rocks that seemed exactly designed for his retreat, went no farther. He felt that he had come into his own domain.

CHAPTER II.

THE settlers around the skirts of Lost Mountain were puzzled and indignant; for six weeks their indignation had been growing, and the mystery seemed no nearer a solution. Something was slaughtering their sheep—something that knew its business and slaughtered with dreadful efficiency. Several honest dogs fell under suspicion, not because there was anything whatever against their reputations, but simply because they had the misfortune to be big enough and strong enough to kill a sheep if they wanted to; and the brooding backwoods-mind, when troubled, will go far on the flimsiest evidence.

Of all the wrathful settlers, the most furious was Brace Timmins. Not only had he lost in those six weeks six sheep, but now his dog, a splendid animal, half-deerhound and half-collie, had been shot on suspicion by a neighbour on no better grounds apparently than his long legs and his long, killing jaws. Still the slaughtering of the flocks went on with undiminished vigour. And a few days later Brace Timmins avenged his favourite by publicly thrashing his too hasty neighbour in front of the cross-roads store. The neighbour, pounded into exemplary penitence, apologised, and as far as the murdered dog was concerned the score was wiped clean. But the problem of the sheep-killing was no nearer solution. If not Brace Timmins's dog, as every one now made prudent haste to acknowledge, then whose dog was it? The life of every dog in the settlement, if bigger than a woodchuck, hung by a thread, which might, it seemed, at any moment turn into a halter. Brace Timmins loved dogs; and not wishing that others should suffer the unjust fate which had overtaken his own, he set his whole woodcraft to the discovery of the true culprit.

Before he had made any great progress, however, on this trail, a new thing happened, and suspicion was lifted from the heads of all dogs. Joe Anderson's dog, a powerful beast, part sheep-dog and part Newfoundland, with a far-off streak of bull, and the champion fighter of the settlements, was found dead in the middle of Anderson's sheep-pasture, his whole throat fairly ripped out. He had died in defence of his charges; and it was plainly no dog's jaws that had done such mangling. What dog, indeed, could have mastered Anderson's Dan?

'It's a bear gone mad on mutton,' pronounced certain of the wise ones, idling at the cross-roads store. 'Ye see as how he hain't et the dawg noways, but just bit him, to teach him not to go interferin' as regards sheep.'

'Ye're all off,' contradicted Timmins with authority. 'A bear'd hev' tore him, an' batter him, an' mauled him more'n he'd hev' liked him. A bear thinks more o' usin' his forepaws than what he does his jaws, ef he gits into any kind o' an onpleasantness. No, boys, our unknown friend up yonder's a *wolf*, take my word for it.'

Joe Anderson snorted, and spat accurately out through the door. 'A *wolf!*' he sneered. 'Go chase yerself, Brace Timmins! I'd like to see any wolf as could 'a' done up my Dan that way!'

'Well, keep yer hair on, Joe,' retorted Timmins easily. 'I'm agoin' after him, an' I'll show him to you in a day or two as like as not.'

'I reckon, Joe,' interposed the storekeeper, leaning forward across the counter, 'as how there be other breeds o' wolf besides the sneakin' little gray varmint o' the East here, what's been cleaned out o' these parts fifty years ago. Ef Brace is right—an' I reckon he be—then it must sure be one o' them big timber-wolves we read about, what the Lord's took it into His head to plank down here in our safe old woods to make us set up an' take notice.—You better watch out, Brace. Ef ye don't git the brute first lick he'll git you!'

'*I'll* watch out,' drawled Timmins confidently; and, selecting a strong steel trap-chain from a box beside the counter, he sauntered off to put his plans in execution.

These plans were simple enough. He knew that he had a wide-ranging adversary to deal with; but he himself was a wide ranger, and acquainted with every cleft and crevice of Lost Mountain. He would find the great wolf's lair, and set his traps accordingly—one in the runway, to be avoided if the wolf was as clever as he ought to be, and a couple of others a little aside, to really do the work. Of course he

would carry his rifle, in case of need; but he wanted to take his enemy alive.

For several arduous but exciting days Timmins searched in vain alike the dark cedar-swamps and the high, broken spurs of the mountain. Then, one windless afternoon, when the forest scents came rising to him on the clear air, far up the steep he found a climbing trail between gray, shelving ledges. Stealthy as a lynx he followed, expecting at the next turn to come upon the lair of the enemy. It was a just expectation; but, as luck would have it, that next turn which would have led him straight to his goal lay around a shoulder of rock whose foundations had been loosened by the rains. With a kind of long growl, rending and sickening, the rock gave way, and sank beneath Timmins's feet.

Moved by the alert and unerring instinct of the woodsman, Timmins leapt into the air. Both high and wide he sprang, and so escaped being engulfed in the mass which he had dislodged. On the top of the ruin he fell; but he fell far and hard, and for some fifteen or twenty minutes after that fall he lay very still, while the dust and débris settled into silence under the quiet flooding of the sun. At last he opened his eyes. For a moment he made no effort to move, but lay wondering where he was. A weight was on his legs, and glancing downward he saw that he was half-covered with earth and rubbish. Then he remembered. Was he badly hurt? He was half-afraid now to make the effort to move, lest he should find himself incapable of it. Still, he felt no serious pain. His head ached, to be sure, and he saw that his left hand was bleeding from a gash at the base of the thumb. That hand still clutched one of the heavy traps which he had been carrying, and it was plainly the trap that had cut him, as if in a frantic effort to escape. But where was his rifle? Cautiously turning his head, he peered around for it; but in vain, for during the fall it had flown far aside into the thicket. As he stared solicitously, all at once his dazed and sluggish senses sprang to life again with a scorching throb which left a chill behind it. There, not ten paces away, sitting up on its haunches and eying him contemplatively, was a gigantic wolf, much bigger, it seemed to him, than any wolf had any right to be.

Timmins's first instinct was to spring to his feet with a yell that would give the dreadful stranger to understand that he was a fellow it would not be well to tamper with. But his woodcraft stayed him. He was not by any means sure that he *could* spring to his feet. Still less was he sure that such an action would properly impress the great wolf, who, for the moment at least, seemed not actively hostile. Stillness, absolute immobility, was the trump-card to be always played in the wilderness when in doubt. So Timmins kept quite still, looking inquiringly at Lone Wolf. And Lone Wolf looked inquiringly at him.

For several minutes this waiting game went on. Then, with easy nonchalance, Lone Wolf lifted one huge hindpaw and vigorously scratched his ear. This very simple action was a profound relief to Timmins.

'Sartain,' he thought, 'the crittur must be in an easy mood, or he'd never think to scratch his ear like that. Or mebbe he thinks I'm so well buried I kin wait, like an old bone.'

Just then Lone Wolf got up, stretched himself, yawned prodigiously, came a couple of steps nearer, and sat down again, with his head cocked to one side and a polite air as if asking, 'Do I intrude?'

'Sartain sure, I'll never ketch him in a better humour,' thought Timmins. 'I'll try the human voice on him.'

'Git to h—— out of that!' he commanded in a sharp voice.

Lone Wolf cocked his head to the other side interrogatively. He had been spoken to by Toomey in that voice of authority, but the words were new to him. He felt that he was expected to do something, but he knew not what. He liked the voice; it was somewhat like Toomey's. He liked the smell of Timmins's homespun shirt; it too was something like Toomey's. He became suddenly anxious to please this stranger. But what was wanted of him? He half-rose to his feet, and glanced around to see if, perchance, the inexplicable order had been addressed to some one else. As he turned, Timmins saw, half-hidden in the heavy fur of the neck, a stout leather collar.

'I swear,' he muttered, 'if 't ain't a *tame* wolf what's got away!' And with that he sat up; and, pulling his legs, without any very serious hurt, from their covering of earth and sticks, he got stiffly to his feet. For a moment the bright landscape reeled and swam before him, and he had a vague sense of having been hammered all over his body. Then he steadied himself. He saw that the wolf was watching him with the expression of a diffident but friendly dog who would like to make acquaintance. As he stood puzzling his wits, he remembered having read about the great fire which had recently done such damage to Sillaby & Hopkins's circus, and he concluded that the stranger was one of the fugitives from that disaster.

'Come here, sir! Come here, Big Wolf!' said he, holding out a confident hand.

'Wolf!' That was a familiar sound to Lone Wolf's ears; it was at least a part of his name. And the command was one he well understood. Wagging his tail gravely, he came at once, and thrust his great head under Timmins's hand for a caress. He had enjoyed his liberty, to be sure, but he was beginning to find it lonely.

Timmins understood animals. His voice, as he talked to the redoubtable brute beside him, was full of kindness, but at the same time vibrant with authority. His touch was gentle, but very firm and unhesitating. Both touch and voice conveyed very clearly to Lone Wolf's disciplined instinct the impression that this man, like Toomey, was a being who had to be obeyed, whose mastery was inevitable and beyond the reach of question. When Timmins told him to lie down he did so at once, and stayed there obediently while Timmins gathered himself together, shook the dirt out of his hair and boots, recovered his cap, wiped his bleeding hand with leaves, and hunted up his scattered traps and rifle. At last Timmins took two bedraggled but massive pork sandwiches wrapped in newspaper from his pocket, and offered one to his strange associate. Lone Wolf was not hungry, being full of perfectly good mutton; but, being too polite to refuse, he gulped down the sandwich. Timmins took out the steel chain, snapped it on to Lone Wolf's collar, said 'Come on!' and started homeward. And Lone Wolf, trained to a short leash, followed close at his heels.

Timmins's breast swelled with exultation. What was the loss of one dog and half-a-dozen no account sheep to the possession of this magnificent captive and the prestige of such a naked-handed capture? He easily inferred, of course, that his triumph must be due, in part at least, to some resemblance to the wolf's former master, whose dominance had plainly been supreme. His only anxiety was as to how the great wolf might conduct himself towards settlement society in general. Assuredly nothing could be more lamb-like than the animal's present demeanour; but Timmins remembered the fate of Joe Anderson's powerful dog, and had his doubts. He examined Lone Wolf's collar, and congratulated himself that both collar and chain were strong.

It was getting well on in the afternoon when Timmins and Lone Wolf emerged from the thick woods into the stumpy pastures and rough, burnt lands that spread back irregularly from the outlying farms. And here, while crossing a wide pasture known as Smith's Lots, an amazing thing befell. Of course Timmins was not particularly surprised, because his backwoods philosophising had long ago led him to the conclusion that when things get started happening they have a way of keeping it up. Days, weeks, months glide by without event enough to ripple the most sensitive memory. Then the whimsical Fates do something different, find it interesting, and proceed to do something else. So, though Timmins had been accustomed all his life to managing bulls, good-tempered and bad-tempered alike, and had never had the ugliest of them presume to turn upon him, he was not astonished now by the apparition of Smith's bull, a wide-horned, carrot-red, white-faced Hereford, charging down upon him in thunderous fury from behind a poplar thicket. In a flash he remembered that the bull, which was notoriously murderous in temper, had been turned out into that pasture to act as guardian to Smith's flocks. There was not a tree near big enough for refuge. There was not a stick big enough for a weapon. And he could not bring himself to shoot so valuable a beast as this fine thoroughbred.

'Shucks!' he muttered in deep disgust. 'I might 'a' knowed it!' Dropping Lone Wolf's chain, he ran forward, waving his arms and shouting angrily. But that red onrushing bulk was quite too dull-witted to understand that it ought to obey. It was in the mood to charge an avalanche. Deeply humiliated, Timmins hopped aside, and reluctantly ran for the woods, trusting to elude his pursuer by timely dodging.

Hitherto Lone Wolf had left all cattle severely alone, having got it somehow into his head that they were more peculiarly under man's protection than the sheep. Now, however, he saw his duty, and duty is often a very well-developed concept in the brain of dog and wolf. His ears flattened, his eyes narrowed to flaming green slits, his lips wrinkled back till his long white fangs were clean bared, and without a sound he hurled himself upon the red bull's flank. Looking back over his shoulder, Timmins saw it all. It was as if all his life Lone Wolf had been killing bulls, so unerring was that terrible chop-ping snap at the great beast's throat. Forward, just behind the bull's jaws, the slashing fangs caught, and Timmins was astounded to see the bull, checked in mad rush, plunge staggering forward upon his knees. From this position he abruptly rolled over upon his side, thrown by his own impetus combined with a dexterous twist of his opponent's body. Then Lone Wolf bounded backward, and stood expectant, ready to repeat the attack if necessary. But it was not necessary. Slowly the great red bull arose to his feet and stared about him stupidly, the blood gushing from his throat. Then he swayed and collapsed. And Lone Wolf, wagging his tail like a dog, went back to Timmins's side for congratulations.

The woodsman gazed ruefully at his slain foe. Then he patted his defender's head, recovered the chain with a secure grip, and said slowly, 'I reckon, partner, ye did yer dooty as ye seen it, an' mebbe I'm beholden to ye fer a hul' skin, fer that there crittur was sartinly amazin' ugly an' spry on his pins. But ye're goin' to be a responsibility some. Ye ain't no suckin' lamb to hev' aroun' the house, I reckon thinkin.'

To these remarks, which he judged from their tone to be approving, Lone Wolf wagged assent, and the homeward journey was continued.

[*Christmas Number.*

Timmins went with his head down, buried in thought. All at once, coming to a convenient log, he seated himself, and made Lone Wolf lie down at his feet. Then he took out the remaining sandwich, which he himself, still shaken from his fall, had no desire to eat, and contemplatively, in small fragments, he fed it to the wolf's great, blood-stained jaws. At last he spoke with the finality of one whose mind is quite made up.

'Partner,' said he, 'there ain't no help for it. Bill Smith 's agoin' to hold *me* responsible for the killin' o' that there crittur o' his'n, an' that means a pretty penny, it bein' a thoroughbred, an' imported at that. He ain't never agoin' to believe but what I let you loose on to him a-purpose. Jest to save *my* hide! Shucks! Moreover, ye may 's well realise y' ain't *popular* round these parts; an' first thing, when I wasn't lookin', somebody 'd be a-puttin' somethin' onhealthy into yer vittles, partner. We 've kind o' took to each other, you an' me; an' I reckon *we'd* git on together *fine*, me always havin' my own way, o' course. But there ain't no help fer it. Ye're too hefty a proposition, by long odds, fer a community like Lost Mountain Settlement. I 'm agoin' to write right off to Sillaby an' Hopkins, an' let 'em have ye back, partner. An' I reckon the price they 'll pay 'll be enough to let me square myself with Bill Smith.'

And thus it came about that within a couple of weeks Lone Wolf and Toomey were once more entertaining delighted audiences, while the settlement of Lost Mountain, with Timmins's prestige established beyond assault, relapsed into its uneventful quiet.

NINE YEARS OLD.

I 'D like to be tall like Mabel,
And clever like Clementine;
I 'd like to stay up for dinner;
But I can't, for I 'm only nine.

And nine 's such a long time going,
I think I shall never be ten;
And suppose, after all this waiting,
It isn't much better then?

Suppose I must stay in the nursery,
With bread-and-butter for tea;
Suppose I must still do lessons,
And go for a walk at three?

Suppose it 's like this for ever,
And my governess always comes—
Practising, singing, sewing,
French, grammar, history, sums?

I 'd like to go out in long dresses,
And pin up my hair on top;
I 'd like to see cook every morning,
And go to the village to shop.

I 'd like to carry a card-case,
And go to afternoon-teas;
Be announced by the servant as 'Mistress,'
And eat all the cake that I please.

My frocks are of serge or of cotton,
I want to wear satin and silk;
I want to drink tea and coffee,
And all that I 'm given is milk.

But then I 'm not old like Mabel,
Nor clever like Clementine;
And all the things that I want to do
I can't, for I 'm only nine.

Nurse says that the time goes quicker
The older and older you grow;
She says that the years are flying;
They aren't; they 're frightfully slow.

Most people, too, are so silly,
They say they would like to be nine;
They wouldn't, they wouldn't really,
If they 'd feelings a bit like mine.

Oh, I want to be tall like Mabel,
And clever like Clementine;
I want to stay up for dinner;
But I can't, for I 'm only nine.

EDITH L. ELIAS.

THE KLOOF OF THE CRYING CHILD.

By H. A. BRYDEN,

Author of 'Kloof and Karroo,' 'Nature and Sport in South Africa,' &c.

T was some years before the war, and Adriaan Stols and I were hunting in a country then and even now little penetrated by gunners, lying to the north-east of the Transvaal. Adriaan was a middle-aged Boer, who had all his life been a professional hunter, and was an excellent specimen of his sturdy race. He was a hearty, good-natured fellow, free from the small meannesses which disfigure the strong characters of so many of his fellows; in the hunting-veldt no better comrade could be desired, and in a tight place Adriaan, with his cool courage, resource, and activity, was absolutely to be relied upon. From early youth Adriaan Stols had followed the game far and wide over the remote interior of South Africa; and in the days when elephants were plentiful he had amassed much ivory and some little store of wealth. He had now settled down on a farm in Waterberg; but each season, as the rains ceased and African winter came round, the hunting-fever seized him and was irresistible. Leaving his wife and family on the farm, sometimes taking one of his sons with him, he trekked into the wilderness with his old wagon; and there, when game was plentiful, he enjoyed himself to his heart's content in pursuit of the various beasts of chase which came within his purview. I had met Adriaan two years before and had seen a good deal of sport with him, and this season we were alone and enjoying ourselves.

Upon the day which I have in my mind's eye we had been hunting koodoo and sable antelope in one of the fairest pieces of country which I have ever had the good luck to set eyes upon. The rains, which had been unusually heavy that season, had just ceased, and the veldt was literally ablaze with flowers. In many of the kloofs down by the bed of the river, wild irises, amaryllis, and lilies bloomed in all their wonderful beauty among the grasses. Here, nestling thick and deep up to the mountain base, were to be seen lovely pelargoniums, which, as we pushed our way through them, grew as high as our horses' shoulders. There you might see a hillside blushing pink and red with flowers. Not seldom the African mistletoe thrust its brilliant scarlet berries from the foliage of some stunted tree. Orchises—orange, blue, white, pink, red, and golden yellow—peeped shyly from the shoulders of the hills; and verbenas, clematis, and many another lovely flower were to be noticed far and wide. Out in the more open country the veldt was gay with oxalis, which in bright hues of white, red, and pink starred the soil. Never have I seen the country fairer—the wilderness, in sooth, blossomed like the rose; one's only regret was that beneath the hot sun of Africa the charm would soon be broken, and in two or three weeks the flowers would be vanishing and the veldt resuming its duller aspect of winter. The air was wonderfully clear and wonderfully bracing; one felt, as one rode abroad in this day of perfection, inhaling deep draughts of the champagne-like atmosphere, that one could live for ever.

Our first item of sport was found among a small troop of koodoo, which we espied beneath us as we came over the neck of a hill. The wind was right, and by a piece of good fortune we managed to drive them out into the open, away from the hillsides and deep covert which these noble antelopes so much affect. In open veldt the gallant beasts, which have not the pace and staying powers of some of the other antelopes, were fated to be ours, and after a smart gallop of a couple of miles we each turned out a good bull from the troop, rode it down, and secured it with a couple of shots. Mine was an unusually fine specimen, and carried magnificent horns; and the sight of the grand spirals, taping sixty inches over the curves, gave me intense satisfaction. Sending back a native 'boy' who rode with us to bring out more men and carry home the flesh, we went on our way. In another hour, riding very cautiously up to the remains of a rhinoceros which we had shot three days before, we surprised a magnificent leopard which, occupied as it was with its loathly feast, fell instantly to our rifles. Then came a long ride in search of sable antelope. We saw other game as we went along — waterbuck, impala, roan antelope, klipspringer, steinbock, and duyker; but not until late in the afternoon did we come up with a herd of sable, after a wonderful bit of spooring on the part of Adriaan Stols. From this troop we secured a grand bull and a cow carrying quite a good pair of horns. To skin them, take off the heads, and load our horses with as much meat as we could carry occupied at least an hour; and the sun was sinking gloriously behind a far-off chain of hills as we climbed to our saddles, and each carrying the head of a swart-wit-pens (as the Boers call sable antelope) on our saddles, set off on our

ride to camp. During our day's hunt we had circled a huge mass of mountain, which now heaved its vast shoulders and jagged crest exactly between us and the place where our wagons stood.

'Adriaan,' said I in Dutch, which I habitually spoke with my Boer comrade, 'we can surely find a way through the mountain yonder, and so make a short cut back to camp? The river seems to run right through the chain. It will save us some miles.'

'Nay, Johan,' he replied—my name, I should say, is John, and he always employed the Dutch equivalent—'I would not ride through the mountain yonder after dusk for a hundred English sovereigns, nor for two hundred!'

'And why on earth not, Adriaan?' I pursued. 'I never knew you afraid of lions yet. And the chances are fifty to one against any of the beasts going for you, even if they happened to be in yonder.'

'Nay, *kerel*,' he replied, 'I'm not thinking of lions at all. I never have feared them yet; though on a dark, stormy night I'll admit freely that a hungry lion is the very devil himself. You are quite right; there is a way through the mountain, and a short cut to the wagons; but that is Crying Child Kloof, and no sensible person goes in there after dark. Almighty! even in the daytime few people care to venture there. Ask the natives at the kraal, five miles away from the head of the kloof, what they think of it. Day or night they'll not venture their skins in the place for anything you like to offer them. As for lions, I doubt if there's one in the whole mountain. Game is never seen there, oddly enough. I once rode through the mountain in daylight, though I didn't half-like it, and I never saw a head of game the whole way. There's something evil and uncanny about the place, and even the beasts like it not.'

'But,' I said, laughing at the Boer's serious face, 'what is it all about, Adriaan? If it isn't lions, is it spooks?'

'I can't tell you what it is, spooks, or the arch-fiend himself, or what,' he returned. 'But the place is evil. Terrible things have happened in there, and no man is sure of his life if he goes through the *poort* after dark.'

'But tell me,' I said, waxing mighty curious, 'what's the yarn, and what's the matter with the place?'

'Well, the story is a long one,' returned Adriaan, still looking truly solemn as he gazed at the dark, bush-grown entrance to the deep *poort* or pass which led into the mountain, 'and I doubt if I'll tell it you now. Wait till after supper to-night, as we sit by the camp-fire comfortably, and I'll try to tell you all I know.'

Swinging round the flank of the big mountain, we rode on steadily, and about an hour after sunset saw before us the flickering light of our camp-fire. We rode on for the best part of another three-quarters of an hour, and then reached the wagons. How well I recollect that glorious evening! Our horses, by this time pretty tired, good beasts, were first looked after and fed. Then, having given directions as to the skinning of my trophies—I always preserved the scalps as well as horns in those days—we washed and prepared for supper, changing our boots for easy *velschoens*, and put on a coat apiece. Our cook, a 'Cape boy' of mixed descent, had prepared an excellent meal, and we sat down to delicious soup and stew compounded of guinea-fowls shot the day before, onions, and potatoes, with a flavouring of sauce and half a tumbler of red Cape wine (Pontac) added towards the end of the cooking. Here was a meal fit for princes, and how much more so for two hungry men who had been all day in the saddle, and had had nothing but a biscuit or two since breakfast at dawn! A tin of American peaches rounded off the dinner, and we always had good bread going, made every two or three days from Boer meal. A kettle of right good Java coffee accompanied our repast, and saw us well into our second and third pipes.

Dinner over, we spread our blankets on the sandy soil alongside the fire, filled our pipes with Mahaliesberg tobacco—the best smoke in the world—and then gently I suggested to Adriaan Stols, now as happy and contented a man as you would find in Africa, that he should tell me something of the mystery of the kloof. 'Why, by the way,' I said, 'do you call it Crying Child Kloof? It's an odd name.'

Adriaan lifted his old, battered, broad-brimmed hat from his head, replaced it, and ran his fingers through his thick brown hair in a way I knew so well. Then looking contemplatively at the fire, he stroked his big beard and patted his broad chest. I knew his mind was working.

'Yes,' he said in his deep, guttural Dutch voice, 'it's an odd name, and a *verdoemed* odd place too, I promise you. The first time I ever came near the kloof was thirty years ago. I was a lad of fifteen then, just beginning to hunt elephants with my father—elephants were plentiful here in those days; and beside my father there camped, close to where our wagons stood, old Piet Louw and one of the Besters, with their wives and families. We were then no more than a hundred paces or so from the entrance of the kloof, on this side of the berg. I can remember there had been some words with the natives who were spooring for us as to coming through the kloof. They refused point-blank to do so, alleging that the place was *m'tagati* [bewitched], that men died there unaccountably, and were found strangled, with swollen faces and broken necks. My father and Piet Louw were

much annoyed; but these natives were far beyond the Transvaal, and quite independent of us and our laws, and we couldn't, therefore, deal with them as we should in our own territory. Well, the upshot of it was that Louw and one of his after-riders, a Griqua boy, went hunting south of the berg, and ventured, in spite of the remonstrances of the natives, to ride through the kloof on their way back to camp that afternoon. I remember it as well as yesterday. It was sunset, and we were all busy about the wagons preparing for supper. Old Piet Louw had not come in, and his *vrouw*, a fussy, short-tempered old dame, was making her usual to-do if anything happened to displease or upset her.

'Suddenly my father cried, "Hark! what is that?"

'We all listened intently, and then we heard the steady, muffled tramp of horses galloping fast. The sound came rapidly nearer, and then, as we all gazed in that direction, we saw Piet Louw and his after-rider emerge from the mouth of the kloof and come flying towards us. There seemed to be something wrong, for the Griqua was galloping close alongside his master and appeared to be holding him in the saddle by one arm. We all stared open-mouthed at the spectacle, and then in another few seconds they reined up in the middle of us.

'"Almighty!" cried my father, as he ran up to Piet and helped him from the saddle, "what in the world is the matter?"

'There was something wrong with the man undoubtedly. He reeled as he reached the ground, and would have fallen if Jacob Bester and my father had not taken each an arm of him and helped him to a camp-chair. He was blue, almost black, in the face, and his right hand grasped his throat.

'"Give me brandy," he said in a choking voice. "I've had a *schrijk* that I sha'n't get over to my dying day. How I got out of the kloof alive I don't know."

'His wife, who for once in her life seemed to be stricken dumb with amazement, fetched him some Cango brandy and a *vatje* of water, and after a stiff pannikin or two Piet seemed to come round.

'"*Kerels*," he said at length, when he was easier, "the Kafirs were right. That kloof yonder"—he gave a shuddering glance in the direction—"is haunted, and the devil himself lies in wait there!"

'Astonishment, blended with fear, was in all our faces, as we stood there crowded round him, waiting for more of his tale.

'"I'll tell you exactly what happened," he went on, after another pull at the brandy-and-water; "and Ruyter here"—nodding at the Griqua who stood close by with the horses—"shall say whether I speak truth or not. I rode off, as you know, early this morning in search of elephants. About ten miles south of the mountain I came up with a troop, and after killing a good bull, with teeth going, I suppose, at about one hundred pounds the pair, nearly got caught by an old, wicked, barren cow, which chased and all but caught me in thick bush. By the time I had got rid of her—and I had a narrow squeak for my life in doing it—the troop had got far away; and although Ruyter—who had meanwhile killed another bull—and I rode some miles on their spoor, they were going too fast, and we never got up with them. Well, we chopped out the teeth and buried them, and then turned for camp. Coming along by the stream I shot a nice pallah ram for meat, and then about half-an-hour before sundown we came to the other entrance of the kloof, and rode our horses quietly along. At first I saw nothing at all to bear out what the Kafirs said about the kloof. 'Tis a wild place, but there's plenty grass and fine grazing. The place was littered with flowers, and the bottom of the kloof is broad and sandy and easy riding. The stream is clear and wide, and carries lots of water. It was a beautiful evening, and I quite enjoyed the ride, and began to think of my supper and the good *vrouw* here, and a pipe and a pleasant chat by the camp-fire. The place was wonderfully silent. I saw no game—in fact, no other sign of life than some vultures soaring up above the berg-top, and a black-and-white raven or two which croaked from the *krantzes* above us. I should judge that the kloof is nearly three miles in length, and we had got quite two-thirds of the way through when we both heard plainly the cry of a little child wailing as if in trouble. Well, as you know, I'm a fool about children. It seemed odd that a *piccanin* should be alone there in that desolate place, and I drew rein and listened. Again came the whimpering cry, this time as if the child were really in pain or fear. It seemed among the bush just in front of us. I rode on ahead, and there amid the shrubbery, on a piece of soft sand, lay a little black child crying and sobbing softly to itself. I looked around. There was not a soul in sight save ourselves. How, I wondered, in the wide world had the child got there, and what was it doing? Then the babe rolled over, and, catching sight of me, held up its little, fat, black arms and sobbed again bitterly. It was more than I could stand. I jumped off my horse, picked up the little thing, and was in the saddle again in a moment.

'"I was scarcely firm in my seat when a feeling of great uneasiness came upon me. I can't well describe it," said Piet, and I remember he gave a shudder as he spoke; "but somehow the presence of that child in my right arm, nestling against my chest, seemed to bring with it fear and loathing. Then it seemed, as the child crept closer to my breast and put up its arms, that it swelled and grew. I had

not ridden fifty yards before the creature's hands were at my throat, gripping me like a blacksmith's vice. For a second or two I could not believe my senses; but the thing grew and grew, the grip strengthened, although with my free hand I strove to release myself, and I was being fast throttled. I knew then that there was something devilishly wrong, and I cried out to the boy, 'Take the thing by the leg, Ruyter, and throw it off!'

'"Ruyter behaved like a man. He laid hold of one leg, and as I dropped my rein and tore at the hands about my throat he gave his horse the spur, and by a sudden jerk freed me from that horrible thing. I promise you I was by that time nearly suffocated. Our horses seemed as much seized with fear as ourselves; and, galloping like furies out of the kloof, we came on as you saw us. My friends," he added solemnly, "the fiend himself is in that place, and the Kafirs are quite right. The kloof is deadly dangerous, *m'tagati* [haunted]. I wouldn't go in there again by myself for ten wagon-loads of ivory. If I had been alone, with that horrible thing squeezing the life out of me, I should have been a dead man by this time! I know it well."

'Piet Louw got up from his chair, shook himself, and rubbed his throat. "*Kerels*," he said, holding up his chin, "are there any marks there?" We all looked intently. Upon the great, tanned, brawny throat of the man—and Piet was a stark fellow, I promise you—there were deep purple marks where fingers had gripped him. He stared at the two horses. "Look at the nags," he said; "they tell a tale."

'We looked. They were both in a muck-sweat and still trembling.

'"They were cool when we started galloping," said Piet, "and we came only half a mile, and it's a fresh evening. They have had a *schrijk* too, that's evident.—Now, Ruyter," he went on, turning to the Griqua boy, whose ordinarily yellow face was at this time a drabby green, "tell them what you saw."

'"What the *baas* has told is quite right," said Ruyter; "the child swelled in his arms. When he picked it up it was a little *piccanin*, so big"—he held apart his hands to describe the length of a small infant. "When I took hold of the *skellum* by the leg and helped to pull it off it was as big as a boy of twelve. My *baases*, it was the devil himself, and nothing else!"

'That was what happened to Piet Louw in the kloof yonder thirty years ago,' added Stols, as he reached for an ember and lit his pipe again.

'It's a strange yarn,' I said meditatively. 'But tell me, Adriaan, don't you think there is an explanation? Mightn't old Piet Louw, for instance, have picked up a young baboon, and when the beast began to struggle so got his fright?'

'That's just what occurred to my father,' returned Stols. 'He would have it that Piet Louw had picked up a *baviaan* in mistake for a black *piccanin*. Piet was mighty angry, and blurted out that the light had not gone when he and Ruyter came up to the place where he picked the thing up; and both he and the Griqua vowed that what they saw was a black child and nothing else. At least it *looked* like a black child. Next morning, when broad daylight came, nothing would satisfy my father but that we should all ride into the kloof and have a look for spoor and see really what had happened. Old Piet Louw didn't half like it; but as, with Bester and his sons, there were seven of us, and we were all armed, he plucked up his courage and said he would come. Well, we rode into the kloof. We spoored the flight of the two horses till we came to the very spot where the scuffle had happened. We could trace the whole story easily in the sand. Here was where the horses had started galloping; there, a little farther, was where Ruyter had ridden alongside his master; farther on the very spot where Piet had got off his horse to pick up the child or spook, or whatever it was. But of the thing itself which he had picked up there was not one trace either in the sand there or where Ruyter, as he and Piet swore, had taken it by the leg and flung it to earth. We searched about everywhere around, but there was not a trace of spoor of a child or a baboon or anything else. Only the spoor of Piet Louw, where he had descended and climbed to his saddle again, and of his and the Griqua boy's horses.

'We rode on through the kloof and saw nothing; and right glad we all were when we emerged from the *poort* at the other end and came into the open veldt again.'

'Has anything happened in the place since, Adriaan?' I said.

'Three years after the time I speak of,' returned Stols, 'a hunting Boer who was up in this country by himself, and knew nothing of the kloof and its evil story, was found dead there. He had ridden through alone, and next morning, when his people went out to search for him, they found him strangled, with a broken neck. They brought out his body, buried it, and went their way. The man's name was Jacobus Kersteyn. There was no explanation of his death, but that it happened I and others know well. I have only once been here since. I took a dislike to the country, beautiful though it is, and well stocked with game; and except one season when I trekked this way, twenty years ago, I have never, till I came here with you, been near the place since.'

'I should very much like to have a look at the kloof, Adriaan,' I said. 'Will you ride through with me to-morrow morning? Your story impresses me, I confess, immensely; but I should like to see with my own eyes this

place of such evil memories and such weird happenings. Will you come?'

'Not I, my friend,' returned Stols with decision. 'I have been through once, and I never want to see the place again. There is something evil about it. The power may yet remain, and I hold that any sensible man, after the terrible things that have happened there, not to one but to many folk, will leave well alone and take no risks. Man and beast I am always open to take my chances with; not so with the powers of darkness. If, as I see, you are curious to pry into this mystery yourself, let me beg of you to do nothing of the kind. Let the kloof alone, and never think of entering it. That is my last word to you. And now, Johan, I am for bed. May you sleep well, and don't dream of the crying child!'

After a hearty good-night, Adriaan and I climbed to our respective wagons and turned in. He was soon asleep; but for my part I lay awake for some time, pondering over the strange narrative I had heard that evening, and wondering whether it were truth or fiction. In front of me, as I gazed out of my wagon—it was a warm night and the fore-clap was not fastened—the wonderful array of stars, pricking the deep velvety indigo of the African night-sky, glittered before my eyes. Presently even these faded from my senses, and I sank into the sound slumber that ever welcomes the wanderer in the veldt.

Next morning it was my business to ride five or six miles to the native kraal which lay nearest us. We needed grain for the hunting-ponies, and I went to see if I could raise some. Stols was busy in camp repairing one of the wagons; and, taking my rifle for a chance shot, I cantered away in the best of spirits. The kraal lay some way beyond the north-east angle of the mountain, and I had no difficulty in finding my way thither. I spoke one or two native dialects, and on arrival at the village I interviewed the headman and made my wants understood. Natives are terribly slow hands at a bargain; they derive enormous pleasure in what to the Englishman is the hateful business of a long haggle over a deal; and it was not till a couple of weary hours had passed that I came to terms with the chief and arranged for a supply equal to three sacks of millet or Kafir corn, a provender which, in the absence of other grain, gives excellent feeding for horses. This business completed, I questioned the chief about the Kloof of the Crying Child. He was at first very reticent; but presently, opening up under the influence of a present of tobacco, he told me a good deal. What he said confirmed completely Adriaan Stols's tale. I asked if any deaths had lately happened in the valley. The chief thought for a few moments, and said, 'Yes, a native from another tribe up north had entered it on his journey south, whither he was marching on his way to Johannesburg. He had never quitted the kloof alive, and his friends who came after him had found his body, strangled, half-way down the place.' This had happened, as well as I could make out, some five years before. All my palaver ended, after a drink of milk I remounted my nag and rode off, taking a sweep round and beyond the mountain in search of game. We were in no need of meat, and I was only on the lookout for an exceptionally fine pair of horns if they came in my way. I saw a good many head of game, and thoroughly enjoyed my ride; but no record pair of horns came within my ken, and as afternoon deepened I turned my good horse's head and set my face for camp.

It was a little before four o'clock as I rode by the entrance to Crying Child Kloof on my way back. Facing the *poort* or pass that led into the mountain, I halted and gazed up the ravine, of which I could discern from this point some three hundred yards. It all looked very picturesque, very quiet, and very innocent, resembling, in fact, scores of passes I have ridden through in various parts of South Africa. I had been thinking about the place all morning and part of the preceding night. The mystery of the kloof obsessed me; I could not get rid of it. I am not a nervous person, and I had hitherto had no sort of personal experience whatever of apparitions, wraiths, phantasms, spooks, or whatever men choose to call them. In fact, I had a natural and hearty contempt for anything of the kind. I was strong, hard, in the rudest health; and here, in the broad and blessed daylight, what had a sane man to fear? My mind was suddenly made up. I cast the warnings of Adriaan Stols to the winds, and, fording the shallow stream which flowed out of the *poort*, emerged on firm and smooth ground and entered the kloof. It was, I knew, scarce three miles long, and I should be through the place and out on the other side in much less than an hour, at least half-an-hour before sunset.

At first I rather enjoyed my ride. It was a magnificent kloof, having a broad, smooth floor fully half a mile wide, from which the great, red, jagged mountain walls towered up grimly on either hand until their peaks were greeted and glorified by the sinking sun. There were many low trees scattered about the valley, mostly thorny acacia and wild olive, and masses of bush grew here and there; and the flowers, just now in their fullest luxuriance, were a perfect sight. But otherwise there was not a sign of life in all the vast, beautiful place. That, I think, was the oddest feature about the ravine—that and an air of preternatural solemnity, of weird, impressive stillness, as if Nature were standing expectant for the happening of some strange event.

I shook off the feeling of oppression which

somehow gathered upon me, and rode on. My good horse, striding along at a quick walk, showed no signs whatever of like or dislike to his environment. Occasionally he cocked his ears, but that was no unusual thing with him. We were getting along capitally, and I suppose had traversed more than half the kloof. I was becoming acclimatised, and the feeling of oppression was sensibly diminished, especially as the thought of Adriaan Stols came into my mind. In twenty minutes I should be clear of the place, and then—I smiled to myself as I thought of it—what a laugh I should have at Adriaan's serious face as I told him of my adventure, or rather lack of adventure!

The smile was instantly banished from my face by a sound which, coming from the shrubbery thirty or forty paces in front, seemed strangely, horribly familiar. It was the wailing, piteous cry of a child in pain. Again and yet again it was repeated, then silence. The tension, from which a moment ago I had thought myself free, was upon my nerves again. I was strung taut, almost to the highest point of human endurance. I confess that for a second or two my heart seemed to stand still. Then there flashed into my mind a coward thought—to turn my horse's head and gallop down the kloof by the way I had come! But, as instantaneously, courage, stiffened by a sense of shame, came to my aid. What had I to be afraid of? I would go forward. My horse had halted at the sound, and stood expectant. I urged him gently with my heel, and he moved on. Again came that soft, piteous, miserable cry, the cry of a little child in real pain. My skin crept, and my back and the palms of my hands were very cold, but I went on. My rifle was loaded and cocked, and I held it ready in my right hand. Then suddenly, passing a bush, my horse halted, and there, a few yards away, lay a little, naked, black child sobbing gently to itself. Strangely enough, now that I saw the thing before me, I felt perfectly self-possessed, and, leaning forward in my saddle, watched the child closely. Something within me warned me not to get down from my horse, not to touch the thing that lay there. It rolled softly this way and that, moaning gently to itself. Still I waited, I cannot say why. I had no intention of getting off my horse, and I have an idea that that resolution of mine passed unconsciously from my mind to the thing lying there before me. Then suddenly, for one fleeting part of a second, I caught a glimpse of the creature's eyes. Never can I forget what I saw there. It was a look so baleful, so terrible, so full of murderous hate, that, digging spurs into my horse, I sprang away, and was next moment galloping madly, furiously for the head of the kloof. As I rode there came from behind me a horrible, demoniacal, mocking laugh which lent fresh impetus to my flight.

I can remember little more of the rest of that whirling ride, except that I emerged presently at the northern *poort*, and, passing out of the hateful kloof, soon saw the welcome sight of our wagons outspanned a quarter of a mile away.

That is all I have to tell about the Kloof of the Crying Child. I have no theories to offer concerning what has happened there and what I myself have seen. I merely state the few plain facts of which I have cognisance. There is some dread mystery about the place; some ancient, evil thing haunts it—of that I am firmly convinced. Africa is a strange country, and in its heart there is yet to be found many a dark secret which all the boasted skill and knowledge of the white man is for the present powerless to explain or penetrate.

NELSON'S MONUMENT IN TRAFALGAR SQUARE,

OCTOBER 21ST.

UNMOVED you stand above the trodden way,
With din of landward traffic in your ears—
You, for whom wailing winds and hissing spray
Made all your music in the far-off years;
You, who in life found seas on every side,
Watch now above the city's ebb and flow.
Nor is there aught within its restless tide
To tell you of the sea of long ago,
Save on that day when, by one impulse swayed,
Its wavering currents set towards your feet,
Bringing, in token of love's debt unpaid,
Pale, fragrant flowers, for death and victory meet.
Then, gazing down, you seem to see once more
The well-known waves break white upon the shore.

E. G. MOORE.

WHEAL CATHERINE OF TRENCROM.

By ALFRED COLBECK,

Author of 'The Secret of the Sebhah,' &c.

CHAPTER I.

THE girl's slight figure was balanced like a bird on the summit of one of the granite bosses on the top of Trencrom. Below her were the woods of Trevethoe, partially covering the softly curved hollow, with the chimneys of the Hall showing, and beyond them the park and the village of St Uny Lelant. In the distance, between the hills, with the full tide surrounding it, St Michael's Mount, crowned with its miniature castle, was clearly defined against the shining waters of the bay. This, as many a time before, was the view which entranced her, the view she loved, and she dwelt upon it while the southerly wind kissed her rounded cheeks and played with the strands of her dark-brown hair.

Northerly, too, the view was superb. Within its confining crescent of yellow and green, light-house-tipped, St Ives Bay gleamed opalescent; and beyond, the long, indented coast-line stretched, in savage cliffs and lonely headlands, as far away as dim Trevose. With Trencrom as the pivot, and slowly turning from Trevose to the Lizard, the vision could range over one-half of the Duchy of Cornwall.

North to south turning eastward the panorama was enchanting; but north to south turning westward there were only the nearer hills, high and stony, and but scantily relieved by the fading yellow gorse and the opening purple heather. One, indeed, directly westward, was crowned by a clump of ragged firs—the point of a granite pinnacle peeped above them. But that was an exception. All the other hills were treeless, and disfigured here and there by the gaunt shells of long-forsaken engine-houses and the rugged refuse-heaps of abandoned tin and copper mines. Aided by a kindly climate, Nature had done her best to redeem the desolation. Sloes were plentiful, and brambles, and woodbine, and wild-apple, and convolvuli; and but for the engine-houses, with their stunted chimneys, these great gray hills would have formed a magnificent natural rockery.

The girl, poised upon the boss of granite, swept the wider view and gave no thought to the other. And yet within the other—and well within it, only down the slope and across the depression—something was happening which presently interested her much more than the scenery. A sound reached her—a sound recurrent and unusual. She turned to ascertain the cause. A young man, a perfect stranger, was tapping with a small hammer selected pieces of the débris of old Wheal Catherine, and scrutinising the broken fragments through a powerful pocket-microscope. She watched him intently. Drawn unconsciously by the compelling gaze, he raised his head and looked at her for a moment, then bent again to his absorbing task. Caught by his look, and a little abashed at the thought that he might imagine she was spying upon him, the girl leaped from the rock and hid behind it, smoothing back the blown tresses and blushing slightly.

Why should she? The wrong was his, if wrong there were, not hers. She was the owner of the débris, and the empty engine-house, and the adjacent unprofitable wilderness, and the abandoned mine itself—she and her mother; and, without permission, this venturesome stranger was cracking the stones and popping the specimens that seemed to suit him into the wallet by his side. The stones were quite worthless. Not even as road-metal could they dispose of them. Other and better material was available, and less expensive to cart away.

In his neat Norfolk suit of serviceable tweed there was nothing to distinguish him from an ordinary tourist. But the ordinary tourist never came to Trencrom. A little farther back, hilarious picnickers were making merry over their gipsy fire and *al fresco* meal. They were not tourists; Trencrom was only a pleasant ramble from their own homes. But the young man of the Norfolk suit was a stranger—a tourist maybe, thought the girl, with a *penchant* for mineralogical research.

'Can you direct me the nearest way to St Ives?'

She turned with a little start, and there he stood before her, cap in hand and smiling. Why had he not gone a step or two farther and asked the picnic-party to direct him? He was a handsome fellow, tall, strong, his clean-shaven face tanned to an outdoor healthiness, and with a humorous gleam in his gray-blue eyes.

'The nearest way is through the fields,'

said she. 'Make for the steeple,' and she pointed at the granite tip peeping above the firs; 'but before you reach it turn to the right and go through the broken ground of Wheal Providence — the mine, you know,' she added by way of explanation, for she feared he might not understand the word 'Wheal.'

'Yes?' he responded deferentially.

'That will bring you to Treloyhan, and from there you can see St Ives.'

'Thank you!' said he. 'Your directions are very explicit. I cannot lose myself.'

'I don't know,' she replied doubtfully. 'To a stranger, the nearest way is not always the quickest. You might do better to keep to the high-road.'

'With the friendly steeple to guide me, I will risk the path through the fields. The high-road does not appeal to me, and Wheal Providence, as you call it, is rather tempting.' And his eyes twinkled. 'I am greatly indebted to you;' and, with a sweep of his cap, he strode away, deigning not to bestow a glance at the picnic-party, who, arrested in their merriment, had been watching them.

The girl passed through an opening in the rocks, and, concealed from view, stood there for a minute or two deeply reflective. Then she tripped down the hill, crossed the road into a coppice, threaded her way through it mechanically, and emerged into a meadow. A seldom-trodden path brought her to the front of a tiny villa, detached, with a small but luxuriant garden in front of it, and behind a bend of the road — the same road that she had crossed farther up. She opened the wicket, and the click of it brought a matronly figure into the trellised porch of the wide doorway.

'Quick, my dear!' said the matronly figure as she noticed her daughter's loitering footsteps and the dream-like look upon her face, both unusual and provoking a mild surprise. 'Tea is waiting. Did you go farther than the hill?'

'No, mother.'

'Are you tired?'

'Tired?' and she lifted her eyebrows. 'Why should I be, mother? A little stroll like that cannot tire me;' and she speared her hat with the pins which had fastened it, tossed it aside, and seated herself at the table. 'It's glorious, mother, on the hill!'

'I thought you were tired, my dear, because you were walking so slowly, and your face was —what shall I say?—quiet, meditative.'

'I was thinking—a rare occupation, mother, for me.'

'A penny for your thoughts, Kitty.'

'A penny, mother!' and she broke into a rippling, musical laugh. 'Nay, you might repent of the bargain; they're not worth it A little junket, please, and some cream, mother. Thank you!'

'Was there any one else on the hill?'

'A picnic-party. Oh, and a gentleman!' she added as a seeming after-thought, not quite easy in her mind at the idea even of an innocent concealment from her mother. 'He asked me the nearest way to St Ives.'

'A stranger?'

'Yes; I haven't seen him before. The junket is delicious, mother; but the cream is a trifle furzy, don't you think so?'

'The merest trifle, Kitty.'

'You rather like the tang of the smoke, don't you?'

'I don't object to it.'

'Then have some more.'

'No, thank you, Kitty; I haven't been out on the hill.' And the conversation—deflected from the stranger, as her daughter hoped it would be — settled down into commonplace channels.

After tea, when they sat by the lamp-light, the mother knitting, the daughter engaged with some filmy fancy-work, the silence was broken by a query from the latter.

'How much did grandfather sink in Wheal Catherine?'

'All he had, my dear, or practically so.'

'But how much?' persisted Kitty.

'Between thirty and forty thousand pounds, I believe.'

'It must have had a very capacious maw, mother, to swallow all that. And father—he was manager of the mine—did he sink anything in it?'

'Yes, when they made him manager; it was one of the conditions. My settlement was secure, Kitty; it was invested in Consols, and fortunately father refused to have it touched, or we should have had scarcely anything to live upon. We haven't much as it is—only that and what his policy brought us—but enough for our simple wants.'

'It is a good thing for us that our wants are simple, mother, and that the dreadful appetite of Wheal Catherine was appeased before it reached the Consols. What a voracious dragon it must have been! But how did we come to possess it, mother—solely, I mean? For others were interested in it as well as father and grandfather.'

'The others were bought out.'

'When the mine was paying?'

'No, afterwards. Father thought it would pay again.'

'Did it?'

'Slightly; then it ceased to pay, and was abandoned, and went to ruin. And we were left, you and I, Kitty, as sole proprietors—well, I was, and what I have is yours.'

'Wasn't it a gamble, mother?'

'A gamble, my dear? Nay, not quite that.

A speculation, perhaps, as all mining must be; but a reasonable speculation, and at first remunerative. The shaft is very deep—deeper by sixty fathoms than they thought they would have to go; but there, and at a lower level still, the lodes are rich, and yielded splendidly. So they would yet if we could work them—or, rather, if the price for copper were such that we could afford to work them. The mine is not exhausted, Kitty. It was not abandoned through the failure of the metal. If the ore down there were only "up to grass," as the miners say—on the surface, that is—we might be millionaires.'

'Then I wish some giant would raise it for us, mother! But the giants have gone from Trencrom.'

'Long ago;' and the mother smiled.

'But if the metal is there, mother, why was the mine abandoned?'

'Didn't I tell you? The prices fell. It wouldn't pay for the working. Tin and copper came in from Australia and South America. They found it nearer the surface. It was easier and cheaper to get. We couldn't compete with them—that was all.'

'Mother!'—and there was a new tone, appealing, vibrant, but very gentle, in Kitty's voice, which caused the mother to raise her head and glance at her daughter apprehensively—'the gentleman I mentioned, who asked me the nearest way to St Ives, was examining the débris of the mine, chipping it with a hammer and inspecting it through a magnifying-glass, and some of it he carried away with him in a leather satchel slung across his shoulders. What could he want it for, think you?'

'Was he young?' The question was a trifle irrelevant, and brought a deeper colour into Kitty's face.

'Yes—that is, not very. Under thirty, I should say. But his age does not concern us. What matters it, mother, whether he was young or old?'

'I was only wondering, my dear.'

'Foolishly, mother. You haven't answered my question.'

'Oh, about the chippings? I really don't know. I should think he must have been searching for stray specimens of tin or copper ore—or mundic, perhaps—or pitch-blende. What was he like, Kitty?'

'Tall, and bronzed, and clean-shaven, like hundreds of other men, except'——

'Except what?'

'His eyes—they were different.'

'How different, Kitty?'

'Well, it's hard to say; but they were different—a grayish-blue, very steady, and with a kindly gleam in them—half-serious, half-humorous, rather expressive eyes.'

'You must have been very observant, Kitty.'

'I couldn't help seeing him, mother. He stood directly in front of me, and wanted to know the *nearest* way.'

'Was he dressed like a gentleman?'

'Mother!' she remonstrated, and then went off into a peal of laughter. Secretly her mother rejoiced to hear it. How could she laugh like that if her heart were stolen? 'He was dressed like a tourist, quietly, mother, in one of those pleated jackets, with a loosely buttoned belt about him. His manners were gentlemanly, and manners are more than dress. You are very inquisitive. Anything more?'

'No, my dear. I am satisfied. I don't go out much. I like to see what you have seen—through your eyes, Kitty; and your impressions, too, I like to feel—when you are able to transmit them. I am growing older. My life is centred in yours.'

'Older! Nay, mother, you are young yet, and there are many years before you;' and she rose and tenderly kissed her. 'There! Who was it that said the other day you were like my elder sister? And, indeed, you are! You've scarcely a wrinkle; and your hair is brown, a richer colour than mine and quite as plentiful; and your eyes are lovelier. Yes, they are!' as her mother faintly protested with an answering smile; 'and you and I, if ever we do grow old—a very remote possibility, mother—must manage it gracefully together.'

Kitty's rosy description was not all affectionate flattery. Her mother was certainly good-looking, younger in appearance than her years warranted, matronly, and inclined to stoutness; but, apart from this, wonderfully like her daughter, and more beautiful, perhaps, in the days of her prime. For her daughter was slim and willowy, not quite so tall, with a face more piquant and an expression less resposeful—a girl of quick, mercurial temperament and nerves highly strung. And in their quiet, sequestered life, with the husband and father gone, and no other members of the family, these two had become all in all to each other.

A secret fear sometimes assailed the mother, which, in the nature of things, she could not share. Responsive to a lover's call, her bird-like daughter might fly away. She was far too sensible to set herself against her daughter's marriage—always supposing, of course, that the right man came and Kitty loved him; but she hoped the nest would be near her own. It would be hard, terribly hard, to part with Kitty if the call should come from some distant place. It was this which had led her to question Kitty about the stranger, to ascertain exactly what had passed between them. She was thankful for Kitty's laugh, and more thankful still when she went singing light-heartedly to her bedroom.

[*Christmas Number.*

But the stranger — what was he thinking? How had the vision of Kitty affected him?

CHAPTER II.

HIS wallet was heavy, but his head was light. The thought of the mineralogical specimens had been driven clean out of his head by the vision of Kitty. He recalled the first glimpse of her, poised on the rock, with the soft, white draperies floating back, and her face uplifted in welcome to the kisses of the southerly breeze. How quickly she had vanished! And what a charming expression of surprise when, asking his way, she turned so suddenly and confronted him! In contrast with the shouts and laughter of the picnic-party—stilled, however, when he appeared and spoke, and inquisitively interested in their interview—her voice was like the breathing of delicate music. She was not of their company, for when they parted she disappeared beyond the rocks, and the picnickers became hilarious again.

Ere he came to the steeple he must turn, she had said, to the right, and work his way toward Treloyhan through the broken ground of Wheal Providence. There was the steeple, directly ahead of him, with its protective copper-tipped point projecting above the firs; and here were the workings of the mine, disused, neglected, like a big open scar on the once fair face of the earth. Whatever the name might be, the workings which the name denoted were far from tempting; but he plunged into them and made his way through them, associating the name, as he had associated the thought, with Kitty's radiant vision. Not the broken ground, but her words of direction, were his Wheal Providence. Who could tell what that chance encounter might mean? He turned to the right, and kept to the right till he reached the open road, and straight before him he saw his destination.

He was too light-headed to moralise. Enfolded in the turn to the right and the keeping to the right, as in a simple parable, lay the trueness and happiness of his life; but of that he thought not—could not think—because he knew not what was coming. The vision had affected him—or was it the tonic properties of that wonderful air?—like a draught of old and mellow wine. He was strangely light-headed for a sober scientist—a man of learned research, with a privilege, granted by many diplomas, of placing at the end of his name a whole row of mystic letters. At the foot of a carefully drafted report on the mineralogical specimens with which he had weighted his wallet those mystic letters would appear in a day or two. But specimens, and report, and letters, and everything else connected with them, were forgotten, lost in the light of the recollection of Kitty; and when he gained the open road and saw St Ives below him, a ridiculous nursery-rhyme suggested itself, and began to dance fantastically through the avenues of his brain. He soliloquised:

> 'Kits, cats, sacks, and wives—
> How many met I going to St Ives?

No difficult problem that, for the one man met possessed them all. Seven wives! I pity him; unless, indeed, he was a greedy chap to appropriate all the seven. He left them behind him—sacks, and cats, and kits, and all the multiplication of sevens—and came out quite alone. And no wonder! Now, what put that silly thing into my head? Going to St Ives, I suppose. And yet—and yet—it must be the girl at Trencrom. Seven wives! H'm—seven is the perfect number; and she would be seven in one—perfect! But who is she? I cannot name her. I know not where she lives. Strange that a girl seen at random should so affect me, when all these years my heart has been as hard as the nether millstone—very strange! Shall I meet her again? I hope so.' Musing in this way, he reached the hotel.

The specimens were left in his bedroom for closer examination on the morrow. He dressed for dinner, and after dinner strolled into the town. A local band was playing loudly on the Malakoff. Visitors and residents were promenading round the bandstand and up and down the terrace to the lilting strains. The music had no attraction for him. He descended the steep and narrow street to the Passmore-Edwards Library. A map of the neighbourhood hung upon the wall. The obliging librarian brought him a directory; and, aided by this, he carefully inspected a part of the map, asked a question or two, and pencilled a name and address in his pocket-book. Then he returned and indulged in a meditative smoke, overlooking from the open veranda the beautiful beach of Porthminster, and dreamily watching the shimmer of the moonlight on the moving waters of the bay.

His first business the following morning, after a plunge at Pednolver and a substantial breakfast, was to write a formal note and despatch it to the name and address he had copied in his pocket-book. Then he gave himself to a long and leisurely examination of the mineralogical specimens. He did not attempt to crush them. Only by reduction and a prolonged scientific process in a properly fitted laboratory could their intrinsic value be finally determined; but he was more than satisfied by the scrutiny he was able to subject them to, and packed them up in a box he had bought, ready to send away by registered parcel-post.

'Heigh-ho!' he exclaimed, glancing at his

watch and stretching himself; 'I've half the day before me. What shall I do? It's no use writing the report until I've interviewed this Mrs Vivian; so that must wait, and this'—and he tapped the box—'until to-morrow. Shall I go to Trencrom? For a sight of the girl I would, and farther. But will she be there to-day? And if she is, what then? I could not ask her again the nearest way to St Ives without giving her the impression that I was a lunatic. Nor could I ask her the nearest way to anywhere; it would be too utterly transparent an excuse for another word or two. She would resent it. My presence, even, a second time in a place so sequestered might alarm her. No, that would never do. She's like a bird—a combination of dove and gull, gentle, but ready for flight, and not to be caught by open approaches. I must trust to chance to meet her. This oxide of uranium may do it'—and he tapped the box again—'for, should all go well with an accommodating Mrs Vivian, I shall have to stay a fairly long time. Goodness! what shall I do? I'll run over to Lelant. The links are good, they say—eighteen holes in rabbit-cropped turf, and sandy hollows, and spike-like bents, with capital sporting hazards; and, yes'—as he looked out of the window—'the breeze is off the sea.'

So away he went to Lelant, and met with company there—golfers like himself, who were glad to include him in a foursome; and he played well, recalling the image of Kitty and wondering if she were a golfer too, and never gave a thought to the formal, business-like missive to the unknown Mrs Vivian, nor dreamt of the effect it was producing as she and Kitty excitedly discussed it in the garden under Trencrom.

'You will see him, of course?' said Kitty.

'I cannot refuse, my dear,' returned her mother.

'Who can he be?' mused Kitty. '"Porthminster Hotel" — that doesn't enlighten us much; all sorts of people stay there. "Mr Cecil Lambert" sounds well; and he "presents his compliments," *et cetera*, and "understands that Mrs Vivian is the owner of Wheal Catherine, a small mining property near Trencrom," and asks for an interview to-morrow at three. H'm—he might have written a little more; there's a blank half-sheet. It's rather tantalising, mother, isn't it, and almost curtly correct?'

'He's a stranger, Kitty.'

'So he is, and we must wait till to-morrow at three. What can he want? To reopen the mine, or explore it, or purchase it, or what? Oh mother!' she exclaimed quite loudly, and fixing upon her incredulous eyes.

'What is it, my dear?'

'I know who he is.'

'You do?'

'Yes—at least, I think so. You remember the gentleman'—— and Kitty finished her remark by an elevation of the eyebrows.

'Who asked you the way to St Ives? Yes, it is not unlikely. But what should he want to see me for?'

'To apologise, mother—that's it. It must be!' and Kitty's eyes sparkled with mischievous excitement. 'He appropriated your property. I saw him. His wallet was bulging with the output of Wheal Catherine—positively bulging, crammed with it—and all collected without permission, and carried away with no word of thanks. It's a visit of reparation, mother. He's made inquiries and discovered the owner; and now he's coming to ease his conscience, and restore the specimens, and prevent prosecution, and'——

'Kitty!' she remonstrated, covering her ears.

'Yes?' returned Kitty demurely.

'You're like a rattle.'

'Because I'm shaken, mother, and the noise I make is proof that there's something in me.'

'Only nonsensical guesses, I fear.'

'Well, we shall know to-morrow at three.'

To-morrow came, and three, but no visitor. At a quarter-past Kitty knitted her brows, and said he was very unpunctual. At half-past she became severe, and declared he wasn't worth waiting for. At a quarter to four she gave him up, and with a resigned expression—a trifle forced and tinged with disappointment—resumed her filmy fancy-work and relapsed into silence.

The gate swung open, and rapid footsteps were heard on the gravel. In response to the bell—jerkily pulled, as if the ringer were in haste—the maid ran to the door and showed the visitor into the drawing-room. She brought back with her a visitor's card. Mrs Vivian glanced at it, started a little, nodded a dismissal to the maid, and glanced at it again. Kitty never raised her head. She pretended to have lost all interest in the visitor. The intricate pattern materialising under her nimble fingers seemed to be absorbing all her thought.

'Kitty!' breathed her mother. The tone, low and insistent, and with a touch of surprise in it, compelled attention.

'Yes?' said Kitty, dropping her work and taking the card. 'Oh—why, he's a savant, mother, distinguished and scholarly! I must be mistaken. This cannot be the gentleman I mentioned to you, but some one older—much older. However, you'll soon see. Don't keep *him* waiting;' and she settled to her work again.

'But, Kitty, you'll come too?'

'There's no need.'

'If there is, I'll call you. Shall I?'

'If there is,' repeated Kitty doubtfully; 'but he's called to see you, mother, not me.'

She was disappointed that the visitor, as she supposed, was not the man she expected. But

relieved, nevertheless, to be able to keep the man she expected in her good graces as a man likely to be prompt. That it might not be dilatoriness but a quite excusable delay never suggested itself to Kitty, nor did it strike her that the stranger she had spoken to was ignorant of her name and unaware of her connection with Wheal Catherine.

He was standing, hat in hand, as Mrs Vivian entered the drawing-room. She knew at once that it was he, and not some older man, despite the fact that he had left the Norfolk suit behind him, and was dressed faultlessly for the call. She took the change of attire as a delicate compliment to herself. His face was flushed with rapid walking, and a dewy perspiration covered his brow.

'Mrs Vivian?' he queried, afraid, after all, that he had made a mistake. He was looking for the appearance of a lady considerably older. 'This is Renowan, I believe?' And she gave a silent assent to both the queries by the suggestion of a bow. 'I have to apologise for the delay. I hope it has not inconvenienced you. I thought your residence, Renowan, was in the village of Lelant. The postal address misled me. So I booked to Lelant and inquired of the stationmaster there, and found, too late to remedy the delay (for there was no conveyance to be had), that it was quite on the outskirts of the parish. Pardon me!'

'I am sorry you have had so long a walk, and so discomforting, too, in this heat. Sit down, please. Our nearest station is Carbis Bay.'

'Yes; it was very stupid of me not to make sure of it before I left St Ives. Then I should have been here in time.'

'It was a natural mistake, Mr Lambert.'

'I must not detain you after keeping you waiting so long. I have called about Wheal Catherine.'

'Don't mention it. The specimens are valueless to me; and if they were not, you are heartily welcome to them.'

'The specimens!' echoed he, at a loss for the moment to understand so inconsequent a rejoinder. 'Oh, I see! You mean those with which I filled my wallet the day before yesterday. I helped myself, certainly,' and he smiled; 'but the place seemed deserted. Was I trespassing? If so, I am sorry, and must apologise again.'

'I thought you meant the specimens when you referred to Wheal Catherine,' said Mrs Vivian, a trifle disconcerted. 'My daughter saw you, from the top of the hill, collecting them.'

'Indeed! Was that your daughter who kindly pointed out to me the nearest way to St Ives?'

'Yes, that was Kitty.'

'It was the mine itself I came to see you about,' said Lambert after the slightest perceptible pause. 'Would you sell it?'

'Sell the mine!' exclaimed Mrs Vivian, completely taken aback by such a proposal.

'Yes,' returned Lambert. 'Would you be willing to enter into negotiations for the disposal of the property? It is yours, I believe, and freehold. You could sell it, couldn't you?'

'Outright, do you mean?'

'That would be preferable to a lease; but in case you do not wish to sell'—and here he hesitated a little—'in case you are advised not to sell, a lease might be arranged, perhaps, on mutually profitable terms.'

'I scarcely know what to say, Mr Lambert. I never expected to receive an offer for it. I thought it was worthless. You must give me time to think it over. I must consult Kitty about it. You see, it is my daughter's almost as much as mine—that is, it will be hers; and she should have some say in the selling of it—or in the leasing of it, if it can be leased. Shall I call her in?'

'If you please.'

He was really delighted, but did not dare to show it, and awaited the appearance of Kitty with a measure of gladsome, nervous excitement. The name, when first it was spoken, had clinched itself into his brain. 'Kitty—Catherine!' he mused while the mother was out of the room. Instead of summoning Kitty, she had excused herself and gone to fetch her. A word of warning was necessary, and a word of explanation, to save Kitty from embarrassment and surprise. 'The name of the girl,' said Lambert to himself, 'and the name of the mine are alike. But the mine is older than the girl; it cannot be named after her. It is older than her mother. It must have been named after some previous Catherine. I wonder what the history of it is.' But the wonder was cut short by the mother's return, accompanied by her lissome daughter.

'We have met before, Miss Vivian,' said he, standing and bowing, 'though informally and without introduction: I did not expect to have the pleasure of meeting you again to-day.'

'My mother tells me that you want to buy Wheal Catherine,' said Kitty with a swift and radiant smile.

'Not exactly that;' and the humorous twinkle in his eyes kindled at Kitty's direct and personal method of putting it. 'I called to make inquiries only—to ascertain, and not for myself, but for others, whether you would be willing to sell it, or'—and again he slightly hesitated—'to lease it, if that would be better for you.'

'Come, mother, what do you say?' asked Kitty, waiting.

'Say, Kitty! What can I say?' returned Mrs Vivian helplessly.

1909.]

'That our willingness may be taken for granted,' said Kitty.

'Yes,' she assented; 'I can say so much.'

'And that is enough, I suppose, to begin with?' and Kitty appealed to their visitor.

'Quite,' said he. 'I cannot reasonably expect anything more.'

'We cannot dispose of the mine as we could of a crate of broccoli,' laughed Kitty. 'And we cannot lease it, can we—that is, if we decide to lease it—without a deed of some sort, and signatures, and witnesses, and provisos, and all that? We shall have to consult a solicitor.'

'One you know, and can trust, and who has acted for you before,' put in Lambert.

'Old Mr Kitto,' said Mrs Vivian.

'Is he your family lawyer?' asked Lambert.

'He was, when the family needed one,' and she smiled pathetically; 'but I and Kitty have seldom troubled him. The documents of Wheal Catherine are lodged with him.'

'And he lives——?'

'In Penzance.'

'Then, when you have decided whether to sell or lease—and I would advise you to consult Mr Kitto about that—negotiations can be opened between him and the solicitors for the syndicate.'

'Oh, it's a syndicate?' said Kitty as Lambert rose and prepared to go.

'Yes; but I 'm not a part of it, Miss Vivian—only the servant of the syndicate for the time being.'

'We are having tea in the garden,' said Mrs Vivian. 'Will you join us?'

He glanced at Kitty, noted the tender flush upon her face, and with a joy in his heart like the springing of a fountain, expressed his thanks and readily consented.

CHAPTER III.

'THIS is a premium on delay,' said Lambert as he sat in the shadow of a gigantic fuchsia and watched his hostess pouring tea.

'Coming or going?' asked Kitty archly.

'Both. I was late in coming, and you invite me to tea; I shall be late in going, and carry away with me the recollection of your kindness. It is very good of you to treat me in this fashion, but rather dangerous.'

'Why?'

'Because it is a temptation to repeat a fault of which I am seldom guilty.'

'This is our usual hour for tea,' said Kitty—'five or thereabout; so you can time your next interview, Mr Lambert—there will be a next, of course, and one after that—to join us again.'

'If you will allow me!'

'We shall be delighted,' said Mrs Vivian. 'Sugar and cream?'

'Three pieces of the first, please, and'—

'Oh, Mr Lambert, and in such a tiny cup!' and Kitty laughed and shook her head in playful remonstrance.

'It brings out the flavour,' he returned gravely, but with glinting eyes—'well out, almost to disappearance—and I prefer it so. That is why I said three pieces, and was about to say cream in proportion.'

'Why, you will never taste it at all,' expostulated Kitty, 'but only the sugar and cream!'

'Which are more to my taste, Miss Vivian, much more, than the tea,' he said as he sipped it; then, to make amends, 'The tea is delicious. What a charming view you have from here!'

'Isn't it lovely?' said Kitty.

'It is indeed!' and he allowed his eyes to wander over the wide prospect and to rest at last upon the castle-crowned crag of St Michael. 'It would be difficult to beat. Whoever built the house had an eye for the beautiful.'

'My grandfather built it—he who opened the mine, you know; but his wife selected the site,' said Kitty.

'So he called the mine Wheal Catherine?' observed Lambert reflectively.

'Yes, after his wife.—Isn't that so, mother?'

'It is, my dear,' responded Mrs Vivian. 'Others did the same. There are lots of them about—mines called after women, long since gone, whose names were supposed to be lucky; and now, alas! the mines are as silent and perhaps as forgotten as they.'

'Wheal Catherine may be an exception,' suggested Lambert.

'If the syndicate works it,' added Kitty.

'Oh, they 'll work it,' returned Lambert, 'if you 'll give them the chance.'

'For copper?' asked Mrs Vivian.

'As a by-product, perhaps,' said Lambert thoughtfully; 'but, no, not for copper. That wouldn't pay as prices are now ruling, except as a by-product. But they 'll work it. Copper didn't pay in your father's time, Mrs Vivian?'

'Not always.'

'And he lost money by the mine?'

'Much.'

'Ah!' He refrained from further questioning, wishing to avoid the appearance of inquisitiveness—in fact, in his present mood (a troubled one, deftly concealed), willing to remain in ignorance—and changed the conversation to a lighter vein. The ladies responded, and all too soon for him and them the time came for his departure.

He crossed the meadow and passed through the plantation; but, instead of climbing over Trencrom and taking the nearest way, he kept straight on. This led him into the main road.

[*Christmas Number.*

Quiet as it was, and, after the turn, direct to his destination, he crossed it, and sauntered down a narrow pathway to the eastern extremity of Carbis Bay. Here a high, sloping promontory known as Carrack Gladden thrust itself boldly into the sea. Westward, where the turf ended above the precipitous black rocks, he turned into a thread-like path along the cliffs, used by hewers and coastguardmen, and followed it slowly, in all its dips and rises and all its windings in and out, in the direction of the quaint little town.

He was thinking deeply. No necessity now was there to hide his troubled mood. With brows knit, and picking his way mechanically, he went, nor allowed his eyes to rove among the beauties of his surroundings. His vision was inward. He was working his way mentally toward an irrevocable decision, and, as he came nearer to it, marking out the steps he must take to render it irrevocable. He wanted information. Something he knew; but he wanted fuller information to clarify his purpose and strengthen him in it, and somehow he must get it. But how, and where? He thought of Mr Kitto and smiled. He was an old man, discreet, doubtless, and faithful; but before Lambert could see Mr Kitto, he must secure his independence and be free to act without reproach.

He devoted the evening to the preparation of his report, and in the morning despatched it with the box of specimens. He was confident that the pitch-blende picked from the débris of Wheal Catherine would amply confirm every word he had written. Laboratory tests were to follow, scientifically exact; but he was not afraid of these. He was sure, indeed, that the results would exceed his estimate. His reputation was at stake, and he was careful that the error—if error there were—should be on the right side. Included in the report was the information he had been requested to obtain: that the mine was freehold; in the possession of Mrs Vivian, Renowan, Lelant, to whom it had come by inheritance, and who could doubtless show an indefeasible title; and that she was willing to negotiate through her solicitor, Mr Kitto of Penzance, for its acquirement by the syndicate—if not by purchase, then by lease. He inserted of set purpose the solicitor's name.

The report was accompanied by a letter. It began in a purely formal manner, but ended with a paragraph quite personal, and, to the syndicate, disappointing and unexpected. He thanked them for the offer they had made him of a seat on the directorate, which, however, he begged respectfully to decline. He was not free to take it. Moreover, with the acceptance of the report, and its verification by the testing of the specimens, he must sever his connection with the syndicate. The work he had undertaken would then be completed.

The chairman wired him to reconsider his decision, to which he replied by wire that his decision had been arrived at deliberately, and must be regarded by the syndicate as final.

Several times during the next few days he asked himself, 'Am I justified in this?' Then, when a full week had passed, he said, 'I will call on Mr Kitto.'

Guided by the name on a brass door-plate—from which, however, it had been almost polished away—he presented himself in the lower office and sent up his card. The elderly clerk reappeared at the top of the stairway and beckoned him to ascend. In an upper office, fronting Market Jew Street, lined with deed-boxes, and containing an old-fashioned escritoire, surmounted by a glass-fronted bookcase full of leather-bound volumes on the law, he was received in a stately but courteous fashion by a gentleman, small in stature, very erect, with a thin, sharp face and deeply sunken but very bright brown eyes. He was dressed entirely in black, relieved only by the whitest of white stocks and the gleaming crystals of a gold pince-nez dangling in front of him. Lambert's card was in his fingers.

'Mr Lambert, I believe,' said he in a dry, clear tone as he put up the pince-nez and glanced at the card—'the gentleman mentioned to me by my client, Mrs Vivian? Take a seat, please. You have called, I suppose, about the proposal to buy or lease Wheal Catherine of Trencrom?'

'It is out of my hands now, Mr Kitto.'

'Indeed!' and he raised his bushy eyebrows. 'Does that mean, Mr Lambert, that the proposal is withdrawn?'

'No; it only means that I am no longer the servant of the syndicate. The negotiations will be opened and carried on between you, if you are acting for Mrs Vivian'—— and here he paused for a reply.

'Oh! yes,' returned Mr Kitto, 'Mrs Vivian has instructed me to proceed.'

'Between you,' said Lambert, picking up the thread again, 'and the syndicate's firm of solicitors. My work is finished.'

'Then to what am I indebted for your call?' asked Mr Kitto, a trifle puzzled, but quietly awaiting developments.

'I am seeking information, in the first place,' replied Lambert; 'and in the second, I am ready to give it, if necessary, up to a certain point, that the interests of your client may not suffer.'

'Yes?' returned the solicitor guardedly and in a non-committal tone.

'You know the history of Wheal Catherine. Would you mind telling me something about it?'

'In what way, Mr Lambert?'

'Whether your client has lost or gained by it?'

'Lost, and heavily—not directly, but through what her father might have left her if he had not devoted all his wealth to the exploitation of the mine.'

'His wealth was considerable?'

'A fair fortune, sir, as fortunes go in a district so remote as this'—and Mr Kitto allowed his features to relax into the semblance of a smile—'enough to have provided well for my client and her daughter.'

'Did the mine ever pay?'

'The dividends which accrued from my small venture in it point that way.'

'Then you were interested in it, Mr Kitto?'

'At one time, and to a very limited extent. Mr Vivian, my client's husband—not her father; he was dead—paid me out, and others also, and worked the mine alone.'

'Successfully?'

'Alas! no.'

'The mine is now considered worthless?'

'That's as may be,' returned the solicitor cautiously. 'It depends upon the views of the purchasers. They wouldn't propose to buy it if it were worthless.'

'In the opinion of your client, I mean.'

'She cannot utilise it. Not a single penny has she got out of it since her husband's death, nor will she, perhaps, if the syndicate decline to purchase it; but that is no reason why she should sell it for "an old song."'

'None whatever,' responded Lambert. 'But I take it, Mr Kitto, you will act under instructions; and seeing the property is unproductive, and likely to be of no use at all, in fact, to Mrs Vivian, she may be inclined to let it go for a very small sum, or to lease it to the syndicate on terms so low that she will derive from the transaction no appreciable benefit. That, considering the amount sunk in it by her father, and her husband's unremunerative toil, would be a pity.'

'More than a pity, sir,' said Mr Kitto with the nearest approach to warmth he had yet shown—'an injustice, if there is money in the mine. A fair return, or as near as we can come to a fair return, for the outlay of her father's wealth and what her husband expended on Wheal Catherine should be secured to Mrs Vivian. Her inclination to deal too easily must be checked. She must be protected against herself. She is a simple-hearted lady, sir—confiding and generous, unacquainted with the ways of the world, and as good as the Gospels, if I may reverently say so; and Miss Vivian is her mother's daughter, brightly reflecting all these gracious qualities, with something superadded of vivaciousness and intenser life.'

'I quite agree with you, Mr Kitto,' returned Lambert gravely; 'and I thank you.'

'Thank me! Why?'

'For the words you have just spoken. They confirm my own ideas of the lady and her daughter, and express them in language better than I can command; and behind them, in your case, to give them weight, is a long and intimate acquaintance that I cannot boast of. I have only known them a few days.'

'I can see we understand each other, Mr Lambert,' said the solicitor with a kindly gleam in his eye, 'and so I may venture to put a plain question to you—more than one, perhaps, if you will allow me. Answer or not, as you please and in any manner you please. Information such as you can give me—or hints, even—will clear the way and assist me to serve my client to the best possible advantage. I naturally object to work in the dark. What would you advise—a sale or a lease?'

'A lease, Mr Kitto.'

'Long or short?'

'Short.'

'Thank you. Your advice is based, I believe, on very sound reasons, and with a view to benefit Mrs Vivian. I lean toward a long lease myself, but you are better informed than I am. Mrs Vivian would sell outright and invest the purchase-money in gilt-edged securities—make sure of it, that is, and give up Wheal Catherine gladly.'

'Her income would be larger eventually by retaining her rights in Wheal Catherine, and quite as safe.'

'She informed me in the interview I had with her of what you had said about the syndicate—that the copper, except as a by-product, was not what they were after, but something of greater value.'

'The copper will scarcely count.'

'Indeed!' and Mr Kitto forgot himself, opened his eyes widely, and stared at his visitor in genuine surprise. 'What is it, then, that will make it worth their while to reopen Wheal Catherine? It is one of the deepest mines in the county; the levels are all flooded; new machinery will be required. All this, Mr Lambert, as you very well know, means an enormous initial outlay. What is it they are hoping to find? Gold?'

'Not hoping, Mr Kitto, but certain to find: and not gold, but something far richer. Nor, for a time, will they have to trouble themselves about the shaft and the levels underground. The extensive refuse-heaps upon the surface will furnish them with ore sufficient for their purpose for some years to come.'

'You surprise me, Mr Lambert!'

'Wheal Catherine is particularly rich in a special quality of pitch-blende, or, to give it another name, oxide of uranium. It was rejected and dumped upon the surface by the miners of forty or fifty years ago. They were ignorant of its properties; so were the scientists of that day. But knowledge has advanced, Mr Kitto; and in the rubbish of the miners of Wheal Catherine is concealed a valu-

[*Christmas Number.*

able product—so far as we know, the most valuable and the most wonderful of all the products of Nature's mysterious laboratory. It will be difficult to get it; but it is there, as a residuum after the extraction of everything else, in payable quantities, too—at sixteen thousand pounds per gramme, its present price, or if the price should fall considerably below that figure.'

'Why, you mean'—— But Mr Kitto held his breath in his amazement.

'Radium.'

'And you would still advise a short lease?' asked the solicitor after a full minute's silence, during which the clock ticked audibly.

'Certainly, and for this reason, Mr Kitto. No one knows whereunto this may grow. Around the mines of the Erzgebirge, in Bohemia, controlled by the Austrian Government—the only source as yet whence radium has been obtained—a spa has sprung up, supplied by the curative waters from the mines. Wheal Catherine is flooded, you say; and it is quite within the bounds of possibility that a similar spa may spring up at Trencrom. No finer situation for a sanatorium than the granite-capped hill behind Renowan could be found in the whole of your beautiful county—a sanatorium, too, which would speedily become famous because of the curative properties of its radio-active waters.'

'An alluring prospect, Mr Lambert,' returned the solicitor—'a very alluring prospect. If what you say is true, or the half of it, many another beside myself will greatly regret that ever we parted with what we supposed to be our worthless shares.'

'But Mrs Vivian will be provided for—and her daughter.'

'Handsomely.'

'They ought to be, considering what they have lost,' said Lambert, 'and that is my chief concern.'

CHAPTER IV.

MANY months passed away. The short winter of the far west came and went, with its high saline winds and its low-drifting rains; and the spring burst upon the land in fits of gleaming sunshine and a bewildering profusion of blossoms and flowers. Men were at work upon the débris of Wheal Catherine. A seven years' lease had been dexterously drafted by Mr Kitto and reluctantly accepted by the syndicate, and with its wafers and signatures now reposed, crisp and clean, among older and mustier documents, in the deed-box of the mine.

Mrs Vivian and Kitty were no longer poor. In prospect they were rich, but they were not one whit the happier. Kitty was not so happy; she sang less; her footstep lost its spring, her cheek its perfect curve, her eyes their sunny radiance; in her lap, unheeded, lay the fancy-work, and her fingers, once so nimble, glancing in and out among the threads, drooped inert or plucked at the pattern, while a pensive expression crept into her face, and she looked out, seeing nothing except the shadowy pictures in her own brain.

Spring had come, and the garden was ablaze with colour; all the banks were primrose-strewn, and the golden gorse glorified the rocky slopes of the great gray hills; the woods were breaking into every shade of russet and green, and all around them the birds were wildly calling. But the charm of it was lost upon Kitty. She seldom climbed Trencrom; and yet the views from the top of the rough old hill were lovelier now, gleaming with colours more wonderful, than at any other period of the year. The silvery distances, through an atmosphere rain-washed, pellucid, and magical, would not repeat themselves until another spring; nor would the air be quite so sweet, nor the sea so glorious, nor the tide of life (in all things warm and sentient) so full and strong. And Kitty knew it and cared not, but sat at home with a sad face, thinking, much to her mother's concern.

'Mr Lambert has not written you?' Kitty remarked in the first of these solitary months.

'No, my dear. Everything is being arranged through Mr Kitto and the solicitors for the syndicate. Mr Kitto told me at our last interview that Mr Lambert's work was completed.'

'He has severed his connection with the syndicate?'

'I suppose so, if we may call it a connection, Kitty. His name is not on the directorate, and never was, Mr Kitto says. He was simply sent down to investigate and report as an expert, and recommended Wheal Catherine as the most suitable mine for the commencement of the syndicate's operations. He was not a member of the syndicate, but only a temporary professional adviser; and, with the payment of his expenses and his fee, his connection with it, such as it was, would naturally cease.'

'Then why did he assent to my playful suggestion,' said Kitty sharply, 'that a second interview with you, and possibly a third, would be necessary?'

'Did he?' and Mrs Vivian glanced at her daughter apprehensively.

'Yes. Don't you remember? I told him he had better time them to take tea with us;' and Kitty blushed a little. 'It wasn't very nice of him to say nothing if he knew that he would not come again.'

'He may have passed it by and answered you, Kitty, in keeping with your own jocular humour. I remember it. But I thought no more about it. Nor did he, evidently. You

shouldn't be piqued, my dear, at a small matter like that.'

'I am not piqued, mother; only I like people to be frank and not leave behind them a false impression. I certainly thought—so did you, mother; now, didn't you?—that he would have to come again, and more than once. And he went away and allowed us to think so, taking no trouble to correct it, and knowingly leaving behind him a false impression.'

'Kitty, you are regarding it altogether in too serious a light. Mr Lambert was a stranger; he rendered us an excellent service, it is true, but true only because we happened to be the fortunate possessors of Wheal Catherine. Still, he was a passing stranger, and you are speaking about him as if he were an old and familiar friend.'

'I wish we had never seen him!' said Kitty bitterly, after a long pause.

To this outspoken regret her mother made no response except by a repetition of the apprehensive glance. There was something wrong with Kitty. Too readily, perhaps, she had given her heart to this passing stranger; and he, unaware of the gift, or despising it, had left them without even a word of farewell. Had Kitty's heart gone with him, or would she recover it? Her mother hoped—prayed almost—that it might prove to be an evanescent fancy; but as the months went by and Kitty became increasingly reserved, apathetic, listless, absorbed with her own reveries, the radiance dimmed in her eyes, the sprightliness gone from her movements, she began to be afraid that, after all, Kitty's heart was irrecoverable, even though it might be less to the scientist than a piece of pitch-blende from the débris of Wheal Catherine.

Kitty never mentioned him. After that first brief conversation she remained resolutely silent, a sign to her mother that her heart was really gone.

Distressed, and scarcely knowing what to do, Mrs Vivian consulted Mr Kitto.

'Have you called in a doctor?' asked Mr Kitto after he had heard of the change in Kitty's appearance and demeanour—a change which he had noticed himself.

'What's the use?' returned Mrs Vivian. 'She would decline to see him.'

'Then take her away. Let her have a little more life—a month in London, say, and then a run on the Continent. You can easily afford it.'

'If that would cure her. But, Mr Kitto—you are an old man, a friend of my father, and of mine, and Kitty's friend too, and I can speak to you—it is not a question of health; not entirely, that is, and she cannot be cured in that way.'

'Then what is it, pray?'

'It is the old question, Mr Kitto—the oldest of all—and one that a woman, the woman concerned, must be silent about, and will hide sometimes from those who are dearest.'

'Ah!' The exclamation was almost a sigh. Mr Kitto was suddenly perturbed, and began to polish the crystals of his pince-nez with nervous rapidity. 'I see! I see! But how can I advise you? Until it comes to settlements and matters of that sort, I am useless; and I gather from what you say that the—the—question, if I may call it a question, is in quite an incipient stage. Who—who—is he?'

'Mr Lambert.'

'Bless me!' and his manner changed entirely. He lifted his flashing eyes to the ceiling and seemed to gather therefrom a sudden illumination. He was no longer perturbed, but alert and decisive. The clue to Lambert's conduct, which, as he thought it over, had considerably puzzled him, appeared to be in his fingers at last. A faint smile softened his features as he said, 'He doesn't know of this?'

'How can he?' returned Mrs Vivian. 'He led us to think that he would call again, and then—without excuse, without explanation—he vanished completely. Rather strange, wasn't it, Mr Kitto?'

'Rather,' murmured the solicitor, almost lost, however, in his own reflections. Then, rousing himself, he said, 'Leave it with me.'

'May I? Thank you! It's a secret, of course—yours and mine. Do what you think best—best for Kitty, who needn't know, and best for him. It's a great relief to me to tell you.'

When Lambert tapped the box of specimens and expressed the hope that the oxide of uranium would keep him in the locality for some time, he was quite sincere; and, until after his interview with Mr Kitto, he fully intended to call at Renowan a second time, and a third, and indeed as often as he could find a reasonable excuse for. It was only upon reflection that he decided to flee. Kitty would have none of him now—so he imagined. She was likely to be rich—if all went well, sure to be rich. To cultivate her acquaintance now, and wait for its ripening, and then propose, would be taking an advantage of a position he had not foreseen—a position, too, of his own creating—when, with no ulterior motive, but out of a simple desire to secure for her and her mother the fruits of an investment and an industry which they were both entitled to reap, he had revealed to Mr Kitto the intentions of the syndicate and the possibilities of Wheal Catherine. He was conscientious to a fault, and extremely sensitive. Rather than expose himself to a charge of self-seeking, and run the risk of a scornful refusal of his offer, because, as many would say and Kitty might think, he had cunningly worked for his own ends, he went off with a sore heart and said nothing.

bearing in silence the greatest disappointment of his life.

'Mr Kitto!' he exclaimed, springing from his chair in the London office and extending his hand in welcome to the old solicitor. 'It is very kind of you to look me up! Are you in town on business?'

'I am,' said Mr Kitto somewhat grimly, but with a humorous gleam in his deep brown eyes; adding, after a pause, 'With you.'

'With me? Well, sit down and tell me what it is, unless we may postpone it and discuss it over dinner. What do you say?' For Mr Kitto was visibly tired after his long journey.

'Thank you, that will be better. After dinner, however, not over it—when my pipe is alight. It is not exactly professional business; and if it were it could wait, at any rate, for an hour or two.'

Across the hearth in Lambert's comfortable quarters they faced each other—the solicitor with his pipe, the scientist with his cigar. Between them, softening the features of both, were the faint gray wreaths of fragrant tobacco. They had dined excellently. Lambert waited for his visitor to begin.

'I want you to go back with me.'

'When?' asked Lambert in surprise.

'Immediately—by the night mail, if you can.'

'Why?' And Lambert's surprise increased.

'For your own happiness and the happiness of another. Listen!' for Lambert was about to interrupt him. 'I am an old man and very lonely. Once, when I was younger than you, I made a mistake—a costly mistake. I am paying for it now, as I have paid for it continuously through fifty long years of loneliness and a regret impossible to overcome. A super-sensitiveness, the fear I had that my motive might be impugned, deterred me from a venture prompted by my heart. I shrank from it and kept silence, fool that I was—if you will pardon my saying so, for I am aware that my words have a double edge. I could have borne it better if I had suffered alone; but I didn't. Another suffered, and from worse than loneliness; and when I discovered it, alas! there was no remedy. I have come to tell you this, and to prevent, if I may, the recurrence of a similar catastrophe.'

A long silence fell between them, broken at last by Lambert, who said, 'You have a good reason for coming?'

'The best.'

'I am greatly indebted to you;' and he stretched out his hand to clasp that of the older man. 'We will catch the night mail.'

The brightness of the afternoon tempted Kitty to the top of Trencrom. She settled, like a brooding bird, upon her favourite rock. The sunshine was all about her. In the distance, divided by the undulating land, the sea shimmered like a pair of burnished silver mirrors. Far above her, invisible in the blue, a skylark sang in exultant ecstasy; his heart was full, and the music fell in a long, thin shower—a sparkling cascade of delightful sounds—to his listening mate below. So insistent was the song that Kitty was compelled to share the joy of his mate, and listen also. Presently, across the shrillness of the skylark's song, came the flute-like piping of a blackbird, notes wonderfully deep and mellow; and Kitty raised herself a little, and searched the higher branches of the coppice in the hope that she would find him. Like the skylark, however, he was invisible.

But some one was walking through the coppice—on the home path, too; not toward Renowan, but from it. And as she watched, startled, he stepped into the high-road, crossed it, and began to climb the hill. Her heart bounded, and the warm blood rushed over her cheeks and brow; she nestled closer to the surface of the rock. He might pass her, unaware of her presence; traverse the top of the hill; and quietly disappear. She hoped he would, then she feared he would; and hope and fear not only alternated, but mingled, as he came steadily upward, rounded the rock, and halted at the foot of it.

'Kitty!' he ventured quietly, after a moment's silence. Her face was turned away from him. She was gazing over the woods, seeing nothing, but endeavouring to steady herself, to grip the nervous emotion that swayed her and master it. His voice helped her. 'I don't deserve it, I know; but have you no word of greeting for me?'

'If you had said "Miss Vivian" I might have had,' she replied coldly and in a tone of disapproval. She turned slowly and fixed her eyes upon his face. Its sadness smote her. 'Where have you come from?' she asked in a softer tone, remembering his approach through the coppice.

'London, *viâ* Lelant and Renowan.'

'And Renowan! You have been home? You have seen mother?'

'Let it be home, Kitty, for both of us, and mother to me as well as you. She desires it, and I with all my heart.'

'And I,' whispered Kitty, yielding; and in a moment he was beside her, where he had seen her first, on the topmost granite boss of old Trencrom.

THE INVISIBLE NUN.

BY W. SHAW SPARROW,

AUTHOR OF 'OLD ENGLAND,' 'THE ENGLISH HOUSE,' &c.

'WE shall be comfortable here till midnight,' said Kellaw, as we settled ourselves in a large bay-window of the long gallery. He spoke in awed tones.

'What comfort after midnight?' I asked.

'None.' His manner was suddenly abrupt and impatient.

'Well then, Kellaw, we have about twenty minutes of enjoyment, and I wish to make the most of it. At present I don't believe in ghosts.'

'Lucky for you! My family has lived with one here in this Jacobean long gallery since the Commonwealth times.'

'What happened then?' I demanded, and our eyes met across the narrow table in our bay-window.

'Heaven knows! A tragedy of some kind, but that's all I can tell you.' He spoke uneasily, and then switched on another bulb of electric light.

'You might tell me what you know about it,' I suggested rather nervously, for at that moment the hoot of an owl came to us from above the chimney-stacks.

'There's a family legend,' said he, 'but you'd not make head nor tail of it. However, here's the story. The Kellaws, under Cromwell, were fanatics, red-hot Puritans, and the owner of this old Hall, Patrick Kellaw, was a ruthless savage. His cruelties were notorious. He had a determined hatred for his eldest daughter Kate, partly because she went over to the papists, and partly because she fell in love with a Royalist, Sir Charles Carew. This man Carew died of fever in 1640, when the king advanced from York to Berwick with his ragged army; and poor Kate took her sorrow so much to heart that she went mad. She dressed herself up as a nun, and wandered about this house at all hours of the day and night chanting prayers. Patrick Kellaw tried to lock her up in her own room; but some servant or other always opened the door, and this rebellion in his own household enraged the savage fool. Servant after servant was sent away, till at last only four persons remained in the Hall: an old cook, Patrick himself, poor mad Kate, and the son and heir, Rupert, a lad of ten, who never left his father's side. One morning it was rumoured that Kate had run away, and the whole country-side went out for days in aimless and useless pursuit, led always by Patrick Kellaw, who swore that his tenants and neighbours were leagued against him, and were determined to hide his daughter. After the search was given up Patrick joined the Cromwellian army, and was shot through the head at Marston Moor. Rupert was brought up by a maiden aunt in London, and this old place was in the hands of caretakers for about twelve years. Poor Kate was forgotten meantime.'

'And the ghost?' I asked. 'When was it first seen?'

'It has never been seen. It is *heard*. Rupert heard it the evening of his arrival here, for I have among the family papers a letter that he wrote to his *fiancée*, Mary Lilburne. But Rupert and his wife don't interest me at all. It is Kate that sticks in my mind; she seems very near to me, and I have a very real and curious affection for her. Can you understand that?'

'Perfectly,' I answered.

'It happened so long ago,' he continued, 'and yet it seems but yesterday.'

'*What* happened?' I asked quickly. 'Have you any guess?'

'I feel—yes, I feel that she was killed, murdered somehow, anyhow,' he replied, looking towards the window. 'And yet I've nothing to go upon.'

'You think about her too much perhaps,' I suggested in a low voice.

'I began to think of her when I was quite a small boy, and now I wouldn't get rid of that habit if I could. Sometimes I awake suddenly in the night, and believe I hear a voice outside my door chanting the *Libera me, Domine*. Then the voice goes downstairs, and presently it comes to me in faint, sweet tones from the great hall. That voice, d'you understand, is my Ophelia'——

Was he mad? Yet something in his tone as he said the last words turned me cold.

'The big clock will strike in a minute,' he went on quickly; 'the boom of it from the great hall is heard here quite distinctly.'

We turned towards the long gallery and listened.

'There it is!' I whispered.

'That clock was made for Patrick Kellaw.' My friend spoke with a vehemence that showed how much he hated Patrick.

'What shall we do now?' I asked, rising from my chair.

'We 'll go into the gallery. I 'll stand at one side, and you at the other, facing me. It 's well to have company.'

We chose a position in the middle of the gallery. Between us was a polished floor about eighteen feet wide; and to the right and left of us the gallery stretched in a dim perspective for rather more than forty yards. The walls, panelled in oak, were hung here and there with old portraits in black frames; and from the ceiling of modelled plaster hung little pendants of electric light just strong enough to illumine everything vaguely.

'A time and place for conspirators!' I suggested.

Tom Kellaw frowned. 'Patrick Kellaw hangs behind you!' he exclaimed harshly, and I jumped around to the panelled wall, startled and dismayed. A portrait met my eyes. It represented a clean-shaven face, with a long, thin mouth, slanting eyes set very wide apart, a broad nose having very large, round nostrils, iron-gray hair closely cropped, and a chin angular and ruthless.

'Hush! Here it is!'

Kellaw's words came in the silence almost like a pistol-shot. In an instant I turned about and looked at my friend.

'You hear it?' he asked, pointing down the gallery.

I listened, and at once distant footfalls were heard, very soft and even-stepped, as if some one walked lightly and thoughtfully. They came nearer and nearer, till at last I could detect the rustling of a dress of some heavy and soft material.

The footfalls passed between us and went on and on; but all at once they became hurried, and a wail of song broke upon the ear, and the words of a Latin prayer trembled in the soprano of a girl's voice. How long it lasted I do not know, but the voice grew fainter and fainter till at last it slipped away from my hearing and was altogether lost. Yet I had a feeling that the prayer was still chanted in some hidden retreat unknown to us.

For a moment I leant against the wall-panelling with my eyes shut, and a wish not to open them. I dreaded to meet the eyes of Kellaw.

'You lean against Patrick!' he cried suddenly, and I sprang forward to his side. 'Come to our bay-window,' he continued, turning from me and leading the way there.

In the recess we sat for several minutes without speaking. Then he said, 'Did you *see* anything?'

'No.'

'But you heard her steps and voice?'

'Oh yes. Very wonderful!'

'Terrible too,' said he; 'for it happens every night, yet I know nothing.'

'Do the footfalls always begin at the same place in the gallery?' I asked.

'Always,' he replied.

'Do they return during the night?'

Kellaw looked at me in surprise. 'What do you mean?' he asked eagerly.

'Why, this. Perhaps the footsteps do return night after night, since they start always from the north end and go to the south.'

'I've never tested that point,' he answered excitedly. 'Shall we do so now, this very night?'

'Of course, old man; and let me suggest another thing. You are more harassed than you like to own by this old family trouble. Why not try to solve the mystery? Something terrible occurred to that unhappy girl, who went mad with sorrow and fancied herself a nun. What that something was may be found out perhaps.'

Kellaw shook his head. 'Not possible,' said he.

'We can try,' I persisted.

'Oh yes, we can try,' said Kellaw wearily.

'My plan is quite simple,' I continued. 'To-morrow night I 'll stand at the far north end of the gallery quite close to the panelled wall, and try to find out precisely where the footsteps begin. If you take up your position at the far south end, near the wainscotting, you 'll see at which point or place the footfalls cease to sound on the oak flooring.'

'What then?' he asked abruptly.

'We 'll strip down the panelling at each end and see what lies behind.'

'I never thought of that,' he said reflectively. 'But the work will be difficult, because at each end of the gallery an old picture is let into the oak panels. They were there in Patrick Kellaw's time.'

'Those pictures, Kellaw, were, then, contemporary with the girl's unhappy life, and from the first they hung in a very bad light.'

'True; and I can't say that I've looked much at the pictures, though they are said to be portraits by Van Dyck.'

'Family portraits?' I asked.

'Yes; one of Patrick, the other of his wife. Both look black and dim. Perhaps they want cleaning and varnishing.'

'It 's light they need, Kellaw—direct light and air. It will be a good action to take them down.'

Kellaw nodded assent, and then asked abruptly, 'Why wait till to-morrow night? Why not begin at once? Unless you 've had enough.'

'As to that,' said I, 'you can trust me to go on. What do you suggest?'

'Listen. If the footsteps return, as you think they may, they 'll start from the south end. There I 'll take my stand, leaving the north end to you. And each of us will take a chair so that we may wait sitting down.

Nerves are apt to be very freakish and uncertain if one stands up to this kind of experience.' He laughed uneasily and stretched himself. The next moment he jerked his head upwards, and glanced at me with whimsical shrewdness. 'If we start at once,' he added, 'we sha'n't have pluck enough to draw back. So come along.'

A few minutes later we had taken up our positions. At my end I could see very dimly the portrait framed in the panelling—an equestrian portrait, with Patrick Kellaw seated on a black charger. I sat sideways, my chair touching the wainscot, and behind me the door into a library. Thence the ticking of a clock came to me, and from time to time the old furniture in the gallery creaked as if to remind me that good timber is always alive and active. Outside, a summer wind played in the ivy and jostled the leaves against window-panes. Then two owls began to hoot questions at each other, and a great longing for the dawn caused me to move restlessly in my chair.

An instant afterwards I started to my feet. What was that? Down the gallery I peered and listened. Yes, from the far end came the sound of a girl's voice singing; it grew nearer and sweeter; the Latin words rang out in full, rich notes; then the voice broke in a wail and stopped suddenly. At that moment it appeared to come from the middle of the gallery, and something—I know not what—set me thinking of Patrick Kellaw's portrait on the inner side-wall.

After the singing ceased I heard the patter of footsteps, and presently I saw that my friend was following them at a distance, treading on tiptoe, and bending forward with one hand raised above his forehead.

Step by step the unseen drew near to me till I could hear the soft rustling of the dress; and there I waited spell-bound, leaning with my shoulder against the portrait. One footfall was muffled, as if constantly in touch with the floor; and, as I wondered over this, the steps came up to the wainscot and stopped dead within a yard or so of my own feet. I gave a sharp cry.

'Don't lose the place,' said Kellaw huskily. 'Mark it carefully. I seem nearer to the mystery,' he cried. 'Where did the footfalls seem to stop?'

'There;' and I pointed out the place.

He fell on his knees and lit a match, and by its flame began to examine the wainscot below the portrait. His hand trembled with agitation and his face looked ghastly. 'Nothing unusual here,' he muttered.

'Kellaw, old man,' I said, 'we've had enough for one night.'

'Too much,' he admitted, pressing his hands to his forehead. 'Never mind, though,' he went on. 'Come, I'll tell you my experience as we go down the gallery.'

He got up from his knees and put his arm in mine. We walked slowly, and stopped here and there to switch off the electric lights.

'When the singing began,' said he, 'the voice seemed to penetrate a great thickness of wall. But it came closer and closer till it appeared very near to me and immediately behind the portrait. Then the footfalls began, as if a door had been opened unknown to me and some one had stepped out into the gallery. Anything more uncanny than that can't be imagined, and I was too afraid to move. The rest you know. The voice stopped singing'——

'Near Patrick Kellaw's portrait?' I interrupted.

'Just so,' he said, and pressed my arm nervously.

'Let's go to bed now,' said I. 'Better discuss the next move by daylight.'

Kellaw accompanied me to my bedroom door.

'If you can't sleep,' said he, 'just think over that next move. Eh—what?'

He was clearly suffering from nervous exhaustion. At breakfast he confessed that he had not slept a wink. 'Poor Kate was in my mind all the time. So I came down at six o'clock and went to the village and engaged two good carpenters. They started work at seven, and will be hard at it all day long. That old woodwork is not an easy thing to displace.'

'You've lost no time, Kellaw. Are we to watch the men at the job?'

He shook his head decisively. 'No; I couldn't stand it. The slow work would annoy me beyond endurance. Let's kill time pleasantly, old man.'

'How?' I asked.

'On the golf-links, eh? Some crack players will be there this morning. Shall we go? Tait's worth seeing—a tiptop man.'

So we spent the day on the links, returning home at seven o'clock. As we walked up the drive to the hall we met the carpenters.

'You've finished, then?' inquired Kellaw.

'The picters are down, sir,' replied one man; 'and as much panelling as we can get in a day's job.'

Kellaw looked keenly disappointed.

'Enough may be down,' I suggested, 'and the men can call in the morning for instructions.'

'True,' said Kellaw.—'Well, good-evening.'

The carpenters touched their caps and moved on, after taking a quick glance at Kellaw's excited face.

'We'll have dinner first,' said he to me. 'If we go now we sha'n't be able to tear ourselves away, and we need food. There's work to be done, old man.'

During dinner many orders were given that astonished the butler. Lamps were to be

put in the bay-windows of the long gallery, a chest of carpenter's tools was to be taken there, and a good pick from the coal-cellar, and no one was to enter the gallery without Kellaw's leave.

Then, turning to me, he said, 'We may need plenty of tools and plenty of light. Which wall shall we attack first—the north one?'

'Yes.'

'Then come along!' he cried, rising quickly from his chair.

It was a quarter to nine when we entered the long gallery, and the twilight of early June filtered through the blinds in the bay-windows. Everything had been prepared for us.

'Get a lamp,' said Kellaw, 'and let us examine the north wall.'

I did as he wished.

'See,' he cried, 'the only panelling which is down is that in which the portrait was recessed! Odd!'

'Why?'

'Because the other panels were more firmly fixed. The carpenters did the easier job first.'

'You think, then, that a part of this wall has been down before?'

Kellaw nodded. 'Cock-sure of it. See here, for instance; just examine this hard plaster.' He tapped the wall with his hand, and his eyes sparkled when he looked at me.

'Yes, yes!' I cried, becoming excited. 'A large hole has been made at one time through this plaster, and when the hole was closed up the workman did his job roughly and badly. The cement is uneven, ragged; it makes an ugly patch that bulges out a little beyond the rest of the wall.'

'Of course it does,' said Kellaw. 'Patrick had a hand in this, I wager,' he continued, hitting the plaster angrily.

'Here's the pick.'

He took it from me and began to strike vigorously. At the end of an hour's hard work we came to a very thick oak door put lengthways into the plaster, and heavily clamped with iron hinge-straps. Behind this wooden defence was a surface of cement, and I tapped it here and there.

'It sounds hollow,' said Kellaw.

'Hollow in places,' I replied, putting my hand on his arm.

For a moment his eyes searched mine; then he said, 'Can't we outline in pencil the space that rings hollow? It will save time. See?'

'Yes;' and we soon fixed the limits of an empty-sounding area of cement that measured about six feet long by four and a half wide.

'It's shaped like a tomb,' Kellaw muttered from behind my shoulder, and his voice and words unnerved me.

'Let's go; we've had enough,' I exclaimed; and I wished to move away; but Kellaw caught me roughly by the shoulder and pulled me towards him, saying in a hot, fierce whisper, 'We must go on. It's duty.'

We went back to our work without another word.

This time the cement was about two inches thick, and we found under it a coarse ground of thick carpet nailed firmly across an opening. It was hard to unfasten this textile fabric; and when at last it fell to the floor, wrenched nail by nail from the firm cement, we turned our backs to the mystery which had been sealed up behind it for many generations.

We were afraid to look; but inaction became worse than action, more unnerving, less bearable, and presently an irritable feeling of shame flamed up in my mind. Then I turned, went forward, and saw before me in the wall a long and shallow recess. On a couch a body lay face downwards. It was dressed in a nun's robe, and I saw that a strong rope was coiled over it and around the couch. All this was indistinct, for my eyes were fascinated by long waves of auburn hair that gleamed dimly in the light; and through this bright covering of beautiful hair I could see, clenched together, the skeleton fingers of one little hand.

A moment later Kellaw looked over my shoulder. His breathing startled me, for he gasped like a spent runner. In his left hand he carried the lamp unsteadily, and with his right hand he gripped my right shoulder. Then came a sudden cry, thick and hoarse, and the next instant the lamp fell crashing into the débris of cement. I expected an explosion, but the lamp went out, and I think the incident was good for both of us.

'Come,' I said to Kellaw, taking him by the arm; and with difficulty I led him to the bay-window where we had talked on the previous night. He fell into a chair, and then across the narrow table, and for several minutes I watched his hands as they twitched convulsively.

Then, with a quick movement, he pulled himself together and looked up. 'I'm cold,' he said. 'But—we—know now, old man; and that—that poor murdered girl'—— Suddenly he hesitated, faltered, broke off.

'Yes, Kellaw?'

'She shall be buried now.' And once more he hid his face from me.

I looked at my watch. In a few seconds it would be midnight, and I should hear again the distant boom from the old clock in the great hall downstairs. Kellaw made no sign that he heard the hour strike, but I believe he listened.

'You notice that?' he exclaimed a moment later, raising his head from the table. 'Hush!'

Through the silence came the pattering of feet, soft and even, and soon, as on the pre-

vious night, the Latin prayer trilled through the gallery, clear, sweet, and infinitely sorrowful. Breathless we listened till the voice trembled out of hearing.

Then Kellaw got up from his chair and cried with energy, 'Come, our work 's not finished yet. Bring that candle; it will do. A lamp 's too dangerous.'

On arriving at the south end of the gallery we found that there was very little to be done, for the carpenters had uncovered a narrow doorway which the portrait and wainscot had masked. The door was one of oak, and two steps led up to it. Kellaw turned the handle with difficulty, then pushed, and the door opened an inch or two.

'It 's not even locked,' he muttered.

'There was no need,' I replied.

Bit by bit the door opened, the old hinges making a great noise; and at last we were able to enter a narrow passage about four feet wide. On each side I could feel unplastered wall, and by candle-light we could see that it was about six feet long. Then it turned at a sharp angle to the right.

From the passage the singing voice could be heard indistinctly; but when we reached the bend it sounded much louder and clearer. Before us was another passage, and at the end of it a small window blocked up with entangled ivy stems and leaves. About four feet from the end, on the left-hand side, we found an open doorway, and there we stopped dead.

The voice now rang out quite near to us, and wondrously sweet. I held the candle at arm's-length into an open space of darkness filled with the music of a chanted prayer. Little by little the rays of light penetrated the darkness, and I saw dimly a little chapel with an altar, and upon the altar stood a tall crucifix of wood. It was there that the voice sang the *Ave Maria*, but I could not see the singer.

We stood there spell-bound. But all at once we shrank backwards into the passage till we touched the wall under the little window, for the song came towards us, and the Unseen moved slowly down the passage and vanished from our hearing.

'Will she ever rest?' I whispered to Kellaw.

'Will the daybreak come?' he replied under his breath.

Kellaw shuddered, and a great silence fell upon us both.

COLLEGE WATER.

My sire is the stooping Cheviot mist,
My mother the heath in her purple train,
And every flower on her gown I 've kissed
Over and over and over again.

The secret ways of the hills are mine,
I know where the wandering moorfowl nest;
And up where the wet gray glidders shine,
I know where the roving foxes rest.

I know what the wind is wailing for
As it searches hollow and hag and peak;
And, riding restless on Newton Tor,
I know what the questing shadows seek.

I know the tale that the brown bees tell,
And they tell it to me with a raider's pride,
As, drunk with the cups of Yeavering Bell,
They stagger home from the English side.

I know the secrets of haugh and hill;
But sacred and safe they rest with me
Till I hide them deep in the heart of Till,
To be taken to Tweed and the open sea.
